

Oxygen XML Developer 27.1

User Guide

Contents

Chapter 1. Introduction.....	22
Chapter 2. Getting Started.....	23
What is Oxygen XML Developer.....	23
Getting Familiar with the Interface.....	24
Supported Document Types.....	25
Resources to Help You Get Started Using Oxygen XML Developer	26
Your First Document or Project.....	28
Creating a New Project.....	28
Getting Help.....	32
Help Menu.....	32
Frequently Used Shortcut Keys.....	36
Accessibility Support in Oxygen.....	41
Oxygen XML Developer VPAT Accessibility Conformance Report.....	45
Chapter 3. Installation.....	69
Installing Oxygen XML Developer on Windows.....	70
Installing Oxygen XML Developer on macOS.....	74
Installing Oxygen XML Developer on Linux.....	76
Installing Oxygen XML Developer on Windows Server.....	81
Installing Oxygen XML Developer on a Linux / UNIX Server.....	83
Site-Wide Deployment.....	85
Licensing.....	86
License Types.....	87
Installing License Servers.....	94
Managing License Servers.....	100
Common Problems: License Server Errors.....	105
Upgrading.....	106
Upgrading Oxygen XML Developer on Windows/Linux.....	107
Upgrading Oxygen XML Developer on macOS.....	108
Installing and Updating Add-ons.....	108
Privacy Options.....	110
Uninstalling.....	113

Chapter 4. Configuration	114
Preferences.....	114
Global Preferences.....	116
Appearance Preferences.....	119
Application Layout Preferences.....	125
Add-ons Preferences.....	127
Project Level Settings Preferences.....	127
Document Type Association Preferences.....	128
Document Templates Preferences.....	157
Encoding Preferences.....	158
Editor Preferences.....	159
CSS Validator Preferences.....	202
XML Preferences.....	203
DITA Preferences.....	237
Markdown Preferences.....	241
Data Sources Preferences.....	242
SVN Preferences.....	247
Diff Preferences.....	252
Archive Preferences.....	256
Plugins Preferences.....	257
External Tools Preferences.....	258
Menu Shortcut Keys Preferences.....	260
File Types Preferences.....	263
Open/Find Resource Preferences Page.....	264
Custom Editor Variables Preferences.....	266
Network Connection Settings Preferences.....	267
XML Structure Outline Preferences.....	272
Views Preferences.....	272
Messages Preferences.....	272
Configuring Options.....	274
Customizing Default Options.....	275
Storing Global and Project Level Options.....	277
Sharing Application Settings.....	278

Importing/Exporting/Resetting Global Options.....	279
Configuring the Layout of the Views and Editors.....	280
Configuring Toolbars.....	286
Import/Export Transformation or Validation Scenarios.....	288
Editor Variables.....	289
Custom Editor Variables.....	297
Custom System Properties.....	298
Localizing the User Interface.....	302
Setting a Java Virtual Machine Parameter when Launching Oxygen XML Developer.....	304
Setting Parameters for the Application Launchers.....	304
Setting Parameters in the Command-Line Scripts.....	307
Creating Custom Startup Parameters File.....	307
How to Increase the Amount of Available Memory.....	308
Chapter 5. Perspectives.....	309
Editor Perspective.....	309
XSLT Debugger Perspective.....	311
XQuery Debugger Perspective	312
Database Perspective	313
Chapter 6. Editing Modes.....	316
Text Editing Mode.....	316
Grid Editing Mode.....	316
Design Editing Mode (Schema Diagram Editor).....	317
Chapter 7. Working With Documents.....	320
Getting Familiar with the Interface.....	320
Configuring the Layout of the Views and Editors.....	322
Configuring Toolbars.....	327
Creating, Opening, Saving, and Closing Documents.....	330
Creating New Documents and Templates.....	330
Opening Documents.....	344
Saving Documents.....	347
Auto Recover Documents.....	347
Closing Documents.....	348
Working with Remote Documents.....	349

Open URL.....	349
WebDAV over HTTPS.....	353
HTTP Authentication Schemes.....	355
Switching, Moving, or Hiding Editor Tabs.....	356
Contextual Menu of the Current Editor Tab.....	358
Viewing File Properties.....	359
Simple Text Editor.....	360
Using Projects to Group Documents.....	361
Creating a New Project.....	361
Project View.....	365
Batch Validation and Transformation.....	377
Sharing a Project - Team Collaboration.....	378
Contextual Project Operations Using 'Main Files' Support.....	381
Search and Find/Replace Features.....	385
Open/Find Resource View.....	385
Open/Find Resource Dialog Box.....	388
Searching in Content.....	391
Searching in File Paths.....	394
Searching in Reviews.....	394
Find/Replace Dialog Box.....	394
Find/Replace in Multiple Files.....	399
Find All Elements Dialog Box.....	405
Find and Invoke Actions.....	406
Quick Find Toolbar.....	408
Keyboard Shortcuts for Finding the Next and Previous Match.....	409
Regular Expressions Syntax.....	409
Spell Checking.....	410
Spell Check Dictionaries and Term Lists.....	412
Learned Words.....	418
Ignored Words (Elements).....	419
Automatic Spell Check.....	419
Spell Check Multiple Files.....	420
Working with Special Characters and Encoding.....	421

Unicode Support.....	422
Opening and Saving Documents with Unsupported Characters.....	423
Unicode Fallback Font Support.....	424
Inserting Special Characters with the Character Map.....	425
Image Preview.....	428
Loading Large Documents.....	428
Optimize Loading for Large Files.....	429
Optimize Loading for Huge Files.....	430
Documents with Long Lines.....	430
Handling Read-Only Files.....	431
Scratch Buffer.....	431
Compare Files or Directories	432
Compare Files Tool.....	433
Compare Directories Tool.....	451
Compare Directories Against a Base (3-Way) Tool.....	457
Generate HTML Report for Directory Comparison.....	464
Viewing Status Information.....	467
Editor Highlights.....	468
Printing a Document.....	469
Chapter 8. Editing Supported Document Types.....	471
Editing XML Documents.....	471
Editing XML Documents in Text Mode.....	471
Editing XML Documents in Grid Mode.....	534
Validating XML Documents.....	543
XML Quick Fixes.....	580
Associating a Schema to XML Documents.....	582
Working with XML Catalogs.....	593
Modular Contextual XML Editing Using 'Main Files' Support.....	596
Search and Refactoring Actions for IDs and IDREFS.....	596
XML Referenced/Dependent Resources View.....	599
Combining XML Content Using DTD Entities and XInclude.....	602
Refactoring XML Documents.....	607
Applying All Default Quick Fix Proposals.....	644

XML Digital Signatures.....	646
Editing XSLT Stylesheets.....	655
Modular Contextual XSLT Editing Using 'Main Files' Support	656
Validating XSLT Stylesheets.....	656
XSLT Quick Fix Support	659
Content Completion in XSLT Stylesheets.....	661
Syntax Highlighting in XSLT.....	668
XSLT Outline View.....	668
XSLT Input View.....	673
XSLT Referenced/Dependent Resources View.....	675
XSLT Component Dependencies View.....	678
Highlight Component Occurrences.....	680
Finding XSLT References and Declarations.....	680
XSLT Stylesheet Component Documentation Support.....	681
XSLT 3.0 Text Value Templates.....	683
XSLT 3.0 Packages (xsl:package Element).....	683
XSLT Refactoring Actions.....	684
XSLT Quick Assist Support.....	689
XSLT Unit Test (XSpec).....	691
Generating Documentation for an XSLT Stylesheet.....	694
Compiling an XSL Stylesheet for Saxon.....	701
Editing Ant Build Files.....	703
Modular Contextual Ant Build File Editing Using 'Main Files' Support.....	704
Validating Ant Build Files.....	704
Transforming Ant Build Files.....	705
Ant Quick Fix Support.....	706
Content Completion in Ant Build Files.....	706
Syntax Highlighting in Ant Files.....	707
Ant Outline View.....	708
Ant Referenced/Dependent Resources View.....	711
Ant Component Dependencies View.....	713
Highlight Component Occurrences.....	714
Find References and Declarations of Ant Components.....	714

Ant Refactoring Actions.....	715
Ant Quick Assist Support.....	716
Editing XML Schemas (XSD).....	717
XML Schema Design Mode (XML Schema Diagram Editor).....	717
Editing XML Schema in Text Editing Mode.....	759
Modular Contextual XML Schema Editing Using 'Main Files' Support.....	759
Validating XML Schema Documents.....	760
Quick Fixes for DTD, XSD, and Relax NG Errors.....	761
Content Completion in XML Schema.....	761
Syntax Highlighting in XML Schema.....	762
XML Schema Outline View.....	763
XML Schema Attributes View.....	765
XML Schema Referenced/Dependent Resources View.....	767
XML Schema Component Dependencies View.....	770
Highlight Component Occurrences.....	772
Searching and Refactoring Actions in XML Schemas.....	772
XML Schema Quick Assist Support.....	774
Generating Sample XML Files.....	776
Generating Documentation for an XML Schema.....	781
Converting Schema to Another Schema Language.....	791
Converting Database to XML Schema.....	794
Flatten an XML Schema.....	795
Generating Java Classes from XML Schema.....	797
XML Schema Regular Expressions Builder Tool.....	797
XML Schema 1.1.....	799
Setting the XML Schema Version.....	800
Editing XQuery Documents.....	802
XQuery Validation.....	802
Content Completion in XQuery.....	803
Syntax Highlighting in XQuery.....	804
Formatting and Indenting XQuery Documents.....	805
Folding in XQuery Documents.....	805
XQuery Outline View.....	806

XQuery Builder View.....	807
XQuery Input View.....	811
Generating HTML Documentation for an XQuery Document.....	813
Transforming XML Documents Using XQuery.....	814
XQuery Unit Test (XSpec).....	818
Editing WSDL Documents (Deprecated).....	819
Modular Contextual WSDL Editing Using 'Main Files' Support.....	820
Validating WSDL Documents.....	821
Content Completion Assistance in WSDL Documents.....	821
WSDL Syntax Highlighting.....	822
WSDL Outline View.....	823
WSDL Referenced/Dependent Resources View in WSDL Documents.....	828
WSDL Component Dependencies View.....	830
Highlight Component Occurrences in WSDL Documents.....	832
Searching and Refactoring Operations in WSDL Documents.....	832
Quick Assist Support in WSDL Documents.....	835
Generating Documentation for WSDL Documents (Deprecated).....	836
WSDL SOAP Analyzer Tool (Deprecated).....	841
Editing CSS Stylesheets.....	845
Validating CSS Stylesheets.....	845
Content Completion in CSS Stylesheets.....	846
Syntax Highlighting in CSS Files.....	847
CSS Outline View.....	847
Folding in CSS Stylesheets.....	848
Formatting and Indenting CSS Stylesheets (Pretty Print).....	848
Minifying CSS Stylesheets.....	848
Editing LESS Stylesheets.....	849
Validating LESS Stylesheets.....	850
Content Completion in LESS Stylesheets.....	850
Syntax Highlighting in LESS Files.....	850
Compiling LESS Stylesheets to CSS.....	851
Editing Relax NG Schemas.....	851
Modular Contextual Relax NG Schema Editing Using 'Main Files' Support.....	852

Relax NG Schema Diagram Editor.....	852
Validating Relax NG Schema Documents.....	856
Content Completion in Relax NG Schemas.....	857
Syntax Highlighting in Relax NG Schemas.....	858
Quick Fixes for DTD, XSD, and Relax NG Errors.....	858
Relax NG Outline View.....	859
RNG Referenced/Dependent Resources View.....	862
Relax NG Schema Component Dependencies View.....	865
Searching and Refactoring Actions in RNG Schemas.....	866
RNG Quick Assist Support.....	868
Configuring a Custom Datatype Library for a RELAX NG Schema.....	870
Editing NVDL Schemas.....	870
NVDL Schema Diagram.....	870
Validating NVDL Schema Documents.....	873
Content Completion in NVDL Schemas.....	873
Syntax Highlighting in NVDL Schemas.....	874
NVDL Outline View.....	875
NVDL Schema Component Dependencies View.....	875
Searching and Refactoring Actions in NVDL Schemas.....	876
Editing JSON Documents.....	878
JSON Editor.....	878
Navigating References in JSON Documents.....	880
Validating JSON Documents.....	883
Content Completion Assistant in JSON.....	891
Associating a Schema to JSON Documents.....	893
Syntax Highlighting in JSON Documents.....	898
Folding in JSON.....	898
JSON Outline View.....	898
JSON to XML Converter.....	901
XML to JSON Converter.....	904
JSON to YAML Converter.....	907
YAML to JSON Converter.....	907
Contextual Menu Actions in JSON Documents.....	908

Transforming and Querying JSON Documents.....	913
Editing JSON Schema Documents.....	921
JSON Schema Editor.....	921
JSON Schema Design Mode (JSON Schema Diagram Editor).....	922
Generating JSON Schema from a JSON File.....	943
Generating JSON Schema Documentation.....	945
Generating Sample JSON Files from a JSON Schema.....	945
XSD to JSON Schema Converter.....	947
JSON Schema Converter.....	947
Validating JSON Schema Documents.....	948
Syntax Highlighting in JSON Schema Documents.....	949
Flatten JSON Schema.....	950
Editing JSON Lines Documents.....	950
Editing JSON5 Documents.....	950
Editing YAML Documents.....	951
YAML Editor.....	951
Validating YAML Documents.....	952
Content Completion Assistant in YAML.....	957
Syntax Highlighting in YAML Documents.....	958
Folding in YAML Documents.....	958
Formatting/Indenting YAML Documents.....	958
YAML Outline View.....	958
YAML to JSON Converter.....	960
JSON to YAML Converter.....	961
Contextual Menu Actions in YAML Documents.....	962
Editing XLIFF Documents.....	967
Editing JavaScript Documents.....	968
JavaScript Editing Actions.....	968
Validating JavaScript Files.....	971
Content Completion in JavaScript Documents.....	971
Syntax Highlighting in JavaScript Documents.....	972
JavaScript Outline View.....	973
Editing XProc Scripts.....	974

Editing Schematron Schemas.....	976
Examples of Schematron Rules and Quick Fixes.....	978
Modular Contextual Schematron Editing Using 'Main Files' Support.....	990
Presenting Schematron Validation Issues.....	990
Integrating Schematron Rules in a Framework and Sharing Them.....	991
Validating Schematron Documents.....	992
Content Completion in Schematron Documents.....	993
Syntax Highlighting in Schematron.....	994
Embedding Schematron Rules in XML Schema or RELAX NG.....	995
Schematron Outline View.....	996
Schematron Referenced/Dependent Resources View.....	998
Highlight Component Occurrences in Schematron Documents.....	1000
Searching and Refactoring Operations in Schematron Documents.....	1001
Quick Assist Support in Schematron Documents.....	1003
Schematron Unit Test (XSpec).....	1004
Editing Schematron Quick Fixes.....	1006
Examples of Schematron Rules and Quick Fixes.....	1006
Defining Schematron Quick Fixes.....	1019
Integrating SQF in a Framework and Sharing Them.....	1028
Validating Schematron Quick Fixes.....	1030
Content Completion in SQF.....	1031
Highlight Quick Fix Occurrences in SQF.....	1031
Searching and Refactoring Operations in SQF.....	1031
Embedding Schematron Quick Fixes in Relax NG or XML Schema.....	1033
Editing SVG Files.....	1034
Standalone SVG Viewer.....	1035
Integrated SVG Viewer in the Results Panel.....	1037
Editing HTML Documents.....	1038
HTML Editor.....	1038
HTML Validation.....	1039
HTML Content Completion Assistant.....	1040
Syntax Highlighting in HTML Documents.....	1041
Folding in HTML.....	1042

Minifying HTML Documents.....	1042
HTML Outline View.....	1042
Querying HTML Documents with XPath.....	1043
Editing Markdown Documents.....	1044
Markdown Editor.....	1045
Creating New Markdown Documents.....	1046
Actions Available in the Markdown Editor.....	1047
Syntax Highlighting in the Markdown Editor.....	1054
Automatic Validation in Markdown Documents.....	1054
Markdown Editor Syntax Rules and Specifications.....	1055
Other Supported Document Types.....	1068
Chapter 9. Built-in Frameworks (Document Types).....	1070
DocBook 4 Document Type (Framework).....	1070
Inserting an Olink in DocBook Documents.....	1071
DocBook 5 Document Type (Framework).....	1075
Inserting an Olink in DocBook Documents.....	1076
DocBook Assembly (5.1 and Later).....	1079
DocBook Topic (5.1 and Later).....	1080
DocBook Targetset Document Type (Framework).....	1081
DITA Topics Document Type (Framework).....	1082
DITA Map Document Type (Framework).....	1083
XHTML Document Type (Framework).....	1084
XHTML Validation.....	1085
TEI P5 Document Type (Framework).....	1086
How to Install a TEI Framework with the Latest Schema and Stylesheets.....	1087
TEI ODD Document Type (Framework).....	1087
jTEI Document Type (Framework).....	1088
JATS Document Type (Framework).....	1089
EPUB Document Type (Framework).....	1090
OpenAPI (Swagger) Document Type (Framework).....	1092
OpenAPI Test Scenario Document Type (Framework).....	1093
AsyncAPI Document Type (Framework).....	1094
JSON-LD Document Type (Framework).....	1095

Chapter 10. Additional XML Editing Frameworks (Document Types)	1096
S1000D Document Type (Framework).....	1096
Chapter 11. Publishing	1098
Transformation Scenarios.....	1098
Built-in Transformation Scenarios.....	1099
Creating New Transformation Scenarios.....	1129
Editing a Transformation Scenario.....	1237
Duplicating a Transformation Scenario.....	1239
Applying Associated Transformation Scenarios.....	1239
Configure Transformation Scenario(s) Dialog Box.....	1240
Batch Transformations.....	1245
Sharing Transformation Scenarios.....	1246
Transformation Scenarios View.....	1246
WebHelp Output Customization.....	1250
WebHelp Responsive Output for DITA.....	1251
DITA to PDF Output Customization.....	1450
CSS-based PDF Customization.....	1450
XSL-FO to PDF Customization.....	1719
DocBook to PDF Output Customization.....	1731
Chapter 12. Working with XPath Expressions	1732
XPath Toolbar.....	1733
XPath Builder View.....	1735
XPath Expression Results View.....	1738
XPath and XML Catalogs.....	1739
XPath Prefix Mapping.....	1740
Chapter 13. Working with Archives	1741
Browsing Archives.....	1741
Working with Archive Files.....	1744
Creating an Archive.....	1746
Editing and Saving Files Inside an Archive.....	1746
Migrating Archives to DITA or TEI.....	1747
Chapter 14. Databases and SharePoint	1748
Working with Databases.....	1748

Data Source Explorer View.....	1748
Table Explorer View.....	1750
Database Connection Support.....	1753
WebDAV Connections.....	1795
SQL Execution Support.....	1798
XQuery and Databases.....	1801
Integration with Microsoft SharePoint.....	1808
How to Configure a SharePoint Connection.....	1809
SharePoint Browser View.....	1813
SharePoint Contextual Menu Actions.....	1815
Browsing for Remote Files with SharePoint Online.....	1818
MS Azure Active Directory Authentication.....	1819
Chapter 15. Importing Data.....	1821
Import from Text Files.....	1821
Import from MS Excel Files.....	1823
Import Database Data as an XML Document.....	1825
Import from HTML Files.....	1828
Import Content Dynamically.....	1828
Chapter 16. XSLT/XQuery Debugging.....	1832
Debugger Layout.....	1833
Control Toolbar.....	1834
Debugging Information Views.....	1838
Multiple Output Documents in XSLT 2.0 and XSLT 3.0.....	1851
Steps in a Typical Debugging Process.....	1851
Identify the XSLT / XQuery Expression that Generated Particular Output.....	1852
Using Breakpoints.....	1855
Performance Profiling of XSLT Stylesheets and XQuery Documents.....	1856
Invocation Tree View.....	1858
Hotspots View.....	1859
Debugging XSLT that Call Java Extensions.....	1861
Debugging Java Extensions.....	1861
Supported Processors for XSLT / XQuery Debugging.....	1862
Chapter 17. Extending Oxygen With the SDK.....	1863

Extending Oxygen XML Developer with Plugins.....	1863
General Configuration of an Oxygen XML Developer Plugin.....	1863
Installing an Oxygen XML Developer Plugin.....	1866
Types of Plugin Extensions Available with the SDK.....	1867
How to Write a CMS Integration Plugin.....	1891
How to Write A Custom Protocol Plugin.....	1896
How to Share a Class Loader Between a Framework and Plugin.....	1896
Packing and Deploying Plugins as Add-ons.....	1897
Testing Plugins and Java Extensions.....	1898
Disabling a Plugin.....	1903
Developer Quick Start Guide.....	1903
Plugins.....	1904
Frameworks.....	1910
Difference Between a Framework (Document Type) and a Plugin Extension.....	1915
SDK Common Use Cases.....	1916
Add Custom Actions to the Contextual Menu.....	1916
Auto-Generate an ID When a Document is Opened or Created.....	1916
Customize the Outline View in Text Mode.....	1917
Open a Document from Another Application.....	1923
Run XSLT or XQuery Transformations.....	1924
Save a New Document with a Predefined File Name Pattern.....	1924
Chapter 18. Add-ons.....	1927
Chapter 19. Tools.....	1928
XML Refactoring.....	1928
Built-in Refactoring Operations.....	1931
Custom Refactoring Operations.....	1944
Storing and Sharing Refactoring Operations.....	1958
Localizing XML Refactoring Operations.....	1959
Generate Sample XML Files.....	1960
Applying All Default Quick Fix Proposals.....	1966
Generate/Convert Schema.....	1968
Convert DB Structure to XML Schema.....	1971
Flatten Schema.....	1972

Generate Java Classes from XSD.....	1973
Compile XSL Stylesheet for Saxon.....	1974
JSON Tools.....	1976
Generate Sample JSON Files.....	1976
Generate JSON Schema.....	1978
JSON to YAML.....	1980
YAML to JSON.....	1980
JSON to XML.....	1981
XML to JSON.....	1984
XSD to JSON Schema Converter.....	1988
JSON Schema Converter.....	1988
OpenAPI Tester.....	1989
Run OpenAPI Test Scenario.....	1989
Format and Indent Files.....	1990
Generate Documentation.....	1991
XML Schema Documentation Generator.....	1992
XSLT Stylesheet Documentation Generator.....	1995
XQuery Documentation Generator.....	1999
WSDL Documentation Generator (Deprecated).....	2001
JSON Schema Documentation Generator.....	2004
OpenAPI Documentation Generator.....	2004
Canonicalize.....	2005
Sign.....	2006
Verify Signature.....	2009
WSDL SOAP Analyzer (Deprecated).....	2009
Testing Remote WSDL Files.....	2011
XML Schema Regular Expressions Builder.....	2012
Large File Viewer.....	2013
Hex Viewer.....	2015
SVG Viewer.....	2016
Tree Editor (Deprecated).....	2018
Comparison Tools.....	2018
Compare Files.....	2018

Merge Documents with Change Tracking Highlights.....	2045
Compare Directories.....	2046
Compare Directories Against a Base (3-Way).....	2052
Generate HTML Report for Directory Comparison.....	2059
Merge Directories with Change Tracking Highlights.....	2062
Syncro SVN Client (Deprecated).....	2066
Main Window.....	2067
Getting Started.....	2082
Syncro SVN Client Views.....	2157
Revision Graph of an SVN Resource.....	2192
Oxygen XML Developer SVN Preferences.....	2197
Entering Local Paths and URLs.....	2197
Technical Issues.....	2198
External Tools.....	2201
Chapter 20. Troubleshooting.....	2204
Performance Problems and Solutions.....	2204
Display Problems on Linux or Solaris.....	2204
Out of Memory on External Processes.....	2204
Too many nested apply-templates calls Error When Running a Transformation.....	2205
Performance Issues with Large Documents.....	2205
Performance Issues when Using Oxygen XML Developer with Remote Desktop.....	2206
Misc Problems and Solutions.....	2207
Address Family Not Supported by Protocol Family.....	2207
Application Reports Errors During Startup After Installing a New Version.....	2207
Application Takes Several Minutes to Start.....	2208
Archive Distribution Fails to Run on macOS 10.12 (Sierra).....	2209
Blank Window is Shown When Starting the App Over an RDP Connection on Linux.....	2209
Cannot Connect to SVN Repository from Repositories View.....	2210
Cannot Open Files from Desktop/Downloads/OneDrive on macOS.....	2211
Cannot Uninstall Oxygen XML Developer in Windows.....	2212
Compatibility Issue Between Java and Certain Graphics Card Drivers.....	2212
Crash at Startup on Windows with an Error About the nvoglv32.dll File.....	2213
Damaged File Associations on macOS.....	2213

Details to Submit in a Request for Technical Support Using the Online Form.....	2214
Dialog Boxes Cannot Be Resized on Mac.....	2215
DITA Map Transformation Fails (Cannot Connect to External Location).....	2215
DITA Map WebHelp Transformation Fails (Duplicate Topic References Found).....	2216
DITA-OT Transformation Takes a Long Time to Process.....	2216
DITA PDF Transformation Fails.....	2217
DITA PDF Processing Common Errors.....	2218
DITA PDF CSS-based Processing Common Errors.....	2219
DITA to CHM Transformation Fails - Cannot Open File.....	2219
DITA to CHM Transformation Fails - Compilation Failed.....	2219
Fonts Installed in Windows Do Not Appear in Fonts Preferences Page.....	2220
Format and Indent Fails.....	2220
Handshake Failure Error When Accessing an HTTPS (SSL) Resource.....	2221
Hunspell Spell Checker is Unusable on Your Platform Error.....	2221
High Resolution Scaling Issues.....	2222
High Resolution Scaling Issues on Linux.....	2222
Images Appear Stretched Out in the PDF Output.....	2222
Increasing the Memory for the Ant Process.....	2224
Java Virtual Machine (JVM) Crash on macOS.....	2224
Keyboard Language Resets to Default on Windows.....	2224
Keyboard Shortcuts Do Not Work At All.....	2225
Keyboard Shortcuts Result in Unexpected Behavior.....	2225
Mac Touch Bar Function Keys Do Not Work.....	2225
Server Signature Mismatch Error.....	2226
MSXML 4.0 Transformation Issues.....	2227
Navigation to a Web Page is Canceled when Viewing CHM on a Network Drive.....	2227
Out Of Memory Error When Opening Large Documents.....	2227
References Outside the Main DITA Map Folder.....	2228
Saxon 9.7 Transformer Issues.....	2229
Scroll Function of my Notebook Trackpad is Not Working.....	2229
Special Characters are Replaced with a Square.....	2230
TocJS Transformation Does not Generate All Files for a Tree-Like TOC.....	2230
Text on Buttons and Labels is Invisible for Linux Installer.....	2231

XML Document Takes a Long Time to Open.....	2231
XSLT Debugger Is Very Slow.....	2231
Chapter 21. Scripting Oxygen.....	2233
DITA Validate and Check For Completeness.....	2233
Transform.....	2234
Validate.....	2235
XML Refactoring.....	2238
DITA Translation Package Builder.....	2239
Batch Converter.....	2241
Compile Framework Script.....	2243
XSLT Stylesheets Documentation.....	2244
XML Schema Documentation.....	2244
JSON Schema Documentation.....	2245
OpenAPI Documentation.....	2247
WSDL Documentation (Deprecated).....	2249
XML Instance Generator.....	2249
Flatten XML Schema.....	2250
Compare Directories.....	2251
Compare Files.....	2256
Merge Files with Change Tracking Highlights.....	2260
Merge Directories with Change Tracking Highlights.....	2262
Format and Indent Files.....	2265
Chapter 22. Glossary.....	2267
Active Cell.....	2267
Anchor.....	2267
Apache Ant.....	2267
Block Element.....	2267
Bookmap.....	2267
Canonicalize.....	2267
Content Completion Assistant.....	2267
Dockable.....	2268
Document Type Association.....	2268
DITA Map.....	2268

DITA Open Toolkit.....	2269
DITA-OT-DIR.....	2269

Introduction

Welcome to the User Manual of Oxygen XML Developer 27.1.

Oxygen XML Developer is a cross-platform application designed to accommodate all of your XML editing, authoring, developing, and publishing needs. It is the best XML editor available for document development using structured mark-up languages such as XML, XSD, Relax NG, XSL, DTD.

It offers developers a powerful **Integrated Development Environment** and the intuitive **Graphical User Interface** of Oxygen XML Developer is easy to use and provides robust functionality for content editing, project management, and validation of structured mark-up sources. Coupled with *XSLT* and *FOP* transformation technologies, Oxygen XML Developer offers support for generating output to multiple target formats, including: *PDF*, *PS*, *TXT*, *HTML*, *JavaHelp*, *WebHelp*, and *XML*.

This user guide is focused on describing features, functionality, the application interface, and to help you quickly get started. It also includes a vast amount of advanced technical information and instructional topics that are designed to teach you how to use Oxygen XML Developer to accomplish your tasks. It is assumed that you are familiar with the use of your operating system and the concepts related to XML technologies and structured mark-up.

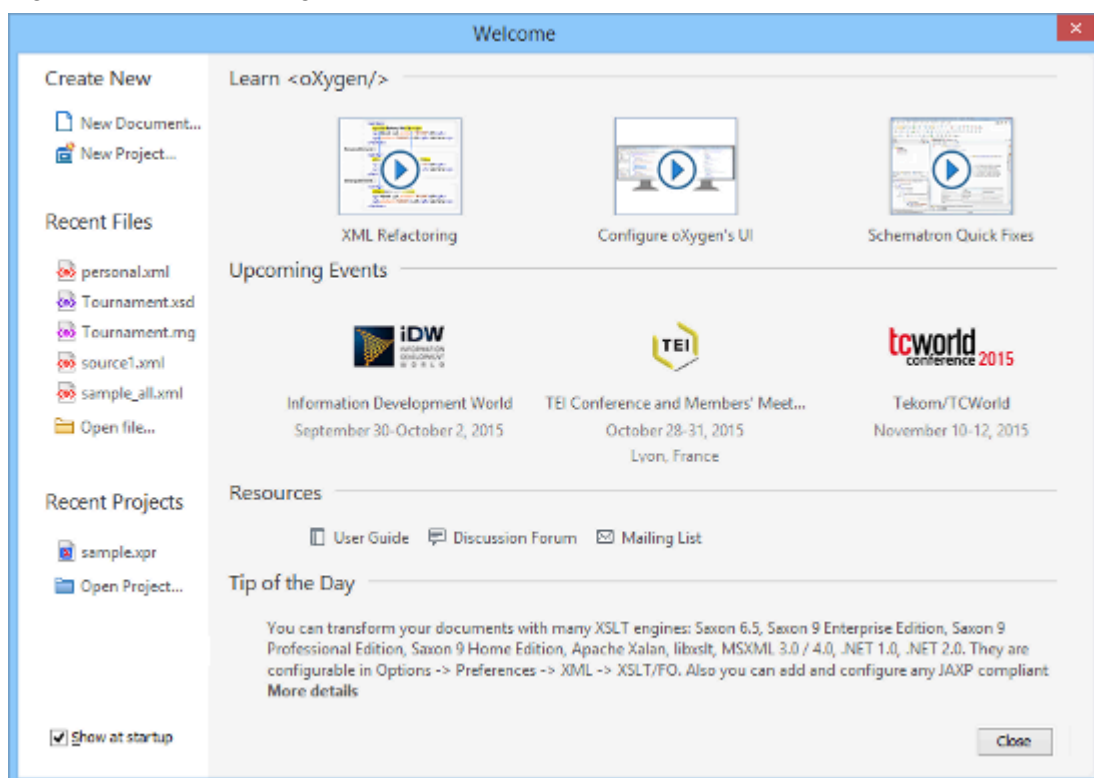

2.

Getting Started

This section provides a variety of resources to help you get the most out of the application. Typically, the first step of getting started with Oxygen XML Developer would be to install the software. For detailed information about that process, see the [Installation chapter \(on page 69\)](#).

After installation, when you launch Oxygen XML Developer for the first time, you are greeted with a **Welcome** dialog box. It presents upcoming events, useful video demonstrations, helpful resources, the tip of the day, and also gives you easy access to recently used files and projects and to create new ones.

Figure 1. Welcome Dialog Box

If you do not want it to be displayed every time you launch Oxygen XML Developer, deselect the **Show at startup** option in the bottom-left corner of the dialog box. To display it any time, go to **Help > Welcome**.

What is Oxygen XML Developer

Oxygen XML Developer is the best XML editor available and is a complete XML development and authoring solution. It is designed to accommodate a large number of users, ranging from beginners to XML experts. It is the only XML tool that supports all of the XML schema languages and provides a large variety of powerful tools for editing and publishing XML documents.

You can use Oxygen XML Developer to work with most XML-based standards and technologies. It is a cross-platform application available on all the major operating systems (Windows, macOS, Linux, Solaris) and can be used either as a standalone application or as an Eclipse plugin.

For a list of many of the features and technologies that are included in Oxygen XML Developer, see the [Oxygen Website](#).

Getting Familiar with the Interface

Oxygen XML Developer includes several [perspectives \(on page 2271\)](#) and [editing modes \(on page 316\)](#) to help you accomplish a wide range of tasks. Each *perspective* and editing mode also includes a large variety of helper views, menu actions, toolbars, and contextual menu functions.

There are various ways that you can [configure the layout of the views or editors \(on page 322\)](#), and you can [customize the toolbars \(on page 327\)](#).

Regardless of the [perspective \(on page 2271\)](#) or editing mode that you are working with, the default layout consists of the following areas:

Menus

Menu-driven access to all the features and functions available in Oxygen XML Developer. Most of the menus are common for all types of documents, but Oxygen XML Developer also includes some context-sensitive and *framework*-specific menus and actions that are only available for a specific context or type of document.

Toolbars

Easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function. Some of the toolbars are common for all *perspectives*, editing modes, and types of documents, while others are specific to the particular *perspective* or mode. Some toolbars are also *framework*-specific, depending on the type of document that is being edited. All the [toolbars can be configured \(on page 327\)](#) to suit your specific needs.

Helper Views

Oxygen XML Developer includes a large variety of [dockable \(on page 2268\)](#) views to assist you with editing, viewing, searching, validating, transforming, and organizing your documents. Many of the views also contain useful contextual menu actions, toolbar buttons, or menus. The most commonly used views for each *perspective* and editing mode are displayed by default and you can choose to display others to suit your specific needs. The [layout of the views can also be configured \(on page 322\)](#) according to your preferences.

Editor Pane

The main editing area in the center of the application. Each editing mode provides a main editor pane where you spend most of your time reading, editing, applying markup, and validating your documents. The editor pane in each editing mode also includes various contextual menu actions and other features to help streamline your editing tasks. Each file that has been opened has a

tab at the top of the editing pane and there are [several ways to switch between tabs or move them \(on page 356\)](#).

Perspectives

Oxygen XML Developer includes [several different perspectives \(on page 309\)](#) that you can use to work with your documents. The **Editor perspective** is the most commonly used *perspective* used for displaying and editing the content of your XML documents, and it is the default *perspective* when you start Oxygen XML Developer for the first time. Oxygen XML Developer also includes a **Database perspective** that allows you to manage databases and their connections and a few debugging *perspectives* that allow you to detect problems in XSLT or XQuery transformations.

Status Bar

The status bar at the bottom of the application contains some useful information when you are working with documents. It includes the following information, in the order it is displayed from left to right:

- The path of the current document.
- The [Unicode value \(on page 422\)](#) for the character directly to the right of the current cursor position.
- The status of the current document. The status of **Modified** is displayed for documents that have not yet been saved. Otherwise, this section is left blank.
- In **Text** editing mode, the current line and character position is displayed.
- If the [Check for notifications option \(on page 116\)](#) is selected, this section will show you when new messages have been received. The types of messages include the addition of new videos on the Oxygen XML Developer website, the announcement of upcoming webinars and conferences where the Oxygen XML Developer team will participate, and more.
- The memory consumption, including the memory used by the application and the maximum amount that is allocated to the application.
- If the [Show memory status option \(on page 118\)](#) is selected, a  **Free unused memory** icon is displayed in the bottom-right corner and you can use this icon to free up unused memory.

Supported Document Types

You can use the main editing pane in Oxygen XML Developer to edit a large variety of document types.

The supported document types include the following:

-  - XML documents
-  - XSLT stylesheets
-  - XML Schema
-  - DTD (Document Type Definition) schemas

-  - RELAX NG full syntax schemas
-  - RELAX NG compact syntax schemas
-  - NVDL (Namespace-based Validation Dispatching Language) schemas
-  - XSL:FO documents
-  - XQuery documents
-  - WSDL documents (Deprecated)
-  - Schematron documents
-  - JavaScript documents
-  - Python documents
-  - CSS documents
-  - LESS documents
-  - XProc scripts
-  - SQL documents
-  - JSON documents
-  - JSON Schema documents
-  - YAML documents
-  - Ant build scripts
-  - Markdown documents
- Additional supported document types include: Text, Java, Properties, Batch, Shell, PowerShell, Dockerfile, and PHP.

Resources to Help You Get Started Using Oxygen XML Developer

Configuring Oxygen XML Developer

There are numerous ways that you can configure Oxygen XML Developer to accommodate your specific needs.

See the [Configuring Oxygen section \(on page 114\)](#) for details on the various ways that you can configure the application and its features.

Video Tutorials and Webinars

The Oxygen XML Developer website includes numerous video demonstrations and webinars that present many of the features that are available in Oxygen XML Developer and show you how to complete specific tasks or how to use the various features.

Go to the [Oxygen Videos page](#) to see the list of video tutorials.

Go to the [Oxygen Events page](#) to see all the upcoming and past webinars, conferences, and other events.

Oxygen XML Developer Documentation

The Oxygen XML Developer documentation includes a plethora of sections and topics to provide you with a variety of information, ranging from basic authoring tasks to advanced developer techniques. You can, of course, search through the documentation using standard search mechanisms, but you can also place the cursor in any particular position in the interface and use the **F1** key to open a dialog box that presents a section in the documentation that is appropriate for the context of the current cursor position. Aside from the other topics in this *Getting Started* section, the following are links to other sections of the documentation that might be helpful for your specific needs:

- **Text Editing Mode Section (on page 316)** - Provides information about the **Text** editor.
- **XML Schema Diagram Editor (on page 317)** - Provides information about the schema design mode.
- **Editing Specific Document Types Chapter (on page 471)** - Includes information about editing numerous different types of documents.
- **Publishing Chapter (on page 1098)** - Provides information about the various ways that you can publish content.
- **Importing Data Chapter (on page 1821)** - Provides information about importing data from text files, MS Excel files, database data, and HTML files.
- **Tools Chapter (on page 1928)** - Details about the various built-in tools that are available in Oxygen XML Developer.
- **Add-ons Chapter (on page 1927)** - Information about how to extend the functionality of Oxygen XML Developer through add-ons.

Sample Documents

Your installation of Oxygen XML Developer includes a large variety of sample documents and projects that you can use as templates to get started and to experiment with the various features and technologies. They are located in the **samples** folder that is located in the installation directory of Oxygen XML Developer. You will find files and folders for various types of documents, including the following:

- **Sample project file (sample.xpr)** - A sample project file that will allow you to experiment with how projects can be structured and used. When you open this project file, you will be able to see all the sample files and folders in the **Project view (on page 365)**.
- **Sample files (personal.xml, etc.)** - A collection of interrelated sample files that will allow you to experiment with the structure and relationship between files, stylesheets, and schemas.
- **Various document type folders** - The various folders contain sample files for numerous document types, such as CSS, DITA, DocBook, ePub, TEI, XHTML, and many others.

Other Resources

The following list includes links to various other resources that will help you get started using the features of Oxygen XML Developer:

- See the [Oxygen XML Developer Blog Site](#) for a large variety of current and archived blogs regarding numerous features, requests, and instructional topics.
- Take advantage of the [Oxygen XML Developer Forum](#) to see various announcements and learn more about specific issues that other users have experienced.
- If you are using DITA, see the incredibly helpful [DITA Style Guide Best Practices for Authors](#).
- To learn about the WebHelp features in Oxygen XML Developer, see the [Publishing DITA to WebHelp](#) section of the website.
- For more information about various additional tools that are integrated into Oxygen XML Developer, see the [Tools section \(on page 1928\)](#).
- See the [External Resource Page](#) for links to various other helpful resources, such as discussion lists, external tutorials, and more.
- See the [Oxygen SDK](#) section for details about the SDK that allows you to extend and develop Oxygen XML Developer *frameworks (on page 2269)* and *plugins (on page 2271)*, and to integrate Eclipse plugins.
- For a list of new features that were implemented in the latest version of Oxygen XML Developer, see the [What's New Section on the website](#).
- You can select the [Tip of the Day \(on page 34\)](#) action in the **Help** menu [\(on page 32\)](#) to display a dialog box that includes a variety of tips for using Oxygen XML Developer.
- You can select [Show Dynamic Help view \(on page 33\)](#) from the **Help** menu [\(on page 32\)](#) to dynamically opens a topic that is relevant to the focused editor, view, or dialog box.

Your First Document or Project

This section includes several topics that will help you get started with your first document or project.

Creating a New Project

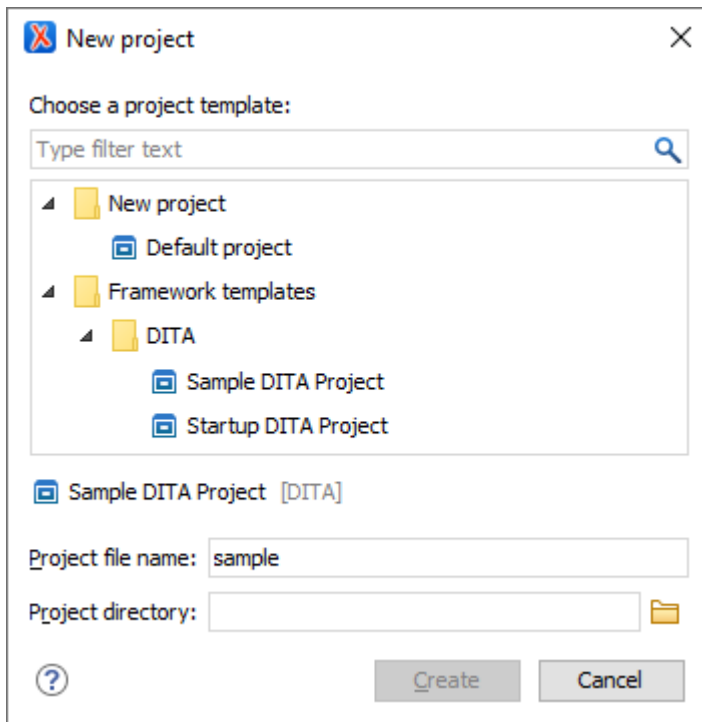

Oxygen XML Developer allows you to organize your XML-related files into projects. This helps you manage and organize your files and also allows you to perform batch operations (such as validation and transformation) over multiple files. You can also [share your project settings and transformation/validation scenarios \(on page 378\)](#) with other users. Use the [Project view \(on page 365\)](#) to manage projects, and the files and folders contained within.

Creating a New Project

To create a new project, select  **New Project** from the **Project** menu, the **New** menu in the contextual menu, or the drop-down menu at the top-left of the **Project** view.

This opens a new project wizard:

Figure 2. New Project Wizard

**Tip:**

There are several sample project templates available for DITA users that can be used as a starting point or for inspiration. These sample project templates are found in the **Framework templates > DITA** folder in the **New Project** wizard: (on page 362)

- **Sample DITA Project** - This is a basic DITA project meant to help new users see how a DITA project is structured.
- **Startup DITA Project** - This is a startup DITA project that imposes a custom set of options (e.g. spell check settings and custom dictionaries), a custom DITA framework extension (e.g. custom new file templates, custom actions, custom CSS used for visual editing) and a folder structure for a DITA project according to best practices. Once created, the project contains a `Readme.html` file that explains all customizations and their benefits. If you plan to start your own DITA project using a version control system (such as Git), you can use this startup DITA project template to customize various aspects of DITA editing and share them with your team.

With the exception of the *Default project* template, which is a pseudo-template and does not exist on the local disk (it is used only to create a new `.xpr` file), project templates are actually ZIP archives (with a `.zxpr` extension) and are stored within the file template directory structure (for example, `frameworks\dita\templates\sample-project\Sample DITA Project.zxpr`).

**Tip:**

Archives with a `.zxpr` extension can be edited in the **Archive Browser** view (on page 1741).

After selecting a project template, you can specify the following:

Project file name

Specifies the name of the new project file. Oxygen XML Developer provides a default proposal for the file name based on the following rules:

- If there is an `.xpr` file inside the archive, its name is used.
- Otherwise, the name of the template is used.

Project directory

Specifies the directory where the archive content will be extracted.

Note:

The archive should not contain an extra single folder as the root. For the **Project directory** path to work properly, the archive must have the `.xpr` file on the first level, along with the other resources (files and folders).

Once you are done, click the **Create** button to begin the creation process. Oxygen XML Developer extracts the content from the archive inside the path specified in the **Project directory** field.

Editor Variables in Project Templates

By default, the editor variables inside project resources created from a project template are not resolved. To start having them resolved, the project template *must be customized (on page 340)* by using the `expandEditorVariablesIncludeFilter` property. This filter determines the resources where the editor variables will be resolved. If you need to exclude a subset of resources from the set specified by the `expandEditorVariablesIncludeFilter` property, the `expandEditorVariablesExcludeFilter` property can be used.

Note:

Usually, project files (`*.xpr`), framework files (`*.framework`), and framework extension scripts (`*.exf`) should be excluded from the editor variable resolving process.

The values of the inclusion and exclusion filters can be file paths relative to the project directory that can use wildcards or simply wildcards. Each filter can have multiple values, separated by spaces.

Possible filter values:

- `./*` - Matches all resources from the first level in the project directory.
- `*` or `./**` - Matches all resources on all levels inside the project directory.
- `dir1/dir2/*.dita` - Matches all `.dita` files from `[PROJECT_DIR]/dir1/dir2`, but not from subdirectories of `dir2`.
- `dir1/dir2/**/*.dita` - Matches all `.dita` files from `[PROJECT_DIR]/dir1/dir2`, including those from subdirectories of `dir2`.
- `dir1/**/*` - Matches all resources on all levels inside `[PROJECT_DIR]/dir1`.

- `dir1/article1.xml, dir2/article2.xml` - Matches only the two `.xml` files.
- `./**/*_suffix.md, ./**/prefix_*.html` - Matches all `.md` files with names that end with `_suffix` and all `.html` files with names that start with `prefix_`.

Adding Items to the Project

To add items to the project, select any of the following actions that are available when invoking the contextual menu in the **Project** view:

New > **File**

Opens a **New** file dialog box that helps you create a new file and adds it to the project structure.

New > **Folder**

Opens a **New Folder** dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

The project itself is considered a logical folder. You can add a logical folder, or content to a logical folder, by using one of the following actions that are available in the contextual menu, when invoked from the *project root*.

New > **Logical Folder**

Creates a logical folder in the tree structure (the icon is a magenta folder on macOS - ).

New > **Logical Folders from Web**

Replicates the structure of a remote folder accessible over SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

Add Folder

Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon of this action is different on macOS - .

Add Files

Adds links to files on the local file system.

Add Edited File

Adds a link to the currently edited file in the project.

Using Linked Folders (Shortcuts)

Another easy way to organize your XML working files is to place them in a directory and then to create a corresponding linked folder in your project. If you add new files to that folder, you can simply use the  **Refresh (F5)** action from the project contextual menu and the **Project view** (on page 365) will display the existing files and subdirectories. If your files are scattered among several folders, but represent the same class of files, you might find it useful to combine them in a logical folder.

You can create linked folders (shortcuts) by dragging and dropping folders from the Windows Explorer (macOS Finder) to the project tree, or by selecting  **Add Folder** in the contextual menu from the *project root*. Linked folders are displayed in the **Project view** ([on page 365](#)) with bold text. To create a file inside a linked folder, select the **New** >  **File** action from the contextual menu. The linked files presented in the **Project view** ([on page 365](#)) are marked with a special icon.

**Note:**

Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

For more information on managing projects and their content, see [Project View](#) ([on page 365](#)).

For more details about how you can share projects with other users, see [Sharing a Project - Team Collaboration](#) ([on page 378](#)).

Related information

[Using Projects to Group Documents](#) ([on page 361](#))

Getting Help

If you run into specific problems while using Oxygen XML Developer you can take advantage of a variety of support related resources. Those resources include the following:

- [The Oxygen XML Developer Support Section of the Website](#)
- [The Oxygen XML Developer Forum](#)
- [The Oxygen XML Developer Video Tutorials](#)
- [The Common Problems and Solutions Section of the User Manual](#) ([on page 2204](#))
- [The Online Technical Support Form](#)

The application also includes various specific help-related resources in the **Help** menu.

Help Menu

The Oxygen XML Developer **Help** menu provides various resources to assist you with your tasks.

This menu includes the following actions or options:

Welcome

This option opens the **Welcome** screen that includes some resources to assist you with using Oxygen XML Developer.

Help (F1)

Use this action (or the **F1** key) to open a dialog box that presents a section in the User Manual that is appropriate for the context of the current cursor position. If the **Use online help** option is selected, this action will open the User Manual in an online mode.

Show Dynamic Help view

Use this action to open a view that loads the latest online WebHelp version of the Oxygen XML Developer User Manual, and dynamically opens a topic that is relevant to the focused editor, view, or dialog box.

You can also open the **Dynamic Help** view by selecting it from the **Window > Show View** menu.

Download User Manual

Opens the appropriate HTML page for downloading the Oxygen XML Developer User Manual. This action is helpful if your internet access is restricted and you need to access the user guide.

Install new add-ons

Opens a dialog box that allows you to install new *add-ons (on page 2271)* to extend the functionality of Oxygen XML Developer.

**Attention:**

To ensure safety, when using an add-on site, make sure it is reputable and trustworthy. Do not install add-ons that are unsigned or from sources that you do not fully trust.

Check for add-ons updates

Opens a dialog box that allows you to check for updates on installed *add-ons (on page 2271)*.

Manage add-ons

Opens a dialog box that allows you to manage installed *add-ons (on page 2271)*.

Check for a New Version

Use this action to view information about the latest version of Oxygen XML Developer.

Check for notifications

Use this action to have the application check **Oxygen's** website for news and events that will be displayed in a dialog box.

Browse Oxygen Website

Opens the Oxygen XML Developer website in your default internet browser.

Register

If you encounter problems with your Oxygen XML Developer license, you can use this option to open a dialog box that provides options for obtaining or using a license key.

Lock/Unlock floating license

If you are using a *Floating License*, you can lock it so that it does not get [released to the pool \(on page 92\)](#) unless you or the system administrator unlocks it.

Report problem

You can use this option to open a dialog box that allows you to write the description of a problem that was encountered while using the application. You can also select additional information to be sent to the technical support team in the five tabs:

- **General info** - You can edit your contact details in case you want to be contacted for further details or to be notified of a resolution.
- **Class Loader URLs** - You can choose whether or not to include the listed *Class Loader URLs* with your report.
- **System properties** - You can choose whether or not to include the listed system property details with your report.

**Tip:**

You are able to change the URL where the reported problem is sent by using the `com.oxygenxml.report.problems.url` system property. The report is sent in XML format through the `report` parameter of the POST HTTP method.

- **Plugins** - You can choose whether or not to include details about your installed *plugins* (on page 2271) with your report.
- **Frameworks** - You can choose whether or not to include details about your installed *frameworks* (on page 2269) with your report.

Support Center

Use this option to open the [Oxygen XML Developer Support Section of the Website](#).

Support Tools > Clipboard Inspector

Opens a dialog box that displays extensive details of all the transferable objects from the clipboard. This is helpful if you experience problems while copying content from other applications and pasting it into Oxygen XML Developer. You can use the **Copy** button to copy all of this data and then paste it into an email to be sent to the *Oxygen* support team.

Support Tools > Randomize XML text content

Use this action when you need to send samples to the *Oxygen* support team and you want to keep the text content confidential. It opens a dialog box that allows you to select the resources that will have the text content randomized. You can then save the resources and send them to the *Oxygen* support team without fear of compromising sensitive or private data. For more information, see [Randomize XML Text Content \(on page 35\)](#).

**Warning:**

Before using this action, it is highly recommended that you copy the XML resources to be processed, save them in a separate folder, and then process this operation on the copies instead of the original files. Otherwise, you may lose your original content.

Tip of the Day

Opens a dialog box that offers tips for using Oxygen XML Developer.

About

Use this option to open a dialog box that contains information about Oxygen XML Developer and the installed version. This dialog box includes the following tabs:

- **Copyright** - This tab contains general information about the product and the version of the product you are using, along with contact details and the *SGN* number. Details regarding the memory usage are also presented at the bottom of the dialog box.
- **Libraries** - This tab presents the list of third-party libraries that Oxygen XML Developer uses. To view the End-User Licence Agreement of each library, double-click it.
- **Frameworks** - This tab contains a list with the *frameworks (on page 2269)* that are bundled with Oxygen XML Developer.
- **System Properties** - This tab contains a list with system properties and their values. The contextual menu allows you to select and copy the properties.

Related information

[Details to Submit in a Request for Technical Support Using the Online Form \(on page 2214\)](#)

Randomize XML Text Content

Oxygen XML Developer includes an action that randomizes the text content of an XML document. This action is available in the **Help > Support Tools** menu. It is helpful if you need to send XML samples to the *Oxygen* support team and you want to keep the text content confidential. It opens a dialog box that allows you to select the resources that will have the text content randomized. You can then save the resources and send them to the *Oxygen* support team without fear of compromising sensitive or private data.

Warning:

Before using this action, it is highly recommended that you copy the XML resources to be processed, save them in a separate folder, and then perform this operation on the copies instead of the original files. Otherwise, you may lose your original content.

Figure 3. Randomize XML Text Content Dialog Box

The **Randomize XML Text Content** dialog box includes the following options:

Scope

Allows you to select the set of files whose text content will be randomized by the operation. You can select from predefined resource sets (such as the current file, your whole project, the current *DITA map (on page 2268)* hierarchy for DITA projects, etc.) or you can define your own set of resources by creating a *working set (on page 2273)*.

Filters

This section includes the following options:

- **Include files** - Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use `build*.xml` for the file pattern.
- **Restrict only to known XML file types** - When selected, only resources with a known XML file type will be affected by the operation.
- **Look inside archives** - When selected, the resources inside archives will also be affected.

Frequently Used Shortcut Keys

Oxygen XML Developer includes numerous shortcut keys that are assigned to actions to help you edit content. All the shortcuts that are assigned to actions are displayed in the table in the **Menu Shortcut Keys** preference page (on page 260).

For information about how to assign or configure shortcut keys, see [How to Assign a Shortcut Key or Edit an Existing Shortcut](#) (on page 262).

Table 1. Frequently Used Shortcut Keys in Oxygen XML Developer

Action	Windows/Linux Shortcut Keys	macOS Shortcut Keys	Description of Default Assigned Action
Attribute Editor	<u>Alt + Enter</u>	<u>Option + Enter</u>	Opens the in-place attribute editor
Beginning	<u>Ctrl + Home</u>	<u>Command + Home</u>	Navigates to the beginning of the document
Check Spelling	<u>F7</u>	<u>F7</u>	Opens the spell checking dialog box
Check Well-Formedness	<u>Ctrl + Shift + W</u>	<u>Command + Shift + W</u>	Check well-formedness of current document
Configure Transformation	<u>Ctrl + Shift + C</u>	<u>Command + Shift + C</u>	Opens the Configure Transformation Scenario dialog box
Content Completion / New Line	<u>Enter</u>	<u>Enter</u>	<ul style="list-style-type: none"> • Author mode - Opens the content completion window • Text mode - Moves cursor to the next line
Content Completion (Text Mode)	<u>Ctrl + Space</u>	<u>Command + Space</u>	Opens the content completion window in Text mode
Create Bookmark #	<u>Ctrl + Shift + 1-9</u>	<u>Command + Shift + 1-9</u>	Create bookmarks numbered 1 through 9
Create Next Bookmark	<u>F9</u>	<u>F9</u>	Create bookmark numbered whatever is next in sequence
Delete Next Word	<u>Ctrl + Delete</u>	<u>Command + Delete</u>	Deletes the next word or whitespace

Table 1. Frequently Used Shortcut Keys in Oxygen XML Developer (continued)

Action	Windows/Linux Shortcut Keys	macOS Shortcut Keys	Description of Default Assigned Action
Delete Previous Word	<u>Ctrl + Backspace</u>	<u>Command + Backspace</u>	Deletes the previous word or whitespace
Delete Tags	<u>Alt + Shift + X</u>	<u>Command + Option + X</u>	Deletes the start and end tag of the current element
Duplicate Lines Up (Text Mode)	<u>Ctrl + Shift + UpArrow</u>	<u>Option + Shift + UpArrow</u>	Duplicates the selected lines (or current line) and inserts it above the current selection/line
Duplicate Lines Down (Text Mode)	<u>Ctrl + Shift + DownArrow</u>	<u>Option + Shift + DownArrow</u>	Duplicates the selected lines (or current line) and inserts it below the current selection or line
End	<u>Ctrl + End</u>	<u>Command + End</u>	Navigates to the end of the document
Exit	<u>Ctrl + Q</u>	<u>Command + Q</u>	Exit the application
Find	<u>Ctrl + F</u>	<u>Command + F</u>	Opens Find/Replace dialog box
Find Next	<u>F3</u>	<u>Command + G</u>	Finds next occurrence of the last searched term
Find Previous	<u>Shift + F3</u>	<u>Command + Shift + G</u>	Finds previous occurrence of the last searched term
Go To Bookmark	<u>Ctrl + 1-9</u>	<u>Command + 1-9</u>	Go to specific bookmark
Go To Definition	<u>Shift + Ctrl + Enter</u>	<u>Shift + Command + Enter</u>	Go to the definition of the selected item in the associated schema.
Help	<u>F1</u>	<u>F1</u>	Opens help documentation
Insert Para / Format Indent	<u>Ctrl + Shift + P</u>	<u>Command + Shift + P</u>	<ul style="list-style-type: none"> • Author mode - Inserts a paragraph at the cursor position • Text mode - Formats and indents current document

Table 1. Frequently Used Shortcut Keys in Oxygen XML Developer (continued)

Action	Windows/Linux Shortcut Keys	macOS Shortcut Keys	Description of Default Assigned Action
Move Tab Left	<u>Ctrl + Alt + Comma</u>	<u>Ctrl + Option + Comma</u>	Moves the current file tab one position to the left
Move Tab Right	<u>Ctrl + Alt + Period</u>	<u>Ctrl + Option + Period</u>	Moves the current file tab one position to the right
Move Node Down (Author)	<u>Alt + DownArrow</u>	<u>Option + DownArrow</u>	Moves the selected XML node down in Author mode
Move Node Down (Text)	<u>Ctrl + Alt + DownArrow</u>	<u>Command + Option + DownArrow</u>	Moves the selected XML node down in Text mode
Move Node Up (Author)	<u>Alt + UpArrow</u>	<u>Option + UpArrow</u>	Moves the selected XML node up in Author mode
Move Node Up (Text)	<u>Ctrl + Alt + UpArrow</u>	<u>Command + Option + UpArrow</u>	Moves the selected XML node up in Text mode
New File	<u>Ctrl + N</u>	<u>Command + N</u>	Opens wizard for creating new documents
Next Word	<u>Ctrl + RightArrow</u>	<u>Command + RightArrow</u>	Navigates to next word
Open/Find Resource	<u>Ctrl + Shift + R</u>	<u>Command + Shift + R</u>	Opens the Open/Find Resource dialog box
Previous Word	<u>Ctrl + LeftArrow</u>	<u>Command + LeftArrow</u>	Navigates to previous word
Print Preview	<u>Ctrl + P</u>	<u>Command + P</u>	Opens the print preview (page setup) dialog box
Quick Assist	<u>Alt + 1</u>	<u>Command + Option + 1</u>	Opens Quick Assist menu if actions are available in the current context (usually indicated with a bulb  icon in the left stripe)
Quick Find	<u>Alt + Shift + F</u>	<u>Option + Shift + F</u>	Opens the Quick Find mechanism at the bottom of the editor
Redo	<u>Ctrl + Y</u> (Windows) - <u>Ctrl + Shift + Z</u> (Linux)	<u>Command + Shift + Z</u>	Redo last editing action

Table 1. Frequently Used Shortcut Keys in Oxygen XML Developer (continued)

Action	Windows/Linux Shortcut Keys	macOS Shortcut Keys	Description of Default Assigned Action
Refresh	<u>F5</u>	<u>F5</u>	Refresh
Remove Bookmarks	<u>Ctrl + F7</u>	<u>Command + F7</u>	Removes all bookmarks
Reopen Last Closed Editor	<u>Ctrl + Alt + T</u>	<u>Command + Option + T</u>	Reopens the editor tab that was closed most recently
Reset Zoom	<u>Ctrl + NumPad0</u>	<u>Command + NumPad0</u>	Resets zoom (default font size)
Save	<u>Ctrl + S</u>	<u>Command + S</u>	Saves current document
Save All	<u>Ctrl + Shift + S</u>	<u>Command + Shift + S</u>	Saves all open files
Scroll Down	<u>Ctrl + DownArrow</u>	<u>Command + DownArrow</u>	Scrolls the editor down
Scroll Up	<u>Ctrl + UpArrow</u>	<u>Command + Up Arrow</u>	Scrolls the editor up
Select Content of Element	<u>Alt + [Mouse Triple Click]</u>	<u>Option + [Mouse Triple Click]</u>	Selects the content of an element in Author mode.
Shift Left	<u>Shift + Tab</u>	<u>Shift + Tab</u>	<ul style="list-style-type: none"> • Author mode - Moves the cursor to the previous XML node • Text mode - Shifts content to the left
Shift Right	<u>Tab</u>	<u>Tab</u>	<ul style="list-style-type: none"> • Author mode - Moves cursor to the next XML node • Text mode - Shifts content to the right
Split Element	<u>Alt + Shift + D</u>	<u>Ctrl + Option + D</u>	Splits the element the cursor position
Surround With	<u>Ctrl + E</u>	<u>Command + E</u>	Surrounds selected content with specified tag

Table 1. Frequently Used Shortcut Keys in Oxygen XML Developer (continued)

Action	Windows/Linux Shortcut Keys	macOS Shortcut Keys	Description of Default Assigned Action
Switch Tabs	<u>Ctrl + Tab</u> / <u>Ctrl + Shift + Tab</u>	<u>Command + Tab</u> / <u>Command + Shift + Tab</u>	Switches between open tabs
Transform	<u>Ctrl + Shift + T</u>	<u>Command + Shift + T</u>	Opens a dialog box for selecting a transformation scenario
Underline / Open URL	<u>Ctrl + U</u>	<u>Command + U</u>	<ul style="list-style-type: none"> Underlines selected content (in the main editor) Opens the URL (when focus is outside the main editor)
Undo	<u>Ctrl + Z</u>	<u>Command + Z</u>	Undo last editing action
Zoom In	<u>Ctrl + NumPad+</u>	<u>Command + NumPad+</u>	Zooms in (increase font size)
Zoom Out	<u>Ctrl + NumPad-</u>	<u>Command + NumPad-</u>	Zooms out (decrease font size)

**Troubleshooting:**

If you encounter problems with keyboard shortcuts not working as expected, see [Keyboard Shortcuts Result in Unexpected Behavior \(on page 2225\)](#) or [Keyboard Shortcuts Do Not Work At All \(on page 2225\)](#).

Accessibility Support in Oxygen

The **Oxygen** team is dedicated to developing software products that are usable for everyone, including those with physical challenges and disabilities. Oxygen XML Developer is designed to adhere to the U.S. Government Section 508 accessibility standards: https://www.oxygenxml.com/xml_editor/section508.html.

Adjusting Fonts and Colors

If you have low vision, go to **Options > Preferences > Appearance > Fonts** where you can adjust the font styles and sizes used in the entire application, both for the editing areas and UI labels. If you have color blindness, you can also adjust most of the colors used in Oxygen XML Developer by going to **Options > Preferences > Appearance** and changing the current color theme. You can also search for other color-related settings in the **Preferences** dialog box.

Installing Oxygen XML Developer

Installation kits for Windows and Linux are made using the Install4j product. If you have problems navigating the Install4j installation wizard, you can run the installation from a [command-prompt application using the -c flag \(on page 72\)](#) like this:

```
C:\Users\your_user_name\Downloads\oxygenAuthor-64bit.exe -c
```

Screen Reader Software (Windows OS)

If you are using a text-to-speech narrator, Oxygen XML Developer supports this since it is a Java application and it is periodically tested on Windows using both the NVDA and JAWS screen readers on the Windows operating system.

Using the JAWS Screen Reader (Windows)

The JAWS (Job Access With Speech) screen reader can be downloaded from: <http://www.freedomscientific.com/Products/Blindness/JAWS>.

For JAWS to work, you need to enable the Java access bridge in Oxygen XML Developer: http://docs.oracle.com/javase/7/docs/technotes/guides/access/enable_and_test.html.

To enable the Java access bridge:

1. Since Oxygen XML Developer comes bundled with its own Java VM, you need to open a command-prompt application and use the **cd** command to go to the Oxygen XML Developer installation directory (for example, in Windows, it would be something like this:

```
cd C:\Program Files\Oxygen XML Editor 21.1
```

2. Then run the following command:

```
jre\bin\jabswitch -enable
```

3. Press **Enter** and you should receive a notification that the access bridge has been enabled.

Once the Java access bridge is enabled and as long as the JAWS narrator is active, when Oxygen XML Developer starts, the narrator will start reading content from Oxygen XML Developer and you can interact with the application and read menus, content from open XML documents, and UI components from dialog boxes and side views.

Using the NVDA Screen Reader (Windows)

The NVDA screen reader can be downloaded for free from: <https://www.nvaccess.org/>.

For NVDA to work, you need to enable the Java access bridge in Oxygen XML Developer: http://docs.oracle.com/javase/7/docs/technotes/guides/access/enable_and_test.html.

To enable the Java access bridge:

1. Since Oxygen XML Developer comes bundled with its own Java VM, you need to open a command-prompt application and use the **cd** command to go to the Oxygen XML Developer installation directory (for example, in Windows, it would be something like this:

```
cd C:\Program Files\Oxygen XML Editor 21.1
```

2. Then run the following command:

```
jre\bin\jabswitch -enable
```

3. Press **Enter** and you should receive a notification that the access bridge has been enabled.

Once the Java access bridge is enabled and as long as the NVDA narrator is started, when Oxygen XML Developer starts, the narrator will start reading content from Oxygen XML Developer and you can interact with the application and read menus, content from open XML documents, and UI components from dialog boxes and side views.

Important:

If after these steps the narrator still does not read anything from a started Oxygen XML Developer application, please go to the folder `C:\Windows\SysWOW64\` and make sure the library `WindowsAccessBridge-32.dll` is present there. If it is not present, try to search online, download the library file and copy it to the folder. Then restart Oxygen XML Developer.

Besides the main editing area, Oxygen XML Developer also has side views (for example, the **Attributes**, **Outline**, **Elements** views) that help with editing the XML content. NVDA versions **2020.1** and older have a [registered bug](#) that makes the narrator read content from the side views when editing in the main editing area. Because of this problem, when using NVDA versions **2020.1** or older, the following workflow is suggested:

1. Start Oxygen XML Developer.
2. Go to the **Window** menu and select **Maximize Editing Area** (or **hold Alt, then W, then M**). This action will hide all side views and allow you to properly edit in the main editing area.
3. Whenever you want to open a side view, go to **Window > Show View** (or **hold Alt, then W, then S**) and choose the view you want to open. For example, to show the **Elements** view, you can **hold Alt, then W, then S, then E**.
4. When you are done using the side view, go to the **Window** menu and select **Hide current view** (or **hold Alt, then W, then H**) to hide the side view and return the focus to the main editing area.

Hints for the Visually Impaired

Here are a few hints for using Oxygen XML Developer if you are visually impaired:

- The top main menu contains actions to open, save, and close documents, switch between open documents, or switch between the various editing modes for XML documents that are already open. All actions in the main menu bar should have mnemonics making it possible to memorize various shortcuts. For example, using the **alt-w-s-e** shortcut should open the **Window** menu, open the **Show view** submenu from it and show the **Elements** view,
 - The **File** menu contains actions to open, save, or close the currently edited XML document.
 - The **Edit** menu contains actions to undo/redo or cut/copy/paste content. They also have the usual shortcuts that can be used instead of directly invoking the actions from the menu.
 - The **Find** menu contains an action to show the **Find/Replace** dialog box. Sometimes the **JAWS** narrator overloads the **CTRL+F** shortcut and presents its own find/replace window but the

Oxygen XML Developer **Find/Replace** dialog box provides the ability to perform complex find/replace operations in the open file.

- In the **Options** menu, you have access to the **Preferences** dialog box that contains global application settings and access to the **Menu Shortcut Keys** table where you can configure shortcuts for the most commonly used actions.
- The **Window** menu includes actions to switch between open XML documents. Also, you can use the **Show view** submenu to open a particular side view and move the focus to that view.
- An open XML document can be edited with accessibility support either in the **Text** editing mode (where the XML tags are accessible in the edited content) or in the visual **Author** editing mode (where the XML tags are hidden and only the text content is shown). You can switch between these editing modes by using the **Document > Edit Mode** menu.
 - **Text** mode provides access to the entire source document with all of its **XML** content, just like you have in any text editing application.

Pressing the **⌘** key will present a list of [available XML elements \(on page 2267\)](#). If you do not want to choose from the list whenever you want to insert an XML element, you have two choices:

- After the list of available XML elements is shown, you can press the **ESC** key to close it and continue to manually insert the XML tag.
- You can disable the content completion list from the **Options > Preferences > Editor / Content Completion** page by deselecting **Enable Content Completion**. After the content completion is disabled, you can force it to be displayed by using the **Ctrl+Space** keyboard shortcut.

In addition, using the **Window > Show view** submenu, you can change focus to the **Attributes**, **Elements**, or **Outline** view. The **Attributes** view presents the existing and possible attributes that can be inserted in an XML tag. The **Elements** view shows you the list of XML elements that can be inserted at the cursor position (also, pressing **F2** on a selected element presents its annotation). The **Outline** view shows the current path in the XML structure.

- **Author** mode is useful for reviewing written XML content because it has support for change tracking and for adding comments. Editing in the **Author** visual editing mode, you have access to only the text content in the XML document.

Pressing **Shift+F2** will read the current element context where the cursor is located. Pressing **Ctrl+Shift+F3** will read the current element context and the entire path in the XML structure where the cursor is located. You can also use the **Outline** view to better understand the XML structure.

In the **Author** editing mode, you can also use the **Attributes** and **Elements** views similar to using them in the **Text** editing mode. Pressing **Enter** in the **Author** visual editing mode can also be used to present a list of allowed elements at the current position.

Screen Reader Software (macOS)

On **macOS**, the application can be used with **VoiceOver** but is not rigorously tested with it. Because of processing limitations of the **VoiceOver** application, various limitations may be encountered. To avoid blocking the application, when tree-structure user interface controls are used (e.g. the **Project** or **Outline** view), if a node in the tree contains more than 500 child nodes, only the first 500 child nodes are accessible to the screen reader.

Oxygen XML Developer VPAT Accessibility Conformance Report

A Voluntary Product Accessibility Template (VPAT) is a document that explains how information and communication technology (ICT) products such as software, hardware, electronic content, and support documentation meet (conform to) the [Revised 508 Standards](#) for IT accessibility. VPAT documents help Federal agency contracting officials and government buyers to assess ICT for accessibility when doing market research and evaluating proposals.

This document provides information about how Oxygen XML Developer addresses the accessibility requirements defined in the international standards.

International Edition

VPAT[®] Version 2.3 – April 2019

Name of Product/Version

Oxygen XML Developer 27.1

Product Description

Oxygen XML Developer is a cross-platform application designed to accommodate all of your XML editing, authoring, developing, and publishing needs.

Date

March 2023

Contact Information

support@oxygenxml.com

Notes

Oxygen XML Developer has been designed and enhanced to adhere to the [U.S. Government Section 508 accessibility standards](#) and the [Web Content Accessibility Guidelines \(WCAG\)](#). For details, see [Accessibility \(on page 41\)](#).

Evaluation Methods Used:

The following applications were used for testing **Oxygen XML Developer**:

- NVDA assistive technology
- JAWS assistive technology

Applicable Standards/Guidelines

This report covers the degree of conformance for the following accessibility standards/guidelines:

Standard/Guideline	Included In Report
Web Content Accessibility Guidelines 2.0	Level A - Yes Level AA - Yes Level AAA - No
Web Content Accessibility Guidelines 2.1	Level A - Yes Level AA - Yes Level AAA - No
Revised Section 508 standards published January 18, 2017 and corrected January 22, 2018	Yes
EN 301 549 Accessibility requirements suitable for public procurement of ICT products and services in Europe - V2.1.2 (2018-08)	No

Terms

The terms used in the Conformance Level information are defined as follows:

- **Supports:** The functionality of the product has at least one method that meets the criterion without known defects or meets with equivalent facilitation.
- **Partially Supports:** Some functionality of the product does not meet the criterion.
- **Does Not Support:** The majority of product functionality does not meet the criterion.
- **Not Applicable:** The criterion is not relevant to the product.
- **Not Evaluated:** The product has not been evaluated against the criterion. This can be used only in WCAG 2.0 Level AAA.

WCAG 2.x Report

Tables 1 and 2 also document conformance with:

Revised Section 508: Chapter 5 – 501.1 Scope, 504.2 Content Creation or Editing, and Chapter 6 – 602.3 Electronic Support Documentation.

Note:

When reporting on conformance with the WCAG 2.x Success Criteria, they are scoped for full pages, complete processes, and accessibility-supported ways of using technology as documented in the [WCAG 2.0 Conformance Requirements](#).

Table 1: Success Criteria, Level A

Criteria	Conformance Level	Remarks and Explanations
<p><u>1.1.1 Non-text Content</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	Text alternatives are provided for non-text content.
<p><u>1.2.1 Audio-only and Video-only (Prerecorded)</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Not Applicable	The product does not play audio and video content to end users.
<p><u>1.2.2 Captions (Prerecorded)</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Not Applicable	The product does not provide pre-recorded media that requires captions.
<p><u>1.2.3 Audio Description or Media Alternative (Prerecorded)</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p>	Not Applicable	The product does not provide pre-recorded media that requires alternate descriptions.

Criteria	Conformance Level	Remarks and Explanations
<ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 		
<p><u>1.3.1 Info and Relationships</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Partially Supports	<p>Information, structure, and relationships conveyed through presentation can be programmatically determined or are available in text, with exceptions that include:</p> <ul style="list-style-type: none"> • Grid editing mode. • Schema Design editing mode. • The editing of profiling attributes using the Edit profiling attributes and Insert/Edit Topic Reference dialog boxes. • The editing of a DITA map in the Author editing mode.
<p><u>1.3.2 Meaningful Sequence</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	<p>The product presents content in a meaningful sequence.</p> <p>Authors should use Unicode right-to-left mark (RLM) or left-to-right mark (LRM) to mix text direction inline.</p>
<p><u>1.3.3 Sensory Characteristics</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	<p>The product provides textual identification for understanding and operating content.</p>
<p><u>1.4.1 Use of Color</u> (Level A)</p>	Supports	<p>Color is not used as the only visual means of conveying information, in-</p>

Criteria	Conformance Level	Remarks and Explanations
<p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 		<p>dicating an action, prompting a response, or distinguishing a visual element.</p>
<p><u>1.4.2 Audio Control</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Not Applicable	<p>There is no sound that plays automatically by default.</p>
<p><u>2.1.1 Keyboard</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Partially Supports	<p>Most of the content is operable through a keyboard interface, with exceptions that include:</p> <ul style="list-style-type: none"> • Some toolbars in the application not being accessible via a keyboard. • Combo boxes and buttons located inside the table from the dialog box used to create or edit a validation scenario.
<p><u>2.1.2 No Keyboard Trap</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Partially Supports	<p>The product does not usually have user interface elements that trap the keyboard focus. Exceptions include some trees located in side views and dialog boxes.</p>

Criteria	Conformance Level	Remarks and Explanations
<p><u>2.1.4 Character Key Shortcuts</u> (Level A 2.1 only)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Not Applicable	The product does not include character key shortcuts.
<p><u>2.2.1 Timing Adjustable</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Not Applicable	The product does not include time limits.
<p><u>2.2.2 Pause, Stop, Hide</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	Side views update their content automatically as a result of the user interaction with the open documents. They can be hidden or this functionality can be inhibited. The product does not include other elements that automatically move, blink, or scroll.
<p><u>2.3.1 Three Flashes or Below Threshold</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	The product does not have content that flashes more than three times in any one second.
<p><u>2.4.1 Bypass Blocks</u> (Level A)</p> <p>Also applies to:</p>	Not Applicable	The application does not contain blocks of repeated content.

Criteria	Conformance Level	Remarks and Explanations
Revised Section 508 <ul style="list-style-type: none"> • 501 (Web)(Software) – Does not apply to non-web software • 504.2 (Authoring Tool) • 602.3 (Support Docs) – Does not apply to non-web docs 		
<p><u>2.4.2 Page Titled</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	Each side view and dialog box in the application has a title.
<p><u>2.4.3 Focus Order</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	Focusable components receive focus in an order that preserves meaning and operability.
<p><u>2.4.4 Link Purpose (In Context)</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	The purpose of each link can be determined from the link text alone or from the link text together with its programmatically-determined link context.
<p><u>2.5.1 Pointer Gestures</u> (Level A 2.1 only)</p> <p>Also applies to:</p>	Not Applicable	The product does not have functionality that requires multi-point or path-based gestures.

Criteria	Conformance Level	Remarks and Explanations
Revised Section 508 – Does not apply		
<p><u>2.5.2 Pointer Cancellation</u> (Level A 2.1 only)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Partially Supports	Almost all pointer operations in the product are activated on Up events. Exceptions may include selection changes in the dialog box for new files and in the side views.
<p><u>2.5.3 Label in Name</u> (Level A 2.1 only)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Supports	The names of the user interface components contain the text that is presented visually.
<p><u>2.5.4 Motion Actuation</u> (Level A 2.1 only)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Not Applicable	The product does not contain functionality that can be operated by device or user motion.
<p><u>3.1.1 Language of Page</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Does Not Support	The product does not report the default language for each open document.
<p><u>3.2.1 On Focus</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	No changes of context occur when any component receives focus.

Criteria	Conformance Level	Remarks and Explanations
<p><u>3.2.2 On Input</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	Changing the setting of any user interface component does not automatically cause a change of context.
<p><u>3.3.1 Error Identification</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	Product shows error messages when user input is invalid.
<p><u>3.3.2 Labels or Instructions</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Partially Supports	Most input areas in the product provide labels and instructions. Exceptions include the content completion windows in the Text , Grid , Author , and schema Design modes.
<p><u>4.1.1 Parsing</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	All labels presenting HTML content in the product have valid HTML content.

Criteria	Conformance Level	Remarks and Explanations
<p><u>4.1.2 Name, Role, Value</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Partially Supports	<p>Almost all visual components in the product have identifiable names and roles with exceptions that include:</p> <ul style="list-style-type: none"> • Grid editing mode. • Schema Design editing mode.

Table 2: Success Criteria, Level AA

Criteria	Conformance Level	Remarks and Explanations
<p><u>1.2.4 Captions (Live)</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Not Applicable	The product does not contain live audio content.
<p><u>1.2.5 Audio Description (Prerecorded)</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Not Applicable	The product does not provide prerecorded video content that requires audio description.
<p><u>1.3.4 Orientation</u> (Level AA 2.1 only)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Supports	Content does not restrict its view and operation to a single display orientation.

Criteria	Conformance Level	Remarks and Explanations
<p><u>1.3.5 Identify Input Purpose</u> (Level AA 2.1 only)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Not Applicable	The content does not contain input fields that collect information about the user.
<p><u>1.4.3 Contrast (Minimum)</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Partially Supports	<p>The product has sufficient contrast between the foreground and background colors, with few exceptions, including:</p> <ul style="list-style-type: none"> • Change tracking content in the document for some of the author colors. • Change tracking content in some review panel items, when the item is selected. • Placeholders shown in empty elements. • Comments marked as done.
<p><u>1.4.4 Resize text</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Partially Supports	<p>In most situations, text in the main editing area, side views, and dialog boxes can be resized to reasonable dimensions by increasing the font without loss of content or functionality and without using assistive technology.</p> <p>Sizes of certain text components cannot be increased.</p>
<p><u>1.4.5 Images of Text</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p>	Supports	The few buttons with icons containing text characters also provide text alternatives.

Criteria	Conformance Level	Remarks and Explanations
<ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 		
<p><u>1.4.10 Reflow</u> (Level AA 2.1 only)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Partially Supports	<p>The majority of the user interface controls can be presented without loss of information or functionality, and without requiring scrolling in two dimensions. In the editor area, the text will re-flow depending on the editor mode (Text/Grid/Author/Design) and both horizontal and vertical scrolls may be needed.</p>
<p><u>1.4.11 Non-text Contrast</u> (Level AA 2.1 only)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Supports	<p>User interface components and states have sufficient contrast against adjacent colors.</p>
<p><u>1.4.12 Text Spacing</u> (Level AA 2.1 only)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Supports	<p>There is no loss of content or functionality occurs by setting line height (line spacing), spacing following paragraphs, letter spacing, and word spacing.</p>
<p><u>1.4.13 Content on Hover or Focus</u> (Level AA 2.1 only)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Partially Supports	<p>The tooltips for most user interface simple components (buttons) are not hoverable and persistent.</p>
<p><u>2.4.5 Multiple Ways</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p>	Supports	<p>There are multiple ways to navigate between the open documents.</p>

Criteria	Conformance Level	Remarks and Explanations
<ul style="list-style-type: none"> • 501 (Web)(Software) – Does not apply to non-web software • 504.2 (Authoring Tool) • 602.3 (Support Docs) – Does not apply to non-web docs 		
<p><u>2.4.6 Headings and Labels</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	Headings and labels describe the topic or purpose.
<p><u>2.4.7 Focus Visible</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Partially Supports	<p>The product has a visible indication of focus for almost all user interface controls (buttons, text fields, combo boxes, etc.) Exceptions include:</p> <ul style="list-style-type: none"> • Combo boxes located in the DITA Maps Manager and Share-Point Browser view. • Filtering buttons located in the Templates tab from the New/Edit scenario and the DITA Reusable Components view. • Tab buttons located in the Insert/Edit Topic Reference dialog box.
<p><u>3.1.2 Language of Parts</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Does Not Support	The language of parts is not specified.

Criteria	Conformance Level	Remarks and Explanations
<p><u>3.2.3 Consistent Navigation</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) – Does not apply to non-web software • 504.2 (Authoring Tool) • 602.3 (Support Docs) – Does not apply to non-web docs 	Supports	The product has a consistent navigation mechanism.
<p><u>3.2.4 Consistent Identification</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) – Does not apply to non-web software • 504.2 (Authoring Tool) • 602.3 (Support Docs) – Does not apply to non-web docs 	Supports	The product components are identified consistently.
<p><u>3.3.3 Error Suggestion</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	The product provides suggestions for the input error if there are any available.
<p><u>3.3.4 Error Prevention (Legal, Financial, Data)</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p>	Not Applicable	The product does not process legal commitments or financial transactions or modify user-controllable data.

Criteria	Conformance Level	Remarks and Explanations
<ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 		
<p><u>4.1.3 Status Messages</u>(Level AA 2.1 only)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Not Applicable	The product does not contain status messages as defined by this criterion.

N/A

Chapter 3: Functional Performance Criteria (FPC)

Criteria	Conformance Level	Remarks and Explanations
302.1 Without Vision	Partially Supports	Much of the product is operable without vision. As noted in 1.3.1 Info and Relationships , some structural and hierarchical information is not communicated to screen readers. Also, as noted in 2.1.1 Keyboard , some components are not accessible via keyboard.
302.2 With Limited Vision	Supports	The product is operable with limited vision.
302.3 Without Perception of Color	Supports	Color is not used as the only visual means of conveying information, indicating an action, prompting a response, or distinguishing a visual element.
302.4 Without Hearing	Supports	The product does not require hearing for use.
302.5 With Limited Hearing	Supports	The product does not require hearing for use.

Criteria	Conformance Level	Remarks and Explanations
302.6 Without Speech	Supports	The product does not require speech for use.
302.7 With Limited Manipulation	Partially Supports	Most content of the product is operable for users with limited manipulation who rely on keyboard access. As noted in 2.1.1 Keyboard , some components are not accessible via keyboard.
302.8 With Limited Reach and Strength	Supports	The product is functional with limited reach and limited strength. It supports operating system tools such as <i>StickyKeys</i> and <i>FilterKeys</i> .
302.9 With Limited Language, Cognitive, and Learning Abilities	Partially Supports	The product is operable by users with limited language, cognitive, and learning abilities. To accommodate users with limited cognition, the UI provides icons, text, or a combination of both, for controls. It provides the ability to change the interface language to 6 languages.

Chapter 4: Hardware

Notes: Not Applicable - **Oxygen XML Developer** is not a hardware product.

Chapter 5: Software

501 General

Criteria	Conformance Level	Remarks and Explanations
501.1 Scope – Incorporation of WCAG 2.0 AA	See WCAG 2.x section (on page 46)	See information in WCAG section

502 Interoperability with Assistive Technology

Criteria	Conformance Level	Remarks and Explanations
502.2.1 User Control of Accessibility Features	Not Applicable	The product is not platform software.

Criteria	Conformance Level	Remarks and Explanations
502.2.2 No Disruption of Accessibility Features	Supports	The product does not disrupt platform features that are defined in the platform documentation as accessibility features.

502.3 Accessibility Services

Criteria	Conformance Level	Remarks and Explanations
502.3.1 Object Information	Partially Supports	Most of the object information can be programmatically determined. As noted in 1.3.1 Info and Relationships , the content from the Grid and schema Design editing modes is not exposed programmatically.
502.3.2 Modification of Object Information	Partially Supports	States and properties that can be set by the user can be set programmatically. As noted in 1.3.1 Info and Relationships , there are few exceptions.
502.3.3 Row, Column, and Headers	Partially Supports	The insert table feature in the editing area of the product does not communicate information about the headers. Row and column information is presented in a way that can be used by assistive technology.
502.3.4 Values	Partially Supports	The current values of an object can be programmatically determined. As noted in 1.3.1 Info and Relationships , there are few exceptions. The content from the Grid and schema Design editing modes is not exposed programmatically.
502.3.5 Modification of Values	Partially Supports	Values that can be set by the user are capable of being set programmatically. As noted in 1.3.1 Info and Relationships , there are few exceptions. The content from the Grid and schema De-

Criteria	Conformance Level	Remarks and Explanations
		sign editing modes cannot be set programmatically.
502.3.6 Label Relationships	Partially Supports	Information, structure, and relationships conveyed through presentation can be programmatically determined or are available in text. As noted in 1.3.1 Info and Relationships , there are few exceptions.
502.3.7 Hierarchical Relationships	Partially Supports	The hierarchical relationships are, in general, accessible programmatically, but as noted in 1.3.1 Info and Relationships , there are few exceptions.
502.3.8 Text	Partially Supports	The content of text objects, text attributes, and the boundary of text rendered to the screen is programmatically determinable. As noted in 1.3.1 Info and Relationships , there are few exceptions, including the text from the Grid and schema Design modes.
502.3.9 Modification of Text	Partially Supports	Text can be set programmatically, including through assistive technology. Text in the editor can be modified using the keyboard. As noted in 1.3.1 Info and Relationships , the text content from the Grid and schema Design editing modes cannot be accessed programmatically.
502.3.10 List of Actions	Supports	Actions that can be executed on an object can be determined programmatically from the context menu or content completion menu.
502.3.11 Actions on Objects	Supports	Actions on objects can performed by users, including those using assistive technologies.
502.3.12 Focus Cursor	Partially Supports	The focus location, selection state, and text insertion point information

Criteria	Conformance Level	Remarks and Explanations
		can be determined programmatically. As noted in 1.3.1 Info and Relationships , the content from the Grid and schema Design editing modes is not exposed programmatically.
502.3.13 Modification of Focus Cursor	Partially Supports	The focus location, selection state and text insertion can be controlled programmatically or through the keyboard. As noted in 1.3.1 Info and Relationships , the content from the Grid and schema Design editing modes cannot be accessed programmatically.
502.3.14 Event Notification	Supports	The changes in states and other properties are communicated through notifications that are communicated to assistive technology.
502.4 Platform Accessibility Features	Not Applicable	This product is not platform software.

503 Applications

Criteria	Conformance Level	Remarks and Explanations
503.2 User Preferences	Partially Supports	<p>The product permits some of the user preferences from platform settings. Exceptions include</p> <ul style="list-style-type: none"> • Cursor thickness is not modified in Text, Author, and Grid editing modes. • Some elements may not use the platform font size. <p>The product provides custom preferences for changing the color, font type, and font size.</p>
503.3 Alternative User Interfaces	Not Applicable	The application does not provide an alternative user interface that functions as assistive technology.

503.4 User Controls for Captions and Audio Description

Criteria	Conformance Level	Remarks and Explanations
503.4.1 Caption Controls	Not Applicable	The product does not provide controls for volume adjustment.
503.4.2 Audio Description Controls	Not Applicable	The product does not provide controls for program selection.

504 Authoring Tools

Criteria	Conformance Level	Remarks and Explanations
504.2 Content Creation or Editing (if not authoring tool, enter “not applicable”)	See the WCAG 2.x section (on page 46)	See information in WCAG section
504.2.1 Preservation of Information Provided for Accessibility in Format Conversion	Partially Supports	For the main XML vocabulary supported in the application (DITA), the accessibility information is preserved in the generated main formats (WebHelp, PDF).
504.2.2 PDF Export	Supports	The product is capable of publishing PDF files that conform to PDF/UA-1.
504.3 Prompts	Partially Supports	For DITA documents, there is an optional Schematron that performs accessibility checks on the content and prompts the authors whenever it detects errors.
504.4 Templates	Does Not Support	The product does provide several templates. However, these templates offer only minimal structure and do not mark content in ways that promote following the WCAG success criteria. The existing templates can be customized.

Chapter 6: Support Documentation and Services**601.1 Scope****602 Support Documentation**

Criteria	Conformance Level	Remarks and Explanations
602.2 Accessibility and Compatibility Features	Partially Supports	The documentation of the product lists and explains the accessibility and compatibility features of the product.
602.3 Electronic Support Documentation	Partially Supports	The self-service documentation is generated with Oxygen XML Web-Help . You can find its VPAT statement here .
602.4 Alternate Formats for Non-Electronic Support Documentation	Not Applicable	Documentation is not provided in non-electronic formats.

603 Support Services

Criteria	Conformance Level	Remarks and Explanations
603.2 Information on Accessibility and Compatibility Features	Supports	The support services cover the accessibility features.
603.3 Accommodation of Communication Needs	Supports	Support is provided over a variety of channels including email and phone.

Installation

Oxygen XML Developer is available on Windows, Linux, and macOS and there are a variety of methods and options for installing and running Oxygen XML Developer on your system or server. This section also includes information about registering, transferring, or releasing licenses, upgrading, installing *add-ons*, and uninstalling.

Choosing How Oxygen XML Developer Runs

You can install Oxygen XML Developer to run in several ways:

- As a desktop application (running standalone or as an Eclipse plugin) on Windows, Linux, or macOS.
- As a desktop application (running standalone or as an Eclipse plugin) on a Unix or Linux server or on Windows Terminal Server.

Choosing an Installer

You also have a choice of several different installers:

- The native installer for your platform (Windows, Linux, or macOS).
- On Windows and Linux, the native installer can also run in unattended mode.

Choosing a License Option

You must [obtain and register a license \(on page 87\)](#) to run Oxygen XML Developer.

You can choose from two types of licenses:

- A named-user license, which can be used by a single person on multiple computers.
- A floating license, which can be used by different people at different times. Only one person can use a floating license at a time.

Upgrading, Transferring, and Uninstalling.

You can also [upgrade \(on page 106\)](#) Oxygen XML Developer, [transfer a license \(on page 89\)](#), or [uninstall \(on page 113\)](#) Oxygen XML Developer.

Getting Help With Installation

If you need help, email support at: support@oxygenxml.com.

Installing Oxygen XML Developer on Windows

System Requirements

Operating Systems

The product has been fully tested on Windows versions 10 and 11. The latest version of Oxygen XML Developer might work on other versions of Windows, but they have not been officially tested.

CPU

- Minimum - Intel/AMD Dual-core class CPU, 2 GHz
- Recommended - Quad-core class processor

Memory

- Minimum - 3 GB of RAM
- Recommended - 8 GB of RAM

Storage

- Minimum - 1 GB free disk space
- Recommended - 2 GB free disk space

Java

Oxygen XML Developer only officially supports Java Virtual Machines with version 17 from Oracle or Eclipse Adoptium. If you use the native Windows installer, Oxygen XML Developer will be installed with its own copy of Java with the specific update version that has been thoroughly tested.

All Platforms Package

If you use the all platforms package, your system must have a compatible Java 17 virtual machine installed. To see the exact Java update version that is supported, go to www.oxygenxml.com, navigate to the **Download** page for the particular product you are installing, and click on the tab for your particular platform.

Note:

Oxygen XML Developer may work with other versions of Java, but since Oxygen XML Developer has only been thoroughly tested with specific versions, there is no guarantee that it will be stable with any other Java version.

Oxygen XML Developer uses the following rules to determine which installed version of Java to use:

1. If you install using the native Windows installer, which installs a version of Java as part of the Oxygen XML Developer installation, the version in the `jre` subdirectory of the installation directory is used.
2. Otherwise, if the Windows environment variable `JAVA_HOME` is set, Oxygen XML Developer uses the Java version pointed to by this variable.
3. Otherwise, the version of Java pointed to by your `PATH` environment variable is used.

If you run Oxygen XML Developer using the batch file, `oxygenDeveloper.bat`, you can edit the batch file to specify a particular version to use.

Windows Installer

To install Oxygen XML Developer using the Windows installer, follow these steps:

1. Make sure that your system meets the [system requirements \(on page 70\)](#).
2. [Download](#) the Windows installer.
3. [Optional] Validate the integrity of the downloaded file by [checking it against the MD5 sum](#) published on the download page.
4. Run the installer and follow the instructions in the installation program.
5. Start Oxygen XML Developer using one of the following methods:
 - Use one of the shortcuts created by the installer.
 - Run `oxygenDeveloper.bat`, which is located in the installation directory.
6. To license your copy of Oxygen XML Developer, go to **Help > Register** and enter your [license information \(on page 87\)](#).

Windows Unattended Installation

You can run the installation in unattended mode by running the installer from the command line with the `-q` parameter. By default, running the installer in unattended mode installs Oxygen XML Developer with the default options and does not overwrite existing files. You can change various options for the unattended installer using the installer command-line parameters.

Windows Installer Command-Line Reference

The Oxygen XML Developer installer for Windows supports a variety of command-line parameters:

-q

Instructs the installer to run in unattended mode. The installer will not prompt the user for input during the install. Default settings will be used for all options unless a `response.varfile` ([on page 74](#)) is specified using the `-varfile` option.

-overwrite

In unattended mode, the installer does not overwrite files with the same name if a previous version of the Oxygen XML Developer is installed in the same folder. The **-overwrite** parameter added after the **-q** parameter forces the overwriting of these files.

-console

Displays a console during an unattended installation.

Note:

If you want the installer to run in the foreground, you need to use the **start /wait** command (for example, `start /wait oxygen.exe -q -console`). Otherwise, it will run in the background.

-varfile

Specifies the location of a `response.varfile` (on page 74), normally to be used during an unattended installation.

-c

Allows users to configure the installation by inputting answers to installation questions in the command line.

Tip:

Using this parameter is the best way to use the installer for people who are visually impaired.

-V[variable name]=[variable value]

This command-line parameter can be used to define any of the variables listed below to be used by an installation.

EXAMPLE:

```
oxygen.exe -q -overwrite -console -VautoVersionChecking=false
```

Command-Line Variables for Preconfiguring License Server Details

For organizations that use a license server to manage user licenses, the Oxygen XML Developer installer also supports the following command-line variables used for preconfiguring license server details:

autoVersionChecking

Used for automatic version checking. Possible values are **true** (default) or **false**.

backup.license.servlet.url

Specifies the URL of the backup HTTP license server.

backup.license.servlet.user.name

Specifies the user name for the backup HTTP license server.

backup.license.servlet.password

Specifies the password for the backup HTTP license server, in clear form (will be stored encrypted).

backup.license.servlet.password.encrypted

Specifies the password for the HTTP license server, in encrypted form. Can be obtained from an entry with the same name in an existing `license.xml` file (found in: `[user_home_directory]\AppData\Roaming\com.oxygenxml.developer`).

downloadResources

Used to download resources (links to video demonstrations, webinars, and upcoming events) from <https://www.oxygenxml.com> to populate the application welcome screen. Possible values are **true** (default) or **false**.

license.servlet.url

Specifies the URL of the HTTP license server.

license.servlet.user.name

Specifies the user name for the HTTP license server.

license.servlet.password

Specifies the password for the HTTP license server, in clear form (will be stored encrypted).

license.servlet.password.encrypted

Specifies the password for the HTTP license server, in encrypted form. Can be obtained from an entry with the same name in an existing `license.xml` file (found in: `[user_home_directory]\AppData\Roaming\com.oxygenxml.developer`).

reportProblem

Used to report a problem encountered while using Oxygen XML Developer. Possible values are **true** (default) or **false**.

EXAMPLE:

```
oxygen.exe "-Vlicense.servlet.url=http://main.licenseserver:8080/oxygenLicenseServlet/license-servlet"
"-Vlicense.servlet.user.name=user" "-Vlicense.servlet.password=mypass"
"-Vbackup.license.servlet.url=http://backup.licenseserver:8080/oxygenLicenseServlet/license-servlet"
"-Vbackup.license.servlet.user.name=user" "-Vbackup.license.servlet.password=mypass"
```

**Note:**

For information about deploying and registering floating licenses for multiple users, see [Registering Floating Licenses for Multiple Users](#) (*on page 93*).

Windows Installer *response.varfile*

The Oxygen XML Developer installer for Windows also creates a file called `response.varfile`, which records the choices that the user made when running the installer interactively. The generated response file is found in the `[OXYGEN_INSTALL_DIR]/.install4j` folder. You can use the `response.varfile` to set the options for an [unintended install \(on page 71\)](#). For more information about the `response.varfile` format, see [install4j site](#).

Variables (can be used in the `response.varfile` or from the command line)

The following variables are supported in the `response.varfile` (or from the command line):

autoVersionChecking

Used for automatic version checking. Possible values are **true** (default) or **false**.

checkNotifications

Used to control checking for application-related news and events. Possible values are **true** (default) or **false**.

downloadResources

Used to download resources (links to video demonstrations, webinars, and upcoming events) from <https://www.oxygenxml.com> to populate the application welcome screen. Possible values are **true** (default) or **false**.

reportProblem

Used to report a problem encountered while using Oxygen XML Developer. Possible values are **true** (default) or **false**.

installAddons

Set to **false** to prohibit the application from allowing the end user to install add-ons.

installAIPositronAddons

Set to **false** to prohibit the application from allowing the end user to install any of the **AI Positron Assistant** add-ons.

Installing Oxygen XML Developer on macOS

System Requirements

Operating system

The product has been fully tested on macOS 13 (Ventura), 14 (Sonoma), and 15 (Sequoia). The latest version of Oxygen XML Developer might work on older versions of macOS, but they have not been officially tested.

CPU

- Minimum - Intel-based Dual-core Mac, 2 GHz
- Recommended - Apple M1 or newer

Memory

- Minimum - 4 GB of RAM
- Recommended - 8 GB of RAM

Storage

- Minimum - 1 GB free disk space
- Recommended - 2 GB free disk space

macOS Installation

To install Oxygen XML Developer on macOS, follow these steps:

1. [Download](#) the macOS installation package (oxygenDeveloper.dmg).
2. [Optional] Validate the integrity of the downloaded file by [checking it against the MD5 sum](#) published on the download page.
3. Double-click the oxygenDeveloper.dmg disk image file to mount it.
4. Drag/Copy the *Oxygen XML Developer* folder to your */Applications* folder (or another location if you wish).

Warning:

If you receive a warning that an *Oxygen XML Developer* installation folder already exists in the *Applications* folder, do not attempt to merge the two installations. Instead, move the old installation folder to the trash bin before installing the application. If you are prompted to **Replace** the old folder, cancel the installation, move the old folder to the trash bin, and restart the installation process.

Important:

Do not copy the files/folders from within the *Oxygen XML Developer* folder (always copy the folder itself), otherwise you will omit invisible files/folders and the application may no longer start.

5. Start Oxygen XML Developer, using one of the following methods:
 - Double-click *Oxygen XML Developer.app*.
 - Run `sh oxygenDeveloper.shsh oxygenJSONEditor.sh` in the command-line interface.
6. To license your copy of Oxygen XML Developer, go to **Help > Register** to enter your [license key \(on page 87\)](#).

macOS Unattended Installation

To install Oxygen XML Developer on macOS in unattended mode, follow these steps:

1. [Download](#) the macOS installation package (oxygenDeveloper.dmg).
2. Mount the oxygenDeveloper.dmg file in the command line.

```
hdiutil attach oxygen.dmg|oxygenAuthor.dmg|oxygenDeveloper.dmg
```

3. Copy the **oxygen** folder for the particular version from the mounted volume to the **Applications** folder (or another folder where you want to install it), as in the following example:

```
cp -aR "/Volumes/Oxygen XML Developer 27.1/Oxygen XML Developer" /Applications/|
```

4. Eject the mounted disc image:

```
hdiutil detach "/Volumes/Oxygen XML Developer 27.1" |
```

Note:

For information about deploying and registering floating licenses for multiple users, see [Registering Floating Licenses for Multiple Users \(on page 93\)](#).

Installing Oxygen XML Developer on Linux

System Requirements

Operating System

The product has been fully tested on Ubuntu 22.04. The latest version of Oxygen XML Developer might work on other flavors/versions of Linux, but they have not been officially tested.

CPU

- Minimum - Intel/AMD Dual-core class CPU, 2 GHz
- Recommended - Quad-core class processor

Memory

- Minimum - 3 GB of RAM
- Recommended - 8 GB of RAM

Storage

- Minimum - 1 GB free disk space
- Recommended - 2 GB free disk space

Java

Oxygen XML Developer only officially supports Java Virtual Machines with version 17 from Oracle or Eclipse Adoptium. If you use the Linux installer, Oxygen XML Developer will be installed with its own copy of Java with the specific update version that has been thoroughly tested.

All Platforms Package

If you use the all platforms package, your system must have a compatible Java 17 virtual machine installed. To see the exact Java update version that is supported, go to www.oxygenxml.com, navigate to the **Download** page for the particular product you are installing, and click on the tab for your particular platform.

Note:

Oxygen XML Developer may work with other versions of Java, but since Oxygen XML Developer has only been thoroughly tested with specific versions, there is no guarantee that it will be stable with any other Java version.

Attention:

Oxygen XML Developer does not work with the **GNU libgcj** Java Virtual Machine.

Oxygen XML Developer uses the following rules to determine which installed version of Java to use:

1. If you used the Linux installer, which installs a version of Java as part of the Oxygen XML Developer installation, the version in the `jre` subdirectory of the installation directory is used.
2. Otherwise, if the Linux environment variable `JAVA_HOME` is set, Oxygen XML Developer uses the Java version pointed to by this variable.
3. Otherwise, the version of Java pointed to by your `PATH` environment variable is used.

You can also change the version of the Java Virtual Machine that runs Oxygen XML Developer by editing the script file, `oxygenDeveloper.sh`.

X.org

The version of Java bundled with Oxygen XML Developer requires **X.org** (Wayland is not supported).

Linux Installer

To install Oxygen XML Developer using the Linux installer, follow these steps:

1. Make sure that your system meets the [system requirements \(on page 76\)](#).
2. [Download](#) the Linux installer.

3. [Optional] Validate the integrity of the downloaded file by [checking it against the MD5 sum](#) published on the download page.
4. Run the installer and follow the instructions in the installation program.

**Note:**

For example, open a shell, `cd` to the installation directory, and at the prompt type `sh ./oxygen-32bit.sh` or `sh ./oxygen-64bit.sh`, depending on which installer you downloaded.

**Warning:**

If you are running the installer as root and your Linux distribution uses Wayland (such as **Ubuntu 17.10** or **Fedora 25**), before running the installer, the local user must first allow the root user to access the X server by running the following command (as the local user):

```
xhost +SI:localuser:root
```

5. Start Oxygen XML Developer using one of the following methods:
 - Use the `developer` shortcut created by the installer.

**Note:**

For **Ubuntu 17.10** (or later), a security dialog box will appear the first time you start the application where you need to select **Trust and Launch** to continue. This dialog box will not appear on subsequent launches.

- From a command line, type `sh oxygenDeveloper.sh`. This file is located in the installation folder.
6. To license your copy of Oxygen XML Developer go to **Help > Register** and enter your [license information \(on page 87\)](#).

Linux Unattended Installation

You can run the installation in unattended mode by running the installer from the command line with the `-q` parameter. By default, running the installer in unattended mode installs Oxygen XML Developer with the default options and does not overwrite existing files. You can change various options for the unattended installer using the installer command-line parameters.

Linux Installer Command-Line Reference

The Oxygen XML Developer installer for Linux supports a variety of command-line parameters:

`-q`

Instructs the installer to run in unattended mode. The installer will not prompt the user for input during the install. Default settings will be used for all options unless a `response.varfile` (on page 80) is specified using the `-varfile` option.

-overwrite

In unattended mode, the installer does not overwrite files with the same name if a previous version of the Oxygen XML Developer is installed in the same folder. The **-overwrite** parameter added after the `-q` parameter forces the overwriting of these files.

-console

Displays a console during the installation.

-varfile

Specifies the location of a `response.varfile` (on page 80), normally to be used during an unattended installation.

-V

Used to define a `variable parameter` (on page 80) to be used by an installation.

EXAMPLE:

```
oxygen.sh -q -overwrite -console -VautoVersionChecking=false
```

Command-Line Variables for Preconfiguring License Server Details

For organizations that use a license server to manage user licenses, the Oxygen XML Developer installer also supports the following command-line variables used for preconfiguring license server details:

autoVersionChecking

Used for automatic version checking. Possible values are **true** (default) or **false**.

backup.license.servlet.url

Specifies the URL of the backup HTTP license server.

backup.license.servlet.user.name

Specifies the user name for the backup HTTP license server.

backup.license.servlet.password

Specifies the password for the backup HTTP license server, in clear form (will be stored encrypted).

backup.license.servlet.password.encrypted

Specifies the password for the HTTP license server, in encrypted form. Can be obtained from an entry with the same name in an existing `license.xml` file (found in: `[user_home_directory]\AppData\Roaming\com.oxygenxml.developer`).

downloadResources

Used to download resources (links to video demonstrations, webinars, and upcoming events) from <https://www.oxygenxml.com> to populate the application welcome screen. Possible values are **true** (default) or **false**.

license.servlet.url

Specifies the URL of the HTTP license server.

license.servlet.user.name

Specifies the user name for the HTTP license server.

license.servlet.password

Specifies the password for the HTTP license server, in clear form (will be stored encrypted).

license.servlet.password.encrypted

Specifies the password for the HTTP license server, in encrypted form. Can be obtained from an entry with the same name in an existing `license.xml` file (found in: `[user_home_directory]\AppData\Roaming\com.oxygenxml.developer`).

reportProblem

Used to report a problem encountered while using Oxygen XML Developer. Possible values are **true** (default) or **false**.

EXAMPLE:

```
oxygen.sh "-Vlicense.servlet.url=http://main.licenseserver:8080/oxygenLicenseServlet/license-servlet"
"-Vlicense.servlet.user.name=user" "-Vlicense.servlet.password=mypass"
"-Vbackup.license.servlet.url=http://backup.licenseserver:8080/oxygenLicenseServlet/license-servlet"
"-Vbackup.license.servlet.user.name=user" "-Vbackup.license.servlet.password=mypass"
```

Note:

For information about deploying and registering floating licenses for multiple users, see [Registering Floating Licenses for Multiple Users \(on page 93\)](#).

Linux Installer *response.varfile*

The Oxygen XML Developer installer for Linux also creates a file called `response.varfile`, which records the choices that the user made when running the installer interactively. The generated response file is found in the `[OXYGEN_INSTALL_DIR]/.install4j` folder. You can use the `response.varfile` to set the options for an **unintended install** ([on page 78](#)). For more information about the `response.varfile` format, see [install4j site](#).

Variable Parameters (can be used in the *response.varfile* or from the command line)

The following variable parameters are supported in the `response.varfile` (or from the command line):

autoVersionChecking

Used for automatic version checking. Possible values are **true** (default) or **false**.

checkNotifications

Used to control checking for application-related news and events. Possible values are **true** (default) or **false**.

reportProblem

Used to report a problem encountered while using Oxygen XML Developer. Possible values are **true** (default) or **false**.

downloadResources

Used to download resources (links to video demonstrations, webinars, and upcoming events) from <https://www.oxygenxml.com> to populate the application welcome screen. Possible values are **true** (default) or **false**.

installAddons

Set to **false** to prohibit the application from allowing the end user to install add-ons.

installAIPositronAddons

Set to **false** to prohibit the application from allowing the end user to install any of the **AI Positron Assistant** add-ons.

Installing Oxygen XML Developer on Windows Server

System Requirements

Operating systems

Windows Server 2012 or Windows Server 2012 R2

CPU

- Minimum - Intel/AMD Dual-core class CPU, 2 GHz
- Recommended - Quad-core class processor

Memory

- Minimum values per user - 1 GB of RAM
- Recommended values per concurrent user - 2 GB of RAM

Storage

- Minimum - 1 GB free disk space
- Recommended - 2 GB free disk space

Java

Oxygen XML Developer only officially supports Java Virtual Machines with version 17 from Oracle or Eclipse Adoptium. If you use the native Windows installer, Oxygen XML Developer will be installed with its own copy of Java with the specific update version that has been thoroughly tested.

All Platforms Package

If you use the all platforms package, your system must have a compatible Java 17 virtual machine installed. To see the exact Java update version that is supported, go to www.oxygenxml.com, navigate to the **Download** page for the particular product you are installing, and click on the tab for your particular platform.

Note:

Oxygen XML Developer may work with other versions of Java, but since Oxygen XML Developer has only been thoroughly tested with specific versions, there is no guarantee that it will be stable with any other Java version.

Oxygen XML Developer uses the following rules to determine which installed version of Java to use:

1. If you install using the native Windows installer, which installs a version of Java as part of the Oxygen XML Developer installation, the version in the `jre` subdirectory of the installation directory is used.
2. Otherwise, if the Windows environment variable `JAVA_HOME` is set, Oxygen XML Developer uses the Java version pointed to by this variable.
3. Otherwise, the version of Java pointed to by your `PATH` environment variable is used.

If you run Oxygen XML Developer using the batch file, `oxygenDeveloper.bat`, you can edit the batch file to specify a particular version to use.

Windows Installer

To install Oxygen XML Developer using the Windows installer, follow these steps:

1. Make sure that your system meets the [system requirements \(on page 81\)](#).
2. [Download](#) the Windows installer.
3. [Optional] Validate the integrity of the downloaded file by [checking it against the MD5 sum](#) published on the download page.
4. Run the installer and follow the instructions in the installation program.
5. Start Oxygen XML Developer using one of the following methods:

- Use one of the shortcuts created by the installer.
 - Run `oxygenDeveloper.bat`, which is located in the installation directory.
6. To license your copy of Oxygen XML Developer go to **Help > Register** and enter your [license information \(on page 87\)](#).

Configuring Windows Terminal Server

1. Install Oxygen XML Developer on the server and make its shortcuts available to all users.
2. Make sure you allocate sufficient memory to Oxygen XML Developer by adding the `-Xmx` parameter either in the `.bat` startup script [\(on page 304\)](#), or in the `.vmoptions` configuration file [\(on page 307\)](#) (if you start it from an executable launcher).

Installing Oxygen XML Developer on a Linux / UNIX Server

System Requirements

Operating system

The product has been fully tested on Ubuntu 22.04. The latest version of Oxygen XML Developer might work on other flavors/versions of Linux, but they have not been officially tested.

CPU

- Minimum - Intel/AMD Dual-core class CPU, 2 GHz
- Recommended - Quad-core class processor

Memory

- Minimum - 3 GB of RAM
- Recommended - 8 GB of RAM

Storage

- Minimum - 1 GB free disk space
- Recommended - 2 GB free disk space

Java

Oxygen XML Developer only officially supports Java Virtual Machines with version 17 from Oracle or Eclipse Adoptium. If you use the Linux installer, Oxygen XML Developer will be installed with its own copy of Java with the specific update version that has been thoroughly tested.

All Platforms Package

If you use the all platforms package, your system must have a compatible Java 17 virtual machine installed. To see the exact Java update version that is supported,

go to www.oxygenxml.com, navigate to the **Download** page for the particular product you are installing, and click on the tab for your particular platform.

**Note:**

Oxygen XML Developer may work with other versions of Java, but since Oxygen XML Developer has only been thoroughly tested with specific versions, there is no guarantee that it will be stable with any other Java version.

**Attention:**

Oxygen XML Developer does not work with the **GNU libgcj** Java Virtual Machine.

Oxygen XML Developer uses the following rules to determine which installed version of Java to use:

1. If you used the Linux installer, which installs a version of Java as part of the Oxygen XML Developer installation, the version in the `jre` subdirectory of the installation directory is used.
2. Otherwise, if the Linux environment variable `JAVA_HOME` is set, Oxygen XML Developer uses the Java version pointed to by this variable.
3. Otherwise, the version of Java pointed to by your `PATH` environment variable is used.

You can also change the version of the Java Virtual Machine that runs Oxygen XML Developer by editing the script file, `oxygenDeveloper.sh`.

Linux Installer

To install Oxygen XML Developer using the Linux installer, follow these steps:

1. Make sure that your system meets the [system requirements \(on page 83\)](#).
2. **Download** the Linux installer.
3. [Optional] Validate the integrity of the downloaded file by [checking it against the MD5 sum](#) published on the download page.
4. Run the installer and follow the instructions in the installation program.

**Note:**

For example, open a shell, `cd` to the installation directory, and at the prompt type `sh ./oxygen-32bit.sh` or `sh ./oxygen-64bit.sh`, depending on which installer you downloaded.

5. Start Oxygen XML Developer using one of the following methods:

- Use the **developer** shortcut created by the installer.
 - From a command line, type `sh oxygenDeveloper.sh`. This file is located in the installation folder.
6. To license your copy of Oxygen XML Developer go to **Help > Register** and enter your [license information \(on page 87\)](#).

Unix/Linux Server Configuration

1. Install Oxygen XML Developer on the server and make sure the `oxygenDeveloper.sh` script is executable and the installation directory is in the PATH of the users that need to use the application.
2. Make sure you allocate sufficient memory to Oxygen XML Developer by setting an appropriate value for the `-Xmx` parameter in the `.sh` startup script.

Note:

The default value of the `-Xmx` parameter is about a quarter of the maximum internal memory available on the machine. To avoid [performance issues with large documents \(on page 2205\)](#), you may need to adjust it.

3. Make sure the X server processes located on the workstations allow connections from the server host. For this, use the `xhost` command.
4. Start telnet (or ssh) on the server host.
5. Start an `xterm` process with the **display** parameter set on the current workstation. For example: `xterm -display workstationip:0.0`.
6. Start Oxygen XML Developer by typing `sh oxygenDeveloper.sh` from the command line. This file is located in the installation folder.

Site-Wide Deployment

If you are deploying Oxygen XML Developer for a group, there are various things you can do to customize Oxygen XML Developer for your users and to make the deployment more efficient.

Creating custom default options

You can [create a custom set of default options \(on page 275\)](#) for Oxygen XML Developer. These will become the default options for each of your users, replacing the normal default settings. Users can still set options to suit themselves in their own copies of Oxygen XML Developer, but if they choose to reset their options to defaults, the custom defaults that you set will be used.

Creating default project files

[Oxygen XML Developer project files \(on page 361\)](#) are used to configure a project. You can [create and deploy default project files \(on page 361\)](#) for your projects so that your users will have a preconfigured project file to begin work with.

Shared project files

Rather than each user having their own project file, you can [create and deploy shared project files \(on page 378\)](#) so that all users share the same project configuration and settings and automatically inherit all project changes.

Using the unattended installer

You can speed up the installation process by using the [unattended installer for Windows \(on page 71\)](#) or [Linux \(on page 78\)](#) installs.

Using floating licenses

If you have a number of people using Oxygen XML Developer on a part-time basis or in different time zones, you can use a [floating license \(on page 91\)](#) so that multiple people can share a license.

Licensing

This section contains information about licensing Oxygen XML Developer, including details about the types of licenses that are available, managing licenses, using a license server to manage licenses for an organization, and information about managing license servers.

Installing a License Server to Manage Licenses

If you are using floating licenses or a large number of user-based licenses (20 or more) for **Oxygen XML Editor/Author/Developer**, you must [set up an Oxygen License Server \(on page 94\)](#).

Registering License Keys

To help you comply with the **Oxygen** EULA (terms of licensing), all floating or named-user licenses must be registered. This means that the license key will be locked to a particular license server deployment and no multiple uses of the same license key are possible.

During the activation process, a code that uniquely identifies your deployment of the license server is sent to the **Oxygen** servers. The servers will then sign the license key.

Splitting or Combining License Keys to Work with Your License Servers

A license server can only manage one license key. If you have multiple license keys for the same version of **Oxygen XML Editor/Author/Developer** and you want to have all of them managed by the same server, or if you have a multiple-user floating license and you want to split it between two or more license servers, [contact the Oxygen support team](#) and ask for a new license key.

You can obtain a license key for Oxygen XML Developer in one of the following ways:

- You can purchase one or more licenses from the Oxygen XML Developer website at <https://www.oxygenxml.com/buy.html> or through one of the [authorized resellers](#). A license key will be sent to you by email.
- If your company or organization has already purchased licenses, contact your license administrator to obtain a license key or configuration details to connect to a license server.

- If you purchased a subscription and you received a registration code, you can use it to obtain a license key from <https://www.oxygenxml.com/registerCode.html>. A license key will be sent to you by email.
- If you want to evaluate the product, you can obtain a trial license key for 30 days from the Oxygen XML Developer website at <https://www.oxygenxml.com/register.html>.

License Types

Oxygen XML Developer is not free software. To activate and use Oxygen XML Developer, you need a license.

The following license types are available:

- A **Named-User License** (on page 87) may be used by a single *Named User* on one or more computers. Named-user licenses are not transferable to a new *Named User*. If you order multiple named-user licenses, you will receive a single license key good for a specified number of *named users*. It is your responsibility to keep track of the *named users* that each license is assigned to.
- A **Floating License** (on page 91) may be used by any user on any machine. However, the total number of copies of Oxygen XML Developer in use at one time must not be more than the number of floating licenses available. A user who runs two different distributions of Oxygen XML Developer (for example, Standalone and Eclipse Plugin) at the same time on the same computer, consumes a single floating license.
- A **Subscription** license that allows you to use the application for a specific period of time (either 6 months or 1 year). This type of license is user-based and is covered by a Support and Maintenance Pack, which means that during the subscription period you will get free upgrades to all major and minor releases and priority technical support.

For demonstration and evaluation purposes, a time-limited license is available upon request at <https://www.oxygenxml.com/register.html>. This license is supplied at no cost for a period of 30 days from the date of issue. During this period, the software is fully functional, enabling you to test all its functionality. To continue using the software after the trial period, you must purchase a permanent license.

For definitions and legal details of the license types, consult the End-User License Agreement available at https://www.oxygenxml.com/eula_developer.html.

Named-User Licenses

A **Named-User License** can be used by a single *Named User* on one or more computers. Named-user licenses cannot be transferred to another *named user*. If you purchase multiple named-user licenses, you will receive a single license key that is valid for a specified number of *named users*. It is your responsibility to keep track of which *named users* are assigned to each license.

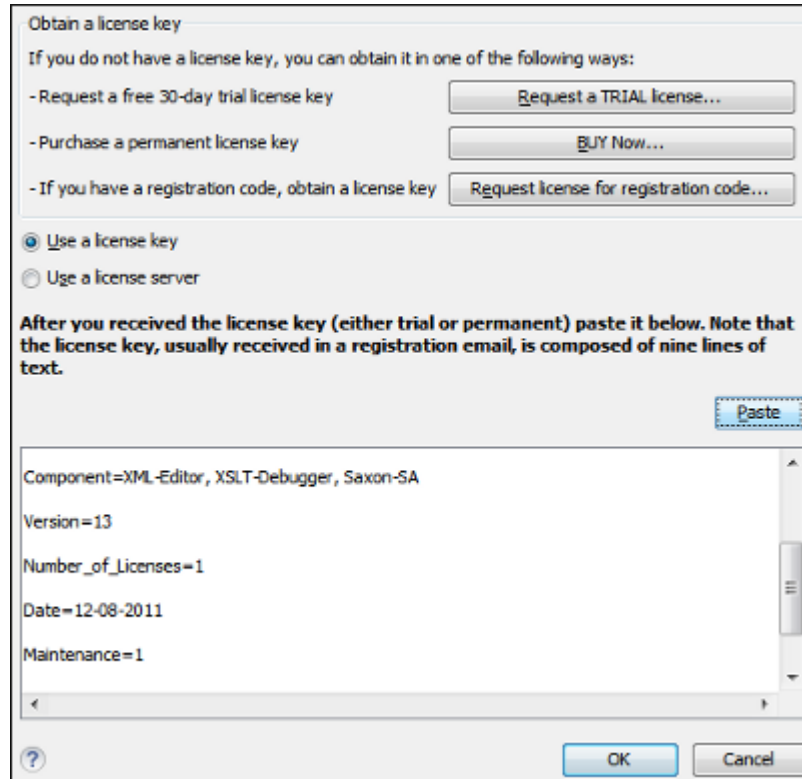

Registering a Named-User License

To register a *Named-User License* on a machine owned by the *Named User*, follow these steps:

1. Purchase a license from the [Oxygen XML Developer website](#). You will receive an email that contains your license key.
2. Save a backup copy of your email message that contains the new license key.
3. Start Oxygen XML Developer.

If this is a new installation of Oxygen XML Developer, the registration dialog box is displayed. If the registration dialog box is not displayed, go to **Help > Register**.

Figure 4. License Registration Dialog Box

4. Select **Use a license key** as the licensing method.

Note:

If your license key has 20 or more licenses, you must use a [license server \(on page 86\)](#) instead.

5. Paste your license key into the registration dialog box. The license key is composed of nine lines of text between two text markers.
6. Click **OK**.

Related information

[Oxygen XML Developer End-User License Agreement](#)

Transferring a License Key

If you want to transfer your Oxygen XML Developer license key to another computer (for example, if you are disposing of your old computer or transferring it to another person), you must first unregister your license. You can then register your license on the new computer in the normal way.

To unregister a license, prior to transferring it, follow this procedure:

1. Go to **Help > Register**.

The license registration dialog box is displayed.

2. Make sure the **Use a license key** option is selected.

3. The license key field should be empty (this is normal). If it is not empty, delete any text in the field.

4. Click the **Remove** button at the bottom-right corner of the dialog box.

A confirmation message is displayed asking if you want to remove your license key.

5. Select between:

- **Yes** - Removes your license key from your user account on the current computer.
- **No** - Falls back to your previous license key, if applicable.

Subscription Licenses

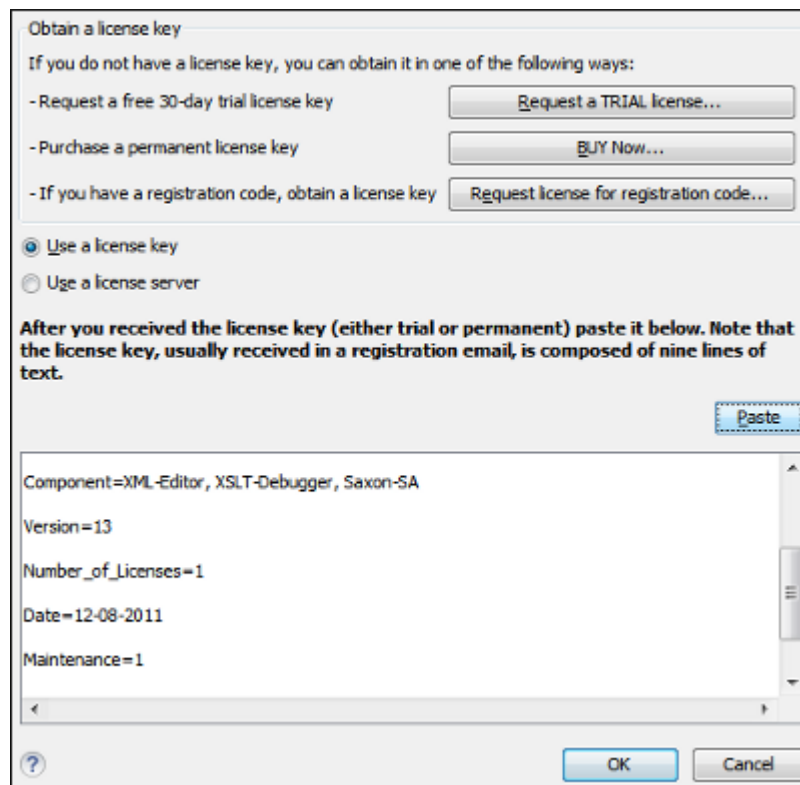

A **Subscription** license that allows you to use the application for a specific period of time (either 6 months or 1 year). This type of license is user-based and is covered by a Support and Maintenance Pack, which means that during the subscription period you will get free upgrades to all major and minor releases and priority technical support.

Registering a Subscription License

To register a *Subscription License*, follow these steps:

1. Purchase a license from the [Oxygen XML Developer website](#). You will receive an email that contains your license key.
2. Save a backup copy of your email message that contains the new license key.
3. Start Oxygen XML Developer.

If this is a new installation of Oxygen XML Developer, the registration dialog box is displayed. If the registration dialog box is not displayed, go to **Help > Register**.

Figure 5. License Registration Dialog Box

4. Select **Use a license key** as the licensing method.

**Note:**

If your license key has 20 or more licenses, you must use a [license server \(on page 86\)](#) instead.

5. Paste your license key into the registration dialog box. The license key is composed of nine lines of text between two text markers.
6. Click **OK**.

Related information

[Oxygen XML Developer End-User License Agreement](#)

Automatic Subscription Renewal

The **Oxygen License Server** has a mechanism that tries to detect when you purchase a renewal of your current subscription and automatically updates the license key.

To determine that a license key you purchased is a renewal of the license key you have currently installed in the License Server, it uses the **Previous order reference number** if you inserted it in the checkout process.

This automatic renewal mechanism makes an HTTP request to https://oxygenxml.com/subscription_management/check_renewal.php and passes the following as parameters:

- The SGN field of the existing license key.
- The server signature that uniquely identifies the License Server installation.

This request is made by the License Server automatically (or manually by pressing the **Check now** link).

This mechanism can be disabled by deselecting the **Automatically check for subscription renewal** checkbox.

Floating Licenses

The floating license type is commonly used by organizations that have a large number of infrequent users who do not require simultaneous access to the application. Instead of each user having their own individual license key, a pool of licenses is available for use on demand, one at a time.

To use floating licenses, a license server is required and the license key needs to be activated. Your system administrator will most likely be responsible for [setting up the license server \(on page 94\)](#). Then you will need to [request a floating license from the server \(on page 91\)](#). This process is designed to ensure compliance with the *Oxygen End-User License Agreement (EULA)*. This means that the license key will be locked to a particular license server deployment, and the same license key cannot be used with any other license server.

For information about releasing and returning a floating license to the pool for other users, see [Releasing a Floating License \(on page 92\)](#).

For information about reserving (or locking) a floating license so that it does not get returned to the pool, see [Reserving a Floating License \(on page 93\)](#).

Requesting a Floating License from a License Server

How to Request a Floating License

To request a floating license from an HTTP license server, follow this procedure:

1. Contact your server administrator to make sure the license server has already been set up and get network address and login details for the license server.
2. Start Oxygen XML Developer.
3. Go to **Help > Register**.

Step Result: The license registration dialog box is displayed.

4. Choose **Use a license server** as licensing method.
5. Select **HTTP/HTTPS Server** as server type.
6. In the *URL* field, enter the address of the license server. The URL address has the following format:
`http://hostName:port/oxygenLicenseServlet/license-servlet.`
7. Complete the *User* and *Password* fields.
8. Click the **OK** button.

Result: If a floating license is available, it is registered in Oxygen XML Developer. To display the license details, open the **About** dialog box from the **Help** menu. If a floating license is not available, you will get a message listing the users currently using floating licenses.

How to Register Floating Licenses for Multiple Users

If you are an administrator and you want to register floating licenses for multiple users without having to open Oxygen XML Developer on each machine to manually configure the registration details one by one, you can use the following procedure:

1. Reset the registration details in Oxygen XML Developer:
 - a. Go to **Help > Register**.
 - b. Click **OK** without entering any information in this dialog box.
 - c. Click **Reset** and restart the application.
2. Register the license using one of the [floating license registration procedures \(on page 91\)](#).

Step Result: A `license.xml` file is created.

3. Copy the `license.xml` file from the [preferences directory \(on page 115\)](#) and place it in the installation folder on each machine to be registered.

Related information

[Installing License Servers \(on page 94\)](#)

Releasing a Floating License

The floating license you are using will be released and returned to the pool if any of the following occur:

- The connection with the license server is lost.
- You exit the application running on your machine, and no other copies of Oxygen XML Developer running on your machine are using your floating license.
- You register a *Named User* license with your copy of Oxygen XML Developer, and no other copies of Oxygen XML Developer running on your machine are using your floating license.
- Your computer idles for more than 2 hours.
- Your system administrator [manually revokes the license \(on page 101\)](#).

Tip:

To prevent your floating license from being released, you can use the **Lock floating license** action available in the **Help** menu. You can use the same action to unlock the license. Note that your [system administrator can also unlock your license \(on page 101\)](#).

To release a floating license on demand, follow these steps:

1. Go to **Help > Register**.

The license registration dialog box is displayed.

2. The license key field should be empty (this is normal). If it is not empty, delete any text in the field.

3. Make sure the **Use a license key** option is selected.

4. Click **OK**.

A dialog box is displayed asking if you want to reset your license key.

5. Select between:

- **Use the last one** - Falls back to your previous license key. Use this option if you want to release a floating license and revert to a *Named User* license.
- **Reset** - Removes your license key from your user account on the current computer.

The **Reset** button erases all the licensing information. To complete the reset operation, close and restart Oxygen XML Developer.

Reserving a Floating License

There may be times when you need to reserve or lock a floating license. For example, you could lock a floating license if you want to use your floating license offline while traveling.

To reserve/lock a floating license, follow these steps:

1. **Important:** The license server must be configured by the server administrator to allow license locking.

See [License Server Management and Statistics - Configuration \(on page 100\)](#).

2. Select **Lock floating license** from the **Help** menu.

3. Click **OK**.

Your floating license is now locked. You can use the same action to unlock the license or you can contact your system administrator to unlock it.

**Note:**

A locked floating license uses one license from the license pool for the entire period it remains locked.

Registering Floating Licenses for Multiple Users

If you are an administrator and you want to register floating licenses for multiple users without having to open Oxygen XML Developer on each machine to manually configure the registration details one by one, you can use the following procedure:

1. Reset the registration details in Oxygen XML Developer:

- a. Go to **Help > Register**.
- b. Click **OK** without entering any information in this dialog box.
- c. Click **Reset** and restart the application.

2. Register the license using one of the [floating license registration procedures \(on page 91\)](#).

Step Result: A `license.xml` file is created.

3. Copy the `license.xml` file from the `preferences` directory (on page 115) and place it in the installation folder on each machine to be registered.

Related information

[Requesting a Floating License from a License Server \(on page 91\)](#)

[Installing License Servers \(on page 94\)](#)

Installing License Servers

If you are using floating licenses or a large number of user-based licenses (20 or more) for **Oxygen XML Editor/Author/Developer**, you must set up an **Oxygen License Server**.

The HTTP License Server is available in several distributions, tailored for covering various deployment configurations:

- **Windows installer** - Easy-to-use Windows installation wizard. Requires elevated permissions to run it.
- **All-platform distribution** - Script-based deployment that does not require elevated permissions to run it. Provides scripts for Windows, macOS, and Linux.
- **Web Archive (WAR) distribution** - Provides more flexibility in your deployment configuration, but it requires an existing HTTP server (such as Apache Tomcat).

HTTP License Server System Requirements

Table 2. Minimum Requirements

Hardware	Specification
CPU	1 core
RAM	512 MB/Linux OS, 1 GB/Windows OS (256 MB available memory)
Hard Disk Space	500 MB
Network Requirements	Network interfaces stay unchanged (static MAC addresses) after activation
Server OS Requirements	<ul style="list-style-type: none"> • Linux • Windows (Server 2022 is supported)
Antivirus and Firewall Requirements	Allow access to the configured TCP port (default 8080)

**Note:**

Oxygen XML Editor/Author/Developer version 17 or higher requires a license server version 17 or higher. License servers version 20.1 or higher can be used with any version of a floating or named-user license key.

**Restriction:**

The floating license server does not work with *Docker* containers.

License Activation

The activation process involves binding your license key to a unique license server deployment. Once the process is complete, you cannot activate the license key with another license server deployment.

To activate the license key directly from License Server's UI, you need to access it from a browser with internet access.

**Note:**

During this process, the activation signature, provided license key, and any configured public URLs are sent to oxygenxml.com.

Activation Signature

The default signature calculation is "*Use machine signature (MAC, etc.)*" where the *activation signature* of the License Server instance is computed from various machine IDs.

The **Use the public URL of the License Server** option offers a more flexible activation signature, as you can choose where you provide the exact URL that *Oxygen* applications will use to request a license (the URL should be in the format of: `http(s)://my-domain:port/context-name/license-servlet`). This reduces number of machine IDs used to compute the *activation signature*.

**Note:**

The public server URL does not have to be accessible from outside your network. It should not be a local URL (e.g. `localhost` and `127.0.0.1`) as they are not supported.

Manual License Activation Procedure

If you cannot access the License Server administration page from a browser that has internet access (therefore, the license cannot be activated automatically during the installation), you can manually activate the license by following these steps:

1. Access the HTTP license server management page in a web browser.
2. Copy the machine signature code.

**Note:**

The machine signature is displayed on the page as long as the license key has not yet been activated. If you are trying to update/replace an already activated license key, the machine signature can be found by clicking on **Remove/Replace License**, then selecting **Replace** on the next page.

3. Go to the activation page at: <http://www.oxygenxml.com/activation/>.
4. Enter or paste the machine signature code and the license key, then click **Activate**.

Step Result: The activated license key is displayed on-screen.

5. Copy the activated license key and paste it in the license registration page of the HTTP server.

Preconfiguring License Server Details When Installing Oxygen XML Developer

It is possible to install Oxygen XML Developer with the license server details preconfigured. For more information, see:

- **Windows:** [Windows Installation: Command-Line Parameters for Preconfiguring License Server Details \(on page 72\)](#).
- **Linux:** [Linux Installation: Command-Line Parameters for Preconfiguring License Server Details \(on page 79\)](#).

Backup License Server Information

If you want to use a backup license server, the setup instructions are the same as the procedures for a main license server, but it requires its own separate license key. Contact the [Oxygen support team](#) to find out more details about the backup license pricing and availability.

Related information

[Troubleshooting: Server Signature Mismatch Errors \(on page 105\)](#)

Installing the License Server Distribution for Windows

1. Download the HTTP license server installer from the [HTTP License Server website](#).
2. Run the installer and follow the on-screen instructions.
3. You must configure two sets of credentials:
 - a. **Administrator credentials** - Used for accessing the **Oxygen** license server administrative interface.
 - b. **Standard user credentials** - Used by an **Oxygen** application to connect to the license server.

4. You can choose to change the default 8080 port the server runs on. If you need to change the port after the installation, you can edit the following `vmoptions` file: `oXygen HTTP License Server\Windows Service\oXygenHTTPLicenseServer.vmoptions`.
5. Optionally, you can choose to install the server as a Windows service. In this case, you can choose the name of the Windows service.

**Tip:**

In case you run into issues, the license server log file is located in:

`[Installation_Directory]\work\logs\oXygenLicenseServlet.log`.

Installing the License Server All-Platform Distribution

1. **[Prerequisite]** Java 11 or later must be installed.
2. Download the HTTP license server all-platform archive from the [HTTP License Server website](#).
3. Unpack the archive.
4. Run the license server scripts suitable for your operating system (`licenseServer.bat` for Windows or `licenseServer.sh` for Linux and macOS).

**Note:**

To specify a port other than the default 8080, you can pass a new port number as an argument to the scripts (for example, `licenseServer.bat 8082`). You can also change the port by editing the `vmoptions` file located at `oXygen HTTP License Server\Windows Service\oXygenHTTPLicenseServer.vmoptions`.

5. On the first run, you are prompted to set two sets of credentials:
 - a. **Administrator credentials** - Used for accessing the **Oxygen** license server administrative interface.
 - b. **Standard user credentials** - Used by an **Oxygen** application to connect to the license server.

**Tip:**

If you want to manually install, start, stop, or uninstall the server as a Windows service, run the following scripts from a command line as an Administrator:

- `installWindowsService.bat [serviceName]` - Installs the server as a Windows service with the name `serviceName`. The parameters for the license key folder and the server port can be set in the `oXygenLicenseServer.vmoptions` file.
- `startWindowsService.bat [serviceName]` - Starts the Windows service.
- `stopWindowsService.bat [serviceName]` - Stops the Windows service.
- `uninstallWindowsService.bat [serviceName]` - Uninstalls the Windows service.

If you do not provide the `serviceName` argument, the default name `oxygenLicenseServer` is used.

If the license server is installed as a Windows service, the error messages are redirected to the `errLicenseServer.log` file in `oxygen HTTP License Server\work\Windows Service` folder.

Installing the License Server WAR Distribution

1. Make sure that you have Java Servlet Container installed on the server you have selected to be the license server. Apache Tomcat 5.5 through 9.x is recommended (available at <http://tomcat.apache.org>). Tomcat 9.x is officially supported.

Note:

Tomcat 10.x and later will not work with the license server.

Important:

By default, the license server stores the statistics database and other data in the Java Servlet Container's temporary directory. If you are not using Apache Tomcat, this directory may be deleted when the server is stopped or restarted. However, you can set the `oxygen.license.server.work.dir` system property to specify a different path for the directory where the database is stored.

2. Download the HTTP license server **Web Archive** (.war) from the [HTTP License Server website](#).
3. Configure three user roles in your installation of the Java Servlet Container (such as Apache Tomcat):
 - a. One user with the role `user`, used by an **Oxygen** application to connect to the license server. In the subsequent example, this user name is **John**.
 - b. Another user with the role `admin`, used for accessing the HTTP License Server administrative interface and the management interface. In the subsequent example, this user name is **Mary**.

For example, in Apache Tomcat, a typical way to achieve this is to edit the `tomcat-users.xml` file from your Tomcat installation (if using a Tomcat **zip/tar.gz** distribution, by default this configuration file is found in the `/TomcatInstallFolder/conf/` directory). After adding the three users, the configuration file might look like this:

```
<tomcat-users xmlns="http://tomcat.apache.org/xml"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://tomcat.apache.org/xml tomcat-users.xsd"
  version="1.0">
  <!-- ... other user and role definitions ... -->
  <role rolename="user"/>
  <role rolename="admin"/>
```

```

<role rolename="manager-gui" />

<user username="John" password="user_pass" roles="user" />

<user username="Mary" password="admin_pass" roles="admin" />

<user username="tomcat" password="s3cret" roles="manager-gui" />

</tomcat-users>

```

4. Deploy the WAR file.

For example, in Apache Tomcat, go to the Web Application Manager page and log in with the user you configured with the *admin* role (*Mary* in the example above). In the **WAR file to deploy** section, choose the WAR file and click the **Deploy** button. The `oxygenLicenseServlet` application is now up and running, but the license key is not yet registered.

5. Go to the HTTP License Server administration page. By default, the address of this page is `http://<server-address>/oxygenLicenseServlet`. In Apache Tomcat, you can also open this page by clicking the `oxygenLicenseServlet` link in the manager page.

You need to authenticate with the user configured with the `manager-gui` role (*tomcat* in the example above).

6. **Activate the license key.** This process involves binding your license key to your license server deployment. The browser used in the activation process needs to have Internet access.

Note:

If you cannot access the internet during the deployment, you can manually activate the license key.

Once the process is completed you cannot activate the license on another license server. Follow these steps to activate the license:

- a. Paste your license key into the form and click **Register/Activate**.

Step Result: You will be redirected to an online form hosted on the **Oxygen** website. This form is pre-filled with an activation code that uniquely identifies your license server deployment, and your license key.

- b. Click **Register/Activate**.

If the activation process is successfully completed, your license server is running. Follow the on-screen instructions to configure the Oxygen XML Developer client applications.

7. The application's log file location is specified by the `log4j.appender.R2.File` property from the `WEB-INF/lib/log4j.properties` configuration file.

For example, in Apache Tomcat, the configuration file is located at: `TomcatInstallDir/webapps/oxygenLicenseServlet/WEB-INF/lib/log4j.properties` and the default log file location is `TomcatInstallDir/logs/oxygenLicenseServlet.log`.

Installing Multiple Instances of WAR Distribution on a Tomcat Web Server

For organizations that have multiple sets of licenses (for example, an integrator with multiple clients might host a different license server for each client), use this procedure to install multiple instances of the *Oxygen License Servlet* on a Tomcat web server:

1. Rename the license server WAR file according to your needs. For example, you could use the customer name and a number (e.g. *client23415*).
2. Go to your Tomcat license server manager (e.g. <http://my.tomcatserver.com:port/manager/>) and enter your credentials.
3. Scroll to **WAR file to deploy** and press **Browse** button.
4. Locate the WAR file from step 1 and press the **Open** button.
5. Press the **Deploy** button.
6. Check that the newly deployed license server is running (it must be in the **Applications** table).

Managing License Servers

This section includes information about managing the your license server.

License Server Management and Statistics Pages

A system administrator can manage and access information about the license server at: <http://hostName:port/oxygenLicenseServlet>.

This page provides access to several statistics reports and management tasks. It also displays the current status of the server and provides additional instructions for using the license server with **Oxygen XML Editor/Author/Developer**.

This page includes the following links for accessing statistics or managing tasks:

- **Current Allocated Licenses** - Opens the **Allocated License Report** page (*on page 101*).
- **Usage Statistics** (Available only for floating licenses) - Opens the **License Usage Statistics** page (*on page 101*).
- **View License Key** - Use this link to open a page where you can see details about the license key.
- **Replace/Remove License Key** - Use this link if you need to **replace or remove the current license key** (*on page 103*).
- **Configuration** - Opens a page where you can configure notification settings and set up the mail server used for sending emails whenever license requests from users are rejected. This page also contains a **Allow users to lock licenses** option. Enabling this option allows the users to **lock/reserve a floating license** (*on page 93*).
- **Users management** (Available only for named-user licenses) - Opens a page where you can manage the list of users who are entitled to use the license key.
- **Allowed users list** (Available only for named-user licenses) - Opens a page where you can see the allowed users list (if one has already been configured), along with instructions for configuring one.

Allocated License Report Page

This report page provides a system administrator the ability to revoke or unlock current running instances of licenses and includes the following information:

- **License load** - A graphical indicator that shows how many licenses are available.
- **License server status** - General information about the license server status, such as start time, license counts, rejected and acknowledged requests, average usage time, license refresh and timeout intervals, location of the license key, and the server version.
- **Current running instances** - Lists all currently acknowledged users, including user name, date and time when the license was granted, IP and MAC address of the computer where **Oxygen** runs, and lock status.
 - **Revoke** - A system administrator can click on the  **Revoke** icon next to a user name to release that particular license and return it to the pool.
 - **Unlock** - If a user has locked their license, the system administrator can also unlock it from this page.

Note:

This report is also available in XML format at: `http://hostName:port/oxygenLicenseServlet/licenseServlet/report-xml`.

License Usage Statistics Page (Floating License Only)

This report page provides some usage statistics for the floating licenses. It is helpful for determining the number of licenses that are needed and monitoring times when licenses are consumed. It includes the following information:

- **Maximum number of concurrent licenses** - Shows the maximum number of floating licenses that can be consumed at any given time.
- **Concurrent license consumption per day** - A chart that shows the peak number of licenses that were consumed and the total number of users that were rejected, on a daily basis. This chart can be used to detect the amount of concurrent licenses that are needed to avoid having rejected users.

Tip:

You can click on any bar to see the license consumption per hour for that particular day.

Figure 6. Concurrent License Consumption per Day Chart

- **Concurrent license consumption per hour** - A chart that shows the peak number of licenses that were consumed per hour throughout that particular month. This is useful for identifying the time of day when the most licenses were consumed.

Figure 7. Concurrent License Consumption per Hour Chart

Users Management Page (Named-User License Only)

When a named-user license key is used, the license server allocates available licenses in the order they are requested until the maximum number is reached. Any additional users attempting to obtain a license key will be rejected.

This page provides access to the list of registered users and allows the server admin to:

- Revoke a user's right to use a license.
- Reactivate a previously deactivated user.

Figure 8. Users List Management Page

The screenshot displays the 'XML License Server User Management' interface. At the top, there is a navigation link '< Back to main page'. Below this, the 'License server status' is shown in a table:

Total licenses	6
Used licenses	5
Available licenses	1

Below the status table, the section 'Users: 6' is displayed. This section contains a table with two columns: 'User Name' and 'Deactivated'. The 'Deactivated' column contains checkboxes for each user. The user 'bogdan_d' has a checked checkbox, while all other users have unchecked checkboxes.

User Name	Deactivated
andrei	<input type="checkbox"/>
bogdan	<input type="checkbox"/>
bogdan_d	<input checked="" type="checkbox"/>
mihaela	<input type="checkbox"/>
mircea	<input type="checkbox"/>
teodor	<input type="checkbox"/>

Replacing or Removing a License Key in an HTTP License Server

The following procedure assumes that your HTTP license server contains a previously activated license key and provides instructions for replacing it with another one or removing it completely.

This is useful if, for instance, you want to upgrade your existing license to the latest version or if you receive a new license key [that accommodates a different number of users \(on page 86\)](#).

Replacing a License Key

To replace a license key that is activated on your HTTP license server with a new one, follow these steps:

1. Access the license server by following the link provided by the Tomcat Web Application Manager page and log in using your **admin** credentials.
2. Click the **Replace/Remove license key** link. This will open a page that contains details about the license currently in use.
3. Click the **Replace** button.
4. Paste the new license key in the displayed form.
5. Click **Register/Activate**. The browser used in the process needs to have Internet access.

Step Result: You will be redirected to an online form hosted on the **Oxygen** website. This form is pre-filled with an activation code that uniquely identifies your license server deployment and your license key.

**Note:**

If you cannot access the online activation form, you can [manually activate the license key \(on page 95\)](#).

Result: If the activation process is completed successfully, your license server is now running using the new license key. You can click **View license key** to inspect the key currently used by the license server.

Removing a License Key

To remove a license key that is activated on your HTTP license server, follow these steps:

1. Access the license server by following the link provided by the Tomcat Web Application Manager page and log in using your **admin** credentials.
2. Click the **Replace/Remove license key** link. This will open a page that contains details about the license currently in use.
3. Click the **Remove** button to begin the license deletion procedure.
4. Click the **Remove** button in the confirmation page.

**Important:**

The removal process is irreversible. Once the process is complete, you cannot restore the license key.

Upgrading Your HTTP License Server

The goal of the following procedure is to help you minimize the downtime when you upgrade the HTTP License Server to its latest version:

1. Access the license server by following the link provided by the Tomcat Web Application Manager page. If prompted for authentication, use the **admin** credentials.
2. Click the **View license key** link and copy the displayed license key to a file for later use.
3. Go to the Tomcat Web Application Manager page, log in with the user you configured with the **admin** role, and *Undeploy* the license server.
4. [Download the Web Archive \(WAR\) distribution of HTTP license server.](#)
5. Deploy the downloaded license server.
6. Access the license server by following the link provided by the Tomcat Web Application Manager page. If prompted for authentication, use the credentials configured for the **admin** user.
7. Paste your license key into the form and register it.

Configuring a License Server to Only Allow Certain Users

A system administrator can configure the license server to only allow specific users to request a license. This is available only for named-user licenses (not floating licenses) and is managed using an *Allowed Users List*.

To configure an *Allowed Users List*:

1. Create a text file named **allowed-users.txt**.
2. Enter the user name for each allowed user on a separate line.
3. Save the file in the license server work directory. You can go to the license server management page, and under *Management Tasks*, click the **Allowed users list** link to open a page where you can see the exact directory where it needs to be stored.

Note:

If the `allowed-users.txt` file is present but it is empty, all users are allowed to request a license.

In the license server management page, there is a link to the **Allowed users list** under *Management Tasks*. Also, in the **Current Allocated Licenses** page, there is a **Show allowed users** button. Both of them direct you to a page where you can see the *Allowed Users List* (if one has already been configured), along with instructions for configuring one. The list updates automatically between license requests every 30 seconds if the file is changed.

Common Problems: License Server Errors

This section includes some common problems that may appear when setting up a license server.

Server Signature Mismatch Error

Problem

I receive an error indicating that *the current license was already activated on a License Server* or that the *License Server's Signature does not match*.

During the license activation process, the license key becomes bound to a particular license server deployment. This means that a code that uniquely identifies your license server deployment (called *Server Signature*) is sent to the **Oxygen** servers, which in turn will sign the license key. The *Server Signature* is computed from the list of network interfaces of the server where you deployed the license.

When starting the license server, if you receive an error stating that your *Server Signature* does not match, there are several possible causes:

Possible Cause 1

The license key was moved to a new server that hosts your license server.

Solution

Revert to your previous configuration.

Possible Cause 2

A new network interface was changed, added, or activated in the server that hosts your license server.

Note:

A specific example of when this could happen is if the Bluetooth or the WiFi module is activated/deactivated.

Solution

If reverting is not possible, contact the [Oxygen support team](#).

Possible Cause 3

The license server was restarted from a different location as the previous restart. For example, some server configurations will have the Apache Tomcat server installed in a versioned folder (`/usr/local/apache-tomcat-V.V.V`) with a symbolic link to the typical folder (`/usr/local/tomcat`). The server can be restarted from either location, but it is recommended to always restart from the typical folder (`/usr/local/tomcat`) and always restart from the same location.

Solution

The server simply needs to always be restarted from the same location.

Upgrading

From time to time, upgrades and patch versions of Oxygen XML Developer are released to provide enhancements that fix problems and add new features.

By default, Oxygen XML Developer automatically checks for new versions at startup (or every 24 hours from startup). If a newer version is detected, a dialog box will automatically be displayed that provides information about the type of upgrade or update that is available. If a new patch of a new version is detected, the dialog box will be displayed only when the new patch version includes a critical bug fix or when the license allows upgrading to the new version.

To disable this check, open the **Preferences** dialog box (**Options > Preferences**) (on page 114), go to **Global**, and deselect **Automatic Version Checking**.

To check for new versions manually, go to **Help > Check for New Versions**. This opens a dialog box that displays information about whether or not a newer version is available.

Upgrading Oxygen XML Developer on Windows/Linux

What is Preserved During an Upgrade?

When you install a new version of Oxygen XML Developer, some data is preserved and some is overwritten. If there is a previous version of Oxygen XML Developer already installed on your computer, it can coexist with the new one, which means you do not have to uninstall it.

If you install over a previously installed version:

- All the files from its install directory will be removed, including any modification in *framework* (on page 2269) files, XSLT stylesheets, *XML Catalogs* (on page 2273), and templates.
- All global user preferences are preserved in the new version.
- All project preferences will be preserved in their project files.
- Any custom *frameworks* (on page 2269) that were stored outside the installation directory (as configured in **Document type associations > Locations** (on page 129)) will be preserved and will be found by the new installation.

If you install in a new directory:

- All the files from the old install directory will be preserved, including any modification in *framework* (on page 2269) files, XSLT stylesheets, *XML Catalogs* (on page 2273), and templates. However, these modifications will not be automatically imported into the new installation.
- All global user preferences are preserved in the new version.
- All project preferences will be preserved in their project files.
- Any custom *frameworks* (on page 2269) that were stored outside the installation directory (as configured in **Document type associations > Locations** (on page 129)) will be preserved and will be found by the new installation.

How to Upgrade Oxygen XML Developer on Windows or Linux

1. Upgrading to a new version might require a new license key. To check if your license key is compatible with the new version, select **Help > Check for New Version**. Note that the application needs an Internet connection to check the license compatibility.
2. Download and install the new version according to the instructions for your platform and the type of installer you selected.
3. If you installed from an archive (as opposed to an executable installer) you may have to update any shortcuts you have created or modify the system PATH to point to the new installation folder.
4. Restart Oxygen XML Developer.
5. If you require a new license for your upgrade, install it now according to the procedure for your platform and the type of installer you selected.

Upgrading Oxygen XML Developer on macOS

What is Preserved During an Upgrade?

When you install a new version of Oxygen XML Developer, first you need to remove or rename the old installation directory. By renaming the directory, it can coexist with the new installation and the following data will be preserved:

- All the files from the old install directory will be preserved, including any modification in *framework* (on page 2269) files, XSLT stylesheets, *XML Catalogs* (on page 2273), and templates. However, these modifications will not be automatically imported into the new installation.
- All global user preferences are preserved in the new version.
- All project preferences will be preserved in their project files.
- Any custom *frameworks* (on page 2269) that were stored outside the installation directory (as configured in **Document type associations > Locations** (on page 129)) will be preserved and will be found by the new installation.

How to Upgrade Oxygen XML Developer on macOS

1. [Uninstall the current version of Oxygen XML Developer](#) (on page 113) or rename the installation directory.
2. Upgrading to a new version might require a new license key. To check if your license key is compatible with the new version, select **Help > Check for New Version**. Note that the application needs an Internet connection to check the license compatibility.
3. Download and install the new version in an empty folder according to the instructions for your platform and the type of installer you selected.
4. If you installed from an archive (as opposed to an executable installer) you may have to update any shortcuts you have created or modify the system PATH to point to the new installation folder.
5. Restart Oxygen XML Developer.
6. If you require a new license for your upgrade, install it now according to the procedure for your platform and the type of installer you selected.

Installing and Updating Add-ons

Oxygen XML Developer provides an *add-on* (on page 2271) mechanism that can automatically discover and install *plugins* (on page 1897) from a remote location.

**Note:**

Frameworks that you install through the add-ons system are read-only.

Installing Add-ons

To install an add-on that is hosted on a remote update site, follow these steps:

1. Go to **Help > Install new add-ons**.
2. In the displayed dialog box, enter or paste the update site that hosts the add-on in the **Show add-ons from** field (or select it from the drop-down menu, if applicable). The default add-ons are hosted on <https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml>. If you want to see a list of all the default and sample add-ons that are available on the *Oxygen* remote update sites, choose **ALL AVAILABLE SITES** from the drop-down menu. The add-ons list contains the name, status, update version, Oxygen XML Developer version, and the type of the add-on (either **framework**, or **plugin**). A short description of each add-on is presented under the add-ons list.

**Note:**

To see all the versions of the add-ons, deselect **Show only compatible add-ons** and **Show only the latest version of the add-ons**. Incompatible add-ons are shown only to acknowledge their presence on the remote update site, but you cannot install an incompatible add-on.

3. Choose the add-ons you want to install, click the **Next** button, then follow the on-screen instructions.

**Note:**

Accepting the license agreement of the add-on is a mandatory step in the installation process.

**DANGER:**

Installing from update sites other than the official **Oxygen** sites may cause security risks. Please verify that all your installed third-party add-ons come from companies or individuals that you have verified and that you implicitly trust. As a way to help with identifying possible add-on security problems, Oxygen XML Developer issues warnings for unsigned plugins.

**Note:**

All add-ons are installed in the `extensions` directory inside the Oxygen XML Developer preferences directory (*on page 115*).

**Tip:**

As an alternate approach, you can add an **Install** button to a web page that links to a URL that has the syntax `https://host/path/to/updateSite.xml?oxygenAddonId=addOnIDValue` and drop the button into the application's main editing area.

Managing Installed Add-ons

To manage the installed add-ons, follow these steps:

1. Go to **Help > Manage add-ons**
2. The displayed dialog box presents a list of your installed add-ons along with various information (such as the installed version, the compatible *Oxygen* version, and more). The **Status** column will indicate if

an update is available for a particular add-on. Also, you can click on the row for any particular add-on that has an update available to see details for the update (displayed in the preview pane below the list of add-ons).

3. To update an add-on, select the checkbox for the specific add-on, then click **Update** to update it (or **Uninstall** to remove it). If there is a newer version of the add-on available, Oxygen XML Developer will download the package and install it. Follow the on-screen instructions to complete the installation process.

**Note:**

Accepting the license agreement of the add-on is a mandatory step in the installation process.

Checking for Add-on Updates

To check if there are available updates for the installed add-ons, go to **Help > Check for add-ons updates**. This action displays updates that are compatible with the current Oxygen XML Developer version.

Preserving Installed Add-ons After Upgrading Oxygen to a New Version

After installing or upgrading to a new version of Oxygen XML Developer, when you re-start the application, a dialog box will be displayed where you can decide which previously installed versions of add-ons should be imported and used for the new version of the product.

After you make the decision to import previous add-ons to the new application version, add-ons installed for previous versions remain present in the application settings folder and can still be used with those older application versions. The application may advise you to cleanup your previously installed add-on by displaying a dialog box where you can decide which previously installed versions of add-ons should be preserved or removed. To remove all add-ons for a particular application version (to free up disk space), select it in the main pane of the dialog box and click the **Remove add-ons** button.

Related information

[Packing and Deploying Plugins as Add-ons \(on page 1897\)](#)

Privacy Options

As an on-premise desktop application, Oxygen XML Developer does not store sensitive user data or user-specific files on remote servers. The full [Privacy Policy](#) is available on the official Oxygen XML Developer web site.

Whenever it is started, the application may connect to its official web site (<https://www.oxygenxml.com>) to provide notifications about new releases or new events. In the **Global** preferences page, there are some checkboxes that can be disabled if you do not want this type of information retrieved:

Automatic Version Checking

If this option is selected, the application obtains information about new available versions from the official Oxygen XML Developer web site. No specific information about the current installation is passed to the Oxygen XML Developer web site during this process.

Check for Oxygen-related events at startup

If this option is selected, the application obtains information about events that get displayed in the **Welcome** screen. The types of downloaded events include information about the addition of new videos on the website, announcements of upcoming webinars and conferences where the Oxygen XML Developer team will participate, and more. No specific information about the current installation is passed to the Oxygen XML Developer web site during this process.

Check for Oxygen-related notifications

If this option is selected, the application obtains information about other various notifications that get displayed [on the right side of the status bar \(on page 321\)](#). No specific information about the current installation is passed to the Oxygen XML Developer web site during this process.

Providing installation-specific details to the Oxygen XML Developer technical support team is also possible by using the **Help > Report problem** action from the main menu. Also, if an *unhandled/fatal* error occurs in the application, the user is presented with a **Report problem** dialog box and can choose to submit the error and its context for analysis. The **Report problem** dialog box shows the exact specific details that are sent to the Oxygen XML Developer technical support team and can be examined by the end user before being sent. No files or confidential information are sent.

When the application is installed on Windows or Linux using the provided installation kit, the last installation step allows you to click a **Privacy Options** link to choose which privacy-related settings should be disabled before the application starts for the first time. The **Privacy Options** can also be disabled when performing an unattended install. See instructions here: [Windows Unattended Installation \(on page 71\)](#).

Besides the settings already present in the **Global** preferences page, the **Privacy Options** dialog box contains two extra settings:

Allow installing add-ons

If this option is not selected, the end user is not allowed to install add-ons in the application.

Allow installing "AI Positron Assistant" add-ons

If this option is not selected, the end user is not allowed to install any of the **AI Positron Assistant** add-ons in the application.

Figure 9. Installation - Privacy Policy Link

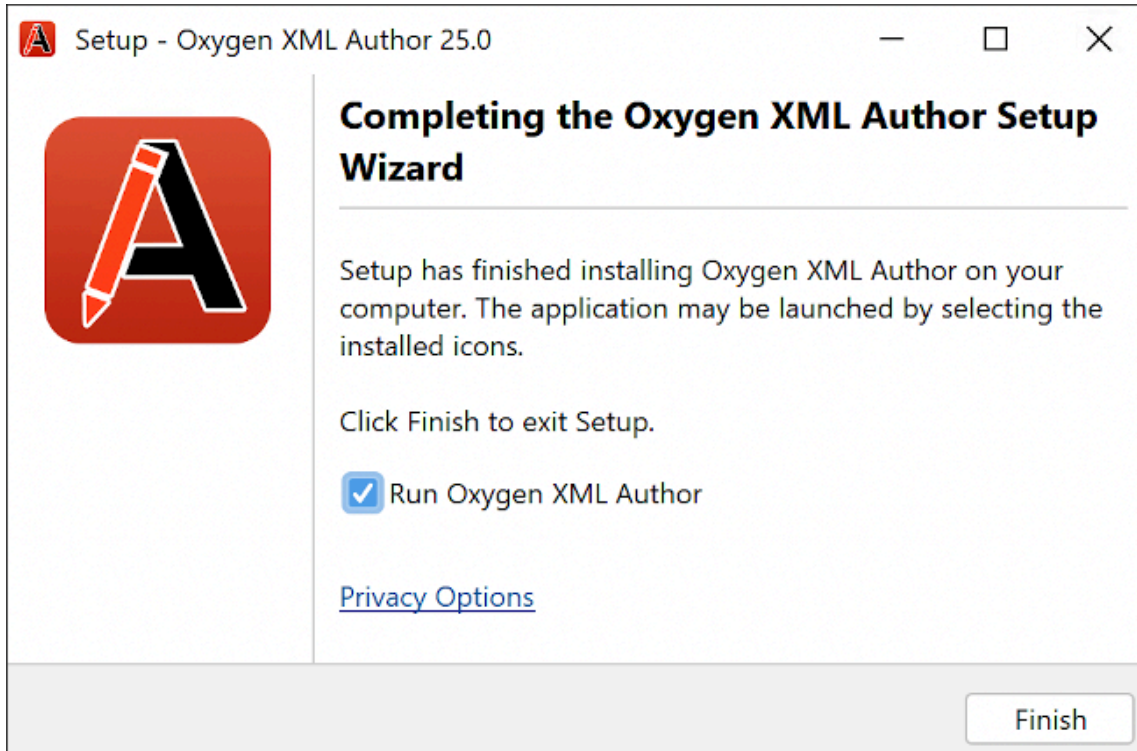

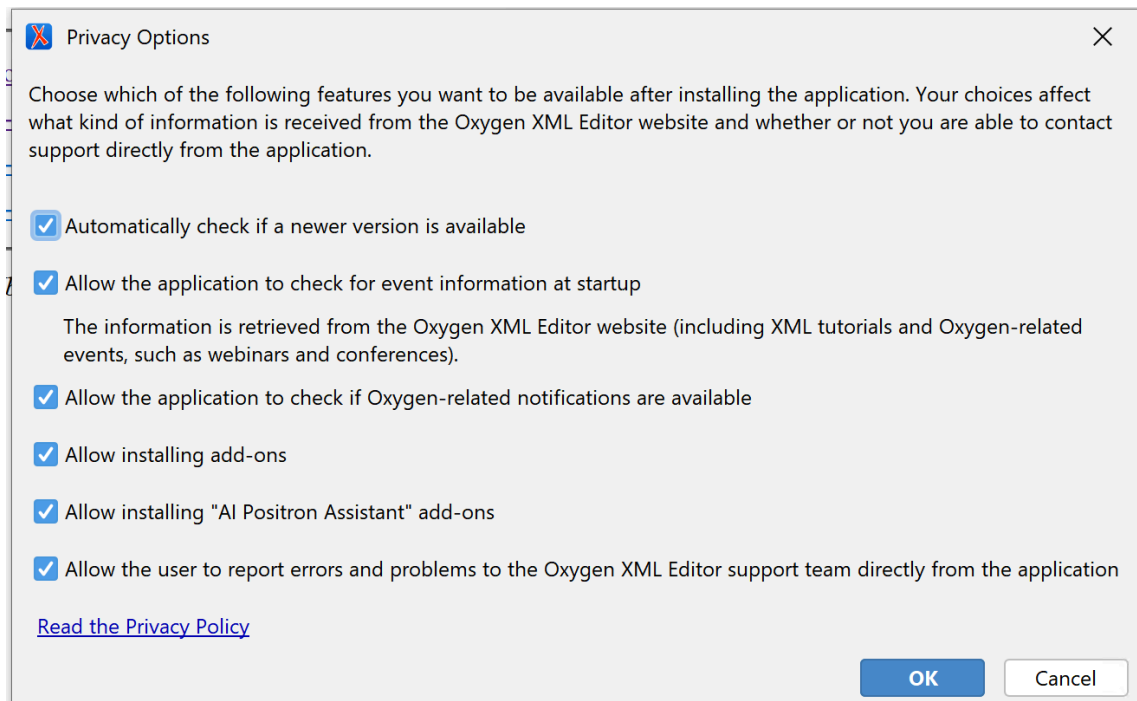

Figure 10. Installation -Privacy Options

Uninstalling

How to Uninstall Oxygen XML Developer

CAUTION:

The following procedure will remove Oxygen XML Developer from your system. **All data stored in the installation directory will be removed, including any customizations or any other data you have stored within that directory. Make a backup of any data you want to keep before proceeding.**

1. Back up any data you want to keep from the Oxygen XML Developer installation folder.
2. Remove the application according to your operating system:
 - **Windows or Linux** - Use the appropriate uninstaller shortcut provided with your OS.
 - **macOS** - Manually delete the installation folder and all its contents.
3. If you want to remove the user preferences:
 - **Windows** - Remove the directory: `%APPDATA%\com.oxygenxml.developer%APPDATA%\com.oxygenxml.jsoneditor`. Note that the `AppData` directory is hidden. If you cannot locate it, type `%APPDATA%` and press `ENTER` in the File Explorer address bar. (`%APPDATA%` expands to `[user-home-dir]\AppData\Roaming`).
 - **macOS** - Remove the directory: `Library/Preferences/com.oxygenxml.developerLibrary/Preferences/com.oxygenxml.jsoneditor` of the user home folder.
 - **On Linux**, remove the directory: `.com.oxygenxml.developer.com.oxygenxml.jsoneditor` from the user home directory.

Unattended Uninstall

The unattended uninstall procedure is available only on Windows and Linux.

Run the uninstaller executable from a command line with the `-q` parameter.

- **Windows** - The uninstaller executable is called `uninstall.exe` and is located in the *Oxygen* installation directory.
- **Linux** - The uninstaller executable is called `uninstall` and is located in the *Oxygen* installation directory.

4.

Configuring Oxygen XML Developer

This chapter presents all the user preferences and options that allow you to configure various features and aspects of the application itself. It also includes information about storing and sharing options, importing and exporting options or scenarios, customizing system properties, setting startup parameters, and the [editor variables \(on page 289\)](#) that are available for customizing user-defined commands.

Preferences

You can configure Oxygen XML Developer options using the **Preferences** dialog box.

To open the preferences dialog box, go to **Options > Preferences**.

You can select the preference page you are interested in from the tree on the left of the **Preferences** dialog box. You can filter the tree by using the filter text box and the following buttons are available to the right of the text box:

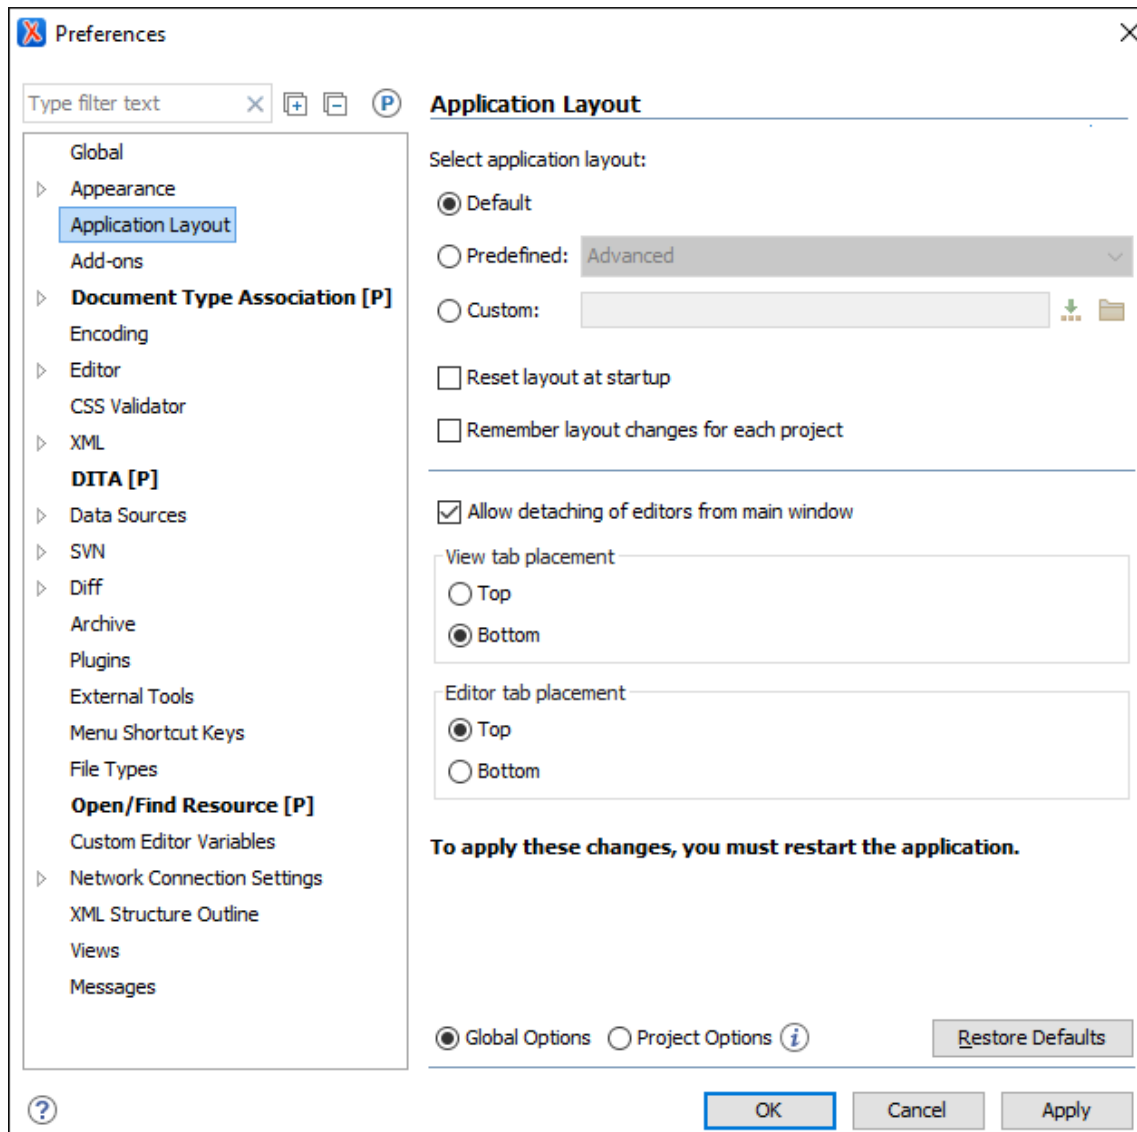

-  **Expand All** - Expands the structure of the tree to show all preference pages.
-  **Collapse All** - Collapses the structure of the tree to show only the 1st level preference pages.
-  **Project-Level Options Only** - If toggled on, it filters the tree to only show the preference pages that are [saved at project level \(on page 278\)](#).

Figure 11. Preferences Dialog Box

Click the  icon or press **F1** for help on any preferences page.

Some preference pages include an option to control how the options are stored, either as **Global Options** (on page 278) or **Project Options** (on page 278).

Figure 12. Controlling the Storage of the Preferences

You can restore options to their default values by pressing the **Restore Defaults** button, available in each preferences page.

Preferences Directory Location

A variety of resources (such as global options, license information, and history files) are stored in a preferences directory (`com.oxygenxml`) that is in the following locations:

- **Windows (7, 8, 10)** - `[user_home_directory]\AppData\Roaming\com.oxygenxml.developer`
- **macOS** - `[user_home_directory]/Library/Preferences/com.oxygenxml.developer`
- **Linux/Unix** - `[user_home_directory]/.com.oxygenxml.developer`

Global Preferences

The global options cover various aspects of the overall operation of Oxygen XML Developer. To configure the **Global** options, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Global**.

The following options are available in the **Global** preferences page:

Automatic Version Checking

If this option is selected, Oxygen XML Developer will check for a new version on startup.

Check for Oxygen-related events at startup

If this option is selected, Oxygen XML Developer will check for various new event updates on the Oxygen XML Developer website and if any new events are found, they will be presented at startup.

Check for notifications

If selected (default value), the application will check for various types of messages from the Oxygen XML Developer website and they will be displayed in the status bar. The types of messages include the addition of new videos on the website, the announcement of upcoming webinars and conferences where the Oxygen XML Developer team will participate, and more.

Language

This option specifies the language used in the user interface. You can choose between English, French, German, Dutch, Japanese, or Chinese. You must restart Oxygen XML Developer for the change to take effect.

Other language

This option sets the language used in the user interface using an interface localization file. For details about creating this file, see [Localizing the User Interface \(on page 302\)](#). You can use this option to set the language of the user interface to a language that is not shipped with Oxygen XML Developer.

Note:

If some interface labels are not rendered correctly after restarting the application, (for example, Korean characters are not displayed correctly), make sure that your operating system has the appropriate language pack installed (for example, the East-Asian language pack).

Line separator

This option specifies the type of line separator to be used when saving files. Use **System Default** to select the normal line separator for your OS. The other two possible selections are **Unix-like** and **Windows-like**.

Notes:

- This option is ignored if the **Detect the line separator on file open** option ([on page 117](#)) is selected AND a line separator is automatically detected.
- When changing the selection in this option, the change does not affect an opened file until you make a modification to the file and save it. At that point, all line separators in the file will change to the type of line separator you chose in this option.

Detect the line separator on file open

When this option is selected, the editor detects the line separator when a file is loaded and it uses it when the file is saved. If this option is not selected, you can use the **Line separator** option ([on page 116](#)) to choose the type of line separator to be used when saving files.

Tip:

To see the line separator type for the current file, you can use the **Properties** view (**Window > Show View > Properties**).

Default Internet browser

This option sets the Web browser that Oxygen XML Developer will use to do the following:

- Open (X)HTML or PDF transformation results.
- Open a web page.

If you leave this setting blank, the system default browser will be used.

Open last edited files from project

When this option is selected, Oxygen XML Developer opens the files you had open the last time you used a project whenever you open the application or switch to that project.

Load file content only when switching to its corresponding editor tab

When selected (default), files that were left open in the previous editing session remain as placeholder tabs but the file content is loaded only when switching to the corresponding editor tab. This helps to improve performance. If the option is deselected, the previously open files are all re-loaded at startup.

Check opened files for file system changes

When this option is selected, Oxygen XML Developer checks the content of the all open editors to see if they have been updated by another application. If the file has changed, Oxygen XML Developer will ask you if you want to reload the file.

Auto update unmodified editors on file system changes

If this option is selected, Oxygen XML Developer automatically updates unmodified editors if the edited file changes externally.

Beep on operation finished

When this option is selected, Oxygen XML Developer beeps when a validation or transform action ends. Different tones are used for success and failure. The tones used may depend on the sound settings in your operating system.

Show memory status

When this option is selected, the memory that Oxygen XML Developer uses is displayed in the status bar. To free memory, click the  **Free unused memory** button located at the right side of the status bar. The memory status bar turns yellow or red when Oxygen XML Developer uses too much memory. You can change the amount of memory available to Oxygen XML Developer by [changing the parameters of the application launcher \(on page 304\)](#).

Order of switching between editor tabs

This option specifies the order for [switching between open file tabs when using **Ctrl + Tab** \(**Command + Tab on macOS**\) or **Ctrl + Shift + Tab** \(**Command + Shift + Tab on macOS**\) \(on page 356\)](#). You can choose between:

- **Recently used order** - Switches to the most recently used tab.
- **Visual order** - Switches to the next tab in visual order.

File Chooser Dialog section

Use platform file chooser (Windows and macOS)

This option is selected by default and it specifies that the native file chooser is used. You can deselect this option if you want the Java Swing file chooser to be used instead. If Oxygen XML Developer encounters a problem while using the native file manager, it will avoid using it again in the current session, even if this option is selected.

Consider application bundles to be directories when browsing (macOS only)

This option is available only on the macOS platform. When selected, the file browser dialog box allows you to browse inside an application bundle, as in a regular folder. Otherwise, it is not allowed (the same as the Finder application on macOS).

Show hidden files and directories

If this option is selected, Oxygen XML Developer shows system hidden files and folders in the file browser dialog box and the folder browser dialog box.

**Tip:**

On macOS, you need to press **Command + Shift + Period** in the file browser to show hidden files.

File chooser opens

This option specifies the starting directory that the [file browser dialog box \(on page 344\)](#) will open. You can choose between:

- **Directory of the selected file** - The file browser opens the folder where the selected file is stored, depending on the current selection (for example, a file could be selected from the **Project** view, , main editing pane, or another location within the application).
- **Last visited directory** - The file browser opens the last visited folder.

Appearance Preferences

This preferences page contains various options that allow you to change the appearance of the user interface of Oxygen XML Developer. To configure the **Appearance** options, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **Appearance**.

The following options are available in the **Appearance** preferences page:

Look and Feel

This option allows you to change the graphic style (look and feel) of the user interface.

Depending on the operating system, you can choose between various predefined style options.

Theme

This option allows you to choose predefined color themes that will be applied over the entire user interface. You can select between the following:

- **Light** (default theme in Windows)
- **Classic** (default theme in macOS)

**Note:**

In Windows, if a high contrast theme is detected and the **Theme** option is set to *Classic* and the **Look and Feel** option [\(on page 119\)](#) is set to *Default* or *Windows*, Oxygen XML Developer inherits the high contrast theme colors that are set in the operating system.

- **Graphite**

You can also change various appearance-related options in other preference pages for the selected theme by clicking on the various links in this section.

Custom Themes

You can also create custom themes to share with others or use in other installations of Oxygen XML Developer. To create a custom theme, follow these steps:

1. Select a **Theme** to use as a base.
2. Configure the desired options in any of the option pages listed in this preferences page.
3. Click **Export** and specify a name for your custom theme. If you save the theme to the default file path, your custom theme will immediately appear in the **Theme** drop-down list. Otherwise, if you save it to another location, you can use the **Import** button ([on page 120](#)) to make it appear in the drop-down list.

Note:

In macOS (starting with Yosemite), if you choose *Graphite* for the **Theme**, it is recommended that you select the **Use dark menu and Dock** option that is found in **System Preferences > General**.

Theme preview area

Displays a preview of the current **Theme** selection ([on page 119](#)) (available for predefined color themes).

Theme management section

Reset

Resets the theme to its default values (this option is available when the theme is modified).

Rename

Changes the name of the theme (not available for default or predefined themes).

Delete

Removes the selected theme (not available for default or predefined themes).

Import

Allows you to import a color theme from an XML theme file. You can use this option to load an exported [custom theme](#) ([on page 120](#)).

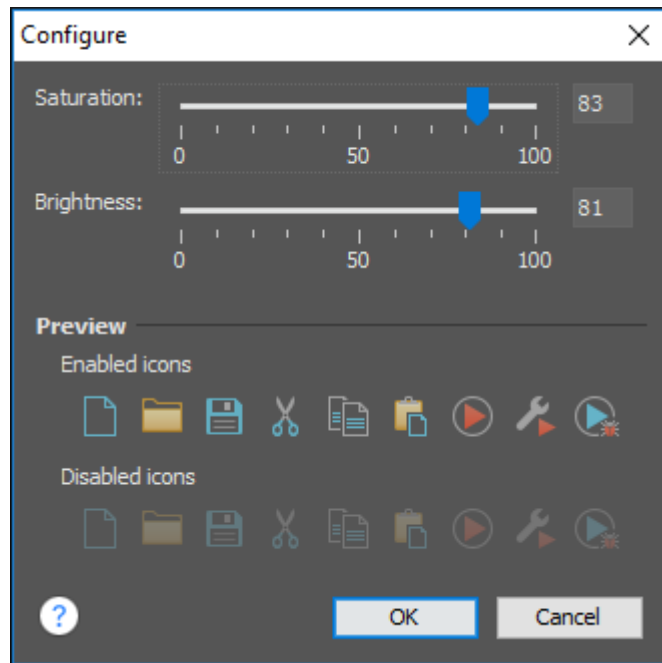

Export

Allows you to export the current color theme into an XML theme file that can then be shared with others or imported into another installation of Oxygen XML Developer.

Configure icon saturation and brightness link

This link is available if you are using the **Graphite theme** ([on page 119](#)). It opens a dialog box where you can configure the saturation and brightness for all the icons in Oxygen XML Developer.

Figure 13. Configure Icon Saturation and Brightness Dialog Box

Colors Preferences

Oxygen XML Developer allows you to configure the colors for frames, dialog boxes, controls, and commands. To configure the **Colors**, open the **Preferences** dialog box (**Options > Preferences**) ([on page 114](#)) and go to **Appearance > Colors**.

Clicking the color button for any of the options opens a **Choose color** dialog box. It includes several tabs that allow you to configure the color in numerous ways. This page allows you to select and configure the color for the following:

Background Colors

Background

Background color for various general user interface items.

Components background

Background color for various components (such as text fields, views, tables, and dialog boxes).

Components selection background

Background color for the current selections in certain components, such as some views and panes.

Components inactive selection background

Background color for a selection in a view that is not the current focus.

Menus, toolbars and frame background

Background color for specific components such as menus, toolbars, and the application frame.

Menus and toolbars selection background

(This option is not available for macOS) Background color for menu selections and toolbar buttons.

View titles background

Background color for the titles of view and tabs.

Status bar background

Background color of the status bar at the bottom of the editor.

Foreground Colors

Foreground

Foreground color for various general user interface items.

Component selection foreground

Foreground color for the current selection.

Disabled foreground

Foreground color for various components that are not the current focus (such as views other than the currently selected one).

Link foreground

Foreground color for links in views and dialog boxes.

View titles foreground

Foreground color for the title bar of views.

Status bar foreground

Foreground color for the text in the status bar at the bottom of the editor.

Other Colors

Borders and table grids

Color for certain borders and table grid lines.

Text component border

Color for the borders of text fields and drop-down lists.

View/Editor tabs border

Color for the borders of views and tabs.

Scroll bars, chevrons

Color for scroll bars (navigation bars) and chevrons (button to expand a non-visible area).

Separator

Color for the separators in toolbars, menus, and dialog boxes.

**Note:**

You must restart the application for your changes to be applied.

Fonts Preferences

Oxygen XML Developer allows you to choose the fonts to be used in the **Text**, **Design**, and **Grid** editor modes. To configure the font options, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Appearance > Fonts**.

The following options are available:

Editor

Specifies the font family, size, and weight to be used in the **Text** mode editor. To change the current values, double-click the text field or click the **Choose** button. This opens a dialog box where you can choose the font family, font size, and whether or not to bold the text. You can enter or paste content in the **Sample** box to see a preview of how it will look in the application. If you select the **Show only the fonts that can render the sample text** option and paste content in the **Sample** box, the application detects fonts that can render the particular character set and filters the fonts that can be selected accordingly.

**Note:**

On macOS, the default font, Monaco, cannot be rendered in bold.

**Tip:**

If you have recently installed fonts in Windows and they do not appear in the list of available fonts, you need to make sure you install the fonts via the **Install for all users** option instead of **Install for me**. For more details, see [Fonts Installed in Windows Do Not Appear in Fonts Preferences Page](#) (on page 2220).

Schema default font

This option allows you to choose the font to be used in:

- The **Design** mode.
- Images with schema diagram fragments that are included in the HTML documentation generated from an XML Schema.

To change the current values, double-click the text field or click the **Choose** button. This opens a dialog box where you can choose the font family, font size, and whether or not to bold the text. You can enter or paste content in the **Sample** box to see a preview of how it will look in the application. If you select the **Show only the fonts that can render the sample text** option and paste content in the **Sample** box, the application detects fonts that can render the particular character set and filters the fonts that can be selected accordingly.

Text antialiasing

This option allows you to set the text anti-aliasing behavior:

- **Default** - Allows the application to use the setting of the operating system, if available.
- **On** - Sets the text anti-aliasing to pixel level.
- **Off** - Disables text anti-aliasing.
- Sub-pixel anti-aliasing modes, such as GASP, LCD_HRGB, LCD_HBGR, LCD_VRGB, and LCD_VBGR.

Text components

Specifies the font family, size, and weight to be used in text boxes within the interface. This same font influences the appearance of the content in the **Project** and **DITA Maps Manager** views. To change the current values, double-click the text field or click the **Choose** button. This opens a dialog box where you can choose the font family, font size, and whether or not to bold the text. You can enter or paste content in the **Sample** box to see a preview of how it will look in the application. If you select the **Show only the fonts that can render the sample text** option and paste content in the **Sample** box, the application detects fonts that can render the particular character set and filters the fonts that can be selected accordingly.

GUI

Specifies the font family, size, and weight to be used for user interface labels. To change the current values, double-click the text field or click the **Choose** button. This opens a dialog box where you can choose the font family, font size, and whether or not to bold the text. You can enter or paste content in the **Sample** box to see a preview of how it will look in the application. If you select the **Show only the fonts that can render the sample text** option and paste content in the **Sample** box, the application detects fonts that can render the particular character set and filters the fonts that can be selected accordingly.

View titles font

Specifies the font family, size, and weight to be used in the titles of the various views within the interface. To change the current values, double-click the text field or click the **Choose** button. This opens a dialog box where you can choose the font family, font size, and whether or not to bold the text. You can enter or paste content in the **Sample** box to see a preview of how it will

look in the application. If you select the **Show only the fonts that can render the sample text** option and paste content in the **Sample** box, the application detects fonts that can render the particular character set and filters the fonts that can be selected accordingly.

**Note:**

You must restart the application for your changes to be applied.

Related information

[Changing the Font Size in the Editor \(on page 476\)](#)

Application Layout Preferences

Oxygen XML Developer offers various *perspectives* (on page 2271) and views that you can arrange in a variety of layouts to suit your needs.

To configure the application layout options, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Application Layout**. The following options are available:

Select application layout

You can choose between the following three layouts:

Default

Uses the default layout for all *perspectives* (on page 2271). Any modification of this layout (such as closing views, displaying views, or a new view arrangement) is saved on exit and reloaded at start-up.

Predefined

Allows you to choose one of the predefined layouts.

- **Advanced** - All views are displayed.
- **Basic** - Only the **Project view** (on page 365) and **Outline view** (on page 494) are visible. Recommended when you edit XML content and you need maximum screen space.
- **Schema development** - The **Project** (on page 365), **Component Dependencies** (on page 770), **Referenced/Dependent Resources** (on page 767), **Outline** (on page 763), **Palette** (on page 719), and **Attributes** (on page 765) views are displayed.
- **XQuery development** - The **Project** (on page 365), **Outline** (on page 806), **XSLT/XQuery Input** (on page 673), **XPath/XQuery Builder** (on page 807), and **Transformation Scenarios** (on page 1246) views are displayed.
- **XSLT development** - The **Project** (on page 365), **Component Dependencies** (on page 678), **Referenced/Dependent Resources** (on page

675), **Outline** (on page 668), **Attributes** (on page 497), **Model** (on page 499), **XSLT/XQuery Input** (on page 673), **XPath/XQuery Builder** (on page 807), and **Transformation Scenarios** (on page 1246) views are displayed.

Custom

Allows you to specify a custom layout to be used. You can save your preferred layout using **Window > Export Layout**, then enter the location of the saved layout file in this setting.

Reset layout at startup

When this option is selected, Oxygen XML Developer forgets any changes made to the layout during a session and reloads the default layout the next time it is started. This is useful when you want to keep a fixed layout from one session to another.

Remember layout changes for each project

When this option is selected, Oxygen XML Developer saves layouts individually for each project. When you switch projects, the layout you last used for that project is loaded automatically.

Allow detaching of editors from main window

When this option is selected, you can drag and drop an editor window outside of the main screen. This is useful especially when you are using two monitors and you want to view files side by side.

Note:

If the main screen is maximized, you cannot drag and drop an editor outside of it.

View tab placement

Specifies whether the *View* tabs are located at the top or bottom of the window.

Editor tab placement

Specifies whether the *Editor* tabs are located at the top or bottom of the window.

The changes you make to any layout are preserved between working sessions. The predefined *layout* files are saved in the `preferences` directory of Oxygen XML Developer.

Resources

For more information about configuring the user interface of Oxygen XML Developer, watch our video demonstration:

<https://www.youtube.com/embed/anwjepfAdEk>

Add-ons Preferences

You can use [add-ons \(on page 2271\)](#) to enhance the functionality of Oxygen XML Developer. To configure the **Add-ons** options, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Add-ons**.

The following options are available in this preferences page:

Enable automatic updates checking

When this option is selected, Oxygen XML Developer will automatically search for available updates.

Add-on Sites URLs

This is a list of the URLs for the add-on sites. You can add, edit, and delete sites in this list by using the buttons below the list.

Attention:

To ensure safety, when using an add-on site, make sure it is reputable and trustworthy. Do not install add-ons that are unsigned or from sources that you do not fully trust.

Automatically install add-ons

You can use this section to specify required add-ons for a project. Then, when a user opens the project, the specified add-ons will be automatically installed after prompting the user. You can use **Ctrl+Space** to open a pop-up window with the list of detected add-ons that you can select to be marked for automatic installation. You can also manually enter the add-on ID and multiple IDs can be entered by separating with either a space or new line.

Project Level Settings Preferences

The **Project Level Settings** preference page allows you to decide whether various settings should be saved in the project configuration file or in the global settings. Settings that are saved at project level can easily be shared with others. To configure these options, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Project Level Settings**.

The following options can be toggled on or off to determine which settings will be saved at project level:

Allow validation scenario associations to be saved at project level

When this option is selected, the associations for [custom validation scenarios \(on page 555\)](#) will be stored according to their storage location.

- If you associate a scenario that is stored at the project or framework level, the association will be saved at project level (in the project configuration file).
- If you associate a scenario at global level, it will be saved globally.

If this option is not selected, the association is not allowed to be saved at project level and will be saved globally (even if the scenario is saved in the project file).

Allow transformation scenario associations to be saved at project level

When this option is selected, the associations for [custom transformation scenarios \(on page 1129\)](#) will be stored according to their storage location.

- If you associate a scenario that is stored at the project or framework level, the association will be saved at project level (in the project configuration file).
- If you associate a scenario at global level, it will be saved globally.

If this option is not selected, the association is not allowed to be saved at project level and will be saved globally (even if the scenario is saved in the project file).

Document Type Association Preferences

Oxygen XML Developer uses [document type associations \(on page 2268\)](#) to associate a [document type \(on page 1070\)](#) with a set of functionality provided by a [framework \(on page 2269\)](#). To configure the **Document Type Association** options, open the **Preferences** dialog box (**Options > Preferences**) ([on page 114](#)) and go to **Document Type Association**.

The following actions are available in this preferences page:

Discover more frameworks by using add-ons update sites

Click on this link to specify URLs for *framework* add-on update sites.

Document Type Table

This table presents the currently defined [frameworks \(on page 2269\)](#) ([document type associations \(on page 2268\)](#)), sorted by priority and alphabetically. Each edited document type has a [set of association rules \(on page 132\)](#) (used by the application to detect the proper document type association to use for an open XML document).

Disable all

Disables all document types listed in the table.

New

Opens a **Document type** configuration dialog box ([on page 130](#)) that allows you to add a new *framework*.

Edit

Opens a **Document type** configuration dialog box ([on page 130](#)) that allows you to edit an existing *framework*.

Note:

If you try to edit an existing *framework* when you do not have write permissions to its storage location, a dialog box will be shown asking if you want to extend it.

Duplicate

Opens a **Document type configuration dialog box** (on page 130) that allows you to duplicate the configuration of an existing *framework*. This will create a snapshot of the *framework* in its current form. It is merely a copy of the document type and will not *evolve* along with the base document type as the **Extend** action does.

Extend

Opens a **Document type configuration dialog box** (on page 130) that allows you to extend an existing *framework*. You can add or remove functionality starting from a base document type. All of these changes will be saved as a patch. When the base document type is modified and evolves (for example, from one application version to another) the extension will evolve along with the base document type, allowing it to use the new actions added in the base document type.

Delete

Deletes the selected *framework* (document type).

Enable DTD/XML Schema processing in document type detection

When this option is selected (default value), the matching process also examines the DTD/XML Schema associated with the document. For example, the fixed attributes declared in the DTD for the root element are also analyzed, if this is specified in the association rules. This is especially useful if you are writing DITA customizations. DITA topics and maps are also matched by looking for the `@DITAArchVersion` attribute of the root element. This attribute is specified as `default` in the DTD and it is detected in the root element, helping Oxygen XML Developer to correctly match the DITA customization.

Only for local DTDs/XML Schemas

When this option is selected (default value), only the local DTDs / XML Schemas will be processed.

Enable DTD/XML Schema caching

When this option is selected (default value), the associated DTDs or XML Schema are cached when parsed for the first time, improving performance when opening new documents with similar schema associations.

Locations Preferences

Oxygen XML Developer allows you to change the location where *frameworks* (on page 2269) (document types) are stored, and to specify additional *framework* directories. The **Locations** preferences page allows you to specify the main *frameworks* folder location. You can choose between the **Default** directory (`[OXYGEN_INSTALL_DIR]/frameworks`) or a **Custom** specified directory. You can also change the current *frameworks* folder location value using the `com.oxygenxml.editor.frameworks.url` system property set in either the *.vmoptions* configuration files (on page 304) or in the *startup scripts* (on page 307).

A list of additional **frameworks** directories can also be specified. The application will look in each of those folders for additional document type configurations to load. Use the **Add**, **Edit** and **Delete** buttons to manage the list of folders.

A document type configuration (*framework*) can be loaded from the following locations:

- **Internal preferences** - The document type configuration is stored in the application **Internal preferences** (*on page 131*).
- **Additional *framework* directories** - The document type configuration is loaded from one of the specified **Additional frameworks directories** list.
- **Add-ons** - An *add-on* (*on page 2271*) can contribute a *framework*. You can manage the add-ons locations in the **Add-ons preferences page** (*on page 127*).
- **The *frameworks* folder** - The main folder containing *framework* configurations.

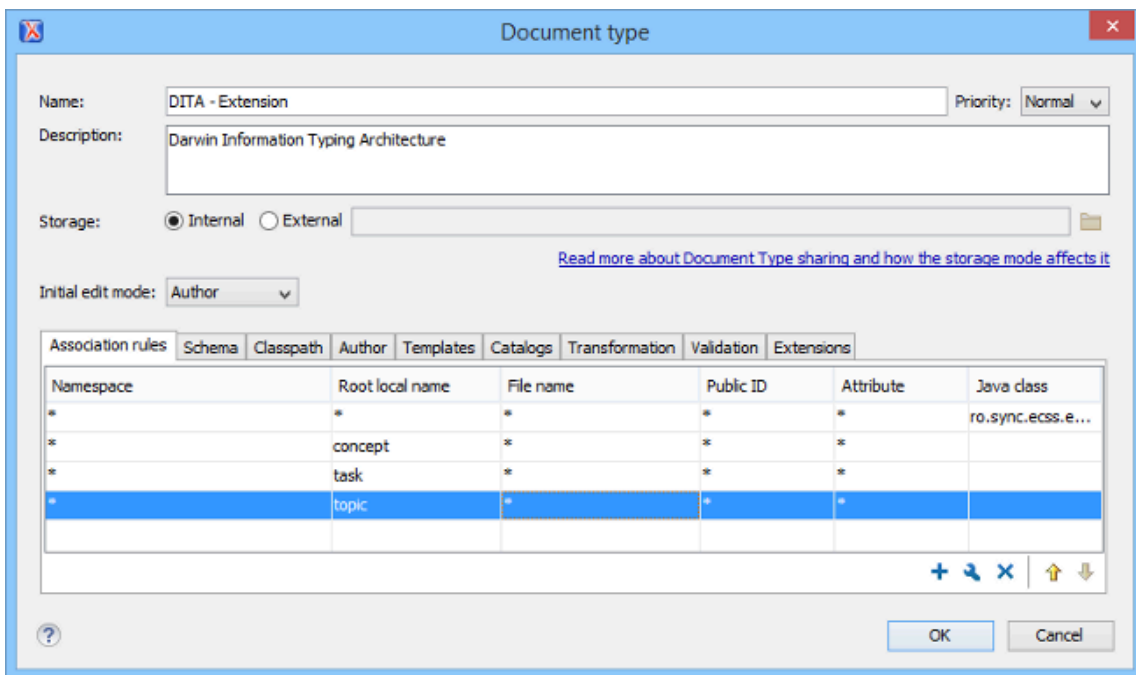

All loaded document type configurations are first sorted by priority, then by document type name and then by load location (in the exact order specified above). When an XML document is opened, the application chooses the first document type configuration from the sorted list that matches the specific document.

All loaded document type configurations are first sorted by priority, then by document type.

Document Type Configuration Dialog Box

The **Document Type Configuration** dialog box allows you to create or edit a *framework* (*on page 2269*) (document type). It is displayed when you use the **New**, **Edit**, **Duplicate**, or **Extend** buttons in the **Document Type Association preferences page** (*on page 128*) (open the **Preferences** dialog box (**Options > Preferences**) (*on page 114*) and go to **Document Type Association**).

Figure 14. Document Type Configuration Dialog Box

The configuration dialog box includes the following fields and sections:

Name

The name of the *framework*. This will be displayed as its name in the **Document Type** column in the **Document Type Association** preferences page (*on page 128*).

Priority

Depending on the priority level, Oxygen XML Developer establishes the order that the existing *frameworks* are evaluated to determine the type of a document you are opening. It can be one of the following: Lowest, Low, Normal, High, or Highest. You can set a higher priority for *frameworks* you want to be evaluated first.

Note:

The built-in document types are set to Low priority by default. *Frameworks* that have the same priority are sorted alphabetically.

Description

The document type description displayed as a tooltip in the **Document Type Association** preferences page (*on page 128*).

Storage

The location where the framework is saved. If you select the **External** storage option, the framework is saved in a specified file with a mandatory extension (located in a subdirectory of your current framework directory. If you select the **Internal** storage option, the framework configuration data is saved in the Oxygen XML Developer internal options file.

Initial edit mode

Sets the default edit mode when you open a document for the first time: **Editor specific**, **Text**, **Grid** and **Design** (available for the W3C XML Schema editor). If the **Editor specific** option is selected, the initial editing mode is determined based upon the document type. You can find the mapping between editors and edit modes in the **Edit modes** preferences page. (*on page 161*) You can impose an initial mode for opening files that match the association rules of the document type. For example, if the files are usually edited in the **Author** mode, you can set it in the **Initial edit mode** combo box.

Note:

You can also customize the initial mode for a document type in the **Edit modes** preferences page. Open the **Preferences** dialog box (**Options > Preferences**) (*on page 114*) and go to **Editor > Edit modes**.

Configuration Tabs

The bottom section of the dialog box includes various tabs where you can configure numerous options for the *framework*.

Association Rules Tab

To open the **Association Rules** tab of the **Document type** configuration dialog box, open the **Preferences** dialog box (**Options > Preferences**) (on page 114), go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button (on page 128), and click on the **Association Rules** tab.

In the **Association rules** tab, you can perform the following actions:

 **New**

Opens the **Document type rule** dialog box allowing you to create *association rules*.

 **Edit**

Opens the **Document type rule** dialog box allowing you to edit the properties of the currently selected *association rule*.

 **Delete**

Deletes the currently selected *association rules* from the list.

 **Move Up**

Moves the selected *association rule* up one spot in the list.

 **Move Down**

Moves the selected *association rule* down one spot in the list.

By combining multiple association rules you can instruct Oxygen XML Developer to identify the type of a document. Oxygen XML Developer identifies the type of a document when the document matches at least one of the *association rules*. This tab gives you access to a **Document type rule** dialog box that you can use to create *association rules* that activate on any document matching all the criteria defined in the dialog box.

To create a new association rule, click the  **New** button at the bottom of the **Association Rules** tab, or to edit an existing rule, click the  **Edit** button.

Figure 15. Document Type Rule Dialog Box

The **Document type rule** dialog box includes the following fields and options:

Namespace

Specifies the namespace of the root element from the association rules set (* (*any*) by default). If you want to apply the rule only when the root element has no namespace, leave this field empty (remove the **ANY_VALUE** string).

Root local name

Specifies the local name of the root element (* (*any*) by default).

File name

Specifies the name of the file (* (*any*) by default).

Public ID

Represents the Public ID of the matched document.

Attribute Local name

Specifies the local name of the attributes for the root element (* (*any*) by default).

Attribute Namespace

Specifies the namespace of the attributes for the root element (* (*any*) by default).

Attribute Value

Specifies the value of the attributes for the root element (* (*any*) by default).

Java class

Presents the name of the Java class that is used to determine if a document matches the rule. This Java class should implement the `ro.sync.ecss.extensions.api.DocumentTypeCustomRuleMatcher` interface.

**Tip:**

You can use wildcards (? and *) or [editor variables \(on page 289\)](#) in the **Document Type Rule** dialog box, and you can enter multiple values by separating them with a comma.

Schema Tab

In the **Schema** tab, you can specify a default schema for Oxygen XML Developer to use if a document does not contain a schema declaration and no default validation scenario is associated with it.

To open the **Schema** tab of the **Document type** configuration dialog box, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#), go to **Document Type Association**, use the **New, Edit, Duplicate, or Extend** button [\(on page 128\)](#), and click on the **Schema** tab.

This tab includes the following options for defining a schema to be used if no schema is detected in the XML file:

Schema type

Use this drop-down list to select the type of schema.

Schema URI

You can specify the URI of the schema file. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** [\(on page 289\)](#) button, or the browsing actions in the  **Browse** drop-down list.

**Tip:**

It is a good practice to store all resources in the *framework* directory and use the `#{framework}` [editor variable \(on page 295\)](#) to reference them. This is a recommended approach to designing a self-contained document type that can be easily maintained and shared between multiple users.

Classpath Tab

The **Classpath** tab displays a list of folders and *JAR* [\(on page 2270\)](#) libraries that hold implementations for API extensions, implementations for custom **Author** mode operations, various resources (such as stylesheets), and *framework* [\(on page 2269\)](#) translation files. Oxygen XML Developer loads the resources looking in the folders in the order they appear in the list (from top to bottom).

To open the **Classpath** tab of the **Document type** configuration dialog box, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#), go to **Document Type Association**, use the **New, Edit, Duplicate, or Extend** button [\(on page 128\)](#), and click on the **Classpath** tab.

The **Classpath** tab includes the following actions:

 **New**

Opens a dialog box that allows you to add a resource to the table in the **Classpath** tab. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** (on page 289) button, or the browsing actions in the  **Browse** drop-down list.

**Tip:**

The path can also contain wildcards (for example, `${framework}/lib/*.jar`).

 **Edit**

Opens a dialog box that allows you to edit a resource in the **Classpath** tab. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** (on page 289) button, or the browsing actions in the  **Browse** drop-down list.

**Tip:**

The path can also contain wildcards (for example, `${framework}/lib/*.jar`).

 **Delete**

Deletes the currently selected resource from the list.

 **Move Up**

Moves the selected resource up one spot in the list.

 **Move Down**

Moves the selected resource down one spot in the list.

Use parent classloader from plugin with ID (on page 1896)

Use this option to specify the ID of a *plugin* (on page 2271). The current *framework* has access to the classes loaded for the *plugin*.

Related information

[Extensions Tab \(on page 157\)](#)

[Author Tab \(on page 135\)](#)

Author Tab

The **Author** tab is a container that holds information regarding the CSS file used to render a document in the **Author** mode, and regarding *framework* (on page 2269)-specific actions, menus, contextual menus, toolbars, and content completion list of proposals.

To open the **Author** tab of the **Document type** configuration dialog box, open the **Preferences** dialog box (**Options > Preferences**) (on page 114), go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button (on page 128), and click on the **Author** tab.

The options that you configure in the **Author** tab are grouped in subtabs.

CSS Subtab

The **CSS** subtab contains the CSS files that Oxygen XML Developer uses to render a document in the **Author** mode. In this subtab, you can set *main* and *alternate* CSS files. When you are editing a document in the **Author** mode, you can switch between these CSS files from the **Styles** drop-down menu on the **Author Styles** toolbar.

To open the **CSS** subtab, open the **Preferences** dialog box (**Options > Preferences**) (on page 114), go to **Document Type Association**, use the **New, Edit, Duplicate, or Extend** button (on page 128), click on the **Author** tab, and then the **CSS** subtab.

The following actions are available in the **CSS** subtab:

New

Opens a dialog box that allows you to add a CSS file. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** (on page 289) button, or the browsing actions in the  **Browse** drop-down list.

Edit

Opens a dialog box that allows you to edit the current selection.

Delete

Deletes the currently selected CSS file.

Move Up

Moves the selected CSS file up in the list.

Move Down

Moves the selected CSS file down in the list.

Enable multiple selection of alternate CSSs

Allows users to apply multiple alternate styles, as layers, over the main CSS style. This option is selected by default for DITA document types.

If there are CSSs specified in the document then

You can choose between the following options for controlling how the CSS files that are set in this subtab will be handled if a CSS is specified in the document itself:

- **Ignore CSSs from the associated document type** - The CSS files set in this CSS subtab are overwritten by the CSS files specified in the document itself.
- **Merge them with CSSs from the associated document type** - The CSS files set in this CSS subtab are merged with the CSS files specified in the document itself.

Actions Subtab

The **Actions** subtab of the **Document Type Configuration** dialog box contains a sortable table with all the **Author** mode actions that are configured for the specific *framework* (on page 2269). Each action has a unique ID, a name, a description, and a shortcut key.

To open the **Actions** subtab, open the **Preferences** dialog box (**Options > Preferences**) (on page 114), go to **Document Type Association**, select your framework, use the **Duplicate** or **Extend** button to create an extension of the framework (or the **Edit** button for an already extended framework), click on the **Author** tab, and then the **Actions** subtab.

The following features are available in this subtab:

Export existing actions

It is possible to export existing actions to use them in other frameworks. Each exported action is extracted from the framework configuration file and exported as an individual XML file.

To export actions, the **Storage option** (on page 131) in the top part of the **Document Type Configuration** dialog box must be set to **External** and the external location must be a subdirectory of your current framework directory.

The  **Export** action is found by right-clicking an action or a selection of multiple actions (the  **Export** button is also located below the table of actions). If you choose to export a single action, a resulting dialog box will allow you to select the destination path for the new XML file that contains the configuration details of the action. If you export multiple actions, they will automatically be saved as individual XML files inside a newly created folder (it will have **_externalAuthorActions** at the end of the folder name) inside your current framework directory.

Result: Exported actions will display the  icon in the first column in the table.

Important:

The newly created files for the exported actions will not appear on disk until you click **OK** several times to confirm your changes and exit the **Preferences** dialog box.

Tip:

If you want to create a new XML file for an action, there is a document template called **Author Actions** in the **New document wizard** (on page 330) to help you get started.

Note:

You can add or edit the action files outside of Oxygen XML Developer, but you will need to restart the application each time to reload the changes.

Open in editor 

For exported actions, there is a  **Open in editor** action in the contextual menu that will open the file for that action in the main editor.

Create a new action (+)

Use the  **New** button (located underneath the table of actions) to open the **Action dialog box** (*on page 138*) where you can configure a new action.

Duplicate an existing action ()

Use the  **Duplicate** action (found in the contextual menu and underneath the table of actions) to duplicate the selected action.

Edit an existing action ()

Use the  **Edit** button (found in the contextual menu and underneath the table of actions) to open the **Action dialog box** (*on page 138*) where you can edit the selected action.

Delete an existing action ()

Use the  **Delete** button (found in the contextual menu and underneath the table of actions) to delete the selected action.

Author Action Dialog Box

To edit an existing document type action or create a new one, [open the Preferences dialog box \(Options > Preferences\)](#) (*on page 114*), go to **Document Type Association**, use the **New, Edit, Duplicate, or Extend** button (*on page 128*), click on the **Author** tab, and then the **Actions** subtab. At the bottom of this subtab, click  **New** to create a new action, or  **Edit** to modify an existing one.

Figure 16. Action Dialog Box

The screenshot shows the 'Action' dialog box with the following fields and options:

- ID:** bold
- Name:** `$(i18n(bold))`
- Menu access key:** B
- Description:** `$(i18n(bold_description))`
- Large icon (24x24):** /images/Bold24.png (with a 'B' preview and 'Browse' button)
- Small icon (16x16):** /images/Bold16.png (with a 'B' preview and 'Browse' button)
- Shortcut key:** M1+B (with a 'Clear' button)
- Enable platform-independent shortcut keys** (with an info icon)
- Operations:**
 - 1
 - Activation XPath:** (empty field)
 - This XPath expression applies only to elements as. [More details](#)*
 - Operation:** ro.sync.ecss.extensions.common.Operation (with a 'Choose' button)
 - Arguments:**

Name	Description	Type	Value
element	The element to surround with.	Fragment	
schemaAware	This argument applies only on the sun	ConstantList	true
 - Operation priority:** Increase Decrease (with +, x, and document icons)
- Evaluate activation XPath expressions even in read-only contexts**

The following options are available in the **Action** dialog box:

ID

Specifies a unique action identifier.

Name

Specifies the name of the action. This name is displayed as a tooltip or as a menu item.

Tip:

You can use the `$(i18n('key'))` editor variable (on page 296) to allow for multiple translations of the name.

Menu access key

In Windows, you can access menus by holding down **Alt** and pressing the keyboard key that corresponds to the *letter* that is underlined in the name of the menu. Then, while still holding down **Alt**, you can select submenus and menu action the same way by pressing subsequent corresponding keys. You can use this option to specify the *letter* in the name of the action that can be used to access the action.

Description

A description of the action. This description is displayed as a tooltip when hovering over the action.

**Tip:**

You can use the `#{i18n('key')}` editor variable (on page 296) to allow for multiple translations of the description.

How to translate frameworks link

Use this link to see more information about localizing frameworks.

Large icon

Allows you to select an image for the icon that Oxygen XML Developer uses for the toolbar action.

**Tip:**

A good practice is to store the image files inside the *framework* directory and use the `#{frameworks}` editor variable (on page 296) to make the image relative to the *framework* location. If the images are bundled in a *jar* archive (for instance, along with some Java operations implementation), it is convenient to reference the images by their relative path location in the *class-path*.

Small icon

Allows you to select an image for the icon that Oxygen XML Developer uses for the contextual menu action.

Shortcut key

This field allows you to configure a shortcut key for the action that you are editing. The `+` character separates the keys.

Enable platform-independent shortcut keys

If this checkbox is selected, the shortcut that you specify in this field is platform-independent and the following modifiers are used:

- **M1** represents the **Command** key on macOS, and the **Ctrl** key on other platforms.
- **M2** represents the **Shift** key.
- **M3** represents the **Option** key on macOS, and the **Alt** key on other platforms.
- **M4** represents the **Ctrl** key on macOS, and is undefined on other platforms.

Operations section

In this section of the **Action** dialog box, you configure the functionality of the action that you are editing. An action has one or more operation modes. The evaluation of an XPath expression activates an operation mode. The first selected operation mode is activated when you trigger the action. The scope of the XPath expression must consist only of element nodes and attribute nodes of the edited document. Otherwise, the XPath expression does not return a match

and does not fire the action. For more details see: [Controlling Which Author Operations Gets Executed Through XPath Expressions \(on page 141\)](#).

The following options are available in this section:

Activation XPath

An XPath 2.0 expression that applies to elements and attributes. For more details see: [Controlling Which Author Operations Gets Executed Through XPath Expressions \(on page 141\)](#).

Operation

Specifies the invoked operation that can be a default operation or a custom operation.

Arguments

Specifies the arguments of the invoked operation. The  **Edit** at the bottom of the table allows you to edit the arguments of the operation.

Operation priority

Increases or decreases the priority of an operation. The operations are invoked in the order of their priority. If multiple XPath expressions are true, the operation with the highest priority is invoked.

-  **Add** - Adds an operation.
-  **Remove** - Removes an operation.
-  **Duplicate** - Duplicates an operation.

Evaluate activation XPath expressions even in read-only contexts

If this checkbox is selected, the action can be invoked even when the cursor is placed in a read-only location.

Controlling Which Author Operations Gets Executed Through XPath Expressions

An **Author** mode action can have multiple operation modes, each one invoking an Author operation with certain configured parameters. Each operation mode has an XPath 2.0 expression for activating it.

For each operation mode of an action, the application will check if the XPath expression is fulfilled (when it returns a non-empty node set or a **true** result). Only the first operation whose XPath operation is fulfilled will be executed.

The following special XPath extension functions are provided:

- *oxy:allows-child-element()* (on page 142) - Use this function to check whether or not an element is valid child element in the current context, according to the associated schema.
- *oxy:allows-global-element()* (on page 144) - Use this function to check whether or not an element is a valid global element for the current *framework* (on page 2269), according to the associated schema.
- *oxy:current-selected-element()* (on page 145) - Use this function to get the currently selected element.
- *oxy:selected-elements()* (on page 145) - Use this function to get the selected elements.
- *oxy:is-required-element()* (on page 146) - Use this function to check if the element returned by the given XPath expression is required (based on the rules declared in the schema).
- *oxy:platform()* (on page 146) - Use this function to get the current platform in cases where you want to enable or disable an action depending on the platform. Possible values include: *eclipse*, *standalone* and *webapp*.

oxy:allows-child-element() Function

The **oxy:allows-child-element()** function allows you to check whether or not an element that matches the arguments of the function is valid as a child of the element at the current cursor position, according to the associated schema. It is evaluated at the cursor position and has the following signature:

```
oxy:allows-child-element($childName, ($attributeName, $defaultAttributeValue, $contains?))
```

The following parameters are supported:

childName

The name of the element that you want to check if it is valid in the current context. Its value is a string that supports the following forms:

- The child element with the specified local name that belongs to the default namespace.

```
oxy:allows-child-element("para")
```

The above example verifies if the `<para>` element (of the default namespace) is allowed in the current context.

- The child element with the local name specified by any namespace.

```
oxy:allows-child-element("*:para")
```

The above example verifies if the `<para>` element (of any namespace) is allowed in the current context.

- A prefix-qualified name of an element.

```
oxy:allows-child-element("prefix:para")
```

The prefix is resolved in the context of the element where the cursor is located. The function matches on the element with the `para` local name from the previously resolved

namespace. If the prefix is not resolved to a namespace, the function returns a value of `false`.

- A specified namespace-URI-qualified name of an element.

```
oxy:allows-child-element("{namespaceURI}para")
```

The `namespaceURI` is the namespace of the element. The above example verifies if the `<para>` element (of the specified namespace) is allowed in the current context.

- Any element.

```
oxy:allows-child-element("**")
```

The above function verifies if any element is allowed in the current context.

Note:

A common use case of `oxy:allows-child-element("**")` is in combination with the `attributeName` parameter.

attributeName

The attribute of an element that you want to check if it is valid in the current context. Its value is a string that supports the following forms:

- The attribute with the specified name from no namespace.

```
oxy:allows-child-element("**", "class", " topic/topic ")
```

The above example verifies if an element with the `@class` attribute and the default value of this attribute (that contains the `topic/topic` string) is allowed in the current context.

- The attribute with the local name specified by any namespace.

```
oxy:allows-child-element("**", "*:localname", " topic/topic ")
```

- A qualified name of an attribute.

```
oxy:allows-child-element("**", "prefix:localname", " topic/topic ")
```

The prefix is resolved in the context of the element where the cursor is located. If the prefix is not resolved to a namespace, the function returns a value of `false`.

defaultAttributeValue

A string that represents the default value of the attribute. Depending on the value of the next parameter, the default value of the attribute must either contain this value or be equal to it.

contains

An optional boolean. The default value is `true`. For the `true` value, the default value of the attribute must contain the `defaultAttributeValue` parameter. If the value is `false`, the two values must be the same.

oxy:allows-global-element() Function

The **oxy:allows-global-element()** function allows you to check whether or not an element that matches the arguments of the function is valid for the current *framework* (on page 2269), according to the associated schema. It has the following signature:

```
oxy:allows-global-element($elementName, ($attributeName, $defaultAttributeValue, $contains?))
```

The following parameters are supported:

elementName

The name of the element that you want to check if it is valid in the current *framework*. Its value is a string that supports the following forms:

- The element with the specified local name that belongs to the default namespace.

```
oxy:allows-global-element("para")
```

The above example verifies if the `<para>` element (of the default namespace) is allowed in the current *framework*.

- The element with the local name specified by any namespace.

```
oxy:allows-global-element("*:para")
```

The above example verifies if the `<para>` element (of any namespace) is allowed in the current *framework*.

- A prefix-qualified name of an element.

```
oxy:allows-global-element("prefix:para")
```

The prefix is resolved in the context of the *framework*. The function matches on the element with the `para` local name from the previously resolved namespace. If the prefix is not resolved to a namespace, the function returns a value of `false`.

- A specified namespace-URI-qualified name of an element.

```
oxy:allows-global-element("{namespaceURI}para")
```

The `namespaceURI` is the namespace of the element. The above example verifies if the `<para>` element (of the specified namespace) is allowed in the current *framework*.

- Any element.

```
oxy:allows-global-element("***)
```

The above function verifies if any element is allowed in the current *framework*.

attributeName

The attribute of an element that you want to check if it is valid in the current *framework*. Its value is a string that supports the following forms:

- The attribute with the specified name from no namespace.

```
oxy:allows-global-element("***, "class", " topic/topic ")
```

The above example verifies if an element with the `class` attribute and the default value of this attribute (that contains the `topic/topic` string) is allowed in the current *framework*.

- The attribute with the local name specified by any namespace.

```
oxy:allows-global-element("***, "*/localname", " topic/topic ")
```

- A qualified name of an attribute.

```
oxy:allows-global-element("***, "prefix:localname", " topic/topic ")
```

The prefix is resolved in the context of the *framework*. If the prefix is not resolved to a namespace, the function returns a value of `false`.

defaultAttributeValue

A string that represents the default value of the attribute. Depending on the value of the next parameter, the default value of the attribute must either contain this value or be equal to it.

contains

An optional boolean. The default value is `true`. For the `true` value, the default value of the attribute must contain the `defaultAttributeValue` parameter. If the value is `false`, the two values must be the same.

oxy:current-selected-element() Function

This function returns the fully selected element. If no element is selected, the function returns an empty sequence.

Example: oxy:current-selected-element Function

```
oxy:current-selected-element()[self::p]/b
```

This example returns the `` elements that are children of the currently selected `<p>` element.

oxy:selected-elements() Function

This function returns the selected elements from **Author** mode.

Example: `oxy:selected-elements` Function

```
oxy:selected-elements()[self::para][@audience="novice"]
```

This example would activate an action when at least one of the selected elements is a `<para>` element with the `@novice` attribute defined.

`oxy:is-required-element()` Function

This function checks if the element returned by the given XPath expression is required (based on the rules declared in the schema). It has only one argument, an XPath expression, and the XPath expression must be written in such a way that it returns a single element.

Example: `oxy:is-required-element` Function

```
oxy:is-required-element(.)
```

This example would check to see if the current element is required by the schema.

`oxy:is-editable-element()` Function

This function checks if the element returned by the given XPath expression is editable (content can be inserted in it), meaning both that the entire XML file is editable and that the current context where the element is placed is editable. For example, if the element is inside an *xi:included* section, it is not editable.

It only has one argument, an XPath expression, and the XPath expression must be written in such a way that it returns a single element.

Example: `oxy:is-editable-element` Function

```
oxy:is-editable-element(ancestor-or-self::table)
```

This example would return *true* if the cursor is placed inside a table and it is editable or *false* if it is not editable.

`oxy:platform()` Function

This function returns the current platform. You can use this if you want to enable or disable an action depending on the platform. The possible values are: **standalone**, **eclipse**, or **webapp**.

Example: `oxy:platform` Function

```
oxy:platform()="standalone"
```

This example would keep the action activated for the *standalone* distribution of Oxygen XML Developer, but disable it for the *Eclipse* and *Web Author* distributions.

Menu Subtab

In the **Menu** subtab, you can configure which actions will appear in the *framework (on page 2269)*-specific menu. The subtab is divided into two sections: **Available actions** and **Current actions**.

To open the **Menu** subtab, open the **Preferences** dialog box (**Options > Preferences**) (on page 114), go to **Document Type Association**, use the **New, Edit, Duplicate, or Extend** button (on page 128), click on the **Author** tab, and then the **Menu** subtab.

The **Available actions** section presents a table that displays the actions defined in the **Actions** subtab, along with their icon, ID, and name. The **Current actions** section holds the actions that are displayed in the Oxygen XML Developer menu. To add an action in this section as a sibling of the currently selected action, use the

 **Add as sibling** button. To add an image in this section as a child of the currently selected action, use the  **Add as child** button.

The following actions are available in the **Current actions** section:

 **Edit**

Edits an item.

 **Remove**

Removes an item.

 **Move Up**

Moves an item up.

 **Move Down**

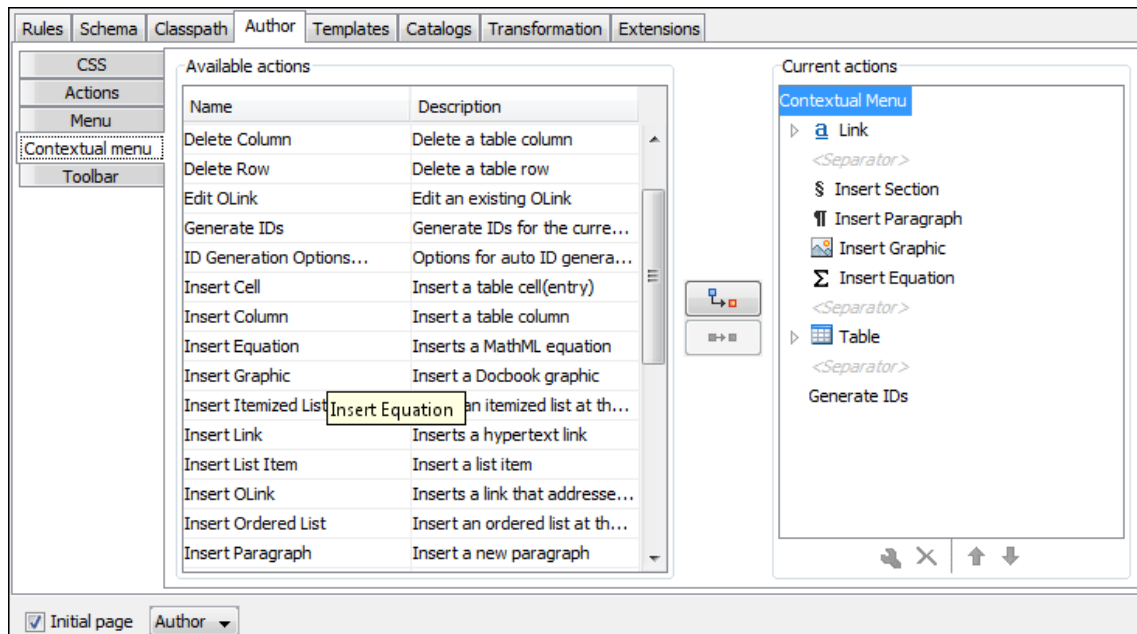

Moves an item down.

Contextual Menu Subtab

In the **Contextual menu** subtab you configure what *framework (on page 2269)*-specific action the *Content Completion Assistant (on page 2267)* proposes. The subtab is divided into two sections: **Available actions** and **Current actions**.

To open the **Contextual Menu** subtab, open the **Preferences** dialog box (**Options > Preferences**) (on page 114), go to **Document Type Association**, use the **New, Edit, Duplicate, or Extend** button (on page 128), click on the **Author** tab, and then the **Contextual Menu** subtab.

Figure 17. Contextual Menu Subtab

The **Available actions** section presents a table that displays the actions defined in the **Actions** subtab, along with their icon, ID, and name. The **Current actions** section contains the actions that are displayed in the contextual menu for documents that belong to the edited *framework*.

The following actions are available in this subtab:

Add as sibling

Adds the selected action or submenu from the **Available actions** section to the **Current actions** section as a sibling of the selected action.

Add as child

Adds the selected action or submenu from the **Available actions** section to the **Current actions** section as a child of the selected action.

Edit

This option is available for container (submenu) items that are listed in the **Current actions** section. It opens a configuration dialog box that allows you to edit the selected container (submenu).

Figure 18. Menu Action Configuration Dialog Box

The following options are available in this dialog box:

Name

Specifies the name of the action. This name is displayed as a tooltip or as a menu item.

Tip:

You can use the `$(i18n('key'))` editor variable (on page 296) to allow for multiple translations of the name.

Menu access key

In Windows, you can access menus by holding down **Alt** and pressing the keyboard key that corresponds to the *letter* that is underlined in the name of the menu.

Then, while still holding down **Alt**, you can select submenus and menu action the same way by pressing subsequent corresponding keys. You can use this option to specify the *letter* in the name of the action that can be used to access the action.

Menu icon

Allows you to select an image for the icon that Oxygen XML Developer uses for the container (submenu).

Promote items when in a table context

If this option is selected, when invoking the contextual menu from within a table, all the actions in this container (submenu) will be promoted to the main level in the contextual menu. Actions and submenus that are not promoted are still available in the **Other actions** submenu when invoking the contextual menu within a table.

✕ Remove

Removes the selected action or submenu from the **Current actions** section.

↑ Move Up

Moves the selected item up in the list.

↓ Move Down

Moves the selected item down in the list.

Toolbar Subtab

In the **Toolbar** subtab you configure what *framework* (on page 2269)-specific action the Oxygen XML Developer toolbar holds. The subtab is divided into two sections: **Available actions** and **Current actions**.

To open the **Toolbar** subtab, open the **Preferences** dialog box (**Options > Preferences**) (on page 114), go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button (on page 128), click on the **Author** tab, and then the **Toolbar** subtab.

The **Available actions** section presents a table that displays the actions defined in the **Actions** subtab, along with their icon, ID, and name. The **Current actions** section holds the actions that are displayed in the Oxygen XML Developer toolbar when you work with a document belonging to the edited *framework*. To add an action in this section as a sibling of the currently selected action, use the  **Add as sibling** button. To add an action in this section as a child of the currently selected action, use the  **Add as child** button.

The following actions are available in the **Current actions** section:

Edit

Edits an item.

Remove

Removes an item.

Move Up

Moves an item up.

Move Down

Moves an item down.

Content Completion Subtab

In the **Content Completion** subtab you configure what *framework* (on page 2269)-specific the *Content Completion Assistant* (on page 2267) proposes. The subtab is divided into two sections: **Available actions** and **Current actions**.

To open the **Content Completion** subtab, open the **Preferences** dialog box (**Options > Preferences**) (on page 114), go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button (on page 128), click on the **Author** tab, and then the **Content Completion** subtab.

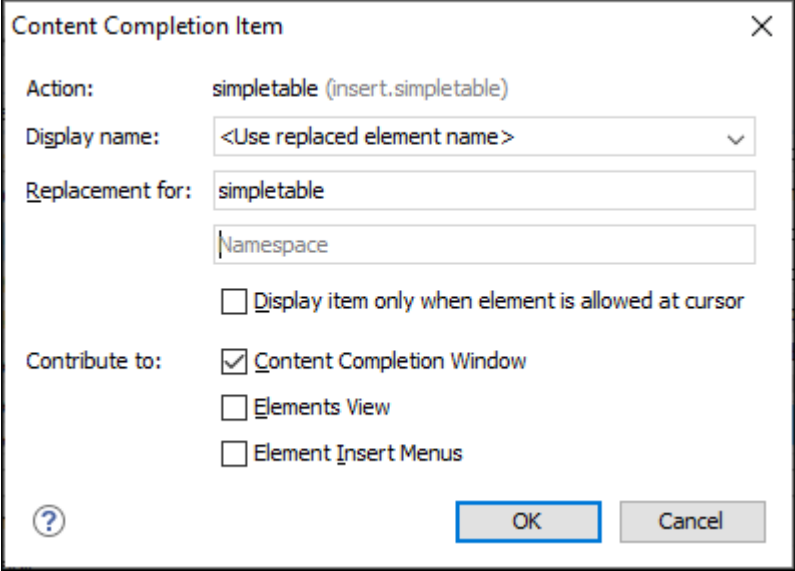

Available and Current Actions

The **Available actions** section presents a table that displays the actions defined in the **Actions** subtab, along with their icon, ID, and name. The **Current actions** section holds the actions that the *Content Completion Assistant* proposes when you work with a document that belongs to the edited *framework*.

To add the selected available action as a sibling of the currently selected action in the **Current actions** section, use the  **Add as sibling** button. To add it as a child of the currently selected action, use the  **Add as child** button. To edit an existing action, select it and use the  **Edit** button. To remove an existing action, use the  **Remove** button. You can also move items up and down the list using the  **Move Up** or  **Move Down** buttons.

Adding an action (or editing an existing one) opens the **Content Completion Item** dialog box.

Figure 19. Content Completion Item Dialog Box

Use this dialog box to configure the action:

Action

Displays the name of the selected action.

Display name

You can use the drop-down menu to choose between displaying the action name or the replaced element name, or you can enter another name to be displayed.

Replacement for

Use this section to replace an existing element with the configured action:

- **Element name** and **Namespace** - The name (and namespace, if needed) of the replaced element. The original element no longer needs to be excluded using the [Filter - Remove content completion items table \(on page 152\)](#).
- **Display item only when element is allowed at cursor** - The configured action is contributed in the UI components selected in the **Contribute to** section only if the associated schema allows the original element at the current location in the document. This is equivalent to defining activation XPaths in the [Author Action dialog box \(on page 138\)](#) using the `oxy:allows-child-element()` XPath extension function. Activation XPaths for the action are still checked when the action is invoked.

Contribute to

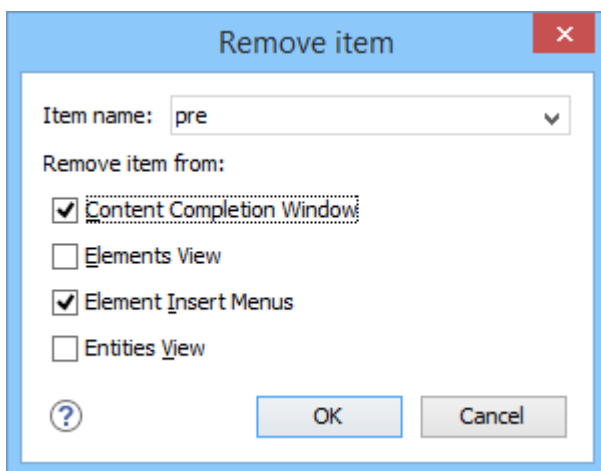

Use this section to specify where to display the configured item in the interface:

- **Content Completion Window** - The configured item will appear in the *Content Completion Assistant* (on page 2267).
- **Elements View** - The configured item will appear in the **Elements** view.
- **Element Insert Menus** - The configured item will appear in the **Append Child, Insert Before**, or **Insert After** menus that are available in certain contextual menus (for example, the contextual menu of the **Outline** view).

Filter Table

The **Filter** section presents a table that allows you to add elements to be filtered from the *Content Completion Assistant* or from some specific helper views or menus. Use the **+** **Add** button to add more filters to the table, the **✎** **Edit** button to modify an existing item in the table, or the **✕** **Remove** button to remove a filtered item. The **+** **Add** and **✎** **Edit** buttons open a **Remove item** dialog box.

Figure 20. Remove Item Dialog Box

Use this dialog box to add or configure the elements that will be filtered:

Item name

Use this text field to enter the name of the element to be filtered. The drop-down list also includes a few special content completion actions that can be filtered:

- **<SPLIT> [elementName]** - Filters split entries for elements that have the form **Split elementName** or **New elementName**.
- **<SPLIT>** - Filters split entries for all elements.
- **<ENTER>** - Filters **Insert New Line** entries that appear in elements where whitespace is significant.

The filter list can be used to remove only content completion items contributed by the schema associated to the document and it does not remove actions added to the content completion

list via the framework configuration. The element name specified in the filter is not namespace aware, it matches the name of the element defined in the associated schema exactly as it would appear rendered in the content completion window.

Note:

If you try to insert an element in an invalid position (for example, using the content completion assistant), the editor will attempt to make the insertion valid. This may mean finding an alternate position for the insertion or splitting the element at the current position. If a **<SPLIT>** entry is added in the filter list for an element, the editor will never split that element.

Remove item from

You can choose to filter the element from any of the following:

- **Content Completion Window** - The element will not appear in the *Content Completion Assistant* (on page 2267).
- **Elements View** - The element will not appear in the **Elements** view.
- **Element Insert Menus** - The element will not appear in the **Append Child, Insert Before, or Insert After** menus that are available in certain contextual menus (for example, the contextual menu of the **Outline** view).
- **Entities View** - The element will not appear in the **Entities view** (on page 501).

Templates Tab

The **Templates** tab specifies a list of directories where new document templates are located for this particular framework. These directories, along with the document templates that are saved inside them, will appear in the **New Document wizard** (on page 330) inside the **Framework templates** category according to your framework and the directory path you specify in this tab.

To open the **Templates** tab of the **Document type** configuration dialog box, open the **Preferences** dialog box (**Options > Preferences**) (on page 114), go to **Document Type Association**, use the **New, Edit, Duplicate, or Extend** button (on page 128), and click on the **Templates** tab.

The **Templates** tab includes the following actions:

+ New

Opens a dialog box that allows you to specify the path to a directory that contains document templates for this framework. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** (on page 289) button, or the browsing actions in the  **Browse** drop-down list.

**Tip:**

The path can also contain wildcards. For example, using `${frameworkDir}/templates/*` would add all the template folders found inside the `templates` directory.

Edit

Opens a dialog box that allows you to edit the path of a directory that contains document templates for this framework. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** (on page 289) button, or the browsing actions in the **Browse** drop-down list.

**Tip:**

The path can also contain wildcards. For example, using `${frameworkDir}/templates/*` would add all the template folders found inside the `templates` directory.

Delete

Deletes the currently selected template directory from the list.

Move Up

Moves the selected template directory up one spot in the list.

Move Down

Moves the selected template directory down one spot in the list.

[Sharing Custom Document Templates \(on page 344\)](#)

Catalogs Tab

The **Catalogs** tab specifies a list of *XML Catalogs*, specifically for the edited *framework* (on page 2269), that are added to list of catalogs that Oxygen XML Developer uses to resolve resources.

To open the **Catalogs** tab of the **Document type** configuration dialog box, open the **Preferences** dialog box (**Options > Preferences**) (on page 114), go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button (on page 128), and click on the **Catalogs** tab.

You can perform the following actions:

Add

Opens a dialog box that allows you to add a catalog to the list. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** (on page 289) button, or the browsing actions in the **Browse** drop-down list.

 **Edit**

Opens a dialog box that allows you to edit the path of an existing catalog.

 **Delete**

Deletes the currently selected catalog from the list.

 **Move Up**

Moves the selected catalog up one spot in the list.

 **Move Down**

Moves the selected catalog down one spot in the list.

Transformation Tab

In the **Transformation** tab, you can configure the transformation scenarios associated with the particular *framework* (on page 2269) you are editing. These transformation scenarios are presented in the **Configure Transformation Scenarios** dialog box (on page 1240) when transforming a document and you can specify which scenarios will be used by default for a particular document type.

To open the **Transformation** tab of the **Document type** configuration dialog box, open the **Preferences** dialog box (**Options > Preferences**) (on page 114), go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button (on page 128), and click on the **Transformation** tab.

The **Transformation** tab offers the following options:

Default checkbox

You can set one or more of the scenarios listed in this tab to be used as the default transformation scenario when another specific scenario is not specified. The scenarios that are set as default are rendered bold in the **Configure Transformation Scenarios** dialog box (on page 1240).

 **New**

Opens the **New scenario** dialog box allowing you to create a new transformation scenario for the particular document type (on page 1129).

 **Duplicate**

Allows you to duplicate the configuration of an existing transformation scenario. It opens the **Edit scenario** dialog box where you can configure the properties of the duplicated scenario (on page 1239).

 **Edit**

Opens the **Edit scenario** dialog box allowing you to edit the properties of the currently selected transformation scenario (on page 1237).

 **Delete**

Deletes the currently selected transformation scenario.

 **Import scenarios**

Imports transformation scenarios.

 **Export selected scenarios**

Export transformation scenarios.

 **Move Up**

Moves the selection to the previous scenario.

 **Move Down**

Moves the selection to the next scenario.

Validation Tab

In the **Validation** tab, you can configure the validation scenarios associated with the particular *framework* (on page 2269) you are editing. These validation scenarios are presented in the **Configure Validation Scenarios** dialog box when validating a document and you can specify which scenarios will be used by default for a particular document type.

**Note:**

If a *main file* is associated with the current file, the validation scenarios defined in the *main file*, along with any Schematron schema defined in the default scenarios for that particular *framework*, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular *framework*. For more information on *main files*, see [Contextual Project Operations Using 'Main Files' Support \(on page 381\)](#) or [Modular Contextual XML Editing Using 'Main Files' Support \(on page 596\)](#).

To open the **Validation** tab of the **Document type** configuration dialog box, open the **Preferences** dialog box (**Options > Preferences**) (on page 114), go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button (on page 128), and click on the **Validation** tab.

The **Validation** tab offers the following options:

Default checkbox

You can set one or more of the scenarios listed in this tab to be used as the default validation scenario when another specific scenario is not specified in the validation process. The scenarios that are set as default are rendered bold in the **Configure Validation Scenarios** dialog box.

 **New**

Opens the **New scenario** dialog box allowing you to create a new validation scenario.

 **Duplicate**

Allows you to duplicate the configuration of an existing validation scenario. It opens the **Edit scenario** dialog box where you can configure the properties of the duplicated scenario.

 **Edit**

Opens the **Edit scenario** dialog box allowing you to edit the properties of the currently selected validation scenario.

 **Delete**

Deletes the currently selected validation scenario.

 **Import scenarios**

Imports validation scenarios.

 **Export selected scenarios**

Export validation scenarios.

 **Move Up**

Moves the selected scenario up one spot in the list.

 **Move Down**

Moves the selected scenario down one spot in the list.

Extensions Tab

The **Extensions** tab specifies implementations of Java interfaces used to provide advanced functionality to the document type.

To open the **Extensions** tab of the **Document type** configuration dialog box, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#), go to **Document Type Association**, use the **New, Edit, Duplicate, or Extend** button [\(on page 128\)](#), and click on the **Extensions** tab.

Libraries containing the implementations must be present in the *classpath* [\(on page 134\)](#) of your document type. The Javadoc available at <https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/> contains details about how each API implementation functions.

Document Templates Preferences

Oxygen XML Developer provides a variety of built-in document templates that make it easier to create new documents in various formats. The list of available templates is presented in the **New Document wizard** [\(on page 330\)](#) when you create a new document ( **New** toolbar button or **File > New**).

You can also [create your own templates \(on page 339\)](#) and share them with others. You can store your custom document templates in the existing `templates` folder in the Oxygen XML Developer installation directory or store them in a custom directory. If you store them in a custom directory, you need to use this **Document Templates** preferences page to add that directory to the list of template directories that Oxygen XML Developer makes available in the **New Document** wizard.

To add a template directory, follow these steps:

1. open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Document Templates**.
2. Use the **New** button to select a location of the new document template folder.
3. You can also use the **Edit** or **Delete** buttons to manage folders in the list, and you can alter the order that Oxygen XML Developer looks in these directories by using the **Up** and **Down** buttons.

Result: This will add the folder to the list in this preferences page and it will now appear in the **New Document wizard** (on page 330) in a category based upon the folder path you specified.

**Note:**

For DITA templates, they will also appear in the dialog box for creating new DITA topics, but if you [customize the template](#) (on page 340), you need to set the `type` property to **dita** in the corresponding properties file.

Encoding Preferences

Oxygen XML Developer lets you configure how character encodings are recognized when opening files and which encodings are used when saving files. To configure encoding options, [open the Preferences dialog box](#) (**Options > Preferences**) (on page 114) and go to **Encoding**.

The following encoding options are available:

Fallback character encoding

Specifies the default character encoding of non-XML documents if their character encoding cannot be determined from other sources (for example, it is not specified in the document or determined by the file type).

**Note:**

For certain document types, the following encoding detection rules are used:

- For XML, DTD, and CSS documents, Oxygen XML Developer tries to collect the character encoding from the document. If no such encoding is found, then *UTF-8* is used.
- For JavaScript, JSON, SQL, XQuery, and RNC, the *UTF-8* encoding is used.

UTF-8 BOM handling

This setting specifies how to handle the *Byte Order Mark* (BOM) when Oxygen XML Developer saves a UTF-8 XML document:

- **Keep** (default) - Do not alter the BOM declaration of the currently open file.
- **Write** - Save the BOM bytes.
- **Don't Write** - Do not save the BOM bytes. Loaded BOM bytes are ignored.

**Note:**

The UTF-16 BOM is always preserved. UTF-32 documents have a *big-endian* byte order.

Encoding errors handling

This setting specifies how to handle characters that cannot be represented in the character encoding that is used when the document is opened. The available options are:

- **REPORT** (default) - Displays an error identifying the character that cannot be represented in the specified encoding. Unrecognized characters are rendered as an empty box.
- **REPLACE** - The character is replaced with a standard replacement character. For example, if the encoding is UTF-8, the replacement character has the Unicode code `FFFD`, and if the encoding is ASCII, the replacement character code is 63.
- **IGNORE** - The error is ignored and the character is not included in the document displayed in the editor.

**Attention:**

If you edit and save the document, the characters that cannot be represented in the specified encoding are dropped.

Encoding for Base64, Base32, Hex conversions

Specifies the encoding to be used when invoking the **Encode Selection** or **Decode Selection** actions for *Base64 (on page 524)*, *Base32 (on page 525)*, or *Hex conversions (on page 526)*. The default setting is *UTF8*.

Encode non-ASCII characters in URL paths

If selected (default), Oxygen XML Developer will escape non-ASCII characters (encode them with their hexadecimal equivalent) within URL paths. If you are using a non-Latin alphabet (such as Arab, Japanese, Chinese), it may be beneficial to deselect this option so that non-ASCII characters in URL paths will not be escaped and will remain more readable.

Editor Preferences

Oxygen XML Developer offers the possibility to configure the appearance of various components and features of the main editor. To access these options, open the **Preferences** dialog box (**Options > Preferences**) (on *page 114*) and go to **Editor**.

The following options are available:

Selection background color

Allows you to set the background color of selected text.

Selection foreground color

Allows you to set the color of selected text.

Completion proposal background

Allows you to set the background color of the *Content Completion Assistant* (on page 2267).

Completion proposal foreground

Allows you to set the color of the text in the *Content Completion Assistant* (on page 2267).

Documentation window background

Allows you to set the background color of the documentation of elements suggested by the *Content Completion Assistant* (on page 2267).

Documentation window foreground

Allows you to set the color of the text for the documentation of elements suggested by the *Content Completion Assistant* (on page 2267).

Find highlight color

Allows you to set the color of the highlights generated by the **Find** and **Find all** actions.

XPath highlight color

Allows you to set the color of the highlights generated when you run an XPath expression.

Declaration highlight color

Allows you to set the color of the highlights generated by the **Find declaration** action.

Reference highlight color

Allows you to set the color of the highlights generated by the **Find reference** action.

Maximum number of highlights

Allows you to set the maximum number of highlights that Oxygen XML Developer displays.

Show TAB/NBSP/EOL/EOF marks

Makes the **TAB/NBSP/EOL/EOF** characters visible in the editor. You can use the color picker to choose the color of the marks.

Show SPACE marks

Makes the space character visible in the editor.

Can edit read-only files

If this option is selected, Oxygen XML Developer will let you edit read-only files. When you try to save them, a **Save As** dialog box will be displayed to avoid overwriting the initial resource. If the option is not selected, a warning message is displayed when you try to edit a read-only file.

Display quick-assist and quick-fix side hints

Displays the *Quick Assist* (on page 2272) icon (💡) and *Quick Fix* (on page 2272) icon (🔧) in the line number stripe on the left side of the editor.

Undo history size

Allows you to set the maximum amount of undo operations you can perform in any of the editor modes (**Text, Design, Grid**).

Enable mouse-wheel zooming

If selected, you can use **Ctrl + MouseWheelForward (Command + MouseWheelForward on macOS)** to increase the editor font (zoom in) or **Ctrl + MouseWheelBackwards (Command + MouseWheelBackwards on macOS)** to decrease the editor font (zoom out). It is enabled by default on Windows and Linux, while it is disabled by default on macOS, due to the way inertia affects the mouse wheel on this operating system.

Edit Modes Preferences

Oxygen XML Developer lets you configure which edit mode a file is opened in the first time it is opened. This setting only applies the first time a file is opened. The current editing mode of each file is saved when the file is closed and restored the next time it is opened. To configure the options for editing modes, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **Editor > Edit Modes** .

Allow Document Type specific edit mode setting to override the general mode setting

If selected, the initial edit mode setting set in the [Document Type configuration dialog box \(on page 130\)](#) overrides the general edit mode setting from the table below.

Select the initial edit mode (page) for each editor

This table specifies the default editing mode that will be opened for each type of document when the **Allow Document Type specific edit mode setting to override the general mode setting** option is not selected. Use the **Edit** button to change the initial edit mode for each type of document (editor). The initial edit mode can be one of the following:

- **Text**
- **Grid**
- **Design** (available only for the XSD editor).

Figure 21. Edit Modes Preferences Page

Editor / Edit modes

Allow Document Type specific edit mode setting to override the general edit mode settings

Select the initial edit mode (page) for each editor

Editor	Edit Mode
XML Editor	Text
XSD Editor	Design
HTML Editor	Text
WSDL Editor	Text
XSL Editor	Text
NVDL Editor	Text
XProc Editor	Text
RNG Editor	Text
Schematron Editor	Text

Text Preferences

Oxygen XML Developer allows you to configure how the **Text** mode editor appears. To configure these options, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Editor > Edit modes > Text**.

The following options are available:

Editor background color

Sets the background color for the **Text** editing mode, **Outline** view, and some external tool editors (**Large File Viewer** (on page 2013), **Compare Files** (on page 433), **Compare Directories** (on page 451)).

Editor cursor color

Sets the color for the cursor in **Text** mode.

Highlight current line

If selected, the current line is highlighted with the foreground color specified with the color chooser.

Show line numbers

If selected (default value), line numbers are shown in the editor panels and in the **Output view** (on page 1833) of the debugger *perspectives* (on page 2271). You can also specify the color for the line numbers using the color chooser. Printed output will also include the line numbers.

Show print margin

If selected, it allows you to set a safe print limit in the form of a vertical line displayed in the right side of the editor pane. You can also customize the print margin line color.

Print margin column

Allows you to specify a limit for the print width, measured in the number of characters.

Line wrap

If selected, long lines are automatically wrapped in edited documents. The line wrap does not alter the document content since the application does not use *new-line* characters to break long lines.

Cut / Copy whole line when nothing is selected

If selected, **Cut** and **Copy** actions operate on the entire current line when nothing is selected in the editor.

Enable folding

If selected (default value), the vertical stripe that holds the folding markers is displayed in **Text** mode.

XML section

Highlight matching tag

If selected, when you place the cursor on a start or end tag, Oxygen XML Developer highlights the corresponding member of the pair. You can also customize the highlight color.

Lock the XML tags

If selected, XML are locked and cannot be edited in **Text** mode.

JSON section

Show property name after ending bracket

If enabled (default), property names are displayed after the ending bracket when editing JSON documents in **Text** mode. You can also use the transparency slider to adjust the level of transparency or opaqueness.

YAML section

Show SPACE marks for YAML only

If enabled (default), space characters are visible in the YAML editor.

Diagram Preferences

For certain XML languages, Oxygen XML Developer provides a diagram view as part of the **Text** mode editor. To configure the **Diagram** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) (*on page 114*) and go to **Editor > Edit modes > Text > Diagram**.

The following options are available in this preference page:

Show Full Model XML Schema diagram

When this option is selected, the **Text** mode editor for XML Schemas includes a split-screen view that shows a diagram of the schema structure. This is useful for seeing the effects of schema changes you make. For editing a schema using a diagram instead of text, use the [schema Design view \(on page 317\)](#).

Note:

When handling very large schemas, displaying the schema diagram might affect the performance of your system. In such cases, disabling the schema diagram view improves the speed of navigation through the edited schema.

Enable Relax NG diagram and related views

Enables the Relax NG schema diagram and synchronization with the related views ([Attributes \(on page 497\)](#), [Model \(on page 499\)](#), [Elements \(on page 501\)](#), [Outline \(on page 859\)](#)).

Show Relax NG diagram

Displays the Relax NG schema diagram in the split-screen views ([Full Model View \(on page 853\)](#) and [Logical Model View \(on page 854\)](#)).

Enable NVDL diagram and related views

Enables the NVDL schema diagram and synchronization with the related views ([Attributes \(on page 497\)](#), [Model \(on page 499\)](#), [Elements \(on page 501\)](#), [Outline \(on page 875\)](#)).

Show NVDL diagram

Displays the NVDL schema diagram in the split-screen views ([Full Model View \(on page 871\)](#) and [Logical Model View \(on page 872\)](#)).

Location relative to editor

Allows you to specify the location of the schema diagram panel relative to the diagram **Text** editor.

Show/Hide Annotations link

Use this link to navigate to the [Schema Design preferences page \(on page 166\)](#) where you can choose to show or hide annotations in schema diagrams.

Zoom link

Use this link to navigate to the [Schema Design preferences page \(on page 167\)](#) where you can adjust the default zoom level of schema diagrams.

Grid Preferences

Oxygen XML Developer provides a **Grid view** ([on page 316](#)) of an XML document. To configure the **Grid** mode options, [open the Preferences dialog box \(Options > Preferences\)](#) ([on page 114](#)) and go to **Editor > Edit modes > Grid**.

The following options are available:

Compact representation

If selected, the *compact representation* of the grid is used: a child element is displayed beside the parent element. In the *non-compact representation*, a child element is nested below the parent.

Format and indent when passing from grid to text or on save

If selected, the content of the document is formatted and indented each time you switch from the **Grid** view to the **Text** view.

Default column width (characters)

Sets the default width (in characters) of a table column of the grid. A column may contain the following:

- Element names
- Element text content
- Attribute names
- Attribute values

If the total width of the grid structure is too large you can resize any column by dragging the column margins with the mouse pointer, but the change is not persistent. To make it persistent, set the new column width with this option.

Active cell color

Allows you to set the background color for the *active cell* ([on page 2267](#)) of the grid. The keyboard input always goes to the *active cell* and the selection always contains it.

Selection color

Allows you to set the background color for the selected cells of the grid, except the *active cell* ([on page 2267](#)).

Border color

Allows you to set the color used for the lines that separate the grid cells.

Background color

Allows you to set the background color of grid cells that are not selected.

Foreground color

Allows you to set the text color of the information displayed in the grid cells.

Row header colors

Background color

Allows you to set the background color of row headers that are not selected.

Active cell color

Allows you to set the background color of the row header cell that is currently active.

Selection color

Allows you to set the background color of the header cells corresponding to the currently selected rows.

Column header colors

The column headers are painted with two color gradients, one for the upper 1/3 part of the header and the other for the lower 2/3 part. The start and end colors of the first gradient are set with the first two color buttons. The start and end colors of the second gradient are set with the last two color buttons.

Background color

Allows you to set the background color of column headers that are not selected.

Active cell color

Allows you to set the background color of the column header cell that is currently active.

Selection color

Allows you to set the background color of the header cells corresponding to the currently selected columns.

Schema Design Preferences

Oxygen XML Developer provides a [graphical schema design editor \(on page 317\)](#) to make editing XML Schema easier. To configure the **Schema Design** options, open the **Preferences** dialog box (**Options > Preferences**) [\(on page 114\)](#) and go to **Editor > Edit modes > Schema Design**.

The following options are available in the **Schema Design** preferences page:

Show annotation in the diagram

When selected, Oxygen XML Developer displays the content of documentation in schema diagrams.

When trying to edit components from another schema

The schema diagram editor will combine schemas imported by the current schema file into a single schema diagram. You can choose what happens if you try to edit a component from an imported schema. The options are:

- **Always go to its definition** - Oxygen XML Developer opens the imported schema file so that you can edit it.
- **Never go to its definition** - The imported schema file is not opened and the component cannot be edited in place.
- **Always ask** - Oxygen XML Developer asks if you want to open the imported schema file.

Zoom

Allows you to set the default zoom level of the schema diagram.

XSD Properties Preferences

Oxygen XML Developer lets you control which properties to display for XML Schema components in the XML Schema **Design** view (*on page 317*). To configure the schema design properties displayed, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **Editor > Edit modes > Schema Design > XSD Properties**.

This preferences page contains the following:

Show additional properties in the diagram

If this option is selected, the properties selected in the property table are shown in the XML Schema **Design** mode. This option is selected by default.

Properties Table

Show

Use this column in the table to select the properties that you want to be displayed in the XML Schema **Design** mode.

Only if specified

Use this column to select if you want the property to be displayed only if it is defined in the schema.

JSON Schema Properties Preferences

Oxygen XML Developer lets you control which properties to display for JSON Schema components in the JSON Schema **Design** mode. To configure the JSON properties that are displayed, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **Editor > Edit modes > Schema Design > JSON Schema Properties**.

This preferences page contains the following:

Show additional properties in the diagram

If this option is selected, the properties selected in the property table are shown in the JSON Schema **Design** mode. This option is selected by default.

Properties Table

Show

Use this column in the table to select the properties that you want to be displayed in the JSON Schema **Design** mode.

Only if specified

Use this column to select if you want the property to be displayed only if it is defined in the schema.

Open Preferences

Oxygen XML Developer lets you control how files are opened. To configure the options for opening documents, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Editor > Open**.

The following options are available:

Open each document in a tab next to the current one

When selected (default), each new document is opened in a tab next to the currently open tab. If not selected, each new document is opened in a tab at the end of the current tab stack.

Restore cursor position

Selected by default, it ensures that the last position of the cursor will be remembered when a document is re-opened. If this option is not selected, the cursor will always be positioned at the beginning of the document.

Lock local resources

When this option is selected and you open a file from the local file system or a shared network drive, Oxygen XML Developer locks the file for the current user and the file becomes read-only for other users while the lock exists. Locked and read-only files have a lock icon (🔒) displayed on their editor tabs. Newly created files are *locked* when you first save them. If you select this option with files already opened in Oxygen XML Developer, it will *lock* all the currently open files. If you deselect this option with files already opened, it will unlock them by deleting the corresponding `.lock` files. When you try to save locked (read-only) files, a **Save As** dialog box will be displayed to avoid overwriting the initial resource.

Support for Special Characters section**Note:**

The options in this section only affect the **Text** editing mode.

When bidirectional text, Asian languages, or other special characters are detected

You can choose how you want Oxygen XML Developer to handle bidirectional text, Asian languages, or other special characters when they are detected in **Text** mode. You can choose one of the following:

- **Enable support for special characters** - The support for special characters will always be enabled. For details about what this means, see [Bidirectional Text Support in Text Mode - Enabled \(on page 519\)](#).
- **Disable support for special characters** - The support for special characters will always be disabled. For details about what this means, see [Bidirectional Text Support in Text Mode - Disabled \(on page 519\)](#).
- **Prompt for each document** (default setting) - You will be prompted to choose whether or not to enable the support for special characters whenever they are detected in a newly opened document. For details about which setting to choose, see [Special Character Support in Text Mode \(on page 518\)](#).

Disable special characters support for documents larger than (characters)

Enabling bidirectional text editing support can affect performance on large files. When this option is selected, bidirectional editing is disabled for files exceeding the specified size (even if the [Enable support for special characters option \(on page 169\)](#) is selected). The default limit is 300 MB. You can change it to 500 MB or 800 MB, but it is recommended that you always leave this option selected regardless of the limit that is set.

Performance section

Optimize loading in the Text edit mode for files over (MB)

File loading is optimized for reduced memory usage for any file whose size is larger than the value specified in this drop-down list. This is useful for editing large files, but there are [several restrictions \(on page 428\)](#) for memory-intensive operations.

Show warning when loading large documents

Oxygen XML Developer will warn you if you open a file that is bigger than the specified size.

Optimize loading for documents with lines longer than (Characters)

Line wrap is automatically performed for documents that contain lines that exceed the length specified in this text field. For a list of the restrictions applied to a document with long lines, see [Editing Documents with Long Lines \(on page 430\)](#).

Show warning when loading documents with long lines

When selected, Oxygen XML Developer will warn you when you open a file with lines longer than the specified length. To reduce the length of lines in a file, format and indent the document after it is opened in the editor panel. For a list of the restrictions applied to a document with long lines, see [Documents with Long Lines \(on page 430\)](#).

Save Preferences

Oxygen XML Developer lets you control how files are saved. To configure the options for saving documents, open the **Preferences** dialog box (**Options > Preferences**) (*on page 114*) and go to **Editor > Save**.

The following options are available:

Show "Save as" option to save newly created documents in the "New" document wizard

It is selected by default, but if you deselect this option, the **Save as** option (*on page 332*) will not be available in the **New Document wizard** (*on page 330*), so you will not have the ability to change the default name and path of the new file.

Safe save (only for local files)

In the unlikely event of a failure when attempting a **Save** action, this option provides increased protection from corruption of the original file. When this option is selected, it saves the content to a temporary file and if the save is unsuccessful, the editor preserves its unsaved state status.

Automatically save the document every

If selected, your documents are automatically saved after a preset time interval that is specified in the drop-down list.

On Save, make backup copy with extension (only for local files)

If selected, a backup copy is made when saving the edited document. This option is available only for local files (files that are stored on the local file system). The default backup file extension is `.bak`, but that can be changed in the text field.

Save auto-recover information every

If selected, your documents are automatically saved to a backup file after the time interval specified in the drop-down list.

Auto-recover file location

Specifies the location of the backup file for auto-recovery.

Validate document before saving

If selected, Oxygen XML Developer runs a validation that checks your document for errors before saving it.

Save all files before transformation or validation

Saves all opened files before validating or transforming an XML document. This ensures that any dependencies are resolved when modifying the XML document and its XML Schema.

Save all files before calling external tools

If selected, all files are saved before executing an external tool.

Automatically compile LESS to CSS when saving

If selected, when you save a LESS file it will automatically be compiled to CSS (deselected by default).

**Important:**

If this option is selected, when you save a LESS file, the CSS file that has the same name as the LESS file is overwritten without warning. Make sure all your changes are made in the LESS file. Do not edit the CSS file directly, as your changes might be lost.

Performance section**Clear undo buffer on save**

If selected, Oxygen XML Developer clears its undo buffer when you save a document. Thus, modifications made prior to saving the document cannot be undone. Select this option if you frequently encounter **out of memory** errors when editing large documents.

Format Preferences

This preferences page contains various formatting options that influence editing and formatting.

**Note:**

These settings apply to the formatting of source documents. The formatting of output documents is determined by the [transformation scenarios that create them \(on page 1098\)](#).

To configure the **Format** options, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Editor > Format**.

The following options are available:

Detect indent on open

If selected, Oxygen XML Developer detects how a document is indented when it is opened. Oxygen XML Developer uses a heuristic method of detection by computing a weighted average indent value from the initial document content. You can deselect this setting if the detected value does not work for your particular case and you want to use a fixed-size indent for all the edited documents. If this option is selected, Oxygen XML Developer detects the following:

- When TAB characters are used to indent content, the size of the TAB characters is used for the indent size.
- Otherwise, the detected size of SPACE characters is used for the indent size.

**Tip:**

If you want to minimize the formatting differences created by the **Format and Indent** operation in a document edited in the **Text** edited mode, make sure that both the **Detect indent on open** and **Detect line width on open (on page 173)** options are selected.

Use zero-indent, if detected

By default, if no indent was detected in the document, the fixed-size indent is used. Select this option if all of your documents have no indentation and you want to keep them that way.

Indent with tabs

If selected, indents are created using TAB characters. If unchecked, lines are indented using space characters. Selecting this option automatically disables the **Detect indent on open** ([on page 171](#)) option.

Indent size

The meaning of this setting depends on the following:

- If the **Detect indent on open** option ([on page 171](#)) is selected and TAB characters are detected at the beginning of the line, the *indent size* is the width of a TAB character. Otherwise, the *indent size* value is ignored and Oxygen XML Developer uses the number of detected SPACE characters.
- If the **Indent with tabs** option ([on page 172](#)) is selected, the *indent size* is the width of a TAB character.
- If neither of these options are selected, the *indent size* is the number of SPACE characters used for indenting the text lines.

For additional information about changing the *indent size*, see [Setting an Indent Size to Zero](#) ([on page 514](#)).

For information about when this setting is used, see [Where Indent Size and Line Width Settings are Used in Oxygen XML Developer](#) ([on page 173](#)).

Indent on enter

If selected, when you press **Enter** to insert a line break in the **Text** editing mode, an indentation will be added to the new line.

Enable smart enter

If selected, when you press the **Enter** key between a start and an end XML tag in the **Text** editing mode, the cursor is placed in an indented position on the empty line formed between the start and end tag.

Format and indent the document on open

If selected, an XML document is formatted and indented before opening it in Oxygen XML Developer.

Note:

Some specialized types of XML documents do not benefit from this feature, including Relax NG, XSD, XSL, and Ant. However, the feature is available for some non-XML types of documents, such as CSS and JSON.

Detect line width on open

If selected, Oxygen XML Developer automatically detects the line width when the document is opened.

Hard line wrap (Limit to "Line width - Format and Indent")

If selected, when typing content in the **Text** editing mode and the maximum line width is reached, a line break is automatically inserted.

Line width - Format and Indent

Defines the number of characters after which the **Format and Indent** (pretty-print) action performs hard line-wrapping. For example, if set to 100, after a **Format and Indent** action, the longest line will have a maximum of 100 characters.

Note:

To avoid having an indent that is longer than the line width setting and without having sufficient space available for the text content, the indent limit is actually set at half the value of the **Line width - Format and Indent** setting. The remaining space is reserved for text.

For information about when this setting is used, see [Where Indent Size and Line Width Settings are Used in Oxygen XML Editor \(on page 173\)](#).

Clear undo buffer before Format and Indent

The **Format and Indent** operation can be *undone*, but if used intensively, a considerable amount of the memory allocated for Oxygen XML Developer will be used for storing the undo states. If this option is selected, Oxygen XML Developer empties the undo buffer before doing a **Format and Indent** operation. This means you will not be able to undo any changes you made before the format and indent operation. Select this option if you encounter out of memory problems (**OutOfMemoryError**) when performing the **Format and Indent** operation.

Where Indent Size and Line Width Settings are Used in Oxygen XML Developer

The values set in the **Indent Size** and **Line Width - Format and Indent** options are used in various places in the application, including the following:

- When the **Format and Indent** action is used in the **Text** editing mode.
- When you press **Enter** to break a line in the **Text** editing mode.
- When the **Hard line wrap (Limit to "Line width - Format and Indent")** option is selected and the maximum line width is reached while editing in the **Text** mode.

Resources

For more information about the formatting options offered by Oxygen XML Developer, watch our video demonstration:

<https://www.youtube.com/embed/1plmdN0Cfso>

XML Preferences

To configure the **XML** Formatting options, open the **Preferences** dialog box (**Options > Preferences**) (*on page 114*) and go to **Editor > Format > XML**.

The following options are available:

Format Section

This section includes the following drop-down boxes:

Preserve empty lines

The **Format and Indent** operation preserves all empty lines found in the document.

Preserve text as it is

The **Format and Indent** operation preserves text content as it is, without removing or adding any white space.

Preserve line breaks in attributes

Line breaks found in attribute values are preserved.

Note:

When this option is selected, the **Break long attributes** option (*on page 174*) is automatically disabled.

Break long attributes

The **Format and Indent** operation breaks long attribute values.

Indent inline elements

The *inline elements* are indented on separate lines if they are preceded by white spaces and they follow another element start or end tag. For example:

Original XML:

```
<root>
  text <parent> <child></child> </parent>
</root>
```

Indent inline elements selected:

```
<root> text <parent>
  <child/>
</parent>
</root>
```

Indent inline elements not selected:

```
<root> text <parent> <child/> </parent> </root>
```

Expand empty elements

If not selected (default), the **Format and Indent** operation results in an empty XML element being serialized in a compact form (`<a atr1="v1"/>`). If selected, the same operation results in empty XML elements being serialized in expanded form (for example, `<a atr1="v1">`).

Note:

When using the **Format and Indent** operation in **Text** mode, if the **Schema-aware format and indent** option ([on page 176](#)) is enabled, Oxygen XML Developer will use information from the associated schema and avoid expanding tags for elements that are defined as *empty* in the schema.

Sort attributes

The **Format and Indent** operation sorts the attributes of an element lexicographically.

Add space before slash in empty elements

Inserts a space character before the trailing / and > of empty elements.

Break line before an attribute name

When selected, the **Format and Indent** operation always breaks the line before any attribute name in an XML element. By default, the setting is not selected, which means that new lines might still be added before the attribute names but only if the line of content would overflow the maximum line width specified in the **Format preferences page** ([on page 171](#)).

Element Spacing Section

This section controls how the application handles whitespaces found in XML content. You can **Add** or **Remove** element names or simplified XPath expressions in the various tabs.

The XPath expressions can accept multiple attribute conditions and inside each condition you can use *AND/OR* boolean operators and parentheses to override the priority.

You can use one or more of the following attribute conditions (default attribute values are not taken into account):

- `element[@attr]`- Matches all instances of the specified element that include the specified attribute.
- `element[not(@attr)]`- Matches all instances of the specified element that do not include the specified attribute.

- `element[@attr = "value"]`- Matches all instances of the specified element that include the specified attribute with the given value.
- `element[@attr != "value"]`- Matches all instances of the specified element that include the specified attribute and its value is different than the one given.

Example: The following is an example of how you could use multiple boolean operators and parentheses inside an attribute condition:

```
*[@a and @b or @c and @d]
*[@a and (@b or @c) and @d]
```

The following are just examples of how simplified XPath expressions might look like:

- `elementName`
- `//elementName`
- `/elementName1/elementName2/elementName3`
- `//xs:localName` **Note:** The namespace prefixes (such as `xs`) are treated as part of the element name without taking its binding to a namespace into account.
- `//xs:documentation[@lang="en"]`

The tabs are as follows:

Preserve space

List of elements that will have the **Format and Indent** operation preserve the whitespaces (such as blanks, tabs, and newlines).

Default space

List of elements that will have the content normalized (multiple contiguous whitespaces are replaced by a single space), before applying the **Format and Indent** operation.

Mixed content

The elements from this list are treated as mixed content when applying the **Format and Indent** operation. The lines are split only when whitespaces are encountered.

Line break

List of elements that will have line breaks inserted, regardless of their content. You can choose to break the line *before* the element, *after*, or *both*.

Schema-aware format and indent

The **Format and Indent** operation takes the schema information into account with regard to the *space preserve*, *mixed*, or *element only* properties of an element.

Indent Section

Includes the following options:

Indent (when typing) in preserve space elements

Normally, the *Preserve space* elements (identified by the `xml:space` attribute set to `preserve` or by their presence in the **Preserve space** tab of the **Element Spacing** list (on page 175)) are ignored by the **Format and Indent** operation. When this option is selected and you edit one of these elements, its content is formatted.

Indent on paste - sections with number of lines less than 300

When you paste a chunk of text that has fewer than 300 lines, the inserted content is indented. To keep the original indent style of the document you copy content from, deselect this option.

Whitespaces Preferences

When Oxygen XML Developer formats and indents XML documents, a whitespace normalization process is applied, thus replacing whitespace sequences with single space characters. Oxygen XML Developer allows you to configure which Unicode characters are treated as spaces during the normalization process.

To configure the **Whitespace** preferences, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Editor > Format > XML > Whitespaces**.

This table lists the Unicode whitespace characters. Select any that you want to have treated as whitespace when formatting and indenting an XML document.

The whitespaces are normalized when the **Format and Indent** action is applied on an XML document.

Note:

The whitespace normalization process replaces any sequence of characters declared as whitespaces in the **Whitespaces** table with a single space character (`U+0020`). If you want to be sure that a certain whitespace character will not be removed in the normalization process, deselect it in the **Whitespaces** table.

Important:

The characters with the codes `U+0009` (TAB), `U+000A` (LF), `U+000D` (CR) and `U+0020` (SPACE) are always considered to be whitespace characters and cannot be deselected.

XQuery Preferences

To configure the **XQuery** Formatting options, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Editor > Format > XQuery**.

The following options are available:

- **Preserve line breaks** - All initial line breaks are preserved.
- **Break line before an attribute name** - Each attribute of an XML element is written on a new line and properly indented.

XPath Preferences

To configure the **XPath** Formatting options, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Editor > Format > XPath**.

The following option is available:

Format XPath code embedded in XSLT, XSD and Schematron files

If selected, the **Format and Indent** action applied on an XSD, XSLT, or Schematron document will perform an XPath-specific formatting on the values of the attributes that accept XPath expressions.

Note:

For XSLT documents, the formatting is not applied to *attribute value templates*.

CSS Preferences

Oxygen XML Developer can format and indent your CSS files. To configure the **CSS** formatting options, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Editor > Format > CSS**.

The following options control how your CSS files are formatted and indented:

Class body on new line

If selected, the *class* body (including the curly brackets) is placed on a new line. This option is not selected by default.

Indent class content

When selected (default state), the *class* content is indented.

Add space before the value of a CSS property

When selected (default state), whitespaces are added between the `:` (colon) and the value of a style property.

Add new line between classes

If selected, an empty line is added between two classes. This option is not selected by default.

Preserve empty lines

When selected (default state), the empty lines from the CSS content are preserved.

Allow formatting embedded CSS

When selected (default state), CSS content that is embedded in XML is also formatted when the XML content is formatted.

JavaScript Preferences

To configure the **JavaScript** format options, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Editor > Format > JavaScript**.

The following options control the behavior of the **Format and Indent** action:

- **Start curly brace on new line** - Opening curly braces start on a new line.
- **Preserve empty lines** - Empty lines in the JavaScript code are preserved. This option is selected by default.
- **Allow formatting embedded JavaScript** - Applied only to XHTML documents, this option allows Oxygen XML Developer to format embedded JavaScript code, taking precedence over the [Schema-aware format and indent \(on page 176\)](#) option. This option is selected by default.

JSON Preferences

To configure the **JSON** format options, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **Editor > Format > JSON**.

The following option is available:

Sort keys - If enabled, when using the **Format and Indent** action on JSON content, dictionary items are sorted alphabetically by key name.

Content Completion Preferences

Oxygen XML Developer provides a [Content Completion Assistant \(on page 2267\)](#) that provides a list of available options at any point in a document and can auto-complete structures, elements, and attributes. To configure the **Content Completion** preferences, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **Editor > Content Completion**. These options control how the *Content Completion Assistant* works.

The following options are available:

Auto close the last opened tag

When selected, Oxygen XML Developer automatically closes the last open tag when you type `</`.

Automatically rename/delete/comment matching tags

If you rename, delete, or comment out a start tag, Oxygen XML Developer automatically renames, deletes, or comments out the matching end tag.

Note:

If you select **Toggle comment** for multiple starting tags and the matching end tags are on the same line as other start tags, the end tags are not commented.

Enable content completion

Toggles the content completion feature on or off.

Consider subsequent sibling elements

When this option is selected (default), the subsequent sibling elements of the current element are taken into account when using the *Content Completion Assistant*. For example, in DITA, if

you invoke the content completion before an already inserted required element (e.g. a `<title>` element), the content completion mechanism will not offer a proposal to insert a title (since it was already inserted).

Close the inserted element

When you choose an entry from the *Content Completion Assistant* list of proposals, Oxygen XML Developer inserts both start and end tags. The following additional options are available with regard to closing the element:

- **If it has no matching tag** - The end tag of the inserted element is automatically added only if it is not already present in the document.
- **Add element content** - Oxygen XML Developer inserts the required elements specified in the DTD, XML Schema, or RELAX NG schema that is associated with the edited XML document.
 - **Add optional content** - If selected, Oxygen XML Developer inserts the optional elements specified in the DTD, XML Schema, or RELAX NG schema.
 - **Add first Choice particle** - If selected, Oxygen XML Developer inserts the first **choice** particle specified in the DTD, XML Schema, or RELAX NG schema.

Case sensitive search

When selected, the search in the *Content Completion Assistant* is case-sensitive when you type a character ('a' and 'A' are different characters).

Note:

This option is ignored when the current language itself is not case-sensitive. For example, the case is ignored in the CSS language.

Position cursor between tags

When selected, Oxygen XML Developer automatically moves the cursor between the start and end tag after inserting the element. This only applies to:

- Elements with only optional attributes or no attributes at all.
- Elements with required attributes, but only when the **Insert the required attributes** option ([on page 180](#)) is not selected.

Show all entities

Oxygen XML Developer displays a list with all the internal and external entities declared in the current document when you type the start character of an entity reference (for example, `&`).

Insert the required attributes

If selected, Oxygen XML Developer automatically inserts the required attributes taken from the DTD or XML Schema for an element inserted with the *Content Completion Assistant*. For ID attributes that are required, a unique value is automatically generated for each new ID.

Insert the fixed attributes

If selected, Oxygen XML Developer automatically inserts any **FIXED** attributes from the DTD or XML Schema for an element inserted with the *Content Completion Assistant*.

Show recently used items

When selected, Oxygen XML Developer remembers the last inserted items from the *Content Completion Assistant* window. The number of items to be remembered is limited by the **Maximum number of recent items shown** list box. These most frequently used items are displayed on the top of the content completion window and are separated from the rest of the suggestions by a thin gray line .

Maximum number of recent items shown

Specifies the limit for the number of recently used items presented at the top of the *Content Completion Assistant* window.

Learn attributes values

When selected, Oxygen XML Developer learns the attribute values used in a document.

Learn on open document

Oxygen XML Developer automatically learns the document structure when the document is opened.

Learn words (Dynamic Abbreviations, available on Ctrl+Space)

When selected, Oxygen XML Developer learns the typed words and makes them available in a content completion fashion by pressing **Ctrl + Space** on your keyboard;

**Note:**

For the words to be learned, they need to be separated by space characters.

Activation delay of the proposals window (ms)

Delay in milliseconds from the last key press until the *Content Completion Assistant* is displayed.

XSLT Preferences

XSLT stylesheets are often used to create output in XHTML or XSL-FO. In addition to suggesting content completion options for XSLT stylesheet elements, Oxygen XML Developer can suggest elements from these vocabularies. To configure the XSLT content completion options, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **Editor > Content Completion > XSLT**.

The following options are available:

Include elements declared in the schema section

This section includes options with regard to detecting elements from the declared schema.

Automatically detect HTML or Formatting Objects

Detects if the output being generated is HTML or FO and provides content completion for those vocabularies. Oxygen XML Developer analyzes the namespaces declared in the root element to find an appropriate schema.

If the detection fails, Oxygen XML Developer uses one of the following options:

- **None** - The *Content Completion Assistant (on page 2267)* suggests only XSLT elements.
- **HTML** - The *Content Completion Assistant (on page 2267)* includes HTML elements, including HTML5 elements (such as `<video>`, `<canvas>`, etc.).
- **Formatting objects** - The *Content Completion Assistant (on page 2267)* includes Formatting Objects (XSL-FO) elements as substitutes for `<xsl:element>`.
- **Custom schema** - If you want content completion hints for another output vocabulary, you can use this option to specify the path to the schema for that vocabulary. The supported schema types are DTD, XML Schema, RNG schema, or NVDL schema for inserting elements from the target language of the stylesheet.

Documentation schema section

This section specifies an additional schema that will be used for documenting XSL stylesheets. You can choose between the following:

- **Built-in schema** - Uses the built-in schema for documentation.
- **Custom schema** - Allows you to specify a custom schema for documentation. The supported schema types are XSD, RNG, RNC, DTD, and NVDL.

XPath Preferences

Oxygen XML Developer provides content-completion support for XPath expressions. To configure the options for the content completion in XPath expressions, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Editor > Content Completion > XPath**.

The following options are available:

- **Enable content completion for XPath expressions** - Enables the *Content Completion Assistant in XPath expressions (on page 663)* that you enter in the `@match`, `@select`, and `@test` XSL attributes and also in the XPath toolbar (on page 1733).
 - **Include XPath functions** - When this option is selected, XPath functions are included in the content completion suggestions.
 - **Include XSLT functions** - When this option is selected, XSLT functions are included in the content completion suggestions.
 - **Include axes** - When this option is selected, XSLT axes are included in the content completion suggestions.
- **Show signatures of XSLT / XPath functions** - Makes the editor indicate the signature of the XPath function located at the cursor position in a tooltip. See the *XPath Tooltip Helper (on page 667)* section for more information.

- **Function signature window background** - Specifies the background color of the tooltip window.
- **Function signature window foreground** - Specifies the foreground color of the tooltip window.

XSD Preferences

Oxygen XML Developer provides content completion assistance when you are writing XML Schema (XSD). To configure XSD preferences, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **Editor > Content Completion > XSD**. The option in this preferences page allows you to define additional elements to be suggested by the *Content Completion Assistant (on page 2267)* in `<xs:appinfo>` elements (in addition to the elements defined in the XML Schema).

The following option is available:

When in "xs:appinfo" context, also include elements declared in the schema

You can choose between the following:

- **None** - The *Content Completion Assistant* offers only the XML Schema schema information.
- **ISO Schematron** - The *Content Completion Assistant* also includes ISO Schematron elements in `<xs:appinfo>`.
- **Schematron 1.5** - The *Content Completion Assistant* also includes Schematron 1.5 elements in `<xs:appinfo>`.
- **Other** - The *Content Completion Assistant* also includes elements from an XML Schema identified by a URL in `<xs:appinfo>` elements.

JavaScript Preferences

Oxygen XML Developer can provide content completion suggestions when you are writing JavaScript files. To configure content completion support for JavaScript, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **Editor > Content Completion > JavaScript**. You can configure the following options:

Enable content completion

Enables the content completion support for JavaScript files.

Use built-in libraries

Allows Oxygen XML Developer to include components (object names, properties, functions, and variables) collected from the built-in JavaScript library files when making suggestions.

Use defined libraries

Oxygen XML Developer can also use JavaScript libraries when making suggestions. List the paths (URIs) of any JavaScript files you want Oxygen XML Developer to use when making suggestions.

**Note:**

The paths can contain [editor variables \(on page 289\)](#) such as `${pdu}`, or `${oxygenHome}`. You can make these paths relative to the project directory or installation directory.

JSON Preferences

Oxygen XML Developer can provide content completion suggestions when you are editing JSON files. To configure content completion support for JSON, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **Editor > Content Completion > JSON**. You can configure the following options:

Generate required content

When invoking content completion over JSON files, all contextual required content is automatically generated according to the specifications from the associated JSON Schema.

Generate optional properties

If selected, optional properties that are defined in the associated JSON Schema will be added when using content completion in JSON files.

Generate additional content

If selected, additional properties (or additional items for arrays) that are defined in the associated JSON Schema will be added when using content completion in JSON files.

YAML Preferences

Oxygen XML Developer can provide content completion suggestions when you are editing YAML files. To configure content completion support for YAML, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **Editor > Content Completion > YAML**. You can configure the following options:

Generate required content

When invoking content completion over YAML files, all contextual required content is automatically generated according to the specifications from the associated JSON schema.

Property value

You can specify the way the values of the properties are generated. The following options are available:

- *None* - Assigns empty values for properties (a template file will be generated). This is the default value.
- *Default* - Assigns the name of the property as the value (for strings) or assigns the specified minimum value (for numbers).
- *Random* - Assigns random values according to schema restrictions.

Generate optional properties

If selected, optional properties that are defined in the associated JSON schema will be added when using content completion in YAML files.

Generate additional content

If selected, additional properties (or additional items for arrays) that are defined in the associated JSON schema will be added when using content completion in YAML files.

Annotations Preferences

Certain types of schemas (XML Schema, DTDs, Relax NG) can include annotations that document the various elements and attributes that they define. Oxygen XML Developer can display these annotations when offering content completion suggestions. To configure the **Annotations** preferences, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **Editor > Content Completion > Annotations**.

The following options are available:

Show annotations in Content Completion Assistant

If selected, Oxygen XML Developer displays the schema annotations of an element, attribute, or attribute value currently selected in the *Content Completion Assistant (on page 2267)* proposals list.

Show annotations in tooltip

If selected, Oxygen XML Developer displays the annotation of elements and attributes as a tooltip when you hover over them with the cursor in the editing area or in the **Elements** view. If not selected, tooltips are disabled in all modes.

Show annotation in HTML format, if possible

This option allows you to view the annotations associated with an element or attribute in HTML format. It is available when editing XML documents that have associated an XML Schema or Relax NG schema. If this option is not selected, the annotations are converted and displayed as plain text.

Prefer DTD comments that start with "doc:" as annotations

To address the lack of dedicated annotation support in DTD documents, Oxygen XML Developer recommends prefixing with the `doc:` particle all comments intended to be shown to the developer who writes an XML validated against a DTD schema.

If this option is selected, Oxygen XML Developer uses the following mechanism to collect annotations:

- If at least one `doc:` comment is found in the entire DTD, only comments of this type are displayed as annotations.
- If no `doc:` comment is found in the entire DTD, all comments are considered annotations and displayed as such.

If not selected, all comments, regardless of their type, are considered annotations and displayed as such.

Use all Relax NG annotations as documentation

If selected, any element outside the Relax NG namespace, that is `http://relaxng.org/ns/structure/1.0`, is considered annotation and is displayed in the annotation window next to the *Content Completion Assistant (on page 2267)* window and in the **Model view (on page 499)**. When this option is not selected, only elements from the Relax NG annotations namespace, that is `http://relaxng.org/ns/compatibility/annotations/1.0` are considered annotations.

[Schema Annotations in Text Mode \(on page 489\)](#)

Code Templates Preferences

Code templates are code fragments that can be inserted at the current editing position. Oxygen XML Developer includes a set of built-in templates for CSS, LESS, Schematron, XSL, XQuery, JSON, HTML, and XML Schema document types. You can also [define your own code templates \(on page 491\)](#) for any type of file and [share them with your colleagues \(on page 493\)](#) using the template export and import functions.

To configure **Code Templates**, open the **Preferences** dialog box (**Options > Preferences**) [\(on page 114\)](#) and go to **Editor > Templates > Code Templates**.

This preferences page contains a list of all the available code templates (both built-in and custom created ones) and a code preview area. You can disable any code template by deselecting it.

The following actions are available:

New

Opens the **Code template** dialog box that allows you to define a new code template. You can define the following fields:

- **Name** - The name of the code template.
- **Description** - [Optional] The description of the code template that will appear in the **Code Templates** preferences page and in the tooltip message when selecting it from the *Content Completion Assistant (on page 2267)*. HTML markup can be used for better rendering.
- **Associate with** - You can choose to set the code template to be associated with a specific type of editor or for all editor types.
- **Shortcut key** - [Optional] If you want to assign a shortcut key that can be used to insert the code template, place the cursor in the **Shortcut key** field and press the desired key combination on your keyboard. Use the **Clear** button if you make a mistake. If the **Enable platform-independent shortcut keys** checkbox is selected, the shortcut is platform-independent and the following modifiers are used:

- **M1** represents the **Command** key on macOS, and the **Ctrl** key on other platforms.
- **M2** represents the **Shift** key.
- **M3** represents the **Option** key on macOS, and the **Alt** key on other platforms.
- **M4** represents the **Ctrl** key on macOS, and is undefined on other platforms.
- **Content** - Text box where you define the content that is used when the code template is inserted. An [editor variable \(on page 289\)](#) can be inserted in the text box using the  **Insert Editor Variables** button.

Edit

Opens the **Code template** dialog box and allows you to edit an existing code template. You can edit the following fields:

- **Description** - [Optional] The description of the code template that will appear in the **Code Templates** preferences page and in the tooltip message when selecting it from the [Content Completion Assistant \(on page 2267\)](#). HTML markup can be used for better rendering.
- **Shortcut key** - [Optional] If you want to assign a shortcut key that can be used to insert the code template, place the cursor in the **Shortcut key** field and press the desired key combination on your keyboard. Use the **Clear** button if you make a mistake. If the **Enable platform-independent shortcut keys** checkbox is selected, the shortcut is platform-independent and the following modifiers are used:
 - **M1** represents the **Command** key on macOS, and the **Ctrl** key on other platforms.
 - **M2** represents the **Shift** key.
 - **M3** represents the **Option** key on macOS, and the **Alt** key on other platforms.
 - **M4** represents the **Ctrl** key on macOS, and is undefined on other platforms.
- **Content** - Text box where you define the content that is used when the code template is inserted. An [editor variable \(on page 289\)](#) can be inserted in the text box using the  **Insert Editor Variables** button.

Duplicate

Creates a duplicate of the currently selected code template.

Delete

Deletes the currently selected code template. This action is not available for the built-in code templates.

Export

Exports a file with code templates.

Import

Imports a file with code templates that was created by the **Export** action.

You can use the following [editor variables \(on page 289\)](#) when you define a code template in the **Content** text box:

- **`\${caret}** - The position where the cursor is located. This variable can be used in a code template, in **Author** mode operations, or in a **selection plugin**.
- **`\${selection}** - The currently selected text content in the currently edited document. This variable can be used in a code template, in **Author** mode operations, or in a **selection plugin**.
- **`\${ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default_value', @id)}** - To prompt for values at runtime, use the `ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default-value')` editor variable. You can set the following parameters:
 - **'message'** - The displayed message. Note the quotes that enclose the message.
 - **'default-value'** - Optional parameter. Provides a default value.
 - **@id** - Optional parameter. Used for identifying the variable to reuse the answer using the **`\${answer(@id)}** editor variable.
 - **type** - Optional parameter (defaults to **generic**), with one of the following values:

 **Note:**

The title of the dialog box will be determined by the type of parameter and as follows:

- For `url` and `relative_url` parameters, the title will be the name of the parameter and the value of the `'message'`.
- For the other parameters listed below, the title will be the name of that respective parameter.
- If no parameter is used, the title will be "Input".

 **Notice:**

Editor variables that are used within a parameter of another editor variable must be escaped within single quotes for them to be properly expanded. For example:

```
`${ask( 'Provide a date', generic, '${date(yyyy-MM-dd'T'HH:MM)}' )}
```

Parameter	
generic (default)	<p>Format: <code>`\${ask('message', generic, 'default')}</code></p> <p>Description: The input is considered to be generic text that requires no special handling.</p> <p>Example:</p> <ul style="list-style-type: none"> ▪ <code>`\${ask('Hello world!')}</code> - The dialog box has a <i>Hello world!</i> message displayed. ▪ <code>`\${ask('Hello world!', generic, 'Hello again!')}</code> - The dialog box has a <i>Hello world!</i> message displayed and the value displayed in the input box is <i>Hello again!</i>.
url	<p>Format: <code>`\${ask('message', url, 'default_value')}</code></p>

Parameter	
	<p>Description: Input is considered a URL. Oxygen XML Developer checks that the provided URL is valid.</p> <p>Example:</p> <ul style="list-style-type: none"> ▪ <code>\${ask('Input URL', url)}</code> - The displayed dialog box has the name <i>Input URL</i>. The expected input type is URL. ▪ <code>\${ask('Input URL', url, 'http://www.example.com')}</code> - The displayed dialog box has the name <i>Input URL</i>. The expected input type is URL. The input field displays the default value <i>http://www.example.com</i>.
relative_url	<p>Format: <code>\${ask('message', relative_url, 'default')}</code></p> <p>Description: Input is considered a URL. This parameter provides a file chooser, along with a text field. Oxygen XML Developer tries to make the URL relative to that of the document you are editing.</p> <div data-bbox="560 898 1439 1160" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; margin: 10px 0;"> <p> Note: If the <code>\$ask</code> editor variable is expanded in content that is not yet saved (such as an <i>untitled</i> file, whose path cannot be determined), then Oxygen XML Developer will transform it into an absolute URL.</p> </div> <p>Example:</p> <p><code>\${ask('File location', relative_url, 'C:/example.txt')}</code> - The dialog box has the name <i>File location</i>. The URL inserted in the input box is made relative to the currently edited document location.</p>
password	<p>Format: <code>\${ask('message', password, 'default')}</code></p> <p>Description: The input is hidden with bullet characters.</p> <p>Example:</p> <ul style="list-style-type: none"> ▪ <code>\${ask('Input password', password)}</code> - The displayed dialog box has the name <i>Input password</i> and the input is hidden with bullet symbols. ▪ <code>\${ask('Input password', password, 'abcd')}</code> - The displayed dialog box has the name <i>Input password</i> and the input hidden with bullet symbols. The input field already contains the default abcd value.
combobox	<p>Format: <code>\${ask('message', combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}</code></p>

Parameter	
	<p>Description: Displays a dialog box that offers a drop-down menu. The drop-down menu is populated with the given <i>rendered_value</i> values. Choosing such a value will return its associated value (<i>real_value</i>).</p> <div data-bbox="560 387 1437 566" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; margin-bottom: 10px;"> <p> Note: The list of '<i>real_value</i>':'<i>rendered_value</i>' pairs can be computed using <code>\$(xpath_eval())</code>.</p> </div> <div data-bbox="560 595 1437 775" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; margin-bottom: 10px;"> <p> Note: The '<i>default</i>' parameter specifies the default-selected value and can match either a key or a value.</p> </div> <p>Example:</p> <ul style="list-style-type: none"> ▪ <code>\$(ask('Operating System', combobox, ('win':'Microsoft Windows';'macos':'macOS';'lnx':'Linux/UNIX'), 'macos'))</code> - The dialog box has the name '<i>Operating System</i>'. The drop-down menu displays the three given operating systems. The associated value will be returned based upon your selection. <div data-bbox="639 1144 1437 1503" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; margin-bottom: 10px;"> <p> Note: In this example, the default value is indicated by the <i>osx</i> key. However, the same result could be obtained if the default value is indicated by <i>macOS</i>, as in the following example: <code>\$(ask('Operating System', combobox, ('win':'Microsoft Windows';'macos':'macOS';'lnx':'Linux/UNIX'), 'macOS'))</code></p> </div> <ul style="list-style-type: none"> ▪ <code>\$(ask('Mobile OS', combobox, ('ios':'iOS';'and':'Android'), 'Android'))</code> ▪ <code>\$(ask('Mobile OS', combobox, (\$(xpath_eval(for \$pair in (['ios', 'iOS'], ['and', 'Android']) return "" \$pair?1 "" \$pair?2 "" ;)), 'ios'))</code>
<p>editable_combobox</p>	<p>Format: <code>\$(ask('message', editable_combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default'))</code></p> <p>Description: Displays a dialog box that offers a drop-down menu with editable elements. The drop-down menu is populated with the given <i>rendered_value</i> values. Choosing such a value will return its associated real value (<i>real_value</i>) or the value inserted when you edit a list entry.</p>

Parameter	
	<div data-bbox="560 226 1437 394">  Note: The list of 'real_value':'rendered_value' pairs can be computed using <code>#{xpath_eval()}</code>. </div> <div data-bbox="560 421 1437 600">  Note: The 'default' parameter specifies the default-selected value and can match either a key or a value. </div> <p data-bbox="560 656 671 689">Example:</p> <ul data-bbox="619 730 1437 1122" style="list-style-type: none"> ▪ <code>#{ask('Operating System', editable_combobox, ('win':'Microsoft Windows';'macos':'macOS';'lnx':'Linux/UNIX'), 'macos')}</code> - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input. ▪ <code>#{ask('Operating System', editable_combobox, (#{xpath_eval(for \$pair in ([win, 'Microsoft Windows'], [macos, 'macOS'], [lnx, 'Linux/UNIX']) return "" \$pair?1 ":" \$pair?2 ";")), 'ios')}</code>
radio	<p data-bbox="560 1155 1437 1234">Format: <code>#{ask('message', radio, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}</code></p> <p data-bbox="560 1267 1437 1379">Description: Displays a dialog box that offers a series of radio buttons. Each radio button displays a 'rendered_value' and will return an associated real_value.</p> <div data-bbox="560 1413 1437 1592">  Note: The list of 'real_value':'rendered_value' pairs can be computed using <code>#{xpath_eval()}</code>. </div> <div data-bbox="560 1626 1437 1805">  Note: The 'default' parameter specifies the default-selected value and can match either a key or a value. </div> <p data-bbox="560 1850 671 1883">Example:</p>

Parameter	
	<ul style="list-style-type: none"> ▪ <code>\${ask('Operating System', radio, ('win':'Microsoft Windows';'macos':'macOS';'lnx':'Linux/UNIX'), 'macos')}</code> - The dialog box has the name 'Operating System'. The radio button group allows you to choose between the three operating systems. <div style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; margin: 10px 0;"> <p> Note: In this example, <code>macOS</code> is the default-selected value and if selected, it would return <code>macos</code> for the output.</p> </div> <ul style="list-style-type: none"> ▪ <code>\${ask('Operating System', radio, (\${xpath_eval(for \$pair in (['win', 'Microsoft Windows'], ['macos', 'macOS'], ['lnx', 'Linux/UNIX']) return "" \$pair?1 ":" \$pair?2 ";" })), 'ios')}</code>

- **`\${timeStamp}** - The timestamp, which is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.
- **`\${uid}** - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java [UUID](#) class.
- **`\${id}** - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be universally unique.
- **`\${cfn}** - Current file name without the extension and parent folder. The current file is the one currently open and selected.
- **`\${cfne}** - Current file name with extension. The current file is the one currently open and selected.
- **`\${cf}** - Current file as file path, that is the absolute file path of the currently edited document.
- **`\${cfd}** - Current file folder as file path, that is the path of the currently edited document up to the name of the parent folder.
- **`\${frameworksDir}** - The path (as file path) of the `frameworks` directory. When used to define references inside a framework configuration, it expands to the parent folder of that specific framework folder. Otherwise, it expands to the main `frameworks` folder defined in the **Document Type Association > Locations** preferences page.
- **`\${pd}** - The file path to the folder that contains the current project file (`.xpr`).
- **`\${oxygenInstallDir}** - Oxygen XML Developer installation folder as file path.
- **`\${homeDir}** - The path (as file path) of the user home folder.
- **`\${pn}** - Current project name.
- **`\${env(VAR_NAME)}** - Value of the `VAR_NAME` environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the **`\${system(var.name)}** editor variable.
- **`\${system(var.name)}** - Value of the `var.name` Java System Property. The Java system properties can be specified in the command-line arguments of the Java runtime as `-Dvar.name=var.value`. If you are looking for operating system environment variables, use the **`\${env(VAR_NAME)}** editor variable instead.

- **`\${date(pattern)}`** - Current date. The allowed patterns are equivalent to the ones in the [Java SimpleDateFormat](#) class. **Example:** `yyyy-MM-dd`.

**Note:**

This editor variable supports both the **xs:date** and **xs:datetime** parameters. For details about **xs:date**, go to: <http://www.w3.org/TR/xmlschema-2/#date>. For details about **xs:datetime**, go to: <http://www.w3.org/TR/xmlschema-2/#dateTime>.

Related information

[Code Templates](#) (on page 491)

Syntax Highlight Preferences

Oxygen XML Developer supports syntax highlighting in the **Text** mode editors for numerous types of documents, including XML, XHTML, JavaScript, XQuery, XPath, PHP, PowerShell, CSS, LESS, Markdown, Text, DTD, RNC, Java, JSON, Ant, and more.

To configure syntax highlighting, [open the Preferences dialog box \(Options > Preferences\)](#) (on page 114) and go to **Editor > Syntax Highlight**.

To set syntax colors for a language, expand the listing for that language in the top panel to show the list of syntax items for that type of document. Use the color and style selectors to change how each syntax item is displayed. The results of your changes are displayed in the **Preview** panel. If you do not know the name of the syntax token that you want to configure, click that token in the **Preview** area to select it.

**Note:**

All default color sets come with a high-contrast variant that is automatically used when you switch to a black-background or white-background high-contrast theme in your Windows operating system settings. The high-contrast theme will not overwrite any default color you set in **Editor > Syntax Highlight** preferences page.

The settings for XML documents are also used in XSD, XSL, RNG documents and the **Preview** area has a separate tab for each of them when **XML** is selected in the top pane.

The **Enable nested syntax highlight** option controls whether or not content types that are nested in the same file (such as PHP, JS, or CSS scripts inside an HTML file) are highlighted according to the color schemes defined for each content type.

Elements/Attributes by Prefix Preferences

Oxygen XML Developer allows you to specify syntax highlighting colors for elements and attributes with specific namespace prefixes. To configure the **Elements/Attributes by Prefix** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) (on page 114) and go to **Editor > Syntax Highlight > Elements/Attributes by Prefix**.

To change the syntax coloring for a specific namespace prefix, choose the prefix from the list, or add a new one using the **New** button, and use the color and style selectors to set the syntax highlighting style for that namespace prefix.

**Note:**

Syntax highlighting is based on the literal namespace prefix, not the namespace that the prefix is bound to in the document.

If you only want the prefix (and not the whole element or attribute name) to be styled with a particular color, select the **Draw only the prefix with a separate color** option.

Mark Occurrences Preferences

This preferences page specifies which types of files will have the [Highlight IDs Occurrences \(on page 521\)](#) feature activated. To configure these options, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **Editor > Mark Occurrences**:

The following options are available in this preferences page:

Highlight component occurrences in the current file for:

- **XML files** - Activates the [Highlight IDs Occurrences \(on page 521\)](#) feature in XML files.
- **XSLT files** - Activates the [Highlight Component Occurrences \(on page 1000\)](#) feature in XSLT files.
- **XML Schema files** - Activates the [Highlight Component Occurrences \(on page 1000\)](#) feature in XSD files.
- **WSDL files** - Activates the [Highlight Component Occurrences \(on page 1000\)](#) feature in WSDL files.
- **RNG files** - Activates the highlight component occurrences feature in RNG files.
- **Schematron files** - Activates the [Highlight Component Occurrences \(on page 1000\)](#) feature in Schematron files.
- **Ant files** - Activates the [Highlight Component Occurrences \(on page 714\)](#) feature in Ant files.

Declaration highlight color

Allows you to choose the color to be used for highlighting component declarations.

Reference highlight color

Allows you to choose the color to be used for highlighting component references.

Document Validation Preferences

To configure document validation options, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **Editor > Document Validation**. This page contains preferences for configuring how a document is checked for both well-formedness and validation errors.

The following options are available:

Maximum number of validation highlights

If a validation generates more errors than the number specified in this option, only the errors up to this number are highlighted in the editor panel and on the stripe that is displayed at the right side of the editor panel. This option applies to both automatic validation and manual validation.

Validation fatal error highlight color

The color used to highlight fatal validation errors in the document.

Validation error highlight color

The color used to highlight validation errors in the document.

Validation warning highlight color

The color used to highlight validation warnings in the document.

Validation info highlight color

The color used to highlight validation info messages in the document.

Validation success color

The color used to highlight the success indicator of the validation operation in the vertical ruler bar.

Always show validation status

If this option is selected, the current validation error or warning is always visible in the message line at the bottom of the editor panel. This is useful when the **Enable automatic validation** option is selected and the vertical scroll bar changes position due to an error message being displayed.

Enable automatic validation

This causes the validation to be automatically executed in the background as the document is modified in Oxygen XML Developer.

Delay after the last key event (s)

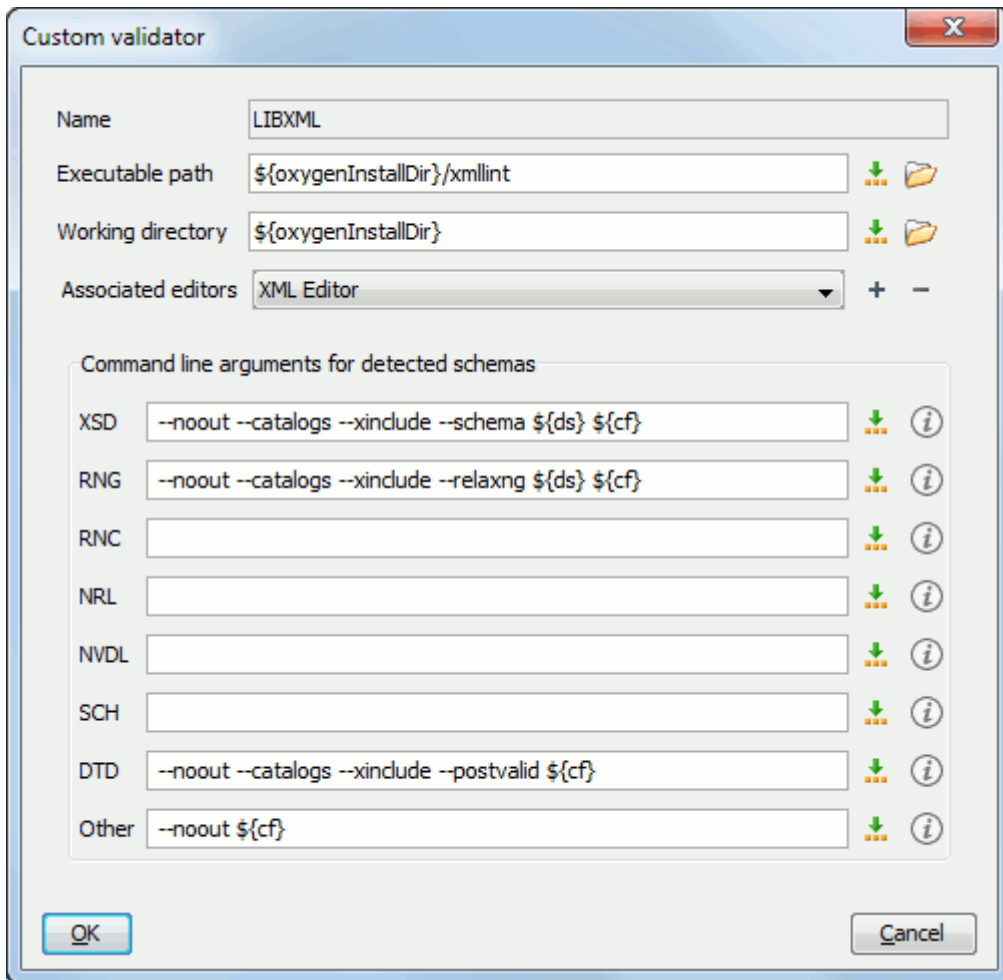

The period of keyboard inactivity before starting a new validation (in seconds).

At the bottom of the preferences page you can [choose whether or not the saved options will be shared with other users by selecting **Global** or **Project** storage options \(on page 277\)](#).

Custom Validation Engines Preferences

As the name implies, the **Custom Validation Engines** preferences page displays the list of custom validation engines that can be associated to a particular editor and used for validating documents. To access this page, [open the **Preferences** dialog box \(**Options > Preferences**\) \(on page 114\)](#) and go to **Editor > Document Validation > Custom Validation Engines**.

If you want to add a new custom validation tool or edit the properties of an existing one, you can use the **Custom Validator** dialog box displayed by pressing the **New** or **Edit** button.

Figure 22. Custom Validator Dialog Box

The **Custom Validator** dialog box allows you to configure the following parameters:

Name

Name of the custom validation engine that will be displayed in the **Validation** toolbar drop-down menu.

Executable path

Path to the executable file of the custom validation tool. You can specify the path by using the text field, the **Insert Editor Variables** (on page 289) button, or the **Browse** button.

Working directory

The working directory of the custom validation tool. You can specify the path by using the text field, the **Insert Editor Variables** (on page 289) button, or the **Browse** button.

Associated editors

The editors that can perform validation with the external tool (XML editor, XSL editor, XSD editor, etc.)

Command-line arguments for detected schemas

Command-line arguments used in the commands that validate the currently edited file against various types of schema (XML Schema, Relax NG full syntax, Relax NG compact syntax, NVDL, Schematron, DTD, etc.) The arguments can include any custom switch (such as `-rng`) and the following [editor variables \(on page 289\)](#):

- **\${cf}** - Current file as file path, that is the absolute file path of the currently edited document.
- **\${currentFileURL}** - Current file as URL, that is the absolute file path of the currently edited document represented as URL.
- **\${ds}** - The path of the detected schema as a local file path for the current validated XML document.
- **\${dsu}** - The path of the detected schema as a URL for the current validated XML document.

[Editor Variables \(on page 289\)](#)

Increasing the Stack Size for Validation Engines

To prevent the appearance of a **StackOverflowException** error, use one of the following methods:

- Use the **com.oxygenxml.stack.size.validation.threads** property to increase the size of the stack for validation engines. The value of this property is specified in bytes. For example, to set a value of one megabyte specify $1 \times 1024 \times 1024 = 1048576$. For information about how to setup the system property on the JVM, see [Setting a Java Virtual Machine Parameter when Launching Oxygen XML Developer \(on page 304\)](#).
- Increase the value of the **-Xss** parameter.

Note:

Increasing the value of the **-Xss** parameter affects all the threads of the application.

Related information

[Setting a Java Virtual Machine Parameter when Launching Oxygen XML Developer \(on page 304\)](#)

Ignored Validation Problems Preferences

Some validation issues include a [Quick Fix \(on page 580\)](#) proposal that instructs the application to ignore that type of validation problem. The ignored problems are then listed in the **Ignored Validation Problems** preferences page. To access this page, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **Editor > Document Validation > Ignored Validation Problems**.

The **Ignored Validation Problems** preferences page includes the following:

Enable support for ignoring validation problems

If this option is selected, the support for ignoring certain validation problems is enabled. This means that when you choose a [Quick Fix proposal to ignore the particular validation problem \(on page 578\)](#), it is added to the table below this option.

Ignored problems table

The table includes an entry for each validation problem that has been ignored. The columns in the table include information about the **Severity**, **Problem ID**, **Message**, and **System ID**. The entries are added automatically when you choose a [Quick Fix proposal to ignore the particular validation problem \(on page 578\)](#). You can delete an entry by selecting it and clicking the **Delete** button at the bottom of the table. The deleted problem is no longer ignored.

**Tip:**

Changes made in this preferences page can be [saved at project level \(on page 278\)](#) so that you can easily share your ignored problems configuration with others.

Spell Check Preferences

Oxygen XML Developer provides support for spell checking in the **Text** mode. To configure the **Spell Check** options, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **Editor > Spell Check**.

The following options are available:

Automatic spell check

This option is not selected by default. When selected, Oxygen XML Developer automatically checks the spelling as you type and highlights misspelled words in the document.

Select editors

You can select which editors (and therefore which file types) will automatically be spell checked. File types such as CSS and DTD are excluded by default since automatic spell checking is not usually helpful in these types of files.

Spell check highlight color

Use this option to set the color used by the spell check engine to highlight spelling errors.

Language options section

This section includes the following language options:

Default language

The default language list allows you to choose the language used by the spell check engine when the language is not specified in the source file. You can [add additional dictionaries to the spell check engines \(on page 410\)](#).

Use "lang" and "xml:lang" attributes

When this option is selected, the contents of an element with one of the `@lang` or `@xml:lang` attributes is checked in that language. Choose between the following two options for instances when these attributes are missing:

- **Use the default language** - If the `@lang` and `@xml:lang` attributes are missing, the selection in the **Default language list** (*on page 198*) is used.
- **Do not check** - If the `@lang` and `@xml:lang` attributes are missing, the element is not checked.

XML spell checking in section

You can choose to check the spelling inside the following XML items:

- **Comments**
- **Processing instructions**
- **Attribute values**
- **Text**
- **CDATA**

Options section

This section includes the following other options:

Check capitalization

When selected, the spell checker reports detected capitalization errors.

Note:

When such problems are reported, they cannot be learned and ignored by the application as words stored in dictionaries, term lists, and the list of learned words are not handled as case-sensitive.

Check punctuation

When selected, the spell checker checks punctuation. Misplaced white space and unusual sequences, such as a period following a comma, are highlighted as errors.

Ignore mixed case words

When selected, the spell checker does not check words containing mixed case characters (for example, *SpellChecker*).

Ignore acronyms

Available only for the **Hunspell Spell Checker**. When selected, acronyms are not reported as errors.

Ignore words with digits

When selected, the spell checker does not check words containing digits (for example, *b2b*).

Ignore duplicates

When selected, the spell checker does not signal two successive identical words as an error.

Ignore URL

When selected, the spell checker ignores words recognized as URLs or file names (for example, *www.oxygenxml.com* or *c:\boot.ini*).

Allow compounds words

When selected, all words formed by concatenating multiple legal words with hyphens or underscores are accepted.

Allow file extensions

When selected, the spell checker accepts any word ending with recognized file extensions (for example, *myfile.txt* or *index.html*).

Ignore elements section

You can use the **Add** and **Remove** buttons to configure a list of element names or XPath expressions to be ignored by the spell checker. The following restricted set of XPath expressions are supported:

- '/' and '//' separators
- '*' wildcard

An example of an allowed XPath expression is: */a/*/b*.

Spell Check Dictionaries Preferences

To set the Dictionaries preferences, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Editor > Spell Check > Dictionaries**. This page allows you to configure the dictionaries (*.dic* files) and term lists (*.tdi* files) that Oxygen XML Developer uses and to choose where to save new learned words.

The following options are valid when Oxygen XML Developer uses the Hunspell spell checking engine:

Dictionaries and term lists default folder

Displays the default location where the dictionaries and term lists that Oxygen XML Developer uses are stored.

Include dictionaries and term list from

Selecting this option allows you to specify a location where you have stored dictionaries and term lists that you want to include, along with the default ones.

**Important:**

Consider the following notes regarding this option:

- The spell checker takes into account dictionaries and term lists collected both from the default and custom locations and multiple dictionaries and term lists from the same language are merged (for example, `en_UK.dic` from the default location is merged with `en_US.dic` from a custom location).
- If you have a generic dictionary file (one that just has a two-letter language code for its file name, such as `en.dic`) saved in either the default or custom location, the other more specific dictionaries (for example, `en_UK.dic` and `en_US.dic`) will not be merged and the existing generic dictionary will simply be used instead.
- If the additional location contains a file with the same name as one from the default location, the file in the additional location takes precedence over the file from the default location.

How to add more dictionaries and term lists link

Use this link to open a topic in the Oxygen XML Developer User Guide that explains how to [add more dictionaries and term lists \(on page 414\)](#).

Save learned words in the following location

Specifies the target where the newly learned words are saved. By default, the target is the application preferences folder, but you can also choose a custom location.

Delete learned words

Opens the list of learned words, allowing you to select the items you want to remove, without deleting the dictionaries and term lists.

**Note:**

Words stored in dictionaries, term lists, and the list of learned words are not handled as case-sensitive. Therefore, you do not need to include both uppercase and lowercase versions of the words.

Related information

[Adding Custom Spell Check Dictionaries \(on page 414\)](#)

[Adding Custom Spell Check Term Lists \(on page 416\)](#)

Print Preferences

Oxygen XML Developer lets you configure how files are printed out of the editor. Note that these settings cover how files are printed directly from Oxygen XML Developer itself, not how they are printed after the XML source has been transformed by a publishing stylesheet. To configure the **Print** options, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **Editor > Print**.

This page allows you to customize the headers and footers added to a printed page when you print from the **Text mode** (*on page 316*) editor. These settings do not apply to the **Grid** (*on page 316*) and **schema Design** (*on page 317*) mode.

You can specify what is printed on the **Left**, **Middle**, and **Right** of the header and footer using plain text of any of the following variables:

- **`\${currentFileURL}** - Current file as URL, that is the absolute file path of the currently edited document represented as URL.
- **`\${cfne}** - Current file name with extension. The current file is the one currently open and selected.
- **`\${cp}** - Current page number. Used to display the current page number on each printed page in the **Editor / Print** Preferences page.
- **`\${tp}** - Total number of pages in the document. Used to display the total number of pages on each printed page in the **Editor / Print** Preferences page.
- **`\${env(VAR_NAME)}** - Value of the `VAR_NAME` environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the **`\${system(var.name)}** editor variable.
- **`\${system(var.name)}** - Value of the `var.name` Java System Property. The Java system properties can be specified in the command-line arguments of the Java runtime as `-Dvar.name=var.value`. If you are looking for operating system environment variables, use the **`\${env(VAR_NAME)}** editor variable instead.
- **`\${date(pattern)}** - Current date. The allowed patterns are equivalent to the ones in the [Java SimpleDateFormat class](#). **Example:** `yyyy-MM-dd`.

Note:

This editor variable supports both the **xs:date** and **xs:datetime** parameters. For details about **xs:date**, go to: <http://www.w3.org/TR/xmlschema-2/#date>. For details about **xs:datetime**, go to: <http://www.w3.org/TR/xmlschema-2/#dateTime>.

For example, to show the current page number and the total number of pages in the top right corner of the page, write the following pattern in the **Right** text area of the **Header** section: `${cp} of ${tp}`.

You can also set the **Color** and **Font** used in the header and footer. Default font is `SansSerif`.

You can place a line below the header or above the footer by selecting **Underline/Overline**.

CSS Validator Preferences

To configure the **CSS Validator** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) (*on page 114*) and go to **CSS Validator**.

You can configure the following options for the built-in **CSS Validator** of Oxygen XML Developer:

- **Profile** - Selects one of the available validation profiles: **CSS 1**, **CSS 2**, **CSS 2.1**, **CSS 3**, **CSS 3 + SVG**, **CSS 3 with Oxygen extensions**, **SVG**, **SVG Basic**, **SVG Tiny**, **Mobile**, **TV Profile**, **ATSC TV Profile**. The **CSS 3 with Oxygen extensions** profile includes all the CSS 3 standard properties and the CSS

extensions specific for **Oxygen**. That means all **Oxygen**-specific extensions are accepted in a CSS stylesheet by [the built-in CSS validator \(on page 845\)](#) when this profile is selected.

- **Media type** - Selects one of the available mediums: **all, aural, braille, embossed, handheld, print, projection, screen, tty, tv, presentation, oxygen**.
- **Warning level** - Sets the minimum severity level for reported validation warnings. Can be one of: **All, Normal, Most Important, No Warnings**.
- **Ignore properties** - You can type comma separated patterns that match the names of CSS properties that will be ignored at validation. The following vendor extensions are specified as ignored by default: **-ro-*** (*PDFreactor*), **-ah-*** (*Antenna House*), **prince-*** (*Prince*). As wildcards you can use:
 - ***** to match any string.
 - **?** to match any character.
- **Recognize browser CSS extensions (also applies to content completion)** - If selected, Oxygen XML Developer recognizes browser-specific CSS properties (no validation is performed). The [Content Completion Assistant \(on page 2267\)](#) lists these properties at the end of its list, prefixed with the following particles:
 - **-moz-** for *Mozilla*.
 - **-ms-** for *Edge*.
 - **-o-** for *Opera*.
 - **-webkit-** for *Safari/Webkit*.

XML Preferences

This section describes the panels that contain the user preferences related with XML.

XML Catalog Preferences

To configure options that pertain to [XML Catalogs \(on page 2273\)](#), open the **Preferences** dialog box (**Options > Preferences**) ([on page 114](#)) and go to **XML > XML Catalog**.

The following options are available:

Prefer

Determines whether public identifiers specified in the catalog are used in favor of system identifiers supplied in the document. Suppose you have an entity in your document that has both a public identifier and a system identifier specified, and the catalog only contains a mapping for the public identifier (for example, a matching public catalog entry). You can choose between the following:

- **system** - If selected, the system identifier in the document is used.
 - **public** - If selected, the URI supplied in the matching public catalog entry is used.
- Generally, the purpose of catalogs is to override the system identifiers in XML documents, so **public** should usually be used for your catalogs.

**Note:**

If the catalog contains a matching system catalog entry giving a mapping for the system identifier, that mapping would have been used, the public identifier would never have been considered, and this setting would be irrelevant.

Verbosity

When using catalogs, it is sometimes useful to see what catalog files are parsed, if they are valid, and what identifiers are resolved by the catalogs. This option selects the detail level of such logging messages of the *XML catalog* resolver that will be displayed in the **Catalogs** table at the bottom of the window. You can choose between the following:

- **None** - No message is displayed by the catalog resolver when it tries to resolve a URI reference, a SYSTEM one or a PUBLIC one with the *XML catalogs* specified in this panel.
- **Unresolved entities** - Only the logging messages that track the failed attempts to resolve references are displayed.
- **All messages** - The messages of both failed attempts and successful ones are displayed.

Resolve schema locations also through system mappings

If selected, Oxygen XML Developer analyzes both *uri* and *system* mappings to resolve the location of schema.

**Note:**

This option is not applicable for DTD schemas since the public and system catalog mappings are always considered.

Process "schemaLocation" namespaces through URI mappings for XML Schema

If selected, the target namespace of the imported XML Schema is resolved through the *uri* mappings. The namespace is taken into account only when the schema specified in the *schemaLocation* attribute was not resolved successfully. If not selected, the system IDs are used to resolve the schema location.

Use default catalog

If this option is selected and Oxygen XML Developer cannot resolve the catalog mapping with any other means, the default global catalog (listed below this checkbox) is used. For more information, see [How Oxygen XML Developer Determines which Catalog to Use \(on page 594\)](#).

Catalogs table

You can use this table to add or manage global user-defined catalogs. The following actions are available at the bottom of the table:

Add

Opens a dialog box that allows you to add a catalog to the list. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** (on page 289) button, or the browsing actions in the  **Browse** drop-down list.

Edit

Opens a dialog box that allows you to edit an existing catalog. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** (on page 289) button, or the browsing actions in the  **Browse** drop-down list.

Delete

Deletes the currently selected catalog from the list.

Up

Moves the selection to the previous resource.

Down

Moves the selection to the following resource.

Note:

When you add, delete, or edit a catalog in this table, you need to reopen the currently edited files that use the modified catalog or run a manual **Validate** action (on page 546) so that the changes take full effect.

You can also add or configure catalogs at *framework* level from the **Catalogs** tab (on page 154) in the **Document Type** configuration dialog box (on page 130).

Related information

[Controlling the Catalog Resolver](#)

[Working with XML Catalogs \(on page 593\)](#)

XML Parser Preferences

To configure the **XML Parser** options, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **XML > XML Parser**.

The configurable options of the built-in XML parser are as follows:

Enable parser caching (validation and content completion)

Enables re-use of internal models when validating and provides content completion in open XML files that reference the same schemas (grammars) such as DTD, XML Schema, or RelaxNG.

Enable system parameter entity expansion in other entity definitions

This security setting controls the expansion of the DTD system parameter entities (the ones that are loaded from disk or from remote sources). This option is off by default, to protect against

XXE attacks. If you enable it, make sure the XML files you are opening or processing with the application come from a trusted source.

Enable secure processing

Enables the configuration of the number of entities that are allowed to be expanded and the maximum occurrence limit for nodes.

Entity expansion limit

The maximum number of entities that are allowed to be expanded by the parser.

Nodes maximum occurrence limit

The maximum occurrence limit for XML schema nodes.

Ignore the DTD for validation if a schema is specified

Forces validation against a referenced schema (XML Schema, Relax NG schema) even if the document includes also a DTD DOCTYPE declaration. This option is useful when the DTD declaration is used only to declare DTD entities and the schema reference is used for validation against an XML Schema or a Relax NG schema.

Note:

Schematron schemas are treated as additional schemas. The validation of a document associated with a DTD and referencing a Schematron schema is executed against both the DTD and the Schematron schema, regardless of the value of the **Ignore the DTD for validation if a schema is specified** option.

Enable XInclude processing

Enables XInclude processing. If selected, the XInclude support in Oxygen XML Developer is turned on for validation and transformation of XML documents.

Base URI fix-up

According to the specification for XInclude, processors must add an `@xml:base` attribute to elements included from locations with a different base URI. Without these attributes, the resulting infoset information would be incorrect.

Unfortunately, these attributes make XInclude processing to not be transparent to Schema validation. One solution to this is to modify your schema to allow `@xml:base` attributes to appear on elements that might be included from different base URIs.

If the addition of `@xml:base` and / or `@xml:lang` is not desired by your application, you can deselect this option.

Language fix-up

The processor will preserve language information on a top-level included element by adding an `@xml:lang` attribute if its included parent has a different [language] property. If the addition of `@xml:lang` is not allowed by your application, you can deselect this option.

DTD post-validation

Select this option to validate an XML file against the associated DTD, after all the content merged to the current XML file using *XInclude* was resolved. If you deselect this option, the current XML file is validated against the associated DTD before all the content merged to the current XML file using *XInclude* is resolved.

XML Schema Preferences

To configure options regarding XML Schema, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **XML > XML Parser > XML Schema**.

This preferences page allows you to configure the following options:

Default XML Schema version

Allows you to select the version of XML Schema to be used as the default. You can choose XML Schema **1.0** or XML Schema **1.1**.

**Note:**

You are also able to set the XML Schema version using the **Customize** option in the **New** document wizard (on page 330).

Default XML Schema validation engine

Allows you to select the default validation engine to be used for XML Schema. You can choose **Xerces** or **Saxon EE**.

Xerces validation features section

Enable full schema constraint checking

Sets the *schema-full-checking* feature to `true`. This enables a validation of the parsed XML document against a schema (XML Schema or DTD) while the document is parsed.

Enable honour all schema location feature

Sets the *honour-all-schema-location* feature to `true`. All the files that declare XML Schema components from the same namespace are used to compose the validation model. If this option is not selected, only the first XML Schema file that is encountered in the XML Schema import tree is taken into account.

Enable full XPath 2.0 for alternative types

When selected (default value), you can use the full XPath support in assertions and alternative types. Otherwise, only the XPath support offered by the Xerces engine is available.

Assertions can see comments and processing instructions

Controls whether or not comments and processing instructions are visible to the XPath expression used for defining an assertion in XSD 1.1.

Saxon EE validation features section

Multiple schema imports

Forces `<xs:import>` to fetch the referenced schema document. By default, the `<xs:import>` fetches the document only if no schema document for the given namespace has already been loaded. With this option in effect, the referenced schema document is loaded unless the absolute URI is the same as a schema document already loaded.

Assertions can see comments and processing instructions

Controls whether or not comments and processing instructions are visible to the XPath expression used to define an assertion. By default, they are not made visible (unlike Saxon 9.3).

Relax NG Preferences

To configure options regarding Relax NG, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **XML > XML Parser > Relax NG**.

The following options are available in this page:

Check feasibly valid

Checks if Relax NG documents can be transformed into valid documents by inserting any number of attributes and child elements anywhere in the tree.

**Note:**

Selecting this option disables the **Check ID/IDREF** option.

Check ID/IDREF

Checks the ID/IDREF matches when a Relax NG document is validated.

Add default attribute values

Default values are given to the attributes of documents validated using Relax NG. These values are defined in the Relax NG schema.

Ignore "data-" attributes in XHTML

This option is selected by default, which means that when XHTML documents are validated with an RNG schema, any **data-** attributes detected in the document will not be taken into account by the validation engine.

Schematron Preferences

To configure options regarding Schematron, open the **Preferences** dialog box (**Options > Preferences**) (on [page 114](#)) and go to **XML > XML Parser > Schematron**.

The following options are available in this preferences page:

ISO Schematron Section

Optimize (visit-no-attributes)

If your ISO Schematron assertion tests do not contain the attributes axis, you should select this option for faster ISO Schematron validation.

Allow foreign elements (allow-foreign)

Enables support for `allow-foreign` on ISO Schematron. This option is used to pass non-Schematron elements to the generated stylesheet.

Use associated XML Schema to expand default attribute values

When selected (default value), if the validated XML document has an XML Schema associated that contains default values for attributes defined in the XML content, the Schematron will be able to match on those default attributes.

Use Saxon EE (schema aware) for xslt2/xslt3 query language binding

When selected, Saxon EE is used for `xslt2/xslt3` query binding. If this option is not selected, Saxon PE is used.

Enable Schematron Quick Fixes (SQF) support

Allows you to enable or disable the support for [Quick Fixes \(on page 2272\)](#) in Schematron files. This option is selected by default.

Embedded rules query language binding

You can control the query language binding used by the ISO Schematron embedded rules. You can choose between: **xslt1**, **xslt2**, or **xslt3**.

Note:

To control the query language binding for standalone ISO Schematron, you need to set the query language to be used with a `@queryBinding` attribute on the schema root element.

Message language

This option allows you to specify the language to be used in Schematron validation messages. You can choose between the following:

- **Use the language defined in the application** - The language that is specified in the [Global Preferences page \(on page 116\)](#) will be used and only the validation messages that match that language will be presented. You can

use the **Change application language** link to navigate to the preferences page where you can specify the language to be used in the application.

- **Use the "xml:lang" attribute set on the Schematron root** - The language specified in the `@xml:lang` attribute from the Schematron root will be used and only the validation message that match that language will be presented.
- **Ignore the language and show all message** - All messages are displayed in whatever language is defined within the Schematron schema.
- **Custom** - Use this option to specify a custom language to be used and only the messages that match the specified language will be presented.

Note:

In all cases, if the selected language is not available for a validation error or warning, all messages will be displayed in whatever language is defined within the Schematron schema.

Schematron 1.5 Section

XPath Version

Allows you to select the version of XPath for the expressions that are allowed in Schematron assertion tests. You can choose between: **1.0**, **2.0**, or **3.0**. This option is applied in both standalone Schematron 1.5 schemas and embedded Schematron 1.5 rules.

Security

Disable Schematron security checks

For security reasons, several security checks are performed on Schematron files that are not located inside a *framework* (on page 2269) or *plugin* (on page 2271). Select this option if your Schematron files are failing because of these security checks and you are unable to move them to a location recognized as safe (a framework or a plugin).

Sample XML Files Generator Preferences

The **Generate Sample XML Files tool** (on page 776) (available on the **Tools** menu) allows you to generate XML instance documents based on an XML Schema. There are various options that can be configured within the tool and these options are also available in the **Sample XML Files Generator** preferences page. This allows you to set default values for these options. To configure the options for generating the XML files, [open the Preferences dialog box \(Options > Preferences\)](#) (on page 114) and go to **XML > Sample XML Files Generator**.

The following options are available:

Generate optional elements

When selected, all elements are generated, including the optional ones (having the `minOccurs` attribute set to 0 in the schema).

Generate optional attributes

When selected, all attributes are generated, including the optional ones (having the `use` attribute set to `optional` in the schema).

Values of elements and attributes

Controls the content of generated attribute and element values. The following choices are available:

- **None** - No content is inserted.
- **Default** - Inserts a default value depending on the data type descriptor of the particular element or attribute. The default value can be either the data type name or an incremental name of the attribute or element (according to the global option from the **Sample XML Files Generator** preferences page). Note that type restrictions are ignored when this option is selected. For example, if an element is of a type that restricts an `xs:string` with the `xs:maxLength` facet to allow strings with a maximum length of 3, the XML instance generator tool may generate string element values longer than 3 characters.
- **Random** - Inserts a random value depending on the data type descriptor of the particular element or attribute.

Important:

If all of the following are true, the **Generate Sample XML Files** tool outputs invalid values:

- At least one of the restrictions is a `regexp`.
- The value generated after applying the `regexp` does not match the restrictions imposed by one of the facets.

Preferred number of repetitions

Allows you to set the preferred number of repeating elements related to `minOccurs` and `maxOccurs` facets defined in the XML Schema.

- If the value set here is between `minOccurs` and `maxOccurs`, then that value is used.
- If the value set here is less than `minOccurs`, then the `minOccurs` value is used.
- If the value set here is greater than `maxOccurs`, then `maxOccurs` is used.

Maximum recursion level

If a recursion is found, this option controls the maximum allowed depth of the same element.

Type alternative strategy

Used for the `<xs:alternative>` element from XML Schema 1.1. The possible strategies are:

- **First** - The first valid alternative type is always used.
- **Random** - A random alternative type is used.

Choice strategy

Used for `<x:choice>` or `<substitutionGroup>` elements. The possible strategies are:

- **First** - The first branch of `<x:choice>` or the head element of `<substitutionGroup>` is always used.
- **Random** - A random branch of `<x:choice>` or a substitute element or the head element of a `<substitutionGroup>` is used.

Generate the other options as comments

If selected, generates the other possible choices or substitutions (for `<x:choice>` and `<substitutionGroup>`). These alternatives are generated inside comments groups so you can uncomment and use them later. Use this option with care (for example, on a restricted namespace and element) as it may generate large result files.

Use incremental attribute / element names as default

If selected, the value of an element or attribute starts with the name of that element or attribute. For example, for an `<a>` element the generated values are: `a1`, `a2`, `a3`, and so on. If not selected, the value is the name of the type of that element / attribute (for example: `string`, `decimal`, etc.)

Maximum length

The maximum length of string values generated for elements and attributes.

Discard optional elements after nested level

The optional elements that exceed the specified nested level are discarded. This option is useful for limiting deeply nested element definitions that can quickly result in very large XML documents.

Related information

[Generating Sample XML Files \(on page 776\)](#)

XProc Preferences

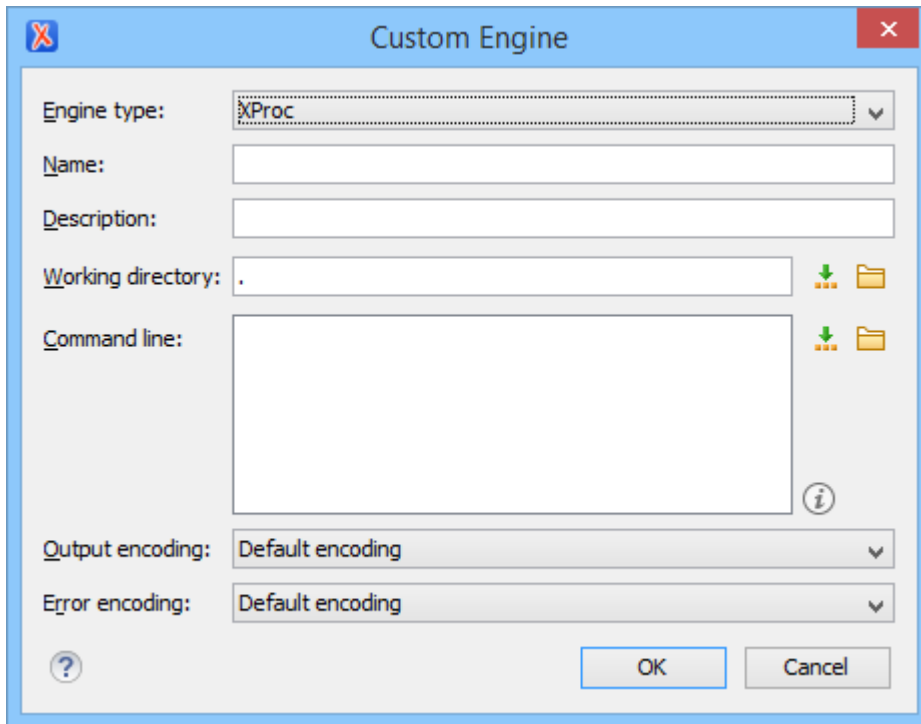

Oxygen XML Developer includes a bundled version of the *Calabash* XProc engine that can be used for XProc transformations and validation, but you also have several ways to integrate other external XProc engines.

If the external engine is Java-based, or it has validation support, or it can receive parameters or ports passed from the transformation, you need to [integrate the external XProc engine using a plugin extension procedure \(on page 1218\)](#).

If you do not need the engine to be used for automatic validation or pass parameters/ports and it is not Java-based, you can add an external XProc engine by using the **XProc** preferences page. [Open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **XML > XProc**.

To add an external engine, click the **New** button. To configure an existing engine, click the **Edit** button. This opens the **Custom Engine** dialog box that allows you to configure an external engine.

Figure 23. Creating an XProc external engine

The following options can be configure in this custom engine configuration dialog box:

- **Name** - The value of this field will be displayed in the XProc transformation scenario and in the command line that will start it.
- **Description** - A textual description that will appear as a tooltip where the XProc engine will be used.
- **Working directory** - The working directory for resolving relative paths. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 289) button, or the  **Browse** button.
- **Command line** - The command line that will run the XProc engine as an external process. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 289) button, or the  **Browse** button.
- **Output encoding** - The encoding for the output stream of the XProc engine, used for reading and displaying the output messages.
- **Error encoding** - The encoding for the error stream of the XProc engine, used for reading and displaying the messages from the error stream.

Note:

You can configure the built-in Calabash processor by using the `calabash.config` file. This file is located in `[OXYGEN_INSTALL_DIR]\lib\xproc\calabash\lib`. If that file does not exist, you have to create it.

The **Show XProc messages** option at the bottom of the **XProc** preferences page can be selected if you want all messages emitted by the XProc processor during a transformation to be presented in dedicated XProc **Results** view ([on page 503](#)).

XSLT/XQuery Preferences

To configure options regarding XSLT and XQuery processors, [open the Preferences dialog box \(Options > Preferences\)](#) ([on page 114](#)) and go to **XML > XSLT-XQuery**. This panel contains only the most generic options for working with XSLT or XQuery processors. The more specific options are grouped in other panels linked as child nodes of this panel in the tree of this **Preferences** page.

There is only one generic option available:

Create transformation temporary files in system temporary directory

It should be selected only when the temporary files necessary for performing transformations are created in the same folder as the source of the transformation (the default behavior when this option is not selected) and this breaks the transformation. An example of breaking the transformation is when the transformation processes all the files located in the same folder as the source of the transformation (including the temporary files) and the result is incorrect or the transformation fails because of this.

XSLT Preferences

To configure the **XSLT** options, [open the Preferences dialog box \(Options > Preferences\)](#) ([on page 114](#)) and go to **XML > XSLT-XQuery > XSLT**.

The XSLT preferences page allows you to customize options for the default XSLT validation engines. You can also specify the engine directly in a [validation scenario](#) ([on page 565](#)).

Note:

If no specific engine is specified in the validation scenario and the XSLT file has a transformation scenario associated, Oxygen XML Developer will use the engine specified in the transformation scenario.

The following options are available in this page:

Validation engine - XSLT 1.0

Allows you to select the XSLT engine to be used for validation of XSLT 1.0 documents.

Validation engine - XSLT 2.0

Allows you to select the XSLT engine to be used for validation of XSLT 2.0 documents.

Validation engine - XSLT 3.0

Allows you to select the XSLT engine to be used for validation of XSLT 3.0 documents.

**Note:**

Saxon-HE does not implement any XSLT 3.0 features. Saxon-PE implements a selection of XSLT 3.0 (and XPath 3.1) features, with the exception of schema-awareness and streaming. Saxon-EE implements additional features relating to streaming (processing of a source document without constructing a tree in memory. For further details about XSLT 3.0 conformance, go to <http://www.saxonica.com/documentation/index.html#!conformance/xslt30>.

XSLT Editor Content Completion Options link

Use this link to switch to the **XSLT Content Completion preferences page** (*on page 181*), where you can configure the XSLT content completion options.

Saxon6 Preferences

To configure the **Saxon 6** options, open the **Preferences** dialog box (**Options > Preferences**) (*on page 114*) and go to **XML > XSLT-XQuery > XSLT > Saxon > Saxon6**.

The built-in Saxon 6 XSLT processor can be configured with the following options:

- **Line numbering** - Specifies whether or not line numbers are maintained and reported in error messages for the XML source document.
- **Disable calls on extension functions** - If selected, external function calls are not allowed. Selecting this option is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, since they carry similar security risks.
- **Handling of recoverable stylesheet errors** - Allows you to choose how dynamic errors are handled. One of the following options can be selected:
 - **recover silently** - Continue processing without reporting the error.
 - **recover with warnings** - Issue a warning but continue processing.
 - **signal the error and do not attempt recovery** - Issue an error and stop processing.

Saxon-HE/PE/EE Preferences

To configure global options for XSLT transformation and validation scenarios that use the **Saxon HE/PE/EE** engine, open the **Preferences** dialog box (**Options > Preferences**) (*on page 114*) and go to **XML > XSLT-XQuery > XSLT > Saxon > Saxon-HE/PE/EE**.

Saxon-HE/PE/EE Options

Oxygen XML Developer allows you to configure the following XSLT options for the Saxon 12.5 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE):

Use a configuration file ("-config")

Select this option if you want to use a Saxon 12.5 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration file by entering it in the **URL** field, or by using the  **Insert Editor Variables** button, or using the browsing actions in the  **Browse** drop-down list.

Attention:

Oxygen XML Developer does not support the `ALLOWED_PROTOCOLS` Saxon property (<http://saxon.sf.net/feature/allowedProtocols>). This feature is specific to Saxon and controls access by Saxon (but not by underlying software, such as the XML parser). For more information, see <https://www.saxonica.com/documentation12/index.html#!configuration/config-features>.

Debugger trace into XPath expressions (applies to debugging sessions)

Instructs the *XSLT Debugger* (on page 1851) to *step into* XPath expressions.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Line numbering ("-l")

Line numbers where errors occur are included in the output messages.

Expand attributes defaults ("-expand")

Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

DTD validation of the source ("-dtd")

Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

- **On** - Requests DTD validation of the source file and of any files read using the `document()` function.
- **Off** - (default setting) Suppresses DTD validation.
- **Recover** - Performs DTD validation but treats the errors as non-fatal.

Note:

Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

Strip whitespaces ("-strip")

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

Saxon-PE/EE Options

The following options are available for Saxon 12.5 Professional Edition (PE) and Enterprise Edition (EE) only:

Register Saxon-JS extension functions and instructions

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 12.5 processors.

Note:

Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Developer only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about [executing such a stylesheet on Saxonica's website](#).

Allow calls on extension functions ("-ext")

If selected, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using `http://[URL]`). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

Enable assertions ("-ea")

In XSLT 3.0, you can use the `<xsl:assert>` element to make assertions in the form of XPath expressions, causing a dynamic error if the assertion turns out to be false. If this option is selected, XSLT 3.0 `<xsl:assert>` instructions are enabled. If it is not selected (default), the assertions are ignored.

Saxon-EE Options

The options available specifically for Saxon 12.5 Enterprise Edition (EE) are as follows:

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Saxon-HE/PE/EE Advanced Preferences

To configure the **Saxon HE/PE/EE Advanced** preferences, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **XML > XSLT-XQuery > XSLT > Saxon > Saxon-HE/PE/EE > Advanced**.

You can configure the following advanced XSLT options for the Saxon 12.5 transformer (all three editions: Home Edition, Professional Edition, Enterprise Edition):

- **URI Resolver class name ("-r")** - Specifies a custom implementation for the URI resolver used by the XSLT Saxon 12.5 transformer (the -r option when run from the command line). The class name must be fully specified and the corresponding `jar` or `class` extension must be configured from [the dialog box for configuring the XSLT extension \(on page 1133\)](#) for the particular transformation scenario.
- **Collection URI Resolver class name ("-cr")** - Specifies a custom implementation for the Collection URI resolver used by the XSLT Saxon 12.5 transformer (the -cr option when run from the command line). The class name must be fully specified and the corresponding `jar` or `class` extension must be configured from [the dialog box for configuring the XSLT extension \(on page 1133\)](#) for the particular transformation scenario.

XSLTProc Preferences (Deprecated)

To configure **XSLTProc** options, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **XML > XSLT-XQuery > XSLT > XSLTProc**.

The following options are available in this preferences page:

- **Enable XInclude processing** - If selected, XInclude references will be resolved when XSLTProc is used as transformer in [XSLT transformation scenarios \(on page 1098\)](#).
- **Skip loading the document's DTD** - If selected, the DTD specified in the DOCTYPE declaration will not be loaded.

- **Do not apply default attributes from document's DTD** - If selected, the default attributes declared in the DTD and not specified in the document are not included in the transformed document.
- **Do not use Internet to fetch DTD's, entities or docs** - If selected, the remote references to DTD's and entities are not followed.
- **Maximum depth in templates stack** - If this limit of maximum templates depth is reached the transformation ends with an error.
- **Verbosity** - If selected, the transformation will output detailed status messages about the transformation process in the **Warnings** view.
- **Show version of libxml and libxslt used** - If selected, Oxygen XML Developer will display in the **Warnings** view the version of the **libxml** and **libxslt** libraries invoked by XSLTProc.
- **Show time information** - If selected, the **Warnings** view will display the time necessary for running the transformation.
- **Show debug information** - If selected, the **Warnings** view will display debug information about what templates are matched, parameter values, and so on.
- **Show all documents loaded during processing** - If selected, Oxygen XML Developer will display in the **Warnings** view the URL of all the files loaded during transformation.
- **Show profile information** - If selected, Oxygen XML Developer will display in the **Warnings** view a table with all the matched templates, and for each template will display: the match XPath expression, the template name, the number of template modes, the number of calls, the execution time.
- **Show the list of registered extensions** - If selected, Oxygen XML Developer will display in the **Warnings** view a list with all the registered extension functions, extension elements and extension modules.
- **Refuses to write to any file or resource** - If selected, the XSLTProc processor will not write any part of the transformation result to an external file on disk. If such an operation is requested by the processed XSLT stylesheet the transformation ends with a runtime error.
- **Refuses to create directories** - If selected, the XSLTProc processor will not create any directory during the transformation process. If such an operation is requested by the processed XSLT stylesheet the transformation ends with a runtime error.

MSXML Preferences (Deprecated)

To configure the MSXML options, [open the Preferences dialog box \(Options > Preferences\)](#) (on page 114) and go to **XML > XSLT-XQuery > XSLT > MSXML (Legacy)**.

The options in this preferences page for the MSXML 3.0 and 4.0 processors are as follows:

Validate documents during parse phase

If selected, and either the source or stylesheet document has a DTD or schema that its content can be checked against, validation is performed.

Do not resolve external definitions during parse phase

By default, MSXML instructs the parser to resolve external definitions such as document type definition (DTD), external subsets or external entity references when parsing the source and style sheet documents. If this option is selected, the resolution is disabled.

Strip non-significant whitespaces

If selected, strips non-significant white space from the input XML document during the load phase. Selecting this option can lower memory usage and improve transformation performance while, in most cases, creating equivalent output.

Show time information

If selected, the relative speed of various transformation steps can be measured, including:

- The time to load, parse, and build the input document.
- The time to load, parse, and build the stylesheet document.
- The time to compile the stylesheet in preparation for the transformation.
- The time to execute the stylesheet.

Start transformation in this mode

Although stylesheet execution usually begins in the empty mode, this default behavior may be changed by specifying another mode. Changing the start mode allows execution to jump directly to an alternate group of templates.

MSXML.NET Preferences (Deprecated)

To configure the **MSXML.NET** options, [open the Preferences dialog box \(Options > Preferences\)](#) (*on page 114*) and go to **XML > XSLT-XQuery > XSLT > MSXML.NET (Legacy)**.

The options in this preferences page for the MSXML.NET processor are as follows:

Enable XInclude processing

If selected, XInclude references will be resolved when MSXML.NET is used as the transformer in the [XSLT transformation scenario](#) (*on page 1098*).

Validate documents during parse phase

If selected, and either the source or stylesheet document has a DTD or schema that its content can be checked against, validation is performed.

Do not resolve external definitions during parse phase

By default, MSXML instructs the parser to resolve external definitions such as document type definition (DTD), external subsets or external entity references when parsing the source and style sheet documents. If this option is selected, the resolution is disabled.

Strip non-significant whitespaces

If selected, strips non-significant white space from the input XML document during the load phase. Selecting this option can lower memory usage and improve transformation performance while, in most cases, creating equivalent output.

Show time information

If selected, the relative speed of various transformation steps can be measured, including:

- The time to load, parse, and build the input document.
- The time to load, parse, and build the stylesheet document.
- The time to compile the stylesheet in preparation for the transformation.
- The time to execute the stylesheet.

Forces ASCII output encoding

There is a known problem with the .NET 1.X XSLT processor (`System.Xml.Xsl.XslTransform` class). It does not support escaping of characters as XML character references when they cannot be represented in the output encoding. This means that it will be outputted as '?'. Usually this happens when output encoding is set to ASCII. If this option is selected, the output is forced to be ASCII encoded and all non-ASCII characters get escaped as XML character references (`&#nnnn;` form).

Allow multiple output documents

This option allows you to create multiple result documents using the `exsl:document` extension element.

Use named URI resolver class

This option allows you to specify a custom URI resolver class to resolve URI references in `<xsl:import>` and `<xsl:include>` instructions (during XSLT stylesheet loading phase) and in `document()` functions (during XSL transformation phase).

Assembly file name for URI resolver class

This option specifies a file name of the assembly where the specified resolver class can be found. The **Use named URI resolver class option (on page 221)** specifies a partially or fully qualified URI resolver class name (for example, `Acme.Resolvers.CacheResolver`). Such a name requires additional assembly specification using this option or the **Assembly GAC name for URI resolver class option (on page 221)**, but fully qualified class name (which always includes an assembly specifier) is *all-sufficient*.

Assembly GAC name for URI resolver class

This option specifies partially or fully qualified name of the assembly in the global assembly cache (GAC) where the specified resolver class can be found.

List of extension object class names

This option allows to specify extension object classes, whose public methods then can be used as extension functions in an XSLT stylesheet. It is a comma-separated list of namespace-qualified extension object class names. Each class name must be bound to a namespace URI using prefixes, similar to providing XSLT parameters.

Use specified EXSLT assembly

MSXML.NET supports a rich library of the EXSLT and EXSLT.NET extension functions embedded or in a *plugin* EXSLT.NET library. EXSLT support is enabled by default and cannot be disabled in this version. Use this option if you want to use an external EXSLT.NET implementation instead of a built-in one.

Credential loading source xml

This option allows you to specify user credentials to be used when loading XML source documents. The credentials should be provided in the `username:password@domain` format (all parts are optional).

Credential loading stylesheet

This option allows you to specify user credentials to be used when loading XSLT stylesheet documents. The credentials should be provided in the `username:password@domain` format (all parts are optional).

XQuery Preferences

To configure the **XQuery** options, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **XML > XSLT-XQuery > XQuery**.

The following generic XQuery preferences are available:

Validation engine

Allows you to select the processor that will be used to validate XQuery documents. If you are validating an XQuery file that has an associated validation scenario, Oxygen XML Developer uses the processor specified in the scenario. If no validation scenario is associated, but the file has an associated transformation scenario, the processor specified in the scenario is used. If the processor does not support validation or if no scenario is associated, then the value from this combo box will be used as validation processor.

Size limit of Sequence view (MB)

When the result of an XQuery transformation is set as a sequence (**Present as a sequence option** (on page 1152)) in the transformation scenario, the size of one chunk of the result that is fetched from the database in lazy mode in one step is set in this option. If this limit is exceeded, go to the **Sequence view** (on page 814) and click **More results available** to extract more data from the database.

Format transformer output

Specifies whether or not the output of the transformer is formatted and indented (*pretty-print* (on page 2271)).

Note:

This option is ignored if you choose **Present as a sequence** (on page 1152) (lazy extract data from a database) from the associated transformation scenario.

Create structure indicating the type nodes

If selected, Oxygen XML Developer takes the results of a query and creates an XML document containing copies of all items in the sequence, suitably wrapped.

**Note:**

This option is ignored if you choose **Present as a sequence** (*on page 1152*) (lazy extract data from a database) from the associated transformation scenario.

Saxon-HE/PE/EE Preferences

To configure global options for XQuery transformation and validation scenarios that use the **Saxon HE/PE/EE** engine, [open the Preferences dialog box \(Options > Preferences\)](#) (*on page 114*) and go to **XML > XSLT-XQuery > XQuery > Saxon-HE/PE/EE**.

Oxygen XML Developer allows you to configure the following XQuery options for the Saxon 12.5 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE):

Use a configuration file ("-config")

Sets a Saxon 12.5 configuration file that is used for XQuery transformation and validation scenarios.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Use linked tree model ("-tree:linked")

This option activates the linked tree model.

Strip whitespaces ("-strip")

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

The following option is available for Saxon 12.5 Professional Edition (PE) and Enterprise Edition (EE) only:

Allow calls on extension functions ("-ext")

If selected, calls on external functions are allowed. Selecting this option is not recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

The options available specifically for Saxon 12.5 Enterprise Edition (EE) are as follows:

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable XQuery update ("-update:(on|off)")

This option controls whether or not XQuery update syntax is accepted. The default value is off.

Backup files updated by XQuery ("-backup:(on|off)")

If selected, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the **Enable XQuery update** option is selected.

Saxon HE/PE/EE Advanced Preferences

To configure **Saxon HE/PE/EE Advanced** preferences, open the **Preferences** dialog box (**Options > Preferences**) (*on page 114*) and go to **XML > XSLT-XQuery > XQuery > Saxon-HE/PE/EE > Advanced**.

The advanced XQuery options that can be configured for the Saxon 12.5 XQuery transformer (all editions: Home Edition, Professional Edition, Enterprise Edition) are as follows:

- **URI Resolver class name** - Allows you to specify a custom implementation for the URI resolver used by the XQuery Saxon 12.5 transformer (the `-r` option when run from the command line). The class name must be fully specified and the corresponding *JAR* or class extension must be configured from [the dialog box for configuring the XQuery extension \(on page 1133\)](#) for the particular transformation scenario.

**Note:**

If your `URIResolver` implementation does not recognize the given resource, the `resolve(String href, String base)` method should return a `null` value. Otherwise, the given resource will not be resolved through the *XML Catalog (on page 593)*.

- **Collection URI Resolver class name** - Allows you to specify a custom implementation for the Collection URI resolver used by the XQuery Saxon 12.5 transformer (the `-cr` option when run from the command line). The class name must be fully specified and the corresponding *JAR* or class extension must be configured from [the dialog box for configuring the XQuery extension \(on page 1133\)](#) for the particular transformation scenario.

Debugger Preferences

To configure the **Debugger** preferences, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **XML > XSLT-XQuery > Debugger**.

The following options are available:

Show `xsl:result-document` output

If selected, the debugger presents the output of `<xsl:result-document>` instructions into the debugger output view.

Infinite loop detection

Select this option to receive notifications when an infinite loop occurs during transformation.

Enable Saxon optimizations

This option is not selected by default and this means that the optimization for the debugging process is suppressed. This is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Maximum depth in templates stack

Allows you to set how many `<xsl:template>` instructions can appear on the current stack. This setting is used by the infinite loop detection.

Debugger layout

If you select the **Horizontal** layout, the stack of XML editors is presented on the left half of the editing area while the stack of XSL editors is on the right half. If you select the **Vertical** layout, the stack of XML editors is presented on the upper half of the editing area while the stack of XSL editors is on the lower half.

Debugger current instruction pointer

Allows you to set the background color of the current execution node, both in the document (XML) and XSLT/XQuery views.

XWatch evaluation timeout (seconds)

Allows you to specify the maximum time that Oxygen XML Developer allocates to the evaluation of XPath expressions while debugging.

Messages

Allows you to specify how to handle the debugging process when the source document involved in a debugging session is edited. You can choose one of the following:

- **Ask me what to do**
- **Always stop the debugging session**
- **Never stop the debugging session**

Profiler Preferences

This section explains the settings available for the XSLT/XQuery Profiler. To access and modify these settings, open the **Preferences** dialog box (**Options > Preferences**) ([on page 114](#)) and go to **XML > XSLT-XQuery > Profiler** (see [Debugger Preferences \(on page 225\)](#)).

The following profiler settings are available:

Show time

Shows the total time that was spent in the call.

Show inherent time

Shows the inherent time that was spent in the call. The inherent time is defined as the total time of a call minus the time of its child calls.

Show invocation count

Shows how many times the call was called in this particular call sequence.

Time scale

Determines the unit of time measurement. You can choose between milliseconds or microseconds.

Hotspot threshold

Hotspots are ignored below this specified amount (in milliseconds). For more information, see [Hotspots View \(on page 1859\)](#).

Ignore invocation less than

Invocations are ignored below this specified amount (in microseconds). For more information, see [Invocation Tree View \(on page 1858\)](#).

Percentage calculation

The percentage base that determines what time span percentages are calculated against. You can choose between the following:

- **Absolute** - Percentage values show the contribution to the total time.
- **Relative** - Percentage values show the contribution to the calling call.

XPath Preferences

To configure XPath options, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **XML > XSLT-XQuery > XPath**.

Oxygen XML Developer allows you to customize the following options:

Unescape XPath expression

If selected, the entities of an XPath expression that you type in the **XPath/XQuery Builder** (on page 1735) and the **XPath toolbar** (on page 1733) are unescaped during their execution. For example, the expression:

```
//varlistentry[starts-with(@os, '&#x73;')]
```

is equivalent to:

```
//varlistentry[starts-with(@os, 's')]
```

Multiple XPath results

Select this option to display the results of an XPath expression in separate tabs in the **Results view** (on page 503).

XPath Default Namespace (only for XPath version 2.0)

Specifies the default namespace to be used for unprefixed element names. You can choose between the following four options:

- **No namespace** - If selected, Oxygen XML Developer considers unprefixed element names of the evaluated XPath expressions as belonging to no namespace.
- **Use the default namespace from the root element** (default selection) - Oxygen XML Developer considers unprefixed element names of the evaluated XPath expressions as belonging to the default namespace declared on the root element of the XML document you are querying.
- **Use the namespace of the root** - If selected, Oxygen XML Developer considers unprefixed element names of the evaluated XPath expressions as belonging to the same namespace as the root element of the XML document you are querying.
- **This namespace** - If selected, you can use the corresponding text field to enter the namespace of the unprefixed elements.

Default prefix-namespace mappings

You can use this table to associate prefixes with namespaces. Use these mappings when you want to define them globally (not for each document). Use the **New** button to add mappings to the list and the **Delete** button to remove mappings.

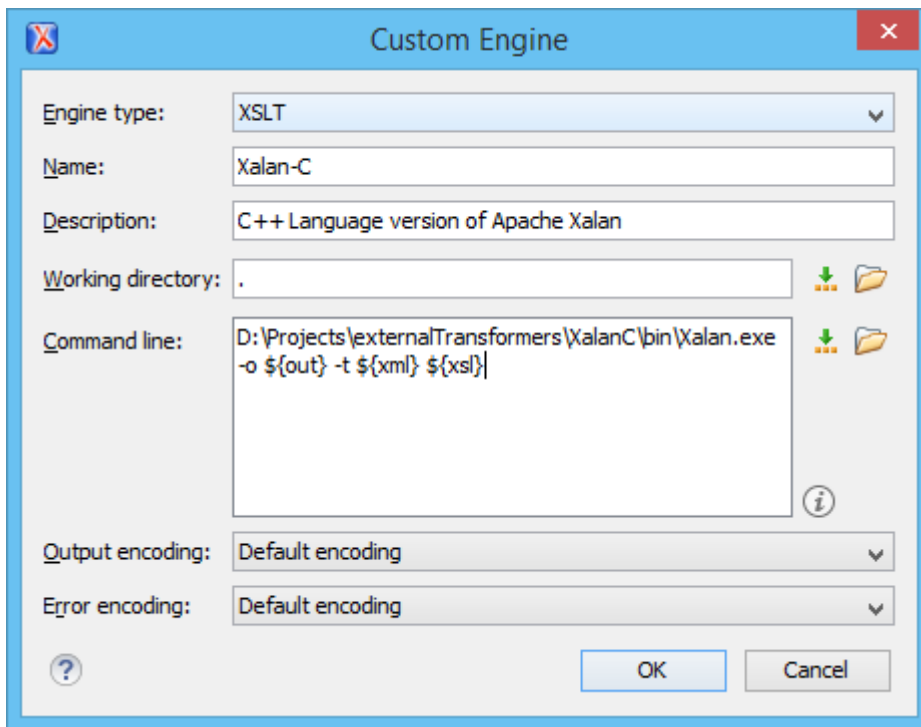

Custom Engines Preferences

Oxygen XML Developer allows you to configure custom processors to be used for running XSLT and XQuery transformations.

To configure the **Custom Engines** preferences, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **XML > XSLT-XQuery > Custom Engines**.

The table in this preferences page displays the custom engines that have been defined. Use the **New** or **Edit** button at the bottom of the table to open a dialog box that allows you to add or configure a custom engine.

Figure 24. Parameters of a Custom Engine

The following parameters can be configured for a custom engine:

Engine type

Specifies the transformer type. You can choose between XSLT and XQuery engines.

Name

The name of the transformer displayed in the dialog box for editing transformation scenarios.

Description

A textual description of the transformer.

Working directory

The start directory of the executable program for the transformer. The following [editor variables](#) (on page 289) are available for making the path to the working directory independent of the location of the input files:

- **`\${homeDir}** - The user home directory in the operating system.
- **`\${cfd}** - The path to the directory of the current file.
- **`\${pd}** - The path to the directory of the current project.
- **`\${oxygenInstallDir}** - The Oxygen XML Developer install directory.

Command line

The command line that must be executed by Oxygen XML Developer to perform a transformation with the engine. The following [editor variables \(on page 289\)](#) are available for making the parameters in the command line (the transformer executable, the input files) independent of the location of the input files:

- **`\${xml}** - The XML input document as a file path.
- **`\${xmlu}** - The XML input document as a URL.
- **`\${xsl}** - The XSL / XQuery input document as a file path.
- **`\${xslu}** - The XSL / XQuery input document as a URL.
- **`\${out}** - The output document as a file path.
- **`\${outu}** - The output document as a URL.
- **`\${ps}** - The platform separator that is used between library file names specified in the class path.

Output Encoding

The encoding of the transformer output stream.

Error Encoding

The encoding of the transformer error stream.

PDF Output Preferences

The **PDF Output** preferences page simply includes links to sub-pages for configuring PDF output options.

FO Processors Preferences

Oxygen XML Developer includes a built-in formatting objects processor (Apache FOP), but you can also configure other external processors and use them in the transformation scenarios for processing XSL-FO documents.

Oxygen XML Developer provides an easy way to add two of the most commonly used commercial FO processors: **RenderX XEP** and **Antenna House Formatter**. You can easily add *RenderX XEP* as an external FO processor if you have the XEP installed. Also, if you have the *Antenna House Formatter*, Oxygen XML Developer uses the environment variables set by the XSL formatter installation to detect and use it for XSL-FO transformations. If the environment variables are not set for the XSL formatter installation, you can browse and choose the executable file just as you would for XEP. You can use these two external FO processors for [DITA-OT transformations scenarios \(on page 1156\)](#) and [XML with XSLT transformation scenarios \(on page 1130\)](#).

To configure the options for the FO processors, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **XML > PDF Output > FO Processors**. This preferences page includes the following options:

Apache FOP Section

In this section, you can configure options for the built-in Apache processor. The following options are available:

Use built-in Apache FOP

Instructs Oxygen XML Developer to use the built-in Apache FO processor. To see the version of the built-in XSL-FO processor for your installation, go to **Help > About > Libraries** and search for *Apache FOP*.

Use other Apache FOP

Instructs Oxygen XML Developer to use another Apache FO processor that is installed on your computer. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 289) button, or the  **Browse** button.

Enable the output of the built-in FOP

All Apache FOP output is displayed in a results pane at the bottom of the Oxygen XML Developer window, including warning messages about FO instructions not supported by Apache FOP.

Memory available to the Apache FOP

If your Apache FOP transformations fail with an Out of Memory error (**OutOfMemoryError**), use this combo box to select a larger value for the amount of memory reserved for Apache FOP transformations.

Configuration file for the built-in FOP

Use this option to specify the path to an Apache FOP configuration file (for example, to render to PDF a document containing Unicode content using a special *true type* font). You can specify the path by using the text field, the  **Insert Editor Variables** (on page 289) button, or the  **Browse** button.

Generates PDF/A-1b output

When selected, PDF/A-1b output is generated.

Notes:

- All fonts have to be embedded, even the implicit ones. More information about configuring metrics files for the embedded fonts can be found in [Add a font to the built-in FOP \(on page 1205\)](#).
- You cannot use the `<filterList>` key in the configuration file since the FOP would generate the following error: *The Filter key is prohibited when PDF/A-1 is active.*

External FO Processors Section

In this section, you can manage the external FO processors you want to use in transformation scenarios. You can use the two options at the bottom of the section to use the **RenderX XEP** or **Antenna House Formatter** commercial FO processors.

Add 'XEP' FO processor (executable file is needed)

If **RenderX XEP** is already installed on your computer, you can use this button to choose the XEP executable script (`xep.bat` for Windows, `xep` for Linux).

Add 'Antenna House' FO processor (executable file is needed)

If **Antenna House Formatter** is already installed on your computer, you can use this button to choose the Antenna House executable script (`AHFCmd.exe` or `XSLCmd.exe` for Windows, and `run.sh` for Linux/macOS).

Note:

The built-in **Antenna House Formatter GUI** transformation scenario requires that you configure an external FO processor that runs `AHFormatter.exe` (Windows only). In the **external FO Processor configuration dialog box** (*on page 232*), you could use `"${env(AHF63_64_HOME)}\AHFormatter.exe" -d ${fo} -s` for the value in the **Command line** field, although the environment variable name changes for each version of the AH Formatter and for each system architecture (you can install multiple versions side-by-side). For more information, see <https://github.com/AntennaHouse/focheck/wiki/focheck>. A list with all AntennaHouse command line parameters can be found here: <https://www.antenna.co.jp/AHF/help/en/ahf-xslcmd.html#cl-parameter>.

You can also add external processors or configure existing ones. Click the **New** button to open a configuration dialog box that allows you to add a new external FO processor. Use the other buttons (**Edit**,  **Duplicate**, **Delete**, **Up**, **Down**) to configure existing external processors.

Figure 25. External FO Processor Configuration Dialog Box

The external **FO Processor** configuration dialog box includes the following options:

Name

The name that will be displayed in the list of available FO processors on the FOP tab of the transformation scenario dialog box.

Description

A textual description of the FO processor that will be displayed in the FO processors table and in tooltips of UI components where the processor is selected.

Working directory

The directory where the intermediate and final results of the processing are stored. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 289) button, or the  **Browse** button. You can use one of the following *editor variables* (on page 289):

- **\${homeDir}** - The path to the user home directory.
- **\${cfd}** - The path of the current file directory. If the current file is not a local file, the target is the user desktop directory.
- **\${pd}** - The project directory.
- **\${oxygenInstallDir}** - The Oxygen XML Developer installation directory.

Command line

The command line that starts the FO processor, specific to each processor. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 289) button, or the  **Browse** button. You can use one of the following *editor variables* (on page 289):

- **`\${method}`** - The FOP transformation method: **pdf**, **ps**, or **txt**.
- **`\${fo}`** - The input FO file.
- **`\${out}`** - The output file.
- **`\${pd}`** - The project directory.
- **`\${frameworksDir}`** - The path of the **frameworks** subdirectory of the Oxygen XML Developer installation directory.
- **`\${oxygenInstallDir}`** - The Oxygen XML Developer installation directory.
- **`\${ps}`** - The platform-specific path separator. It is used between the library files specified in the class path of the command line.

Output Encoding

The encoding of the FO processor output stream that is displayed in a **Results panel** (*on page 503*) at the bottom of the Oxygen XML Developer window.

Error Encoding

The encoding of the FO processor error stream that is displayed in a **Results panel** (*on page 503*) at the bottom of the Oxygen XML Developer window.

CSS-based Processors Preferences

Oxygen XML Developer includes a built-in **XML to PDF transformation with CSS** scenario type for generating PDF output using a CSS-based processor.

To configure the options for the CSS-based processors, [open the Preferences dialog box \(Options > Preferences\)](#) (*on page 114*) and go to **XML > PDF Output > CSS-based Processors**. This preferences page includes the following options:

Oxygen PDF Chemistry Section

Auto-detect

If selected, the directory of the **Chemistry** processor will be automatically detected. This is based on the system's PATH environmental variable. If none is detected, it will use the path of the built-in distribution.

Custom installation directory

Use this option to select an external directory of a custom installation of the **Chemistry** processor.

Memory available to the processor (MB)

Specifies the maximum amount of memory that is available for the transformation. If your transformations fail with an Out of Memory error (**OutOfMemoryError**), you can use this option to select a bigger value for the amount of memory reserved for the process.

Generates PDF/UA-1 output

Use this option to produce output that conforms with the PDF/UA-1 accessibility standards.

**Note:**

This mode has some special requirements. For example, all fonts have to be embedded and the title of documents must be marked using the metadata. For more information, see [Oxygen PDF Chemistry User Guide: Fully Accessible PDF \(PDF/UA1\)](#).

Show console output

Allows you to specify when to display the console output log in the message panel at the bottom of the editor. The following options are available:

- **When build fails** - Displays the console output log only if the build fails.
- **Always** - Displays the console output log, regardless of whether or not the build fails.

Ant Preferences

To set Ant preferences, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **XML > Ant**. This panel allows you to choose the directory containing the *Apache Ant* (on page 2267) libraries (the so-called *Ant Home*) that Oxygen XML Developer uses to handle Ant build files.

There are two options available:

- **Built-in** - the path to the Ant distribution that comes bundled with Oxygen XML Developer installation kit.
- **Custom** - the path to an Ant distribution of your choice.

Import Preferences

To configure importing options, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **XML > Import**. This page allows you to configure how empty values and `null` values are handled when they are encountered in imported database tables or Excel sheets. Also you can configure the format of date / time values recognized in the imported database tables or Excel sheets.

The following options are available:

Create empty elements for empty values

If selected, an empty value from a database column or from a text file is imported as an empty element.

Create empty elements for null values

If selected, `null` values from a database column are imported as empty elements.

Escape XML content

Selected by default, this option instructs Oxygen XML Developer to escape the imported content to an XML-safe form.

Add annotations for generated XML Schema

If selected, the generated XML Schema contains an annotation for each of the imported table columns. The documentation inside the annotation tag contains the remarks of the database columns (if available) and also information about the conversion between the column type and the generated XML Schema type.

Date / Time Format section

Specifies the format used for importing date and time values from Excel spreadsheets or database tables, and in the generated XML schemas. You can choose from the following format types:

- **Unformatted** - The date and time formats specific to the database are used for import. When importing data from Excel a string representation of date or time values are used. The type used in the generated XML Schema is `xs:string`.
- **XML Schema date format** - The XML Schema-specific format ISO8601 is used for imported date / time data (`yyyy-MM-dd'T'HH:mm:ss` for `datetime`, `yyyy-MM-dd` for `date` and `HH:mm:ss` for `time`). The types used in the generated XML Schema are `xs:datetime`, `xs:date` and `xs:time`.
- **Custom format** - If selected, you can define a custom format for timestamp, date, and time values or choose one of the predefined formats. A preview of the values is presented when a format is used. The type used in the generated XML Schema is `xs:string`.

Table 3. Pattern Letters

Letter	Date or Time Component	Presentation	Examples
G	Era designator	Text	AD
y	Year	Year	1996; 96
M	Month in year	Month	July; Jul; 07
w	Week in year	Number	27
W	Week in month	Number	2
D	Day in year	Number	189
d	Day in month	Number	10
F	Day of week in month	Number	2
E	Day in week	Text	Tuesday; Tue
a	Am / pm marker	Text	PM
H	Hour in day (0-23)	Number	0
k	Hour in day (1-24)	Number	24
K	Hour in am / pm (0-11)	Number	0

Table 3. Pattern Letters (continued)

Letter	Date or Time Component	Presentation	Examples
h	Hour in am / pm (1-12)	Number	12
m	Minute in hour	Number	30
s	Second in minute	Number	55
S	Millisecond	Number	978
z	Time zone	General time zone	PST; GMT-08:00
Z	Time zone	RFC 822 time zone	-0800

Pattern letters are usually repeated, as their number determines the exact presentation:

- **Text** - If the number of pattern letters is 4 or more, the full form is used. Otherwise, a short or abbreviated form is used if available.
- **Number** - The number of pattern letters is the minimum number of digits, and shorter numbers are zero-padded to this amount.
- **Year** - If the number of pattern letters is 2, the year is truncated to 2 digits. Otherwise, it is interpreted as a number.
- **Month** - If the number of pattern letters is 3 or more, the month is interpreted as text. Otherwise, it is interpreted as a number.
- **General time zone** - Time zones are interpreted as text if they have names. For time zones representing a GMT offset value, the following syntax is used:
 - **GMTOffsetTimeZone** - GMT Sign Hours: Minutes
 - **Sign** - one of + or -
 - **Hours** - one or two digits
 - **Minutes** - two digits
 - **Digit** - one of 0 1 2 3 4 5 6 7 8 9

Hours must be between 0 and 23, and Minutes must be between 00 and 59. The format is locale independent and digits must be taken from the Basic Latin block of the Unicode standard.

- **RFC 822 time zone**: The RFC 822 4-digit time zone format is used:
 - **RFC822TimeZone**
 - **TwoDigitHours** (must be between 00 and 23)

XML Signing Certificates Preferences

Oxygen XML Developer provides two types of *keystores* (on page 2270) for certificates that are used for digital signatures of XML documents: Java Keystore (**JKS**) and Public-Key Cryptography Standards version 12 (**PKCS-12**). A *keystore* file is protected by a password. To configure a certificate *keystore*, [open the](#)

Preferences dialog box (**Options > Preferences**) (on page 114) and go to **XML > XML Signing Certificates**.

You can customize the following parameters of a *keystore*:

Figure 26. Certificates Preferences Panel

- **Keystore type** - The type of *keystore* (on page 2270) that Oxygen XML Developer uses (**JKS** or **PKCS-12**).
- **Keystore file** - The location of the imported file.
- **Keystore password** - The password that is used for protecting the privacy of the stored keys.
- **Certificate alias** - The alias used for storing the key entry (the certificate or the private key) inside the *keystore* (on page 2270).
- **Private key password** - The private key password of the certificate (required only for JKS *keystores* (on page 2270)).
- **Validate** - Click this button to verify the configured *keystore* (on page 2270) and the validity of the certificate.

XML Refactoring Preferences

To specify a folder for loading the custom XML refactoring operations, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **XML > XML Refactoring**. The following option is available in this preferences page:

Load additional refactoring operations from

Use this text box to specify a folder for loading custom XML refactoring operations. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 289) button, or the  **Browse** button. Oxygen XML Developer looks for XML refactoring operations recursively in the specified folder, so they can be stored in descendant folders.

DITA Preferences

To access the DITA Preferences page, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **DITA**. This preferences page includes the following sections and options:

DITA Open Toolkit section

This section allows you to specify the default directory of the DITA Open Toolkit distribution (bundled with the Oxygen XML Developer installation) to be used for validating and publishing DITA content. You can select from the following:

Built-in Oxygen Publishing Engine (based on DITA-OT 4.x)

Oxygen XML Developer comes bundled with the **Oxygen Publishing Engine** (based on DITA-OT 4.2.3). By default, all defined DITA transformation/validation scenarios will run with this version. The default publishing engine directory is:

`[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT.`

Custom

Allows you to specify a custom directory for your DITA-OT distribution.

Location

You can either provide a new file path for the specific DITA-OT that you want to use or select a previously used one from the drop-down list. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 289) button, or the  **Browse** button.

Important:

Using a custom DITA Open Toolkit may disable certain features in the application. Examples of features that may not work properly:

- If the custom DITA-OT is missing certain publishing plugins, default transformation scenarios such as DITA Map WebHelp Responsive (on page) or DITA Map PDF - based on HTML5 & CSS (on page) may no longer work properly.
- Validation of Markdown documents using Schematron may not work because it is based on a certain DITA Open Toolkit plugin.
- The DITA framework (defined in the **Preferences > Document Type Associations** page) will use the XML catalogs specified in the DITA-OT configured in the **Preferences > DITA** page to perform the validation of all DITA topic types. If this DITA-OT is different from the one that comes bundled with the Oxygen XML Developer default distribution, you might encounter validation-related issues.

CAUTION:

Oxygen XML Developer support engineers do not officially offer support and troubleshooting assistance for custom DITA-OT distributions or custom installed DITA-OT plugins. If you discover any issues or inconsistent behavior while using a custom DITA-OT or a DITA-OT that

contains custom DITA-OT plugins, you should revert to the default built-in DITA-OT.

Enable DITA 2.0 editing support (Experimental)

If selected, you will have access to a **DITA 2.0** folder in the [New Document Wizard \(on page 330\)](#) where you can find new document templates for creating DITA 2.0 maps or topics based on the DITA 2.0 standard DTDs. For example, in a DITA topic based on the DITA 2.0 DTDs, you can insert an `<include>` element that is not found in the DITA 1.3 DTDs.

DITA New Topics Preferences

To access the DITA New Topics preferences page, open the **Preferences** dialog box (**Options > Preferences**) ([on page 114](#)) and go to **DITA > New Topics**. This preferences page includes the following options:

New Topics section

Use the title to generate the file name

This option (and its sub-options) pertain to the rules that will be used to generate file names in the [New Document Wizard \(on page 330\)](#). Select this option to use the text entered in the **Title** field to automatically generate a file name (the generated name can be seen in the **Save as** field). By default, the generated name will replace spaces with underscores (`_`), all illegal characters will be removed, and all upper case characters changed to lower case, but you can use the sub-options to change this.

Replace non-alphanumeric characters with

If selected, the file name generation mechanism will replace all non-alphanumeric characters in the title with the character entered in this option.

Lower case only

If selected, the file name generation mechanism will only use lower case letters.

Use camel case

If selected, the file name generation mechanism will convert the title to a file name using the *camel case* convention where the first word starts with a lower case letter and all subsequent words begin with upper case (for example, `myFileName`).

Upper case first letter

Select this option if you want the file name generation mechanism to convert the title to a file name using the *camel case* convention but with an upper case letter for the first word (for example, `MyFileName`).

Use the file name as the value of the root ID attribute

If selected, when creating a new topic, the file name (as seen in the **Save as** field but without the file extension) will be used as the value of the root `@id` attribute for the new topic.

Inserting Links section

Always set values for the following attributes

Allows you to specify that when a link reference is inserted (using actions in the  **Link** drop-down menu), the values for certain attributes will always be automatically populated with a detected value (based on the specifications), even if it is the same as the default value. You can choose to always populate the values for the following attributes:

- **Format** - If selected, the `@format` attribute will always be automatically populated with a detected value.
- **Scope** - If selected, the `@scope` attribute will always be automatically populated with a detected value.
- **Type** - If selected, the `@type` attribute will always be automatically populated with a detected value.

Use '!' instead of the ID of the parent topic (DITA 1.3)

When addressing a non-topic element within the topic that contains the URI reference, the URI reference can use an abbreviated fragment-identifier syntax that replaces the topic ID with ". ." (`#./elementId`). For more information, see <https://www.oxygenxml.com/dita/1.3/specs/index.html#archSpec/base/uri-based-addressing.html>.

DITA Publishing Preferences

To access the DITA Publishing preferences page, open the **Preferences** dialog box (**Options > Preferences**) (*on page 114*) and go to **DITA > Publishing**. You can also open this page by clicking the **Configure Publishing Templates Gallery** link in the **Templates** tab of the transformation scenario dialog box for **WebHelp Responsive** transformations.

You can use this preferences page to specify additional directories where custom publishing templates are stored. The templates stored in these directories will appear in the preview pane in the **Templates** tab of the transformation scenario dialog box, along with all the built-in templates.

DITA Logging Preferences

To access the DITA Logging preferences page, open the **Preferences** dialog box (**Options > Preferences**) (*on page 114*) and go to **DITA > Logging**. This preferences page includes the following sections and options:

Show console output

Allows you to specify when to display the console output log in the message panel at the bottom of the editor. The following options are available:

- **When build fails** - Displays the console output log only if the build fails.
- **Always** - Displays the console output log, regardless of whether or not the build fails.

Show the following types of messages in a new tab

This section allows you to specify which types of messages will be displayed in separate tabs in the message panel at the bottom of the editor if a DITA transformation results in errors or warnings. You can choose whether or not to display the following types of messages:

- DITA-OT errors
- DITA-OT warnings
- DITA-OT info
- FOP errors
- FOP warnings
- FOP info
- XSLT problems

Markdown Preferences

The **Markdown** preferences page makes it possible to validate Markdown documents with Schematron. To access the page, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Markdown**. This preferences page includes the following options:

Validate converted HTML content

If selected, converted HTML content will be validated using the Schematron file specified in this option.

Validate converted DITA content

If selected, converted DITA content will be validated using the Schematron file specified in this option.

Note:

It is also possible to create a Schematron association for Markdown documents by adding a [catalog mapping](#) (on page 593) for one of the following URIs:

- <http://www.oxygenxml.com/schematron/validation/markdown-as-html>
- <http://www.oxygenxml.com/schematron/validation/markdown-as-dita>

The catalog mapping is a fallback in case the validation is disabled in this preferences page or the path to the Schematron is empty. The associations configured in this preferences page take precedence.

Data Sources Preferences

To configure the **Data Sources** preferences, open the **Preferences** dialog box (**Options > Preferences**) (on [page 114](#)) and go to **Data Sources**. This preferences page allows you to configure data sources and connections to relational and native XML databases. For a list of drivers that are available for the major database servers, see [Download Links for Database Drivers](#) (on [page 247](#)).

Connection Wizards Section

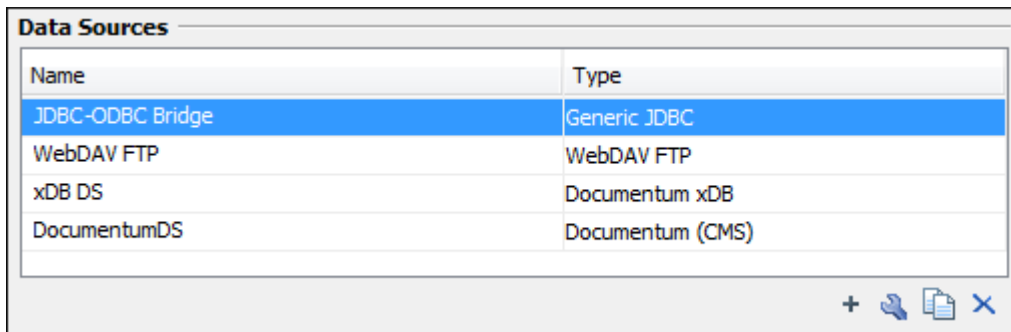

Create eXist-db XML connection

Click this link to open the dedicated **Create eXist-db XML connection** dialog box (on [page 1767](#)) that provides a quick way to create an eXist connection.

Data Sources Section

This section allows you to add and configure data sources.

Figure 27. Data Sources Preferences Panel

The following buttons are available at the bottom of the **Data Sources** panel:

+ New

Opens the **Data Sources Drivers** dialog box that allows you to configure a new database driver.

Figure 28. Data Sources Drivers Dialog Box

The following options are available in the **Data Source Drivers** dialog box:

- **Name** - The name of the new data source driver that will be used for creating connections to the database.
- **Type** - Selects the data source type from the supported driver types.
- **Help button** - Opens the User Manual at [the list of the sections \(on page 247\)](#) where the configuration of supported data sources is explained and the URLs for downloading the database drivers are specified.
- **Driver files (JAR, ZIP)** - Lists [download links for database drivers \(on page 247\)](#) that are necessary for accessing databases in Oxygen XML Developer.
- **Add Files** - Adds the driver class library.
- **Add Recursively** - Adds driver files recursively.
- **Remove** - Removes the selected driver class library from the list.
- **Detect** - Detects driver file candidates.
- **Stop** - Stops the detection of the driver candidates.
- **Driver class** - Specifies the driver class for the data source driver.

Edit

Opens the **Data Sources Drivers** dialog box for editing the selected driver. See above the specifications for the **Data Sources Drivers** dialog box. To edit a data source, there must be no connections using that data source driver.

 **Duplicate**

Creates a copy of the selected data source.

 **Delete**

Deletes the selected driver. To delete a data source, there must be no connections using that data source driver.

Connections Section

This section allows you to add and configure data source connections.

Figure 29. Connections Preferences Panel

The following buttons and options are available at the bottom of the **Connections** panel:

 **New**

Opens the **Connection** dialog box that allows you to configure a new database connection.

Figure 30. Connection Dialog Box

The following options are available in the **Connection** dialog box:

- **Name** - The name of the new connection that will be used in transformation scenarios and validation scenarios.
- **Data Source** - Allows selecting a data source defined in the **Data Source Drivers** dialog box.

Depending upon the selected data source, you can set some of the following parameters in the **Connection details** area:

- **URL** - The URL for connecting to the database server.
- **User** - The user name for connecting to the database server.
- **Password** - The password of the specified user name.
- **Host** - The host address of the server.
- **Port** - The port where the server accepts the connection.
- **XML DB URI** - The database URI.
- **Database** - The initial database name.
- **Collection** - One of the available collections for the specified data source.
- **Use a secure HTTPS connection (SSL)** - Allows you to establish a secure connection to an eXist database through the SSL protocol.

Edit

Opens the **Connection** dialog box, allowing you to edit the selected connection. See above the specifications for the **Connection** dialog box.

 **Duplicate**

Creates a copy of the selected connection.

 **Delete**

Deletes the selected connection.

 **Move Up**

Moves the selected connection up one row in the list.

 **Move Down**

Moves the selected connection down one row in the list.

Limit the number of cells

For performance issues, you can set the maximum number of cells that will be displayed in the **Table Explorer view** ([on page 1750](#)) for a database table. Leave this field empty if you want the entire content of the table to be displayed. By default, this field is set to 2000. If a table that has more cells than the value set here is displayed in the **Table Explorer view** ([on page 1750](#)), a warning dialog box will inform you that the table is only partially shown.

Maximum number of children for container nodes

In Oracle XML, a container can hold millions of resources. If the node corresponding to such a container in the **Data Source Explorer view** ([on page 1748](#)) would display all the contained resources at the same time, the performance of the view would be very slow. To prevent this, only a limited number of the contained resources is displayed as child nodes of the container node. You can navigate to other contained resources from the same container by using the *Up* and *Down* buttons in the **Data Source Explorer view** ([on page 1748](#)). This limited number is set in the field. The default value is 200 nodes.

Table Filters Preferences

The **Table Filters** preferences page allows you to choose the types of tables to be shown in the **Data Source Explorer view** ([on page 1748](#)). To open this preferences page, [open the Preferences dialog box \(Options > Preferences\)](#) ([on page 114](#)) and go to **Data Sources > Table Filters**.

You can choose to display the following types of tables:

- **Alias**
- **Global Temporary**
- **Local Temporary**
- **Synonym**
- **System Table**
- **Table**
- **View**

Download Links for Database Drivers

For a list of major relational databases and the drivers that are available for them, see https://www.oxygenxml.com/database_drivers.html.

In addition, the following is a list of other popular databases along with instructions for getting the drivers that are necessary to access the databases in Oxygen XML Developer:

- **IBM DB2 Pure XML database** (Deprecated) - Go to the [IBM website](#) and in the *DB2 Clients and Development Tools* category select the *DB2 Driver for JDBC and SQLJ* download link. Fill out the download form and download the zip file. Unzip the zip file and use the `db2jcc.jar` and `db2jcc_license_cu.jar` files in Oxygen XML Developer for [configuring a DB2 data source \(on page 1791\)](#).
- **eXist database** - Copy the *jar* files from the eXist database install directory to the Oxygen XML Developer install directory as described in [the procedure for configuring an eXist data source \(on page 1768\)](#).
- **MarkLogic database** (Deprecated) - Download the MarkLogic driver from [MarkLogic Community site](#).
- **Oracle 11g database** (Deprecated) - Go to <http://www.oracle.com/technetwork/database/enterprise-edition/jdbc-112010-090769.html> and download the Oracle 11g JDBC driver called `ojdbc6.jar`.
- **PostgreSQL database** (Deprecated) - Go to <https://jdbc.postgresql.org/download/> and download the PostgreSQL JDBC driver specific for your server version.
- **Microsoft SQL Server 2019 database** (Deprecated) - Download the appropriate MS SQL JDBC driver from the [Microsoft website](#).

SVN Preferences

To configure the options for the SVN client tool, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **SVN**. Some other preferences for the embedded SVN client tool can be set in the global files called `config` and `servers`. These files contain parameters that act as defaults applied to all the SVN client tools that are used by the same user on their computer login account. To open these files for editing, launch the embedded SVN client tool (**Tools >  SVN Client**) and select **Global Runtime Configuration > Edit 'config' file** or **Global Runtime Configuration > Edit 'servers' file** from the SVN client **Options** menu.

Maximum number of lines: 1000

Annotations View

Annotation highlight color:

Revision Graph

Enable log caching

Clear cache (0.0 MB)

The following SVN options can be configured in this preferences page:

Enable symbolic link support (*available only on macOS and Linux*)

Apache Subversion™ can put a symbolic link under version control, via the usual SVN *add* command. The Subversion repository has no internal concept of a symbolic link. It stores a versioned symbolic link as an ordinary file with a `svn:special` property attached. On Unix/Linux, the SVN client sees the property and translates the file into a symbolic link in the working copy. If the symbolic link support is disabled, the versioned symbolic links appear as a text file instead of symbolic link.

Note:

Windows file systems have no symbolic links, so a Windows client will not do any such translation and the object appears as a normal file.

Important:

It is recommended to disable symbolic links support if you do not have versioned symbolic links in your repository, since the SVN operations will work faster. However, you should not disable this option when you do have versioned symbolic links in repository. In that case a workaround would be to reference the working copy by its real path, instead of a path that includes a symbolic link.

Allow unversioned obstructions

Controls how to handle a situation where working copy resources are ignored / unversioned when performing an update operation and incoming files (from the repository) with the same name and location intersect with those being ignored / unversioned. If the option is selected, the incoming items will become BASE revisions of the ones already present in the working copy, and those present will be made versioned resources and will be marked as modified (exactly as if the user first made the update operation and then modified the files). If the option is not selected,

the update operation will fail when encountering files in this situation, possibly leaving other files not updated. By default, this option is selected.

Use unsafe copy operations

Sometimes when the working copy is accessed through Samba and the SVN client cannot make a safe copy of the committed file due to a delay in getting a write permission, the result is that the committed file will be saved with zero length (the content is removed) and an error will be reported. In this case, this option should be selected so that the SVN client does not try to make the safe copy.

Results Console

Specifies the maximum number of lines displayed in the **Console** view. The default value is 1000.

Annotations View

Sets the color used in the editor panel for highlighting all the changes contributed to a resource by the revision selected in the **Annotations** view.

Revision Graph

Enables caching for the action of computing a revision graph. When a new revision graph is requested, one of the caches from the previous actions may be used that will avoid running the whole query again on the SVN server. If a cache is used, it will finish the action much faster.

Working Copy Preferences

To configure the **Working Copy** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) (*on page 114*) and go to **SVN > Working Copy**. The options in this preferences page are specific to SVN working copies and they include the following:

Working copies location

Allows you to define a location where you keep your working copies. This location is automatically suggested when you checkout a new working copy.

Working copy administrative directory

Allows you to customize the directory name where the SVN entries are kept for each directory in the working copy.

When loading an old format working copy

You can instruct the SVN client to do one of the following:

- **Always ask** - You are notified when such a working copy is used and you are allowed to choose what action to be taken (whether or not to upgrade the format of the current working copy).
- **Never upgrade** - Older format working copies are left untouched. No attempt to upgrade the format is made.

**Note:**

SVN 1.6 and older working copies still need to be upgraded before loading them.

Enable working copy caching

If selected, the content of the working copies is cached for refresh operations.

Automatically refresh the working copy

If selected, the working copy is refreshed from cache. Only the new changes (modifications with a date/time that follows the last refresh operation) are refreshed from disk. This option is not selected by default.

Allow moving/renaming mixed revision directories

If selected, Oxygen XML Developer will allow you to move or rename a directory even if its child items have a different revision. Otherwise, an error message is displayed when there are multiple revisions to avoid unnecessary conflicts. It is recommended to leave this option deselected and to **Update** the subtree to a single revision before moving or renaming it.

When synchronizing with repository

The action that will be executed automatically after the **Synchronize** action. The possible actions are:

- **Always switch to 'Modified' mode** - The **Synchronize** action is followed automatically by a switch to **Modified** mode of **Working Copy** view, if **All Files** mode is currently selected.
- **Never switch to 'Modified' mode** - Keeps the currently selected view mode unchanged.
- **Always ask** - The user is always asked if they want to switch to **Modified** mode.

Application global ignores

Allows you to set file patterns that may include the `*` and `?` wildcards for unversioned files and folders that must be ignored when displaying the working copy resources in the **Working Copy** view. These patterns are case-sensitive. For example, `*.txt` matches `file.txt`, but does not match `file.TXT`.

Diff Preferences

To configure the SVN Diff options, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Diff**.

The following option is available:

Compare With External Application

Specifies an external application to be launched for compare operations in the following cases:

- When two history revisions are compared.
- When the working copy file is compared with a history revision.
- When a conflict is edited.

The parameters **\$(firstFile)** and **\$(secondFile)** specify the positions of the two compared files in the command line for the external diff application. The parameter **\$(ancestorFile)** specifies the common ancestor (that is, the BASE revision of a file) in a three-way comparison. The working copy version of a file is compared with the repository version, with the BASE revision (the latest revision read from the repository by an Update or Synchronize operation) being the common ancestor of these two compared versions.

Important:

If the path to the external compare application includes spaces (or any of the subsequent options or arguments), then each of these paths or *tokens* must be double-quoted for the Oxygen XML Developer to correctly parse and identify them. For example,

`C:\Program Files\compareDir\app name.exe` must be written as `"C:\Program Files
 \compareDir\app name.exe"`.

Messages Preferences

The **Messages** preferences page allows you to disable certain warning messages that may appear in the application. To configure these options, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **SVN > Messages**.

This preferences page allows you to disable the following warning messages:

Show confirmation dialog when using the "Update All" action

Allows you to avoid performing accidental update operations by requesting you to confirm them before execution.

Show confirmation dialog for drag and drop actions in Working Copy

This option avoids doing a drag and drop when you just want to select multiple files in the **Working Copy** view.

Show warning dialog when editing conflicts

When the **Edit Conflicts** action is executed, a warning dialog box notifies you that the action overwrites the conflicted version of the file created by an update operation. The conflicted file is overwritten with the version of the same file that existed in the working copy before the update operation and then proceeds with the visual editing of the conflicting file.

Show warning dialog when "svn:externals" definitions are ignored

A warning dialog box is displayed when "svn:externals" definitions are ignored before performing any operation that updates resources of the working copy (such as *Update* and *Override and Update*).

Diff Preferences

The Diff Preferences Page has sub-pages for configuring File Comparisons and Directory Comparisons.

Files Comparison Preferences

To configure the **Files Comparison** options, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Diff > Files Comparison**.

This preferences page allows you to configure the following options:

Enable file comparison in Author mode

If selected, a visual **Author** mode is available in the file comparison tool. It displays the files in a visual mode similar to the **Author** editing mode in *Oxygen XML Editor/Author*. This visual mode is available when both compared files are detected as being XML and from a recognized document type.

Ignore Whitespaces

If selected, before performing the comparison, the application normalizes the content (collapses any sequence of whitespace characters into a single space) and trims its leading and trailing whitespaces.

Note:

If the **Ignore Whitespaces** checkbox is selected, comparing the `a b` sequence with `a b`, Oxygen XML Developer finds no differences, because after normalization, all whitespaces from the first sequence are collapsed into a single space character. However, when comparing `a b` with `ab` (no whitespace between `a` and `b`), Oxygen XML Developer signals a difference.

Two-Way Diff section

Default algorithm

The default algorithm used for comparing two files. The following options are available:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters.
- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words.

- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **Syntax Aware** - Computes differences for the file types or fragments known by Oxygen XML Developer, taking the syntax (the specific types of tokens) into consideration.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Algorithm strength

Controls the amount of resources allocated to the application to perform the comparison. The algorithm stops searching more differences when reaches the maximum allowed resources. A dialog box is displayed when this limit is reached and partial results are displayed. Four settings are available: **Low**, **Medium** (default), **High** and **Very High**.

Three-Way Diff section

Default algorithm

The default algorithm used for performing a three-way comparison. The following options are available:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Algorithm strength

Controls the amount of resources allocated to the application to perform the comparison. The algorithm stops searching more differences when reaches the maximum allowed resources. A dialog box is displayed when this limit is reached and partial results are displayed. Four settings are available: **Low**, **Medium** (default), **High** and **Very High**.

Show pseudo conflicts

Specifies whether or not the file comparison displays pseudo-conflicts. A pseudo-conflict occurs when two users make the same change (for example, when they both add or remove the same line of code).

XML Diff section

Ignore

Allows you to specify the types of XML nodes that will be ignored in the file comparison for the **XML Fast** and **XML Accurate** algorithms. You can choose to ignore *Processing Instructions, Comments, CDATA, DOCTYPE, Text, Namespaces, Prefixes, Namespace declarations, and Attribute order*.

Ignore nodes by XPath

If selected, you can enter an [XPath expression \(on page 1732\)](#) to ignore certain nodes from the comparison. It will be processed as XPath version 2.0. The XPath expression specified in this option is used as the default ignore instructions **only** when the application is started. If you enter an XPath expression in the similar option on the **Diff Files** toolbar, that expression will be used instead.

Merge adjacent differences

If selected, the application considers two adjacent differences as one when the differences are painted in the side-by-side editors. If not selected, every difference is represented separately.

Mark end tags as different for modified elements

If selected, end tags of modified elements are also presented as differences. Otherwise, only the start tags are presented as differences.

Ignore expansion state for empty elements

If selected, empty elements in both expansion states are considered matched (that is `<element/>` and `<element></element>` are considered equal).

Note:

The File Comparison preferences are also accessible through the **Directory Compare Tool (on page 451)** and are taken into account when directory comparisons are invoked.

Appearance Preferences

To configure the appearance options for the Files Comparison tool, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **Diff > Files Comparison > Appearance**. This preferences page offers the following options:

Line wrap

Wraps the lines presented in the two diff panels at the right margin of each panel, so no horizontal scrollbar is necessary.

Incoming color

Specifies the color used on the vertical bar for incoming changes.

Outgoing color

Specifies the color used on the vertical bar for outgoing changes.

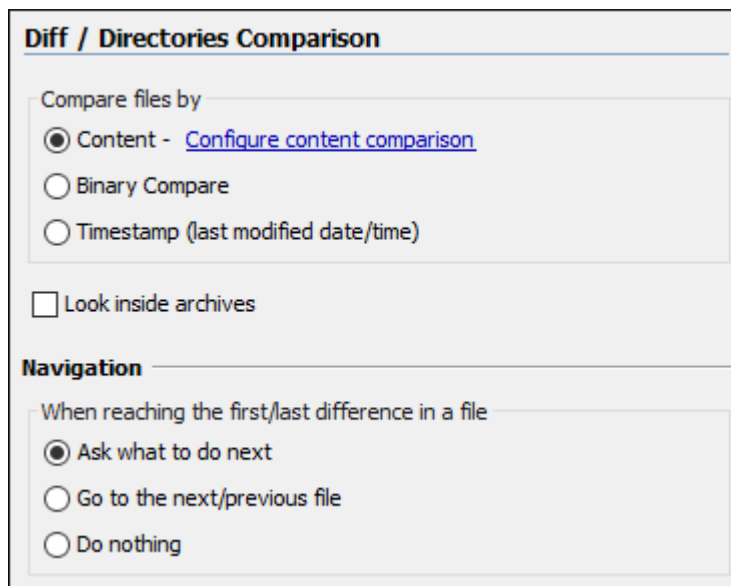

Conflict color

Specifies the color used on the vertical bar for conflicts between the compared files.

Directories Comparison Preferences

To configure the **Directories Comparison** preferences, open the **Preferences** dialog box (**Options > Preferences**) (*on page 114*) and go to **Diff > Directories Comparison**.

Figure 32. Diff Preferences Page

You can specify the following options for the directories comparison tool:

Compare files by

Controls the method used for comparing two files:

- **Content** - The file content is compared using the current [diff algorithm](#) (*on page 252*). This option is applied for a pair of files only if that file type is associated with a built-in editor type (either associated by default or associated by the user when prompted to do so on opening a file of that type for the first time).

You can use the **Configure content comparison** link to open the **Files Comparison preferences page** (*on page 252*) where you can configure options for comparing files. However, the **Ignore nodes by XPath** option is ignored when using the **Compare Directories** tool.

- **Binary Compare** - The files are compared at byte level.
- **Timestamp (last modified date / time)** - The files are compared only by their last modified timestamp.

Look in archives

If selected, [known archive types \(on page 257\)](#) are considered directories and their content is compared just like regular files.

Navigation

This options control the behavior of the differences traversal actions (**Go to previous modification, Go to next modification**) when the first or last difference in a file is reached:

- **Ask what to do next** - A dialog box is displayed asking you to confirm that you want the application to display modifications from the previous or next file.
- **Go to the next/previous file** - The application opens the next or previous file without waiting for your confirmation.
- **Do nothing** - No further action is taken.

Appearance Preferences

To configure the appearance options for the Directories Comparison tool, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **Diff > Directories Comparison > Appearance**.

Figure 33. Diff Appearance Preferences Panel

- **Added/Deleted** - Color used for marking added or deleted files and folders.
- **Modified** - Color used for marking modified files.

Archive Preferences

To configure *Archive* options, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **Archive**.

The following options are available in the **Archive** preferences page:

Archive backup options

Controls if the application makes backup copies of the modified archives. The following options are available:

- **Always create backup copies of modified archives** - When you modify an archive, its content is backed up.
- **Never create backup copies of modified archives** - No backup copy is created.
- **Ask for each archive once per session** - Once per application session for each modified archive, user confirmation is required to create the backup. This is the default setting.

**Note:**

Backup files have the name `originalArchiveFileName.bak` and are located in the same folder as the original archive.

Archive types

This table contains all known archive extensions mapped to known archive formats. Each row maps a list of extensions to an archive type supported in Oxygen XML Developer. You can use the **Edit** button at the bottom of the table to edit an existing mapping or the **New** button to create a new one and associate your own list of extensions to an archive format.

Figure 34. Edit Archive Extension Mappings

**Important:**

You have to restart Oxygen XML Developer after removing an extension from the table for that extension to not be recognized as an archive extension.

Store Unicode file names in Zip archives

Use this option when you archive files that contain international (non-English) characters in file names or file comments. If this option is selected and an archive is modified in any way, UTF-8 characters are used in the names of all files in the archive.

Plugins Preferences

You can add *plugins* (on page 2271) that extend the functionality of Oxygen XML Developer. The *plugins* are shipped as separate packages. To check for new *plugins*, go to http://www.oxygenxml.com/oxygen_sdk.html.

A *plugin* consists of a separate sub-folder in the **Plugins** folder of the Oxygen XML Developer installation folder (for example, `[OXYGEN_INSTALL_DIR]/plugins/myPlugin`). This sub-folder must contain a valid `plugin.xml` file in accordance with the `plugin.dtd` file located in the **Plugins** folder.

Oxygen XML Developer automatically detects and loads *plugins* installed correctly in the **Plugins** folder and displays them in the **Plugins** preferences page. To configure *plugins*, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Plugins**.

You can use the checkboxes in front of each *plugin* to enable or disable them. To display the properties of a *plugin* in the second section of the **Plugins** preferences page, click the name of the *plugin*.

Also, you can install a *plugin* as an add-on. For further details about this, go to [Deploying Add-ons](#) (on page 1897)

External Tools Preferences

A command-line tool can be started in the Oxygen XML Developer user interface as if from the command line of the operating system shell. The **External Tools** preferences page allows you to add and configure these external tools that could be used while working with Oxygen XML Developer. To access this preferences page, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **External Tools** (or select **Configure** from the **Tools > External Tools** menu).

This preferences page presents a list of the external tools that have been configured. You can use the buttons at the bottom of the page to configure the items in the list. Once a tool has been configured, you can open it by selecting it from the **Tools > External Tools** menu or from the  **External Tools** drop-down menu on the toolbar (the **Tools** toolbar needs to be selected in the [Configure Toolbars](#) dialog box (on page 327)).

How to Configure an External Tool

To configure an external tool in the **External Tools** preferences page, use any of the following buttons at the bottom of the page:

- **New** - Adds a new external tool to the list.
- **Edit** - Allows you to configure an existing external tool, selected from the list.
- **Duplicate** - Duplicates an existing external tool, selected from the list, to use as a template for configuring a similar tool.

Any of those three buttons opens the **External Tools** configuration dialog box.

Figure 35. External Tools Configuration Dialog Box

This configuration dialog box includes the following options:

Name

The name of tool that will be displayed in the **Tools > External Tools** menu and in the  **External Tools** drop-down menu on toolbar.

Description

A description of the tool displayed as a tooltip where the tool name is used.

Working directory

The directory that the external tool will use to store intermediate and final results. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 289) button, or the  **Browse** button. You can use one of the following editor variables: `${cfd}` (on page 294), `${pd}` (on page 296), `${oxygenInstallDir}` (on page 296), `${homeDir}` (on page 296), `${system(var.name)}` (on page 297), `${date(pattern)}` (on page 295), `${xpath_eval(expression)}` (on page 297).

Command line

The command line that will start the external tool. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 289) button, or the  **Browse** button. You can use one of the following editor variables: `${homeDir}` (on page 296), `${home}` (on page 296), `${cfn}` (on page 294), `${cfne}` (on page 294), `${cf}` (on page 294), `${currentFileURL}` (on page 295), `${cfd}` (on page 294), `${cfdu}` (on page 294), `${tsf}` (on page 297), `${pd}` (on page 296), `${pdu}` (on page 296), `${oxygenInstallDir}` (on page 296), `${oxygenHome}` (on page 296), `${frameworksDir}` (on page 296), `${frameworks}` (on page 296), `${ps}` (on

page 296), `#{timeStamp}` (*on page 297*), `#{uuid}` (*on page 297*), `#{id}` (*on page 296*), `#{afn}` (*on page 289*), `#{afne}` (*on page 289*), `#{af}` (*on page 289*), `#{afu}` (*on page 289*), `#{afd}` (*on page 289*), `#{afdu}` (*on page 289*), `#{ask('message', type, 'default_value')}` (*on page 290*), `#{dbgXML}` (*on page 295*), `#{dbgXSL}` (*on page 295*), `#{env(VAR_NAME)}` (*on page 295*), `#{system(var.name)}` (*on page 297*), `#{date(pattern)}` (*on page 295*), and `#{xpath_eval(expression)}` (*on page 297*).

Show output messages

When this option is selected, all the messages emitted by the external tool are displayed in the **Results view** (*on page 503*) view. When this option is not selected, only the error messages are displayed. You can also choose the output encoding and content type:

- **Output encoding** - The encoding of the output stream of the external tool that will be used by Oxygen XML Developer to read the output of the tool.
- **Output content type** - A list of predefined content type formats that instruct Oxygen XML Developer how to display the generated output. For example, setting the **Output content type** to `text/xml` enables the syntax coloring of XML output.

Error Encoding

The encoding of the error stream of the external tool that will be used by Oxygen XML Developer to read the error stream.

Shortcut key

You can choose a keyboard shortcut that can be used to launch the external tool.

Menu Shortcut Keys Preferences

You can use the **Menu Shortcut Keys** preferences page to configure shortcut keys for the actions available in Oxygen XML Developer. The shortcuts assigned to actions are displayed in a table in this preference page. To access the full list of shortcut keys, open the **Preferences** dialog box (**Options > Preferences**) (*on page 114*) and go to **Menu Shortcut Keys** (or simply go to **Options > Menu Shortcut Keys**).

For a list of the most commonly used shortcuts, see [Frequently Used Shortcut Keys](#) (*on page 36*).

Figure 36. Menu Shortcut Keys Preferences Page

Menu Shortcut Keys		
Name ^	Category	Shortcut key
Remove all	Bookmarks	Ctrl+F7
Remove all	Breakpoints	Ctrl+Shift+F7
Remove all	Highlights	
Remove all	Results	
Remove comment(s)	Edit	
Remove from Disk	Project	Shift+Delete
Remove from Project	Project	Delete
Remove from version control	Working copy	
Remove highlight(s)	Edit	
Remove selected	Results	Delete
Rename	Archive Browser	F2
Rename	File	F2
Rename	Markup	
Rename	Project	F2
Rename	SharePoint	F2
Repositories	Perspective	

The **Menu Shortcut Keys** preferences page also contains the shortcuts that you define at *document type* level (on page 140).

**Note:**

A shortcut defined at *document type* level overwrites a default shortcut.

Furthermore, the shortcuts table also contains entries for actions that show side-views contributed by plug-ins.

To find a specific action, you can use the filter text field to search through any of the columns in the table. You can also press shortcut key combinations on your keyboard to filter the list and click on a column header to sort that column.

The table includes the following columns or options:

- **Description** - A short description of the action.
- **Category** - A classification of the actions in categories for easier management and more flexibility in assigning multiple keys for the same action.

- **Shortcut key** - The combination of keyboard keys that can be used to launch the action. To add or change a shortcut key, you can either double-click a row or select the row and click the **Edit** button.
- **'Home' and 'End' keys are applied at line level** (available on macOS only) - Controls the way the HOME and END keys are interpreted. If selected, the default behavior of these keys is overridden and the cursor only moves on the current line.

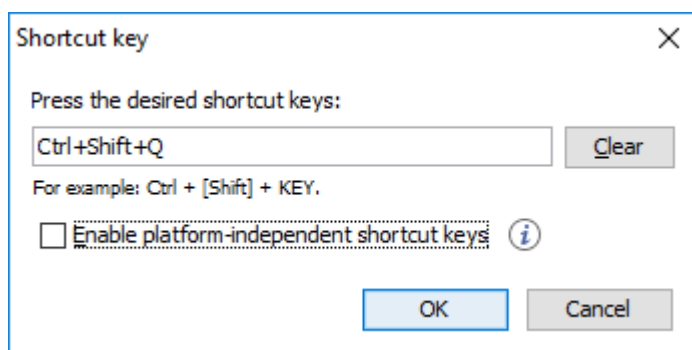

How to Assign a Shortcut Key or Edit an Existing Shortcut

To assign a shortcut key to an action or edit an existing shortcut configuration, follow these steps:

1. Select the action in the table.
2. Click the **Edit** button.

Step Result: The **Shortcut key** configuration dialog box is displayed.

Figure 37. Shortcut Key Configuration Dialog Box

3. Press the desired shortcut keys on your keyboard.
4. If you need the shortcut to work on multiple platforms, select the **Enable platform-independent shortcut keys** option. In this case, the following modifiers are used:
 - **M1** represents the **Command** key on macOS, and the **Ctrl** key on other platforms.
 - **M2** represents the **Shift** key.
 - **M3** represents the **Option** key on macOS, and the **Alt** key on other platforms.
 - **M4** represents the **Ctrl** key on macOS, and is undefined on other platforms.
5. Click **OK** to save your configuration.

Troubleshooting:

If you encounter problems with keyboard shortcuts not working as expected, see [Keyboard Shortcuts Result in Unexpected Behavior \(on page 2225\)](#) or [Keyboard Shortcuts Do Not Work At All \(on page 2225\)](#).

[Frequently Used Shortcut Keys \(on page 36\)](#)

File Types Preferences

Oxygen XML Developer offers built-in editing support for a wide variety of file types, but you can also add new file extensions and associate them with whatever editor type fits your needs. The associations set here between a file extension and the type of editor will determine which editor will be opened for editing purposes when that type of file is created or opened.

To configure the **File Types** options, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **File Types**.

Figure 38. File Types Preferences Page

The table contains the following columns:

- **Extension** - The extensions of the files that will be associated with an editor type.
- **Editor** - The type of editor which the extensions will be associated with. Some editors provide easy access to frequent operations via toolbars (XML editor, XSL editor, DTD editor) while others provide just a syntax highlight scheme (Java editor, SQL editor, Shell editor).

If the editor set here is not one of the XML editors (XML editor, XSL editor, XSD editor, RNG editor, WSDL editor) then the encoding set in the **Encoding for non-XML files** option (on page 158) is used for opening and saving a file of this type.

The files that match the **Ant build patterns** will be associated with the Ant editor.

The files that match the **Binary file patterns** patterns are handled as binary and opened in the associated system application. Also, they are excluded from the following actions available in the **Project view** (on page 365): **File/Replace in Files, Check Spelling in Files, Validate**.

**Note:**

If you associate an empty extension to a content type, all files without extensions will be opened with that specific content type.

Open/Find Resource Preferences Page

You can configure various options that pertain to the **Open/Find Resource** dialog box (on page 388) and **Open/Find Resource** view (on page 385). To access these options, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Open/Find Resource**.

The following options are available in this **Open/Find Resource** preferences page:

Refresh index when opening a map in DITA Maps Manager

If selected, DITA maps that are opened in the DITA Maps Manager will automatically be re-indexed.

Only index files referenced in the context DITA map as "resource-only"

If selected, only files referenced as "resource-only" in the context DITA map or in its referenced sub maps are indexed. By default, the setting is not selected.

**Tip:**

It makes sense to enable this setting if the current opened project contains lots of resources to speed up computation of the reusable components displayed in the **DITA Reusable Components** view's **Components** tab.

Limit search results to

Specifies the maximum number of results that are displayed in the **Open/Find Resource** dialog box/view (on page 388).

Enable searching in content

This option is selected by default and it allows you to use the **Open/Find Resource** dialog box/view (on page 388) to search in content or reviews, as well as in file paths. If this option is not selected, you can only use the **Open/Find Resource** feature to search in file paths.

Content search scope section

Ignore content of these files

Allows you to select specific directories, files, or file types that are ignored when you perform a search. For example, `*.txt` ignores all the `.txt` files, `*/topics/`

* ignores all the files from the `topics` directory, regardless of their depth, and `file:/C:/tmp/*` ignores everything from the `tmp` directory.

Include the contents of these binary files

Results from a search in the **Open/Find Resource** dialog box/view (on page 388) will be returned as a PDF if the PDF contains the searched text. If you want to disable this feature, delete the contents of the text field.

Index the content of remote resources

Controls the indexing of resources that are not local. For example, the resources referenced in a *DITA map* (on page 2268) opened from a remote server (from a CMS or from a WebDAV location) are not indexed by default. To index the content of these resources, select this option.

**Note:**

Selecting this option may lead to delays when the indexing is computed.

Content search options section

Content language

Use this option to specify a language for the search engine to use for the current document. This is helpful if you have multiple languages within the content of a document. The search engine will use a set of *stop words* and analyzers tuned specifically for that specific language. By default, it is mapped to the **UI language** specified in the **Global preferences page** (on page 116). Therefore, you need to change this option only if the language of the text you want to perform the search in differs from the UI language.

**Tip:**

If you select **<Generic language (no stemming)>** from the drop-down list, no word stemming is performed when creating the index. This might be useful if your content has many technical terms that should be indexed as they are.

Stop words

A list of *stop words* that will be filtered out of the search processing. The list is automatically populated based upon the specified **Content language**, but you can add or remove words from the list.

When searching in content, return

This option specifies how matches are returned when doing searches in content. You can choose between two options:

- **Exact matches** - The search results match the exact whole words that you enter in the search field of the **Open/Find Resource** dialog box/view.
- **Prefix matches** (default) - The search results match documents that contain words starting with the search terms. For instance, searching for "pref page" will also find documents containing "preference page".

Automatically join search terms using:

Allows you to select the default boolean operator that Oxygen XML Developer applies when you perform a search. For example, if the AND operator is selected and you search for "car assembly", the matches must contain both of the words. If you choose OR, the matches must contain one of the selected search terms and results that contain both words are promoted to the top of the list.

Enable XML-aware searching

When selected, you can perform [XML-specific searches \(on page 391\)](#) for XML elements and attributes.

Note:

Selecting this option may slow down the indexing of your documents and increase the index size on the disk.

Index files with size less than (KB)

Since indexing can be slowed down when the [Enable XML-aware searching option \(on page 266\)](#) is active, you can use this option to set a maximum file size to be indexed.

Stop Words

A list of comma-separated *stop words*, meaning that the words added in this list are filtered out prior to processing a search query.

[Open/Find Resource View \(on page 385\)](#)

[Open/Find Resource Dialog Box \(on page 388\)](#)

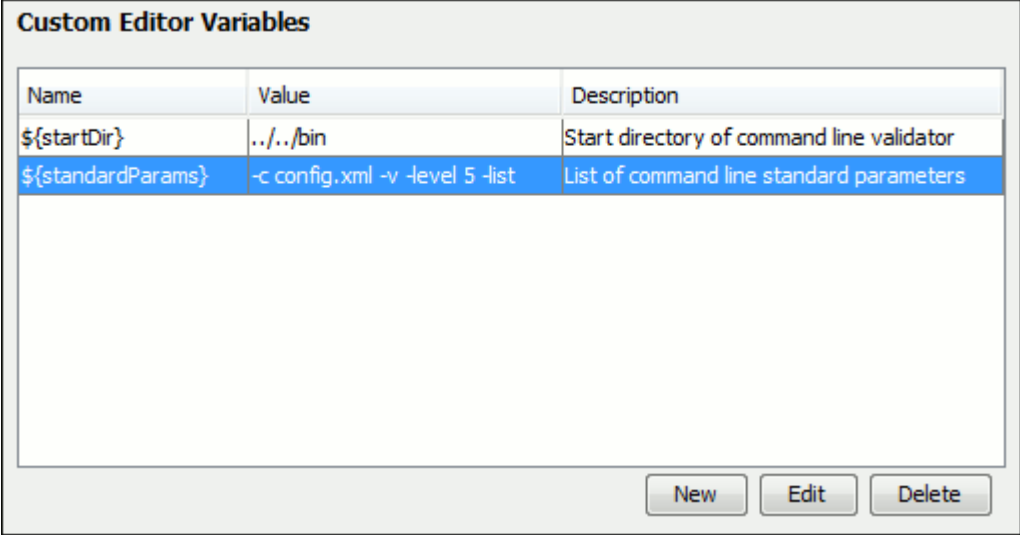

Custom Editor Variables Preferences

An [editor variable \(on page 289\)](#) is useful for making a transformation scenario, validation scenario, or other tool independent of its file path. An editor variable is specified as a parameter in a transformation scenario, validation scenario, or command line of an external tool. Such a variable is defined by a name, a string value, and a text description. A custom editor variable is defined by the user and can be used in the same expressions as the [built-in editor variables \(on page 289\)](#).

Custom editor variables are created and configured in the **Custom Editor Variables** preferences page. To access this page, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Custom Editor Variables**.

This preferences page displays a table of all the custom editor variables that have been defined. The table includes three columns for the editor variable **Name**, its **Value**, and its **Description**. To create a new variable, click the **New** button at the bottom of the table and define your custom editor variable in the subsequent dialog box. To edit an existing custom editor variable, click the **Edit** button and configure the variable in the subsequent dialog box. You can also use the **Delete** button to remove custom editor variables that are no longer needed.

Figure 39. Custom Editor Variables Table

Name	Value	Description
<code>\${startDir}</code>	<code>../../bin</code>	Start directory of command line validator
<code>\${standardParams}</code>	<code>-c config.xml -v -level 5 -list</code>	List of command line standard parameters

Network Connection Settings Preferences

This section presents the options available in the **Network Connection Settings** preferences pages.

Proxy Preferences

Some networks use proxy servers to provide internet services to LAN clients. Therefore, clients behind the proxy may only connect to the Internet via the proxy service. If you are not sure if your computer is required to use a proxy server to connect to the Internet or you do not know the proxy parameters, consult your network administrator.

To configure the **Proxy** options, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Network Connection Settings > Proxy**. The following options are available:

Proxy section

Specifies how HTTP(S) connections go through the proxy server. You can choose between the following three options:

- **Direct connection** - HTTP(S) connections will go directly to the target host without going through a proxy server.
- **Use system settings** (default setting) - HTTP(S) connections will go through the proxy server set in the operating system.

Attention:

The system settings for the proxy cannot be read correctly from the operating system on some Linux systems. The system settings option should work properly on Gnome-based Linux systems, but it does not work on KDE-based ones as the Java virtual machine does not offer the necessary support yet.

- **Manual proxy configuration** - HTTP(S) connections will go through the proxy server specified in the **Web Proxy (HTTP/HTTPS)** section.

Web Proxy (HTTP/HTTPS) section

Address

The address of the proxy server used for manual configurations.

Port

The port of the proxy server used for manual configurations.

No proxy for

Specifies the hosts that the connections must not go through a proxy server. A host needs to be written as a fully qualified domain name (for example, `myhost.example.com`) or as a domain name (for example, `example.com`). Use a comma to separate multiple hosts.

User

The user name for authentication with the proxy server.

Password

The password for authentication with the proxy server.

SOCKS Proxy section

Address

The address of a SOCKS proxy that all connections will pass through. If this field is empty, the connections do not use a SOCKS proxy.

Port

The port of a SOCKS proxy that all connections will pass through.

HTTP(S)/WebDAV Preferences

To set the **HTTP(S)/WebDAV** preferences, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Network Connection Settings > HTTP(S)/WebDAV**. The following options are available:

Maximum number of simultaneous connections per host

Defines the maximum number of simultaneous connections established by the application with a distinct host. Servers might consider multiple connections opened from the same source to be a **Denial of Service** attack. You can avoid that by lowering the value of this option.

Note:

The minimum value that can be set in this option is 5.

Read Timeout (seconds)

The period (in seconds) after which the application considers that an HTTP server is unreachable if it does not receive any response from that server.

Enable HTTP 'Expect: 100-continue' handshake (for HTTP/1.1 protocol)

Activates *Expect: 100-Continue* handshake. The purpose of the *Expect: 100-Continue* handshake is to allow a client that is sending a request message with a request body to determine if the origin server is willing to accept the request (based on the request headers) before the client sends the request body. The use of the *Expect: 100-continue* handshake can result in noticeable performance improvement when working with databases. The *Expect: 100-continue* handshake should be used with caution, as it may cause problems with HTTP servers and proxies that do not support the HTTP/1.1 protocol.

Use the 'Content-Type' header field to determine the content type

When selected, Oxygen XML Developer tries to determine a resource type using the **Content-Type** header field. This header indicates the *Internet media type* of the message content, consisting of a type and subtype. For example:

```
Content-Type: text/xml
```

When unchecked, the resource type is determined by analyzing its extension. For example, a file ending in `.xml` is considered to be an XML file.

Automatic retry on recoverable error

When selected, if an HTTP error occurs when Oxygen XML Developer communicates with a server via HTTP (for example, sending or receiving a SOAP request to or from a Web services server) and the error is recoverable, Oxygen XML Developer tries to re-send the request to the server.

Cache content for similar HTTP requests when opening and validating documents

When opening XML documents that contain lots of `xi:include` elements over HTTP (for example), depending on how content is reused, there may be lots of HTTP requests to the same target files during the validation or opening of the XML document. When this setting is selected,

HTTP calls to the same target file are cached and the opening and validation of such XML documents may take less time.

Automatically accept a security certificate, even if invalid

When selected, the HTTPS connections that Oxygen XML Developer attempts to establish with will accept all security certificates, even if they are invalid.

Important:

By accepting an invalid certificate, you accept (at your own risk) a potential security threat, since you cannot verify the integrity of the certificate's issuer.

Lock WebDAV files on open

If selected, the files opened through WebDAV are locked on the server so that they cannot be edited by other users while the lock placed by the current user still exists on the server.

SFTP Preferences

To configure the **SFTP** options, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Network Connection Settings > SFTP**. You can customize the following options:

Encoding for FTP control connection

The encoding used to communicate with SFTP servers: either ISO-8859-1 or UTF-8. If the server supports the UTF-8 encoding, Oxygen XML Developer will use it for communication. Otherwise, it will use ISO-8859-1. This section also includes a **Show hidden files** toggle option.

Public known hosts file

Specifies the file that contains the list of all SSH server host keys that you have determined are accurate. The default value is `${homeDir}/.ssh/known_hosts`.

Private key file

The path to the file that contains the private key used for the private key method of authentication of the SFTP protocol. Only *RSA* private keys in *PEM* (Base64) and *PPK* (*PuTTY*) formats are supported. Other keys (such as *OpenSSH*) are not supported. The user / password method of authentication has precedence if it is used in the [Open URL dialog box](#) (on page 349).

Passphrase

The passphrase used for the private key method of authentication of the SFTP protocol. The user / password method of authentication has precedence if it is used in the [Open URL dialog box](#) (on page 349).

Trusted Hosts Preferences

Oxygen XML Developer comes with a built-in firewall that controls the access to external resources. Anytime the application detects a request to connect to a remote resource, it checks to see if the URL belongs to a

domain that has been identified as trusted. If not, a confirmation dialog box will be displayed where you can choose whether to allow or reject access to the remote connection.

Figure 40. Trusted Hosts Confirmation Dialog Box

You can configure the list of trusted hosts using the **Trusted Hosts** preferences page. It contains a list of domains that have been identified as trusted. You can add or remove domains from the list and Oxygen XML Developer will allow connections to the listed hosts without requesting user confirmation.

Note:

Connections defined in the **Data Sources** preferences page (on page 242) or accepted by add-ons are also considered trusted.

To add or remove domains, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Network Connection Settings > Trusted Hosts**. The following options are available:

- **New** - Allows you to manually add a new entry to the list of trusted hosts.

Tip:

You can specify a specific port at the end of the URL (for instance, `www.example.com:8080`). Otherwise, if no port is specified, connections will be allowed on all ports for the particular host.

- **Delete** - Allows you to remove an entry from the list of trusted hosts.

SSH Preferences

To configure the **SSH** options, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Connection settings > SSH**. The following options are available:

SSH

Specifies the command line for an external SSH client that will be used when connecting to a SVN+SSH repository. Absolute paths are recommended for the SSH client executable and the file paths given as arguments (if any). Depending on the SSH client used and your SSH server configuration, you may need to specify the user name and/or private key/passphrase in the command line. You can also choose whether to use the **Default SVN user** (the same user name

as the SSH client user) or **Prompt for a SVN user** for SVN repository operations whenever SVN authentication is required. For example, on Windows the following command line uses the `plink.exe` tool as the external SSH client for connecting to the SVN repository with SVN+SSH:

```
C:\plink-install-folder\plink.exe -l username -pw password -ssh -batch  
host_name_or_IP_address_of_SVN_server
```

XML Structure Outline Preferences

To configure options regarding the **Outline** view (*on page 494*), open the **Preferences** dialog box (**Options > Preferences**) (*on page 114*) and go to **XML Structure Outline**. It contains the following options:

Preferred attribute names for display

The preferred attribute names when displaying the attributes of an element in the **Outline** view. If there is no preferred attribute name specified, the first attribute of an element is displayed.

Enable outline drag and drop

Drag and drop is disabled for the tree displayed in the **Outline** view only if there is a possibility to accidentally change the structure of the document by such operations.

Views Preferences

The **Views** preferences page allows you to configure some options regarding certain views. To edit these options, open the **Preferences** dialog box (**Options > Preferences**) (*on page 114*) and go to **Views**.

The following options are available:

Project view section

Enable drag-and-drop in Project view

Enables drag and drop support in the **Project view** (*on page 365*). It should be disabled only if there is a possibility of accidentally changing the structure of the project by drag and drop actions.

Information view section

Maximum number of lines

Specifies the maximum number of lines that can be written in the **Information view** (*on page 467*).

Messages Preferences

The **Messages** preference page allows you to specify whether or not certain messages are displayed. To configure these options, open the **Preferences** dialog box (**Options > Preferences**) (*on page 114*) and go to **Messages**.

The following warning messages can be enabled or disabled:

Show Java vendor warning at startup

If this option is selected, Oxygen XML Developer displays a warning on startup if a non-recommended version of the Java virtual machine is being used.

Show confirmation dialog when moving resources

Specifies whether or not to display a confirmation dialog box when you move a resource in the **Project view** (*on page 365*), **Data Source Explorer view** (*on page 1748*), and **Archive Browser** (*on page 1741*). In the confirmation dialog box, there is an option to choose to not show this dialog box in the future. To reset that behavior, simply select **Restore Defaults** at the bottom of this preferences page.

Show warning when adding resources already included in the project

Specifies whether or not to display a dialog box that warns you if you try to add files that already exist in your project.

Show warning for document size limit for bidirectional text, Asian languages, and other special characters

Specifies whether or not to display a warning message when an open file that contains bidirectional characters is too large and bidirectional support is disabled.

Show warning message when changing the text orientation in the editor

Specifies whether or not to display a warning message when you change the text orientation in the editor.

Show warning when editing long expressions in the XPath toolbar

Specifies whether or not to display an information dialog box that allows you to specify if you want to use the **XPath/XQuery Builder** (*on page 1735*) view when editing long XPath expressions.

Show SFTP certificate warning dialog

Specifies whether or not to display a warning dialog box each time the authenticity of the SFTP server host cannot be established.

Show Enterprise license related message when trying to connect to a Microsoft SharePoint server

Specifies whether or not to display an error message if you try to connect to a Microsoft SharePoint server without having the proper license.

Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions

Specifies whether or not to display a dialog box that allows you to choose a specific encoding whenever you use the **Encode Selection** or **Decode Selection** actions for *Base64* (*on page 524*), *Base32* (*on page 525*), or *Hex conversions* (*on page 526*). In the dialog box, there is an option to choose to not show this dialog box in the future. To reset that behavior, simply select **Restore Defaults** at the bottom of this preferences page.

Convert DB Structure to XML Schema

When tables from a database schema are selected in the **Select database table** section of the **Convert DB Structure to XML Schema** dialog box (*on page 794*) and another database schema is expanded, a confirmation is needed since the previous selection will be discarded. This option specifies whether or not you are always asked if you want the other database schema to always be expanded without asking you, or it is never expanded.

Configuring Options

A set of options controls the behavior of Oxygen XML Developer, allowing you to configure most of the features. To offer you the highest degree of flexibility in customizing the application to fit the needs of your organization, Oxygen XML Developer includes several distinct layers of option values.

Figure 41. Option Lookup Priority

The option layers are as follows (sorted from high priority to low):

- **Project Options** (*on page 278*)

Allows project managers to establish a set of rules for a specific project. These rules standardize the information exchanged by the team members (for example, if the project is stored in a repository, a common set of formatting rules avoid conflicts that may appear when documents modified by various team members are committed to the repository).

- **Global Options** (*on page 278*)

Allows individual users to personalize Oxygen XML Developer according to their specific needs.

- **Customized Default Options** (*on page 275*)

Designed to customize the initial option values for a group of users, this layer allows an administrator to deploy the application preconfigured with a standardized set of option values.

Note:

Once this layer is set, it represents the initial state of Oxygen XML Developer when an end-user selects the **Restore defaults** (*on page 115*) or **Reset Global Options** (*on page 279*) actions.

• Default Options

The predefined default values, tuned so that Oxygen XML Developer behaves optimally in most working environments.

Important:

If you set a specific option in one of the layers, but it is not applied in the application, make sure that one of the higher priority layers does not overwrite it.

Customizing Default Options

Oxygen XML Developer has an extensive set of options that you can configure. When Oxygen XML Developer is installed, these options are set to default values. You can provide a different set of default values for an installation using an XML *options file*.

Creating an XML Options File

To create an *options file*, follow these steps:

1. It is recommended that you use a fresh install for this procedure, to make sure that you do not copy personal or local preferences.
2. Open Oxygen XML Developer and [open the Preferences dialog box \(Options > Preferences\)](#) (*on page 114*).
3. Go through the options and set them to the desired defaults. Make sure that [Global Options](#) (*on page 2269*) is selected in each page.
4. Click **OK** and close the **Preferences** dialog box.
5. Go to **Options > Export Global Options** to create an XML options file.

Controlling Which Options are Stored in the Default Options File

If you want to control exactly which option pages will be stored in the default options file, you can choose to attach them to a project file (`.xpr` file extension) by following this procedure:

1. You may want to use a fresh install for this procedure, to make sure that you do not copy personal or local preferences.
2. In the [Project view](#) (*on page 365*), create a project or open an existing one.
3. [Open the Preferences dialog box \(Options > Preferences\)](#) (*on page 114*).
4. Configure the options in each preferences page that you want to be included in the project file and switch the storage preference to [Project Options](#) (*on page 2272*) in each page.

Note:

Some pages do not have the **Project Options** button, since the options they host might contain sensitive data (such as passwords, for example) that is unsuitable for sharing with other users.

- Click **OK** and close the **Preferences** dialog box.

All explicitly set values are now saved in the project file. You can then share the project file so that your team will have the same option configuration that you stored in the project file.

**Note:**

The project file extension (`.xpr`) must be preserved when the file is distributed to others.

**Notice:**

When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

Configuring an Installation to Use Customized Default Options

There are several methods that you can use to configure an Oxygen XML Developer installation to use the customized default options from the created XML options file.

**Warning:**

The disadvantage of customizing the default options is that if the end-user manually changes an option, the default value will no longer be used. An alternative would be to [use a plugin to impose a set of options](#) ([on page 277](#)).

The possible methods for using customized default options during an installation include:

- **Copy the XML Options File to the Installation Directory**

In the `[OXYGEN_INSTALL_DIR]`, create a folder called `preferences` and copy the created XML options file into it (for example, `[OXYGEN_INSTALL_DIR]/preferences/default.xml`).

**Note:**

The XML file placed in the `preferences` folder can have any name as long as it has the extension `xml` or `xpr`. If there are multiple such files in the `preferences` folder only the first one found is used.

- **Specify a Path to the XML Options File in a Startup Parameter**

Set the path to the XML options file as the value of the `com.oxygenxml.default.options` system property in the [startup parameters](#) ([on page 304](#)). The path can be specified with any of the following:

- A URL or file path relative to the application installation folder. For example:

```
-Dcom.oxygenxml.default.options=options/default.xml
```

- A system variable that specifies the file path. For example:

```
com.oxygenxml.default.options=${system(CONFIG)}/default.xml
```

- An environmental variable that specifies the file path. For example:

```
com.oxygenxml.default.options=${env(CONFIG)}/default.xml
```

Impose a Set of Options Using a Plugin

The [Oxygen XML SDK](#) includes a sample Java-based **oxygen-sample-plugin-impose-options** plugin that shows how to impose a set of options for the end-users every time the API is called. It is possible to use this plugin to impose options but still allow the end-user to change options by calling the API only once, the first time the plugin starts along with Oxygen XML Developer.

A similar JavaScript-based sample **impose-options** plugin is also available here: <https://github.com/oxygenxml/wsaccess-javascript-sample-plugins>. This plugin imports a fixed set of options (saved in XML format) when Oxygen XML Developer starts.

Related information

[Sharing Application Settings \(on page 278\)](#)

Storing Global and Project Level Options

When you configure the Oxygen XML Developer options, you can store them globally or bind them to a specific project by choosing the appropriate setting in the preferences pages. They can then be [shared with others by exporting the global options \(on page 278\)](#) or by [sharing the stored project-level files \(on page 278\)](#). The same is true with transformation and validation scenarios.

For each preferences page, you can choose between **Global Options (on page 278)** and **Project Options (on page 278)** depending upon how you want to store the options in that particular preferences page.

Notice:

Some pages do not have the **Project Options** button, since the options they host might contain sensitive data (passwords, for example), unsuitable for sharing with other users.

If changes have been made to the options in a preferences page and you switch between **Project Options** and **Global Options**, a dialog box will be displayed that allows you to select one of the following:

- **Overwrite** - The existing options from the current preferences page will be overwritten.
- **Preserve** - The existing options from the current preferences page will be preserved.

Figure 42. Controlling the Storage Options for the Preferences

Global Options

By default, **Global Options** is selected in the preferences pages, meaning that the options are stored locally on your computer and are not accessible to other users (unless you [export them into an XML options file that can then be shared](#) *(on page 278)*).

Global options are stored locally in option files (for example, `oxyOptionsSa19.1.xml` for a standalone distribution of Oxygen XML Developer version 19.1) located in the following directories:

- **Windows (7, 8, 10)** - `[user_home_directory]\AppData\Roaming\com.oxygenxml.developer`
- **macOS** - `[user_home_directory]/Library/Preferences/com.oxygenxml.developer`
- **Linux/Unix** - `[user_home_directory]/.com.oxygenxml.developer`

Project Options

If you select **Project Options**, the preferences are stored in the project file (`.xpr`), which can easily be [shared with other users](#) *(on page 278)*.

Notice:

Some pages do not have the **Project Options** button, since the options they host might contain sensitive data (passwords, for example), unsuitable for sharing with other users.

Related information

[Sharing Application Settings](#) *(on page 278)*

[Customizing Default Options](#) *(on page 275)*

[Importing/Exporting/Resetting Global Options](#) *(on page 279)*

Sharing Application Settings

There are a variety of ways that you can share the settings in Oxygen XML Developer with other members of your team so that you all use a common set of options. This topic describes various possibilities.

Share Settings Through a Project File

Most of the preference pages in Oxygen XML Developer include a **Project Options** *(on page 2272)* button that allows you to pass changes to the settings to the current project file that is opened in the **Project view** *(on page 365)*. That project file can then be shared with other users. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have access to the same option configuration that you stored in the project file.

For more information about sharing projects, see [Sharing a Project - Team Collaboration](#) *(on page 378)*.

Share Settings by Exporting/Importing Global Options

Oxygen XML Developer includes actions in the **Options** menu that allow you to export and import the **global settings** *(on page 2269)*. The **Export Global Options** action will save the global settings as an XML properties

file. You can then share those settings with others by using the **Import Global Options** action to import that properties file on their computer.

For more information about global options, see [Importing/Exporting/Resetting Global Options \(on page 279\)](#).

Share Settings with a Custom Options File During Installation

When Oxygen XML Developer is installed, all the settings are set to default values. You can customize the set of default values by creating an XML *options file* that you will use when installing Oxygen XML Developer on each computer. You can then copy the XML options file to the installation directory or specify its path in a startup parameter.

For more information about creating and referencing a custom options file, see [Customizing Default Options \(on page 275\)](#).

Share Settings by Imposing Fixed Options with an API

The Maven-based [Oxygen XML SDK](#) includes a sample *plugin* called **ImposeOptions** that imposes a fixed set of options when the application starts. This can be achieved by using the `PluginWorkspaceProvider.getPluginWorkspace().setGlobalObjectProperty(key, value)` API method.

For more information about this API, see [PluginWorkspaceProvider Class](#).

[Sharing a Project - Team Collaboration \(on page 378\)](#)

[Sharing Transformation Scenarios \(on page 1246\)](#)

[Sharing Validation Scenarios \(on page 575\)](#)

[Customizing Default Options \(on page 275\)](#)

[Importing/Exporting/Resetting Global Options \(on page 279\)](#)

Importing/Exporting/Resetting Global Options

Actions for importing, exporting, and resetting global options are available in the **Options** menu. The export operation allows you to save [global preferences \(on page 2269\)](#) as an XML properties file and the import operation allows you to load the property file. You can use this file to reload saved options on your computer or to [share with others \(on page 277\)](#).

The following actions are available in the **Options** menu:

Reset Global Options

Restores the preference to the factory defaults or to [customized defaults \(on page 275\)](#). This action also resets the transformation and validation scenarios to the default scenarios and clears recently used document templates.

Import Global Options

Allows you to import a set of *Global Options* from an exported XML properties file. You can also select a [project-level options file \(on page 378\)](#) (.xpr) to import all the *Global Options* that are set in that project file. After you select a file, the **Import Global Options** dialog box is displayed, and it informs you that the operation will only override the options that are included in the imported file. You can select the **Reset all other options to their default values** option to reset all options to the default values before the file is imported.

Export Global Options

Allows you to export *Global Options* to an XML properties file. Some user-specific options that are private are not included. For example, passwords and the name of the *Review Author* is not included in the export operation.

Oxygen XML Developer automatically stores your global options in an XML properties file. Depending on the platform you are using, this file is located in the following directories:

- [user-home-folder]\AppData\Roaming\com.oxygenxml.developer for Windows
- [user-home-folder]/Library/Preferences/com.oxygenxml.developer for macOS
- [user-home-folder]/.com.oxygenxml.developer for Linux

The name of the `options` file of Oxygen XML Developer 27.1 is `oxyDeveloperOptionsSa27.1.xml`.

Configuring the Layout of the Views and Editors

All of the side-views available in Oxygen XML Developer are [dockable \(on page 2268\)](#) and there are various ways to configure and arrange the layout of the views and editing panes. You can also [configure the layout of the toolbars \(on page 327\)](#).

To open a view, select it from the **Window > Show View** menu. You can hide a view by closing it with the **X** button at the top-right corner of the view, or with the **Window > Hide current view** action.

Arranging the Layout

You can drag any view to any margin of another view or editor inside the Oxygen XML Developer window. Once you create a layout that suits your needs, you can save it from **Window > Export Layout**. Oxygen XML Developer creates a layout file containing the preferences of the saved layout. To load a layout, go to **Window > Load Layout**. To reset it, select **Window > Reset Layout**.

Note:

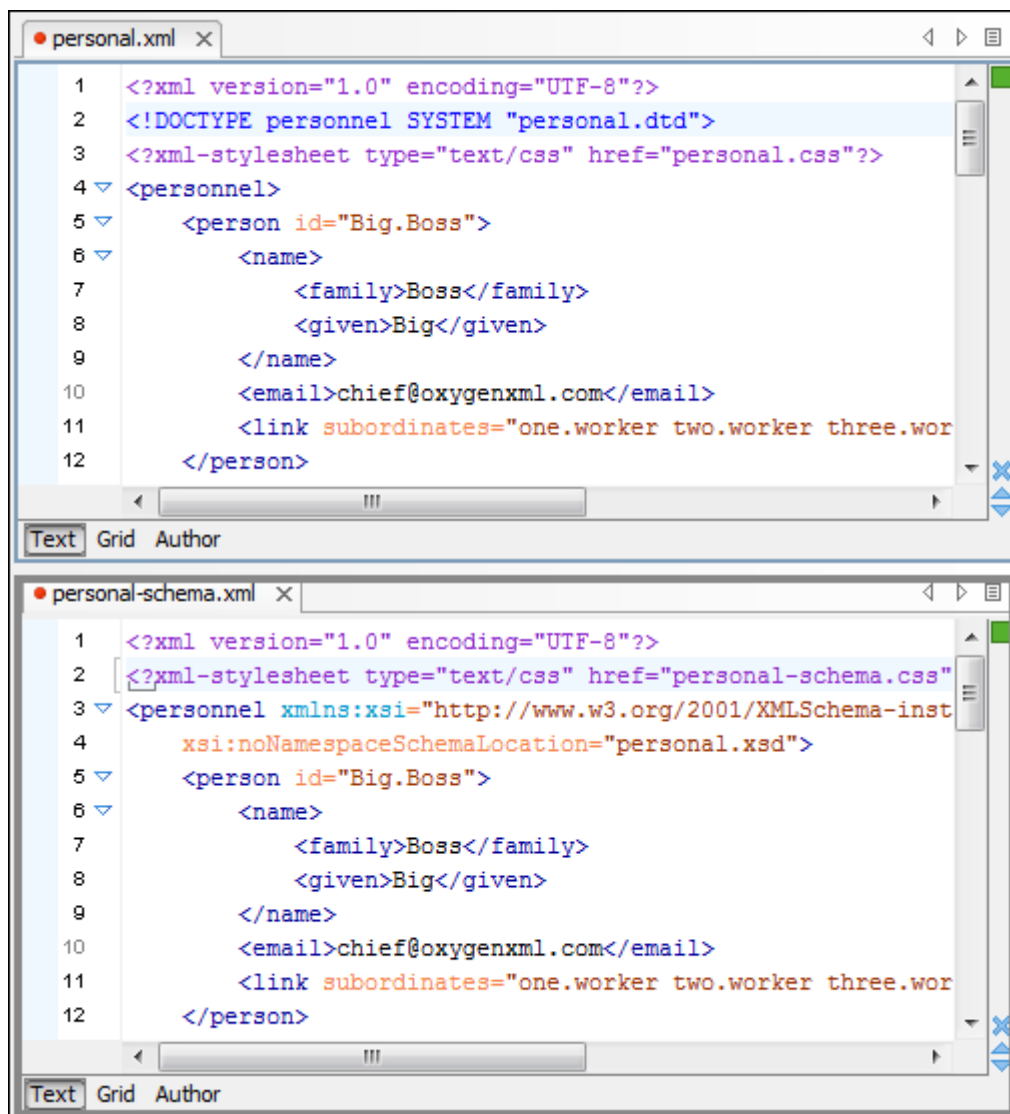

The **Load Layout** menu lets you select between the default layout, a predefined layout, or a custom layout. The changes you make using the **Load Layout** menu are also reflected in the **Application Layout** preferences page.

The changes you make to any layout are preserved between working sessions. The predefined layout files are saved in the [preferences directory](#) (on page 115) of Oxygen XML Developer.

You can drag the editors and arrange them in any order, both horizontally and vertically.

The following image presents two editors arranged as horizontal tiles. To arrange them vertically, drag one of them on top of the other. In the following example, the `personal.xml` file was dragged over the `personal-schema.xml` file:

Figure 43. Drag and Drop Editors

Hide or Float Views

Hide

To gain more editing space in the Oxygen XML Developer window, click  **Toggle auto-hide** in any view. This button sets the view in the *auto-hide* state, making it visible only as a vertical tab, at the margins of the Oxygen XML Developer window. To display a view in the *auto-hide* state, hover its side-tab with your cursor, or click it to keep the view visible until you click elsewhere.

Float

A view can also be set to a floating state by using the  **Toggle floating** action, making it independent from the rest of the Oxygen XML Developer window.

Maximize the Editing Environment

You can configure the interface to maximize the editing area, leaving more vertical screen space available for the main editing pane. This is, for example, useful for presentations on low-resolution screens or for laptops with small screen space. You can use the following two actions that are available in the **Window** menu to create a near full-screen editing environment:

Maximize Editor Area

If toggled on, all side views are minimized to give you more horizontal space in the editing pane.

Hide All Toolbars

If toggled on, all toolbar buttons are hidden to give you more vertical space in the interface.

Tile/Stack Editor Actions

You can also tile or stack all open editors using the following actions from the toolbar or **Window** menu:

Tile Editors Horizontally

Splits the editing area into horizontal tiles, one for each open file.

Tile Editors Vertically

Splits the editing area into vertical tiles, one for each open file.

Stack Editors

The reverse of the **Tile Editors Horizontally/Vertically** actions. Stacks all open editors.

Synchronous Scrolling

Select this action to scroll through the tiled editors at the same time.

Note:

When tiled, you can still drag and drop the editors, but note that they are docked in the same way as a window/view (instead of just tabs). You are actually rearranging the editor windows, so drag the editor tab and drop it to one of the sides of an editor (left/right/top/bottom). While dragging, you will see the dark gray rectangle aligned to one of the sides of the editor, or around the entire editor window. If you drop it to one of the sides, it will dock to that side of the editor. If you drop it when the rectangle is around the entire window of the editor, it will get stacked on top of that editor. You can also grab one of the stacked editors and tile it to one of the sides.

Split Editor Actions

You can divide the editing area vertically and horizontally using the following actions available in the toolbar and **Window** menu:

-  **Split Editor Horizontally** - Splits the editor horizontally so that two editor panes are displayed with one on top of the other. This is useful for comparing and merging content between two documents.
-  **Split Editor Vertically** - Splits the editor vertically so that two editor panes are displayed side by side. This is useful for comparing and merging content between two documents.
-  **Unsplit Editor** - Removes a split action on the editing area.

To maximize or restore the editors, go to **Window > Maximize Editing Area**.

Switch, Move, or Hide Editor Tabs

Each file that has been opened has a tab at the top of the editing pane and there are several ways to switch between tabs or move them, and you can even hide the tabs to only show the currently open file.

Note:

If multiple file tabs are left open when you close the application, upon startup, Oxygen XML Developer will not load the file content until you switch to the corresponding file tab. The tabs remain visible as placeholders until the focus is switched to them. This helps to improve the application's startup time. If you want to disable this feature (meaning that the previously open files will all be re-loaded at startup), deselect the **Load file content only when switching to its corresponding editor tab** option in the **Global preferences page** (*on page 117*).

Switching Editor Tabs

You can switch between editor tabs by using any of the following methods:

Mouse and Scroll Wheel

Of course, you can switch to a different editor tab by left-clicking the tab with your mouse, but when there are too many open tabs to fit on the screen, you can hover over the tab stripe and use the scroll wheel on your mouse to scroll to the left or right (same as using the two arrows on the far-right of the tab stripe).

Buttons on the Far-Right of the Tab Stripe (◀▶☰)

You can use the arrow buttons (◀▶) on the right side of the tab stripe to scroll to the left or right and the ☰ **Show List** button opens a pop-up window that displays all the open file tabs and allows you to select and switch to a specific open file.

Ctrl + Tab (Command + Tab on macOS) [NOTE: Ctrl + Page Down (Ctrl + Option + Right Arrow on macOS) does the same]

Switches to the next open tab in the order specified in the **Order of switching between editor tabs** option (*on page 118*).

Ctrl + Shift + Tab (Command + Shift + Tab on macOS) [NOTE: Ctrl + Page Up (Ctrl + Option + Left Arrow on macOS) does the same]

Switches to the previous open tab in the order specified in the **Order of switching between editor tabs** option (*on page 118*).

Window > Switch editor tab (Ctrl + F9 (Command + F9 on macOS))

This action opens a dialog box that allows you to switch to a particular editor tab by selecting it from a filterable list. This is especially helpful when you have a large amount of open file tabs and you want to switch to a certain tab this is not shown on the screen. It includes a search filter field and several options to help you find specific open file tabs.

Figure 44. Switch Editor Tab Dialog Box

The **Switch Editor Tab** dialog box contains the following options and features:

Search Filter

You can enter text in the filter field at the top of the dialog box to filter the list and search for specific open files. You can enter any number of terms, separated by space, and wildcards are allowed (for example, * to match any sequence of characters, or ? to match a single character). This field also has a history drop-down that allows you to select previously used search terms.

Match all terms

If this option is selected, only the files that match all of your search terms will be displayed. If you use a wildcard in the search filter, this option is automatically disabled.

Include file paths

If this option is selected, the search is expanded to include file paths, and also the paths are displayed in this dialog box.

Case sensitive

If this option is selected, the search operation will be case-sensitive.

List of Open File Tabs

All files that are currently open are displayed in the upper part of the main pane of the dialog box, followed by recently closed files. Files that have been modified but not yet saved are prefixed by an asterisk. To switch to a particular file tab, double-click the file or select it and click **OK**.

Moving Editor Tabs

You can move editor tabs by using any of the following methods:

Mouse Drag

You can use your mouse to drag editor tabs to a new location on the tab stripe.

Ctrl + Alt + Comma

Moves the current file tab one position to the left.

Ctrl + Alt + Period

Moves the current file tab one position to the right.

Hiding Editor Tabs

If you want to hide all the file tabs and only show the currently open file, select **Hide editor tabs** from the **Window** menu. This does not close the other tabs, just hides them. You can still navigate between tabs using keyboard shortcuts (**Ctrl + Tab**, **Ctrl + Shift + Tab**, **Ctrl + F6**, **Ctrl + Shift + F6**) or by selecting **Next editor** or **Previous editor** from the **Window** menu.

For more information about configuring the interface of Oxygen XML Developer, watch our video demonstration:

<https://www.youtube.com/embed/anwjepfAdEk>

Tip:

To get more ideas for more advanced customization possibilities, watch our Webinar: **Working with DITA in Oxygen - Customizing the Editing Experience**. It offers a visual demonstration of how to customize actions, document validation, content completion, new document templates, **Author** mode rendering, and more.

Related information

[Configuring Toolbars \(on page 327\)](#)

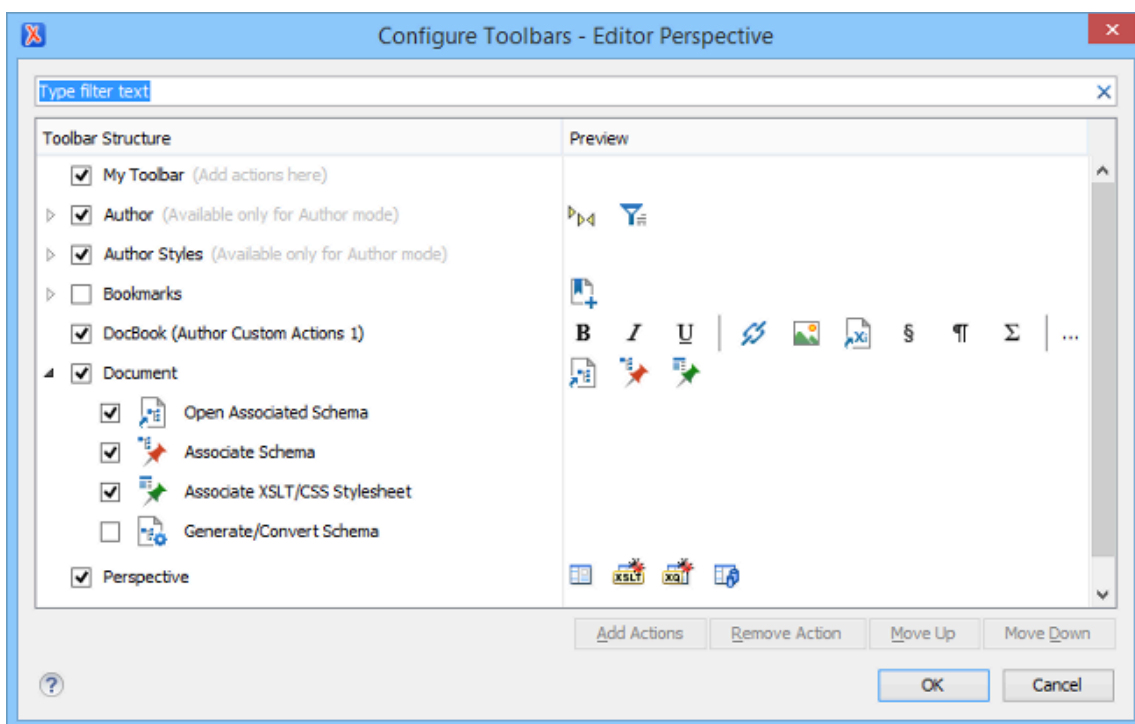

Configuring Toolbars

You can configure the toolbars in Oxygen XML Developer to personalize the interface for your specific needs. You can choose which toolbars to show or hide in the current editor mode (**Text**, **Design**, or **Grid**) and in the current *perspective* (on page 2271) (**Editor**, **XSLT Debugger**, **XQuery Debugger**, or **Database**). You can also choose which actions to display in each toolbar, add actions to toolbars, and customize the layout of the toolbars.

To configure the toolbars, open the **Configure Toolbars** dialog box by doing one of the following:

- Right-click any toolbar and select **Configure Toolbars**.
- Select **Configure Toolbars** from the **Window** menu.

Figure 45. Configure Toolbars Dialog Box

The **Configure Toolbars** dialog box provides the following features:

Filter Text Box

You can use the filter text box at the top of the dialog box to search for a specific toolbar or action.

Show or Hide Toolbars

You can choose whether to show or hide a toolbar by using the checkbox next to the toolbar name. This checkbox is only available for toolbars that are available for the current *perspective* (on page 2271) and editing mode.

Show or Hide Actions in a Toolbar

To show or hide actions in a toolbar, expand it by clicking the arrow next to the toolbar name, then use the checkbox to select or deselect the appropriate actions. The toolbar configuration changes in the **Preview** column according to your changes.

Add Actions to a Toolbar

Use the **Add Actions** button to open the **Add Actions** dialog box that displays all the actions that can be added to any of the toolbars, with the exception of those that are contributed from *frameworks (on page 2269)* or 3rd party *plugins (on page 2271)*.

Remove Actions from a Toolbar

You can remove actions that you have previously added to toolbars by using the **Remove Action** button.

Move Actions in a Toolbar

Use the **Move Up** and **Move Down** actions to change the order of the actions in a toolbar.

The **Configure Toolbars** dialog box also provides a variety of other ways to customize the layout in Oxygen XML Developer.

Customize My Toolbar

You can customize the **My Toolbar** to include your most commonly used actions. By default, this toolbar is listed first. Also, it is hidden until you add actions to it and you can easily hide it with the **Hide "My Toolbar" Toolbar** action that is available when you right-click anywhere in the toolbar area.

Drop-down Menu Actions

Composite actions that are usually displayed as a drop-down menu can only be selected in one toolbar at a time. These actions are displayed in the **Configure Toolbars** dialog box with the name in brackets.

Configure External Tools Action

There is a  **Configure external tools** composite action that appears in the toolbar called **Tools**. It is a drop-down menu that contains any external tools that are configured in the **External Tools** preferences page.

Note:

If no external tools are configured, this drop-down menu is not shown in the toolbar.

Additional actions are available from the **Window** menu or contextual menu when invoked from a toolbar that allows you to further customize your layout. These actions include:

Reset Toolbars

To reset the layout of toolbars to the default setting, select the **Reset Toolbars** action from the contextual menu or **Window** menu.

Reset Layout

To reset the entire layout (including toolbars, editing modes, views, etc.) to the default setting, select **Reset Layout** from the contextual menu or **Window** menu.

Export Layout

You can use the **Export Layout** action that is available in the **Window** menu to export the entire layout of the application to share it with other users.

Hide Toolbars

You can use the **Hide Toolbar** action from the contextual menu to easily hide a displayed toolbar. When you right-click a toolbar it will be highlighted to show you which actions are included in that toolbar.

[Configuring the Layout of the Views and Editors \(on page 322\)](#)

Import/Export Transformation or Validation Scenarios

You can export global transformation and validation scenarios into specialized *scenarios* files. You can import transformation and validation scenarios from various sources (such as project files, *framework* (on page 2269) option files, or exported scenario files). The import and export scenario actions are available in the **Options** menu. The following actions are available:

Import Transformation Scenarios

Loads a set of transformation scenarios from a project file, *framework* options file, or exported scenarios file.

Export Global Transformation Scenarios

Stores a set of global transformation scenarios in a specialized *scenarios* file.

Import Validation Scenarios

Loads a set of validation scenarios from a project file, *framework* options file, or exported scenarios file.

Export Global Validation Scenarios

Stores a set of global validation scenarios in a specialized *scenarios* file.

The **Export Global Transformation Scenarios** and **Export Global Validation Scenarios** options are used to store all the scenarios in a separate file. Associations between document URLs and scenarios are also saved in this file. You can load the saved scenarios using the **Import Transformation Scenarios** and **Import Validation Scenarios** actions. To distinguish the existing scenarios and the imported ones, the names of the imported scenarios contain the word *import*.

Editor Variables

An editor variable is a shorthand notation for context-dependent information, such as a file or folder path, a time-stamp, or a date. It is used in the definition of a command (for example, the input URL of a transformation, the output file path of a transformation, or the command line of an external tool) to make a command or a parameter generic and re-usable with other input files. When the same command is applied to multiple files, the notation is expanded at the execution of the command so that the same command has different effects depending on the actual file.

Oxygen XML Developer includes a variety of built-in editor variables. You can also create your own custom editor variables by using the [Custom Editor Variables preferences page \(on page 266\)](#).

Editor variables are evaluated and automatically expanded in many places in the application, when:

- [Creating new documents from file templates \(on page 339\)](#).
- [Inserting code templates \(on page 339\)](#) in the **Text** mode.
- Running custom configured [External Tools \(on page 2201\)](#).
- Running [validation scenarios \(on page 565\)](#) that use editor variables inside to reference various resources.
- Executing transformation scenarios (of type ANT, DITA-OT ([on page](#)), [XSLT \(on page 1130\)](#), etc.) that have editor variables set as parameter values or as values for references to various resources.
- Using specific Java API `UtilAccess.expandEditorVariables(String, URL)` from plugins and framework extensions.

You can use the following editor variables in Oxygen XML Developer commands of external engines or other external tools, and in various places in the application, such as in transformation scenarios, and validation scenarios:

- **`\${activeConditionSet}** - Current active profiling condition set name. If there is no active condition set, the variable will be replaced with an *empty string*.
- **`\${af}** - The local file path of the ZIP archive that includes the currently edited document.
- **`\${afd}** - The local directory path of the ZIP archive that includes the currently edited document.
- **`\${afdu}** - The URL path of the directory of the ZIP archive that includes the currently edited document.
- **`\${afn}** - The file name (without parent directory and without file extension) of the zip archive that includes the currently edited file.
- **`\${afne}** - The file name (with file extension, for example `.zip` or `.epub`, but without parent directory) of the zip archive that includes the currently edited file.
- **`\${afu}** - The URL path of the ZIP archive that includes the currently edited document.
- **`\${answer(@id)}** - Used in conjunction with the **`\${ask}** editor variable. The **@id** parameter is required and identifies the answer from the **`\${ask}** editor variable with the same ID.

Example:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE topic PUBLIC "-//OASIS//DTD DITA Topic//EN" "topic.dtd">
```

```

<topic id="topic_lcf_lc4_tdb">
  <title></title>
  <body>
    <data name="\${ask('Set a data name', String, 'name', @name)}"></data>
    <p>The name is: \${answer(@name)}</p>
  </body>
</topic>

```

- `\${ask('message', type, ('real_value1':rendered_value1'; 'real_value2':rendered_value2'; ...), 'default_value', @id)}` - To prompt for values at runtime, use the `ask('message', type, ('real_value1':rendered_value1'; 'real_value2':rendered_value2'; ...), 'default-value')` editor variable.

You can set the following parameters:

- **message** - The displayed message. Note the quotes that enclose the message.
- **default-value** - Optional parameter. Provides a default value.
- **@id** - Optional parameter. Used for identifying the variable to reuse the answer using the `\${answer(@id)}` editor variable.
- **type** - Optional parameter (defaults to **generic**), with one of the following values:

Note:

The title of the dialog box will be determined by the type of parameter and as follows:

- For `url` and `relative_url` parameters, the title will be the name of the parameter and the value of the `'message'`.
- For the other parameters listed below, the title will be the name of that respective parameter.
- If no parameter is used, the title will be "Input".

Notice:

Editor variables that are used within a parameter of another editor variable must be escaped within single quotes for them to be properly expanded. For example:

```
\${ask( 'Provide a date',generic, '\${date(yyyy-MM-dd'T'HH:MM)}' )}
```

Parameter	
generic (default)	<p>Format: <code>\\${ask('message', generic, 'default')}</code></p> <p>Description: The input is considered to be generic text that requires no special handling.</p> <p>Example:</p>

Parameter	
	<ul style="list-style-type: none"> ▪ <code>ask('Hello world!')</code> - The dialog box has a <i>Hello world!</i> message displayed. ▪ <code>ask('Hello world!', generic, 'Hello again!')</code> - The dialog box has a <i>Hello world!</i> message displayed and the value displayed in the input box is <i>Hello again!</i>.
url	<p>Format: <code>ask('message', url, 'default_value')</code></p> <p>Description: Input is considered a URL. Oxygen XML Developer checks that the provided URL is valid.</p> <p>Example:</p> <ul style="list-style-type: none"> ▪ <code>ask('Input URL', url)</code> - The displayed dialog box has the name <i>Input URL</i>. The expected input type is URL. ▪ <code>ask('Input URL', url, 'http://www.example.com')</code> - The displayed dialog box has the name <i>Input URL</i>. The expected input type is URL. The input field displays the default value <i>http://www.example.com</i>.
relative_url	<p>Format: <code>ask('message', relative_url, 'default')</code></p> <p>Description: Input is considered a URL. This parameter provides a file chooser, along with a text field. Oxygen XML Developer tries to make the URL relative to that of the document you are editing.</p> <div data-bbox="560 1196 1439 1464" style="border: 1px solid #0070c0; border-radius: 10px; padding: 10px; background-color: #e6f2ff;"> <p> Note: If the <code>ask</code> editor variable is expanded in content that is not yet saved (such as an <i>untitled</i> file, whose path cannot be determined), then Oxygen XML Developer will transform it into an absolute URL.</p> </div> <p>Example:</p> <p><code>ask('File location', relative_url, 'C:/example.txt')</code> - The dialog box has the name <i>File location</i>. The URL inserted in the input box is made relative to the currently edited document location.</p>
password	<p>Format: <code>ask('message', password, 'default')</code></p> <p>Description: The input is hidden with bullet characters.</p> <p>Example:</p>

Parameter	
	<ul style="list-style-type: none"> ▪ <code>ask('Input password', password)</code> - The displayed dialog box has the name 'Input password' and the input is hidden with bullet symbols. ▪ <code>ask('Input password', password, 'abcd')</code> - The displayed dialog box has the name 'Input password' and the input hidden with bullet symbols. The input field already contains the default abcd value.
combobox	<p>Format: <code>ask('message', combobox, ('real_value1':rendered_value1';...;real_valueN':rendered_valueN'), 'default')</code></p> <p>Description: Displays a dialog box that offers a drop-down menu. The drop-down menu is populated with the given <i>rendered_value</i> values. Choosing such a value will return its associated value (<i>real_value</i>).</p> <div data-bbox="560 779 1437 954" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; margin-bottom: 10px;"> <p> Note: The list of '<i>real_value</i>':'<i>rendered_value</i>' pairs can be computed using <code>xpath_eval()</code>.</p> </div> <div data-bbox="560 987 1437 1162" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; margin-bottom: 10px;"> <p> Note: The '<i>default</i>' parameter specifies the default-selected value and can match either a key or a value.</p> </div> <p>Example:</p> <ul style="list-style-type: none"> ▪ <code>ask('Operating System', combobox, ('win':Microsoft Windows';'macos':macOS';'lnx':Linux/UNIX'), 'macos')</code> - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems. The associated value will be returned based upon your selection. <div data-bbox="639 1536 1437 1883" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px;"> <p> Note: In this example, the default value is indicated by the <i>osx</i> key. However, the same result could be obtained if the default value is indicated by <i>macOS</i>, as in the following example: <code>ask('Operating System', combobox, ('win':Microsoft Windows';'macos':macOS';'lnx':Linux/UNIX'), 'macOS')</code></p> </div>

Parameter	
	<ul style="list-style-type: none"> ▪ <code>\${ask('Mobile OS', combobox, ('ios':'iOS';'and':'Android'), 'Android')}</code> ▪ <code>\${ask('Mobile OS', combobox, (\$xpath_eval(for \$pair in (['ios', 'iOS'], ['and', 'Android'])) return "" \$pair?1 ":" \$pair?2 ";")), 'ios')}</code>
editable_combobox	<p>Format: <code>\${ask('message', editable_combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}</code></p> <p>Description: Displays a dialog box that offers a drop-down menu with editable elements. The drop-down menu is populated with the given <i>rendered_value</i> values. Choosing such a value will return its associated real value (<i>real_value</i>) or the value inserted when you edit a list entry.</p> <div data-bbox="560 730 1439 909" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; margin: 10px 0;"> <p> Note: The list of <i>'real_value':'rendered_value'</i> pairs can be computed using <code>\$xpath_eval()</code>.</p> </div> <div data-bbox="560 936 1439 1115" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; margin: 10px 0;"> <p> Note: The <i>'default'</i> parameter specifies the default-selected value and can match either a key or a value.</p> </div> <p>Example:</p> <ul style="list-style-type: none"> ▪ <code>\${ask('Operating System', editable_combobox, ('win':'Microsoft Windows';'macos':'macOS';'lnx':'Linux/UNIX'), 'macos')}</code> - The dialog box has the name <i>'Operating System'</i>. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input. ▪ <code>\${ask('Operating System', editable_combobox, (\$xpath_eval(for \$pair in (['win', 'Microsoft Windows'], ['macos', 'macOS'], ['lnx', 'Linux/UNIX'])) return "" \$pair?1 ":" \$pair?2 ";")), 'ios')}</code>
radio	<p>Format: <code>\${ask('message', radio, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}</code></p> <p>Description: Displays a dialog box that offers a series of radio buttons. Each radio button displays a <i>'rendered_value'</i> and will return an associated <i>real_value</i>.</p>

Parameter	
	<p> Note: The list of <i>'real_value':'rendered_value'</i> pairs can be computed using <code>#{xpath_eval()}</code>.</p> <p> Note: The <i>'default'</i> parameter specifies the default-selected value and can match either a key or a value.</p> <p>Example:</p> <ul style="list-style-type: none"> ▪ <code>#{ask('Operating System', radio, ('win':'Microsoft Windows';'macos':'macOS';'lnx':'Linux/UNIX'), 'macos')}</code> - The dialog box has the name <i>'Operating System'</i>. The radio button group allows you to choose between the three operating systems. <p> Note: In this example, <code>macOS</code> is the default-selected value and if selected, it would return <code>macos</code> for the output.</p> <ul style="list-style-type: none"> ▪ <code>#{ask('Operating System', radio, (#{xpath_eval(for \$pair in (['win', 'Microsoft Windows'], ['macos', 'macOS'], ['lnx', 'Linux/UNIX']) return "" \$pair?1 ":" \$pair?2 ";"}), 'ios')}</code>

- **#{caret}** - The position where the cursor is located. This variable can be used in a code template, in **Author** mode operations, or in a **selection plugin**.
- **#{cf}** - Current file as file path, that is the absolute file path of the currently edited document.
- **#{cfd}** - Current file folder as file path, that is the path of the currently edited document up to the name of the parent folder.
- **#{cfdu}** - Current file folder as URL, that is the path of the currently edited document up to the name of the parent folder, represented as a URL.
- **#{cfn}** - Current file name without the extension and parent folder. The current file is the one currently open and selected.
- **#{cfne}** - Current file name with extension. The current file is the one currently open and selected.
- **#{comma}** - Used to display a comma when the actual comma symbol would be considered part of some sort of instruction or delimiter.
- **#{configured.ditaot.dir}** - The default directory of the DITA Open Toolkit distribution, as configured in the [DITA preferences page \(on page 237\)](#).
- **#{cp}** - Current page number. Used to display the current page number on each printed page in the **Editor / Print Preferences** page.

- **`\${currentFileURL}`** - Current file as URL, that is the absolute file path of the currently edited document represented as URL.
- **`\${date(pattern)}`** - Current date. The allowed patterns are equivalent to the ones in the [Java SimpleDateFormat class](#). **Example:** `yyyy-MM-dd`.

**Note:**

This editor variable supports both the **xs:date** and **xs:datetime** parameters. For details about **xs:date**, go to: <http://www.w3.org/TR/xmlschema-2/#date>. For details about **xs:datetime**, go to: <http://www.w3.org/TR/xmlschema-2/#dateTime>.

- **`\${dbgXML}`** - The local file path to the XML document that is currently selected in the Debugger source combo box (for tools started from the XSLT/XQuery Debugger).
- **`\${dbgXSL}`** - The local file path to the XSL/XQuery document that is currently selected in the Debugger stylesheet combo box (for tools started from the XSLT/XQuery Debugger).
- **`\${dita.dir.url}`** - A special local contextual editor variable that gets expanded only in the **Libraries** dialog box that is accessible from the **Advanced** tab of DITA transformation scenarios. The **Libraries** dialog box allows you to specify additional libraries (*JAR (on page 2270)* files or additional class paths) to be used by the transformer. This ``${dita.dir.url}`` editor variable gets expanded to the value of the `dita.dir` parameter from the **Parameters** tab of the DITA transformation scenario.
- **`\${ds}`** - The path of the detected schema as a local file path for the current validated XML document.
- **`\${dsu}`** - The path of the detected schema as a URL for the current validated XML document.
- **`\${env(VAR_NAME)}`** - Value of the `VAR_NAME` environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the **`\${system(var.name)}`** editor variable.
- **`\${framework(fr_name)}`** - The path (as URL) of the `fr_name` framework.
- **`\${framework}`** - The path (as URL) of the current `framework` directory.
- **`\${frameworkDir(fr_name)}`** - The path (as file path) of the `fr_name` framework.

**Note:**

Since multiple *frameworks* might have the same name (although it is not recommended), for both ``${framework(fr_name)}`` and ``${frameworkDir(fr_name)}`` editor variables Oxygen XML Developer employs the following algorithm when searching for a given *framework* name:

- All *frameworks* are sorted, from high to low, according to their **Priority (on page 131)** setting from the **Document Type configuration dialog box (on page 130)**. Only *frameworks* that have the **Enabled** checkbox selected are taken into account.
- Next, if the two or more *frameworks* have the same name and priority, a further sorting based on the **Storage** setting is made, in the exact following order:
 - *Frameworks* stored in the internal Oxygen XML Developer options.
 - Additional *frameworks* added in the **Locations preferences page (on page 129)**.
 - *Frameworks* installed using the add-ons support.
 - *Frameworks* found in the **main framework location (on page 129) (Default or Custom)**.

- **`\${frameworkDir}** - The path (as file path) of the current `framework` directory.
- **`\${frameworks}** - The path (as URL) of the `frameworks` directory. When used to define references inside a framework configuration, it expands to the parent folder of that specific framework folder. Otherwise, it expands to the main frameworks folder defined in the **Document Type Association > Locations** preferences page.
- **`\${frameworksDir}** - The path (as file path) of the `frameworks` directory. When used to define references inside a framework configuration, it expands to the parent folder of that specific framework folder. Otherwise, it expands to the main `frameworks` folder defined in the **Document Type Association > Locations** preferences page.
- **`\${home}** - The path (as URL) of the user home folder.
- **`\${homeDir}** - The path (as file path) of the user home folder.
- **`\${i18n(key)}** - Editor variable used only at *framework*-level to allow translating names and descriptions of **Author** mode actions in multiple actions.
- **`\${id}** - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be universally unique.
- **`\${makeRelative(base,location)}** - Takes two URL-like paths as parameters and tries to return a relative path. A use-case would be to insert content references to a certain reusable component when defining code templates.

Example:

```
${makeRelative(${currentFileURL}, ${dictionaryURL}#gogu)}
```

- **`\${oxygenHome}** - Oxygen XML Developer installation folder as URL.c
- **`\${oxygenInstallDir}** - Oxygen XML Developer installation folder as file path.
- **`\${pd}** - The file path to the folder that contains the current project file (`.xpr`).
- **`\${pdu}** - The URL path to the folder that contains the current project file (`.xpr`).
- **`\${pluginDir(pluginID)}** - Each plugin has an ID specified in its `plugin.xml` file. This editor variable expands to the file path of the folder that contains the `plugin.xml` file where that specific plugin ID is located.
- **`\${pluginDirURL(pluginID)}** - Each plugin has an ID specified in its `plugin.xml` file. This editor variable expands to the URL path of the folder that contains the `plugin.xml` file where that specific plugin ID is located.
- **`\${pn}** - Current project name.
- **`\${ps}** - Path separator, which is the separator that can be used on the current platform (Windows, macOS, Linux) between library files specified in the class path.
- **`\${rootMapDir}** - Will be expanded to the current root map parent directory file path.
- **`\${rootMapDirURL}** - Will be expanded to the current root map parent directory URL.
- **`\${rootMapFile}** - Will be expanded to the current root map file path.
- **`\${rootMapURL}** - Will be expanded to the current root map URL. For example, if in the main DITA Map you define a key with a certain value:

```
<keydef keys="test">
  <topicmeta><keywords><keyword>ABC</keyword></keywords></topicmeta>
</keydef>
```

you can modify a DITA-OT publishing parameter to have the value: `${xpath_eval(doc('${rootMapURL}')/keydef[@keys='test']/keywords/keyword/text())}`. It will be expanded to the value of that specified key name.

- **\$(selection)** - The currently selected text content in the currently edited document. This variable can be used in a code template, in **Author** mode operations, or in a **selection plugin**.
- **\$(system(var.name))** - Value of the *var.name* Java System Property. The Java system properties can be specified in the command-line arguments of the Java runtime as `-Dvar.name=var.value`. If you are looking for operating system environment variables, use the **\$(env(VAR_NAME))** editor variable instead.
- **\$(timeStamp)** - The timestamp, which is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.
- **\$(tp)** - Total number of pages in the document. Used to display the total number of pages on each printed page in the **Editor / Print** Preferences page.
- **\$(tsf)** - The transformation result file path. If the current opened file has an associated scenario that specifies a transformation output file, this variable expands to it.
- **\$(uuid)** - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java **UUID** class.
- **\$(xmlCatalogFilesList)** - A list of file paths that point to all known XML catalog files, separated by semi-colons (;).
- **\$(xpath_eval(expression))** - Evaluates an XPath expression. Depending on the context, the expression can be:
 - **static** - When executed in a non-XML context. For example, you can use such static expressions to perform string operations on other editor variables for composing the name of the output file in a transformation scenario's **Output** tab.

Example:

```
${xpath_eval(upper-case(substring('${cfn}', 1, 4)))}
```

- **dynamic** - When executed in an XML context. For example, you can use such dynamic expression in a code template or as a value of a parameter of an **Author** mode operation.

Example:

```
${ask('Set new ID attribute', generic, '${xpath_eval(@id)})}
```

Custom Editor Variables

An **editor variable** (on page 289) can be created and included in any user-defined expression where a built-in editor variable is also allowed. For example, a custom editor variable may be necessary for configuring the command line of an external tool, the working directory of a custom validator, the command line of a custom XSLT engine, or a custom FO processor.

You can create or configure custom editor variables in the **Custom Editor Variables** preferences page (on page 266). To create a custom editor variable, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Custom Editor Variables**.
2. Click the **New** button at the bottom of the table.
3. Use the subsequent dialog box to specify the **Name**, **Value**, and **Description** for the new editor variable.
4. Click **OK** to save your configuration.

Related information

[Editor Variables](#) (on page 289)

Custom System Properties

A variety of Java system properties can be set in the application to influence its behavior. For information about how to do this, see [Setting a System Property](#) (on page 305).

com.oxygenxml.disable.http.protocol.handlers

- **Allowed Values:** `true` or `false`
- **Default Value:** `false`
- **Purpose:** By default, Oxygen XML Developer uses the open source Apache HTTP Client software for HTTP(S) connections. If set to `True`, the default Java Sun HTTP(S) will be used instead. You will also lose **WebDAV** support and possibly other related features.

com.oxygenxml.present.license.reminders

- **Allowed Values:** `true` or `false`
- **Default Value:** `true`
- **Purpose:** When set to `false`, Oxygen XML Developer will not display the messages that remind you to renew your Support and Maintenance Pack that covers your current license.

com.oxygenxml.enable.content.reference.caching

- **Allowed Values:** `true` or `false`
- **Default Value:** `true`
- **Purpose:** Enables content reference caching.

com.oxygenxml.eclipse.remove.grid.editing.mode

- **Allowed Values:** `true` or `false`
- **Default Value:** `false`
- **Purpose:** When set to `false`, Oxygen XML Developer does not show the Grid editing mode when opening an XML document.

com.oxygenxml.default.java.accessibility

- **Allowed Values:** `true` or `false`
- **Default Value:** `false`
- **Purpose:** System property that can be set to `true` to force the default detection of java accessibility. If `com.sun.java.accessibility.AccessBridge` cannot be loaded, Oxygen XML Developer forces the Java accessibility to be disabled.

com.oxygenxml.floating.license.timeout

- **Allowed Values:** An integer (minutes)
- **Default Value:** `120`
- **Purpose:** Stores the time interval (in minutes) before floating licenses are released in case of application's inactivity.

com.oxygenxml.language

- **Allowed Values:** Language code (for example, `en-us`)
- **Default Value:** N/A
- **Purpose:** Property that holds the language code set during installation.

com.oxygenxml.default.options

- **Allowed Values:** A URL-type relative or absolute path.
- **Default Value:** N/A
- **Purpose:** Provides the path to an XML file containing default application options. For more details, see [Customizing Default Options \(on page 275\)](#).

com.oxygenxml.customOptionsDir

- **Allowed Values:** A file system absolute path pointing to a folder.
- **Default Value:** N/A
- **Purpose:** Sets a folder to be used by the application to load and save preference files. The default location where the options are saved varies according to the operating system. For more details, see [Importing/Exporting/Resetting Global Options \(on page 279\)](#).

com.oxygenxml.ApplicationDataFolder (Windows only)

- **Allowed Values:** A file system absolute path pointing to a folder.
- **Default Value:** `%APPDATA%`
- **Purpose:** When the application runs on Windows, you can set this property to change the location where the application considers that the `APPDATA` folder is located.

com.oxygenxml.editor.frameworks.url

- **Allowed Values:** A URL-type absolute path.
- **Default Value:** `OXYGEN_DIR \frameworks`
- **Purpose:** Changes the folder where the application considers that the main *frameworks* are installed. It has the same effect as changing the custom *frameworks* directory value in the [Location preferences page \(on page 129\)](#).

com.oxygenxml.editor.plugins.dir

- **Allowed Values:** The path can be specified with any of the following:
 - A URL or file path that is relative to the application's installation folder (for example: `-Dcom.oxygenxml.editor.plugins.dir=my-plugins`).
 - A system variable that specifies the file path (for example: `-Dcom.oxygenxml.editor.plugins.dir=${system(CONFIG)}/plugins`).
 - An environmental variable that specifies the file path (for example: `-Dcom.oxygenxml.editor.plugins.dir=${env(CONFIG)}/plugins`).
- **Default Value:** N/A
- **Purpose:** Specifies the directory where the application finds *plugins* to load.

com.oxygenxml.MultipleInstances

- **Allowed Values:** `true` or `false`
- **Default Value:** `false`
- **Purpose:** If set to `true`, multiple instances of the application are allowed to be started.

com.oxygenxml.xep.location

- **Allowed Values:** A file system absolute path pointing to a folder.
- **Default Value:** N/A
- **Purpose:** Points to a folder where RenderX XEP is installed. Has the same effect as configuring XEP in the [FO Processors preferences page \(on page 229\)](#).

com.oxygenxml.additional.classpath

- **Allowed Values:** A list of *JAR (on page 2270)*-type resources separated by a classpath separator.
- **Default Value:** N/A
- **Purpose:** An additional list of libraries to be used in the application's internal class loader in addition to the libraries specified in the `lib` folder.

com.oxygenxml.user.home (Windows only)

- **Allowed Values:** A file system absolute path pointing to a folder.
- **Default Value:** `USERPROFILE` folder
- **Purpose:** Overwrites the user home directory that was implicitly detected for the application.

com.oxygenxml.use.late.delegation.for.author.extensions

- **Allowed Values:** `true` or `false`
- **Default Value:** `true`
- **Purpose:** All Java extensions in a *framework* configuration are instantiated in a separate class loader. When **true**, the *JAR* libraries used in a certain document type will have priority to resolve classes before delegating to the parent class loader. When **false**, the parent class loader will take precedence.

com.oxygenxml.stack.size.validation.threads

- **Allowed Values:** The number of bytes used for validation threads.
- **Default Value:** `5*1024*1024`
- **Purpose:** Some parts of the application (validation, content completion) that use the Relax NG parser sometimes require a larger *Thread* stack size to parse complex schemas. The default value should be more than enough.

com.oxygenxml.jing.skip.validation.xhtml.data.attrs

- **Allowed Values:** `true` or `false`
- **Default Value:** `true`
- **Purpose:** By default, the Relax NG validation was configured to skip validation for XHTML attributes that start with "data-", which should be skipped from validation according to the XHTML 5 specification.

com.oxygenxml.report.problems.url

- **Allowed Values:** User-defined URL
- **Default Value:** N/A
- **Purpose:** The URL where a problem reported through the **Report Problem** dialog box is sent. The report is sent in XML format using the **report** parameter with the POST HTTP method.

com.oxygenxml.parallel.title.computing.threads

- **Allowed Values:** Integers
- **Default Value:** `4`
- **Purpose:** The number of parallel threads that will be used to compute referenced topic titles. Increasing this value reduces the amount of time it takes to compute topic titles in the **DITA Maps Manager** view.

com.oxygenxml.prefer.plugin.classloader.context.loader

- **Allowed Values:** `true` or `false`
- **Default Value:** `true`

- **Purpose:** Used to instruct the application to use the plugin class loader when there is code that loads content (usually Xerces code) using the thread's class loader. For instance, if you have a plugin that specifies a certain Xerces version and you want to load that version instead of the one from **Oxygen's** `lib` directory.

com.oxygenxml.classic.file.output.stream.save

- **Allowed Values:** `true` or `false`
- **Default Value:** `false`
- **Purpose:** When set to `true`, the files are saved using a Java classic file output stream, which destroys the NTFS alternate data streams set on the file. However, this might prevent data loss in the rare occasions when Oxygen XML Developer saves empty file content over shared network drives.

com.oxygenxml.format.indent.files.parallel

- **Allowed Values:** `true` or `false`
- **Default Value:** `true`
- **Purpose:** By default, when using the **Format and Indent Files** action from the **Project** view, up to four parallel threads are used by the operation, speeding up the processing when formatting very large or a large amount of documents. If the system property is set to `false`, only one thread will be used for the formatter.

Related information

[Setting a System Property \(on page 305\)](#)

Localizing the User Interface

Oxygen XML Developer comes with the following built-in languages: English, French, German, Japanese, Dutch, and Chinese. To change the interface language, go to **Options > Preferences > Global** preferences page, then choose the appropriate language from the **Language** drop-down menu.

You can also localize the interface in another language by creating an interface localization file.

How to Create an Interface Localization File

You can change the language of the Oxygen XML Developer user interface by creating an interface localization file:

1. Identify the code for the new language you want to translate the interface. It is composed from a language code (two or three lowercase letters that conform to the [ISO 639 standard](#)), followed by an underscore character, and a region code (two or three uppercase letters that conform to the [ISO 3166 standard](#)).
2. Write an email to the Oxygen XML Developer support team and ask them to send you the `translation.xml` sample file.

- Open the `translation.xml` file in Oxygen XML Developer. The file contains all the interface messages that can be translated and is updated at every new release with the latest additions. Here is a small sample of its content:

```
<translation>
  <languageList>
    <language description="English" lang="en_US"/>
  </languageList>
  <key value="New">
    <comment>The File/New action. Creates a new document.</comment>
    <val lang="en_US">New</val>
  </key>
  <key value="New_folder">
    <comment>Creates a folder in the Project View.</comment>
    <val lang="en_US">New Folder</val>
  </key>
  .....
</translation>
```

- Update the `<language>` element to reflect the new language. For example, set the `@description` attribute to Spanish and the `@lang` attribute to `es_ES`.
- For each `<key>` element, translate the `<comment>` (optional) and `<val>` elements. For example, set the `@lang` attribute to `es_ES`.

Note:

After you are finished, the file should look like this:

```
<translation>
  <languageList>
    <language description="Español" lang="es_ES"/>
  </languageList>
  <key value="New">
    <comment>El Archivo / Nueva acción. Crea un nuevo documento.</comment>
    <val lang="es_ES">Nuevo</val>
  </key>
  <key value="New_folder">
    <comment>Crea una carpeta en la vista del proyecto.</comment>
    <val lang="es_ES">Nueva carpeta</val>
  </key>
  .....
</translation>
```

6. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114), go to **Global**, and select the **Other language** option (on page 116). Browse for the `translation.xml` file.
7. Restart the application.

Adding New Languages to the Interface

Oxygen XML Developer provides a *plugin* extension is available in the **Oxygen SDK** that provides the ability to contribute a new translation language to the interface. By using this *plugin* extension, you can bundle the new language translation and that new language will be available in the **Languages** drop-down menu in the **Options > Preferences > Global** preferences page (on page 116).

Setting a Java Virtual Machine Parameter when Launching Oxygen XML Developer

You can set Java Virtual Machine parameters (for example, if you want to increase the maximum amount of memory available) for the Oxygen XML Developer [application launchers](#) (on page 304) or [command-line scripts](#) (on page 307). You can also create a [custom startup parameters file](#) (on page 307).

Setting Parameters for the Application Launchers

Increasing the Amount of Memory that Oxygen XML Developer Uses on Windows and Linux

For Windows and Linux installations of Oxygen XML Developer, the startup launchers for the application and its executable internal tools (**Tree Editor**, **XML Schema Regular Expressions Builder**, **Large File Viewer**, **SVN Client**, **Compare Directories**, and **Compare Files**) include a default `.vmoptions` file in the installation directory that contains some startup parameters (such the `-Xmx` parameter, which is used for allocating memory for that particular application). If your installation contains these `.vmoptions` files, you can edit the parameters in them so that the applications will launch with your desired values. **However, if you re-install the application, install an update for the application, or deploy it to other users or machines, those parameters will be reset to their default values.**

To increase the memory available to the Oxygen XML Developer application on Windows:

1. Browse the installation directory of Oxygen XML Developer.
2. Locate the `-Xmx` parameter in the `oxygenDeveloper27.1.vmoptions` file. If it is located in a directory where you do not have write access, copy the file to another folder (where you do have write access), modify it there, and then copy it back to the original location.

Note:

The parameters from the `.vmoptions` file are used when you start Oxygen XML Developer with the `oxygen` launcher (or with the desktop shortcut). If you use the command-line script (`<oxygen.bat>` or `<oxygen.sh>`), make sure you use the following procedure instead: [Setting Parameters in the Command-Line Scripts](#) (on page 307).

**Tip:**

By default, the maximum memory available to the application is about a quarter of the internal memory available on the machine. It is recommended to not use more than half of your existing physical RAM.

3. Restart Oxygen XML Developer. Go to **Help > About** and verify the amount of memory that is actually available (see the **JVM Memory Used** in the last row in the **Copyright** tab). If Oxygen XML Developer does not start and you receive an error message saying that it could not start the JVM, decrease the **-Xmx** parameter and try again.

Increasing the Amount of Memory that Oxygen XML Developer Uses on macOS

To increase the memory available to Oxygen XML Developer on macOS:

1. Create a file named `vmoptions.txt`.
2. Add the **-Xmx** argument (or other Java VM arguments), one per line, and do not add extra new lines at the beginning or end of the file. For example:

```
-Xmx4g
-Dcom.oxygenxml.editor.plugins.dir="$OXYGEN_HOME/plugins"
```

3. Make sure you save the file as plain text (in the **TextEdit**, go to **Menu > Format > Make plain text**) and copy the file to the `Contents` folder for the main application launcher (i.e. `Oxygen XML Developer.app/ContentsOxygen XML Developer.app/Contents`). To show the `Contents` folder for the application launcher, right-click (or **Command+Single-Click**) the Oxygen XML Developer icon in **Finder**, and choose **Show Package Contents**.

Setting a System Property

Depending on the operating system and type of installer, you can set a Java system property in multiple ways:

- **[Windows/Linux Installer]** When installing the application on Windows or Linux using the provided installation kit, you can create your own [custom startup parameters file \(on page 307\)](#) in the installation folder.
- **[macOS Installer]** Create a file named `vmoptions.txt` in the `Contents` folder within the application installation folder, similarly to [this procedure \(on page 305\)](#). Add each system property (or Java VM argument) on a separate line. For example:

```
-DpropertyName1=value1
-DpropertyName2=value2
```

- **[Windows Linux/Mac Startup Scripts]** The application also contains startup scripts in the installation folder. If you are using such scripts to start the application, you can follow this procedure to set system properties for them: [Setting Parameters in the Command-Line Scripts \(on page 307\)](#).

**Note:**

You can also set a system property through a parameter prefixed with `-Doxy` in the command line used to start the application:

```
oxygen25.1.exe "-Doxyproperty.name=value"
```

but this system property will be set immediately after the application starts and might not be available if it is needed sooner.

To check the value for a system property, you can select **Help > About** from the main menu and look in the **System properties** tab.

To view the list of Oxygen XML Developer system properties, go to [Custom System Properties \(on page 298\)](#).

Disabling DPI Scaling

Some users may prefer the look of smaller icons in an HiDPI display. To achieve this, display scaling needs to be disabled for high DPI settings. To disable the DPI scaling, [set the following property \(on page 305\)](#):

```
sun.java2d.dpiaware=false
```

Setting Environment Variables

When started, the application inherits and can access all environment variables set in the operating system. All processes started by the application (for example, publishing using the DITA Open Toolkit engine or starting external tools) also inherit the environment variables provided to the application. Depending on the operating system, environment variables can be set in various ways:

- **[Windows]** (Note: You will need Administrator permissions or to work with a system administrator):
 1. Go to **Start > Edit the system environment variables > Environment Variables**.
 2. Click **New** in the **System variables** section.
 3. Specify the variable name and value in the **Name** and **Value** fields.
 4. Click **OK**.
 5. Restart Windows.
- **[Linux]:**
 1. Append the following line to the `/etc/environment` file:

```
ENV_VAR_NAME=VALUE
```
 2. Reboot the computer.
- **[macOS]:** There is no standard way to set an environment variable so that it is inherited by the applications regardless of the way they start.

To check the value for an environmental variable, you can select **Help > About** from the main menu and look in the **System properties** tab.

Setting Parameters in the Command-Line Scripts

If you start Oxygen XML Developer with a command-line script (`oxygenDeveloper.bat/oxygenDeveloper.sh`), you have to add or modify parameters in the java command at the end of the script.

For example, to set the maximum amount of Java memory to 2 GB in **Windows**, add the **-Xmx** parameter to the last line of the `.bat` file like this:

```
%OXYGEN_JAVA% -Xmx2g -Dsun.java2d.noddraw=true ...
```

On **macOS/Linux**, add the **-Xmx** parameter (followed by a `\`) to a new line just above the `ro.sync.exml.Oxygen\` line (at approximately line 100) in the `.bat` file like this:

```
-cp "$CP"\  
-Xmx2g\  
ro.sync.exml.Oxygen\  
..
```

Creating Custom Startup Parameters File

You can create your own custom `.vmoptions` file and the application and the executable tools will automatically include your custom parameters at startup. The following custom files are recognized by the application and the executable tools:

- `custom_commons.vmoptions` - The parameters and their values of this file will be included in all the startup launchers.
- `custom_<app name>.vmoptions` - The `<app name>` is the name of the executable application or tool (for example, `custom_diffFiles.vmoptions` for the **Compare Files** tool). The parameters and their values of this file will be included in the startup launcher for this particular executable.

For example: To specify a different language for all launchers you can use the custom `vmoptions` file called `custom_commons.vmoptions` and the content would look like this:

```
-Dcom.oxygenxml.language=French
```

For example: To increase the memory available for a specific tool, such as the **Compare Files** tool (`diffFiles.exe`), you can use a custom `vmoptions` file called `custom_diffFiles.vmoptions` and the content would look like this:

```
-Xmx2g
```

To be recognized and included, these custom startup parameter files must be saved in the installation directory of Oxygen XML Developer.

How to Increase the Amount of Available Memory

Determining how to increase the amount of memory that is allocated to Oxygen XML Developer depends on how you launch the application.

- **Windows/Linux Application Launcher** - If you start Oxygen XML Developer using the default startup launcher that was created during a Windows or Linux installation, see [Increasing the Amount of Memory that Oxygen XML Developer Uses on Windows and Linux \(on page 304\)](#).
- **macOS Application Launcher** - If you start Oxygen XML Developer using the default startup launcher that was created during a macOS installation, see [Increasing the Amount of Memory that Oxygen XML Developer Uses on macOS \(on page 305\)](#).
- **Command-Line Script** - If you start Oxygen XML Developer using a command-line script, see [Setting Parameters in the Command-Line Scripts \(on page 307\)](#).
- **Custom Startup Parameters File** - You can also create your own custom startup parameters file and increase the memory using this file. For more information, see [Creating Custom Startup Parameters File \(on page 307\)](#).

5.

Perspectives

An Oxygen XML Developer *perspective* ([on page 2271](#)) is a layout geared towards a specific use. The Oxygen XML Developer interface uses standard interface conventions and components to provide a familiar and intuitive editing environment across all operating systems. There are several *perspectives* that you can use to work with documents in Oxygen XML Developer. You can change the *perspective* by selecting the respective icon () in the top-right corner of Oxygen XML Developer or by selecting the *perspective* from the **Window > Open Perspective** menu.

Editor Perspective

The **Editor** *perspective* ([on page 2271](#)) is the most commonly used *perspective* and it is the default *perspective* when you start Oxygen XML Developer for the first time. It is the *perspective* that you will use to edit the content of your XML documents.

To switch the focus to this *perspective*, select the  **Editor** button in the top-right corner of Oxygen XML Developer (or select **Editor** from the **Window > Open perspective** menu).

The layout of this *perspective* is composed of the following components:

Menus

Provides menu driven access to all the features and functions available in Oxygen XML Developer. Most of the menus are common for all types of documents. However, Oxygen XML Developer also includes some context-sensitive and *framework* ([on page 2269](#))-specific menus that are only available for a specific context or type of document.

Toolbars

Provides easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function. The [toolbars can be configured \(on page 327\)](#) to suit your specific needs.

Editor Pane

The main editing pane where you spend most of your time reading, editing, applying markup, and validating your documents.

Views

Oxygen XML Developer includes a large variety of *dockable* ([on page 2268](#)) views to assist you with editing, viewing, searching, validating, transforming, and organizing your documents. The most commonly used views are displayed by default and you can choose to display others

by selecting them from the **Window > Show View** menu. The [layout of the views can also be configured \(on page 322\)](#) according to your preferences.

When two or more views are displayed, the application provides divider bars. Divider bars can be dragged to a new position increasing the space occupied by one panel while decreasing it for the other.

As the majority of the work process centers around the Editor area, other views can be hidden using the toggle controls located on the top corner of the view ( [ on macOS]).

Some of the most helpful views in the **Editor perspective** include the following:

- **Project view (on page 365)** - Enables the definition of projects and logical management of the documents they contain.
- **Open/Find Resource view (on page 385)** - Designed to offer advanced search capabilities in various scopes.
- **Outline view (on page 494)** - It provides an XML tag overview and offers a variety of functions, such as modifications follow-up, document structure change, document tag selection, and elements filtering.
- **Results view (on page 503)** - Displays the messages generated as a result of user actions such as [validations \(on page 543\)](#), [transformation scenarios \(on page 1098\)](#), [spell checking in multiple files \(on page 420\)](#), search operations, and others. Each message is a link to the location related to the event that triggered the message.
- **Attributes view (on page 497)** - Presents all possible attributes of the current element and allows you to edit attribute values. You can also use this view to insert attributes in **Text** mode.
- **Model view (on page 499)** - Presents the currently edited element structure model and additional documentation as defined in the schema.
- **Elements view (on page 501)** - Presents a list of all defined elements that you can insert at the current cursor position according to the document's schema.
- **Entities view (on page 501)** - Displays a list with all entities declared in the current document as well as built-in ones.
- **Transformation Scenarios view (on page 1246)** - Displays a list with all currently configured transformation scenarios.
- **XPath/XQuery Builder view (on page 1735)** - Displays the results from running an XPath expression.
- **WSDL SOAP Analyzer view (on page 841)** - Provides a tool that helps you test if the messages defined in a Web Service Descriptor (WSDL) are accepted by a Web Services server.

Related information[Editing Supported Document Types \(on page 471\)](#)[Editing Modes \(on page 316\)](#)[Configuring the Layout of the Views and Editors \(on page 322\)](#)

XSLT Debugger Perspective

The **XSLT Debugger perspective** ([on page 2271](#)) allows you to detect problems in an XSLT transformation by executing the process step by step in a controlled environment. To switch the focus to this *perspective*, select the  **XSLT Debugger** button in the top-right corner of the interface or **Window > Open perspective > XSLT Debugger**.

The workspace in this *perspective* is organized as an editing area assisted by special helper views. The editing area contains editor panels that you can [split horizontally or vertically \(on page 225\)](#) in a stack of XML editor panels and a stack of XSLT editor panels. The XML files and XSL files can be edited in **Text mode** ([on page 316](#)) only.

The layout of this *perspective* is composed of the following components:

Menus

Provides menu driven access to all the features and functions available in the **XSLT Debugger**.

Toolbars

Contains all actions needed to configure and control the debugging process. The [toolbars can be configured \(on page 327\)](#) to suit your specific needs.

XML Source Pane

The editing pane where you can display and edit data or document-oriented XML documents.

XSL Source Pane

The editing pane where you can display and edit XSL stylesheets.

Output View

Displays the transformed output that results from the input of a selected document (XML) and selected stylesheet (XSL) to the transformer. The result of transformation is dynamically written as the transformation is processed. There are three types of views for the output: a text view (with XML syntax highlight), an XHTML view, and one text view for each `<xsl:result-document>` element used in the stylesheet (if it is an XSLT 2.0 / 3.0 stylesheet).

Debugging Information Views ([on page 1838](#))

Presented in two panes, they display various types of information that can be used to understand the transformation process. For each information type there is a corresponding tab. While running a transformation, relevant events are displayed in the various information views. This allows you to obtain a clear view of the transformation progress. See the [Debugging](#)

[Information Views \(on page 1838\)](#) topic for a list of all the information views (and links to more details on each view).

**Note:**

You can add XPath expression automatically in the **XWatch** view using the **Watch expression** action from the contextual menu. In case you select an expression or a fragment of it and then click **Watch expression** in the contextual menu, the entire selection is presented in the **XWatch** view. Using **Watch expression** without selecting an expression displays the value of the attribute from the cursor position in the **XWatch** view. Variables detected at the cursor position are also displayed. Expressions displayed in the **XWatch** view are *normalized* (unnecessary white spaces are removed from the expression).

Related information

[Debugging XSLT Stylesheets and XQuery Documents \(on page 1832\)](#)

[XQuery Debugger Perspective \(on page 312\)](#)

XQuery Debugger Perspective

The **XQuery Debugger perspective (on page 2271)** allows you to detect problems in an XQuery transformation process by executing the process step by step in a controlled environment and inspecting the information provided in the special views. To switch the focus to this *perspective*, select the  **XQuery Debugger** button in the top-right corner of the interface or **Window > Open perspective > XQuery Debugger**.

The workspace in this *perspective* is organized as an editing area assisted by special helper views. The editing area contains editor panels that you can [split horizontally or vertically \(on page 225\)](#) in a stack of XML editor panels and a stack of XQuery editor panels. The XML files and XQuery files can be edited in **Text mode (on page 316)** only.

The layout of this *perspective* is composed of the following components:

Menus

Provides menu driven access to all the features and functions available in the **XQuery Debugger**.

Toolbars

Contains all actions needed to configure and control the debugging process. The [toolbars can be configured \(on page 327\)](#) to suit your specific needs.

XML Source Pane

The editing pane where you can display and edit data or document-oriented XML documents.

XQuery Source Pane

The editing pane where you can display and edit XQuery files.

Output View

Displays the transformed output that results from the input of a selected document (XML) and selected XQuery document to the XQuery transformer. The result of transformation is dynamically written as the transformation is processed. There are two types of views for the output: a text view (with XML syntax highlight) and an XHTML view.

Debugging Information Views *(on page 1838)*

Presented in two panes, they display various types of information that can be used to understand the transformation process. For each information type there is a corresponding tab. While running a transformation, relevant events are displayed in the various information views. This allows you to obtain a clear view of the transformation progress. See the [Debugging Information Views *\(on page 1838\)*](#) topic for a list of all the information views (and links to more details on each view).

Note:

You can add XPath expression automatically in the **XWatch** view using the **Watch expression** action from the contextual menu. If you select an expression, or a fragment of it, and then click **Watch expression** in the contextual menu, the entire selection is presented in the **XWatch** view. Expressions displayed in the **XWatch** view are normalized (unnecessary white spaces are removed from the expression).

Resources

For more information about the XQuery debugging capabilities in Oxygen XML Developer, watch our video demonstration:

https://www.youtube.com/embed/o5_M2kbyipU

Related information

[Debugging XSLT Stylesheets and XQuery Documents *\(on page 1832\)*](#)

[XSLT Debugger Perspective *\(on page 311\)*](#)

Database Perspective

The **Database perspective** *(on page 2271)* allows you to manage databases. To switch the focus to this *perspective*, select the  **Database** button in the top-right corner of Oxygen XML Developer or **Window > Open perspective > Database** from the **Window > Open perspective** menu.

The **Database perspective** offers various helpful features, including:

- Support for browsing multiple connections at the same time.
- Support for both *Relational* and *Native XML* databases.
- Browsing the structure of databases.
- Viewing tables from databases.
- Inspecting or modifying data.
- Specifying XML Schemas for XML fields.
- SQL execution.
- XQuery execution.
- Data export to XML.

Supported Databases

Oxygen XML Developer supports numerous types of databases, including:

- eXist XML Database
- IBM DB2 (Enterprise edition only)
- JDBC-ODBC Bridge
- MarkLogic (Enterprise edition only)
- MySQL
- Oracle 11g (Enterprise edition only)
- PostgreSQL (Enterprise edition only)
- SharePoint (CMS)
- Microsoft SQL Server 2005 and Microsoft SQL Server 2008 (Enterprise edition only) (**Deprecated**)

Note:

For the databases marked with "Enterprise edition only", the XML capabilities are only available in the Enterprise edition of Oxygen XML Developer. For a detailed feature matrix that compares the Academic, Professional, and Enterprise editions of Oxygen XML Developer [go to the Oxygen XML Developer website](#).

Supported Capabilities

The supported non-XML capabilities are as follows:

- Browsing the structure of the database instance.
- Opening a database table in the **Table Explorer** view (*on page 1750*).
- Handling the values from **XML Type** columns as String values.

Note:

The non-XML capabilities are available in the Enterprise, Academic, and Professional editions of Oxygen XML Developer by registering the database driver as a *Generic JDBC* type driver when

defining the data source for accessing the database. For more information, see [Database Connection Support \(on page 1753\)](#).

The supported XML capabilities are as follows:

- Displaying an XML Schema node in the tree of the database structure (for databases with an XML-specific structure) with actions for opening, editing, and validating the schemas in an Oxygen XML Developer editor panel.
- Handling the values from **XML Type** columns as XML instance documents that can be opened and edited in an Oxygen XML Developer editor panel.
- Validating an XML instance document added to an XML Type (column of a table, etc.)

Tip:

Connections configured on relational data sources can be used to import data to XML or to generate XML schemas.

Layout of the Database Perspective

The layout of this *perspective* is composed of the following components:

Menus

Provides menu driven access to all the features and functions available in the perspective.

Toolbars

Contains all actions needed to configure and control the debugging process. The [toolbars can be configured \(on page 327\)](#) to suit your specific needs.

Editor Pane

The main editing pane where you spend most of your time reading, editing, applying markup, and validating your documents.

Data Source Explorer View [\(on page 1748\)](#)

Provides browsing support for the configured connections.

Table Explorer View [\(on page 1750\)](#)

Provides table content editing support for inserting new rows, deleting table rows, editing cell values, exporting to an XML file, and more.

Related information

[Working with Databases \(on page 1748\)](#)

[Data Source Explorer View \(on page 1748\)](#)

[Table Explorer View \(on page 1750\)](#)

6.

Editing Modes

The main editing area in Oxygen XML Developer includes several editing modes to suit the type of editing that you want to perform. You can easily switch between modes by clicking on the desired mode at the bottom of the main editing pane. Oxygen XML Developer offers the following editing modes:

- **Text** ([on page 316](#)) - This mode presents the source of the document.
- **Grid** ([on page 316](#)) - This mode displays the document as a structured grid of nested tables.
- **Design** ([on page 317](#)) - This mode is found in the schema editor and represents the schema as a diagram.

The default editing mode that will be initially opened for each type of document can be set in two ways:

- If the **Allow Document Type specific edit mode setting to override the general mode setting** option ([on page 161](#)) is selected in the **Edit Modes** preferences page, then the edit mode specified in the **Document Type** configuration dialog box ([on page 130](#)) is used when that particular type of document is initially opened.
- If the **Allow Document Type specific edit mode setting to override the general mode setting** option ([on page 161](#)) is not selected, then the edit mode specified in the table in the **Edit Modes** preferences page ([on page 161](#)) is used when that particular type of document is initially opened.

Text Editing Mode

The **Text** mode editor in Oxygen XML Developer is designed to be a simple, yet powerful, XML source editor. It provides support to help you edit, transform, and debug XML-based documents. It is similar to other common text editors, but Oxygen XML Developer also includes specialized editing actions, a powerful *Content Completion Assistant*, and many other unique features.

To switch to this mode, select **Text** at the bottom of the editing area.

For more information about working with XML documents in **Text** mode and all of the details about its features, see the **Editing XML Documents in Text Mode** section ([on page 471](#)).

Related information

[Editing XML Documents in Text Mode \(on page 471\)](#)

Grid Editing Mode

The Oxygen XML Developer **Grid** editing mode displays the XML document as a structured grid of nested tables where the text content can be modified without directly interacting with the XML markup. This is helpful

for non-technical users who want to edit text content without modifying the XML markup. You can easily expand or collapse elements within the table and the document structure can be changed with simple drag/drop or copy/paste operations.

To switch to this mode, select **Grid** at the bottom of the editing area.

Text **Grid** Author

Figure 46. Grid Editing Mode

For more information about working with XML documents in **Grid** mode and all of the details about its features, see the [Editing XML Documents in Grid Mode](#) section (on page 534).

Related information

[Editing XML Documents in Grid Mode](#) (on page 534)

Design Editing Mode (Schema Diagram Editor)

Schemas allow document designers to specify the allowed structure and content of a document and to check if it is valid. Oxygen XML Developer provides a simple and expressive schema diagram editor (**Design** mode) for editing XML schemas or JSON schemas. The schema diagram helps both the content authors who want to understand a schema and schema designers who develop complex schemas.

The **Design** mode offers a diagram view of the schema document by rendering all the schema components. You can edit component features directly within the diagram (for instance, the component name, its type, etc.), you can quickly navigate to the referenced definitions (elements, attributes, types, groups, etc.), and you can use drag-and-drop operations to move, copy, or make references. It also features some specialized helper views (such as the **Palette** view and **Facets** view) to further enhance the diagram editor, various contextual menu actions, validation support, and much more.

To switch to this mode, select **Design** at the bottom of the editing area.

Text Grid Author **Design**

Figure 47. XML Schema Diagram

XML Schema Resources

For more information about designing and editing XML schemas, and all the details about the features that are available in the Oxygen XML Developer **Design** mode for XML schema documents, see the [Editing XML Schemas](#) section (on page 717) and the [XML Schema Design Mode \(XML Schema Diagram Editor\)](#) subsection (on page 717).

JSON Schema Resources

For more information about designing and editing JSON schemas, and all the details about the features that are available in the Oxygen XML Developer **Design** mode for JSON schema documents, see the [Editing JSON](#)

Schemas section (*on page 921*) and the **JSON Schema Design Mode (JSON Schema Diagram Editor)** subsection (*on page 922*).

7.

Working With Documents

Oxygen XML Developer includes a variety of general features that can be used when working with most types of documents. More specialized features are available when working with specific types of documents, such as the various types of XML documents, [CSS \(on page 845\)](#), [JavaScript \(on page 968\)](#), [Markdown \(on page 1044\)](#), and more. For details about those specialized features for specific types of documents, see [Editing Supported Document Types \(on page 471\)](#).

This chapter includes information about how to create and work with documents, working with projects, and various general editing features. This chapter also includes information about some of the special tools that are included in Oxygen XML Developer, such as the [file and directory comparison tools \(on page 432\)](#).

Getting Familiar with the Interface

Oxygen XML Developer includes several [perspectives \(on page 2271\)](#) and [editing modes \(on page 316\)](#) to help you accomplish a wide range of tasks. Each *perspective* and editing mode also includes a large variety of helper views, menu actions, toolbars, and contextual menu functions.

There are various ways that you can [configure the layout of the views or editors \(on page 322\)](#), and you can [customize the toolbars \(on page 327\)](#).

Regardless of the [perspective \(on page 2271\)](#) or editing mode that you are working with, the default layout consists of the following areas:

Menus

Menu-driven access to all the features and functions available in Oxygen XML Developer. Most of the menus are common for all types of documents, but Oxygen XML Developer also includes some context-sensitive and *framework*-specific menus and actions that are only available for a specific context or type of document.

Toolbars

Easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function. Some of the toolbars are common for all *perspectives*, editing modes, and types of documents, while others are specific to the particular *perspective* or mode. Some toolbars are also *framework*-specific, depending on the type of document that is being edited. All the [toolbars can be configured \(on page 327\)](#) to suit your specific needs.

Helper Views

Oxygen XML Developer includes a large variety of [dockable \(on page 2268\)](#) views to assist you with editing, viewing, searching, validating, transforming, and organizing your documents. Many of the views also contain useful contextual menu actions, toolbar buttons, or menus. The most

commonly used views for each *perspective* and editing mode are displayed by default and you can choose to display others to suit your specific needs. The [layout of the views can also be configured \(on page 322\)](#) according to your preferences.

Editor Pane

The main editing area in the center of the application. Each editing mode provides a main editor pane where you spend most of your time reading, editing, applying markup, and validating your documents. The editor pane in each editing mode also includes various contextual menu actions and other features to help streamline your editing tasks. Each file that has been opened has a tab at the top of the editing pane and there are [several ways to switch between tabs or move them \(on page 356\)](#).

Perspectives

Oxygen XML Developer includes [several different perspectives \(on page 309\)](#) that you can use to work with your documents. The **Editor perspective** is the most commonly used *perspective* used for displaying and editing the content of your XML documents, and it is the default *perspective* when you start Oxygen XML Developer for the first time. Oxygen XML Developer also includes a **Database perspective** that allows you to manage databases and their connections and a few debugging *perspectives* that allow you to detect problems in XSLT or XQuery transformations.

Status Bar

The status bar at the bottom of the application contains some useful information when you are working with documents. It includes the following information, in the order it is displayed from left to right:

- The path of the current document.
- The [Unicode value \(on page 422\)](#) for the character directly to the right of the current cursor position.
- The status of the current document. The status of **Modified** is displayed for documents that have not yet been saved. Otherwise, this section is left blank.
- In **Text** editing mode, the current line and character position is displayed.
- If the [Check for notifications option \(on page 116\)](#) is selected, this section will show you when new messages have been received. The types of messages include the addition of new videos on the Oxygen XML Developer website, the announcement of upcoming webinars and conferences where the Oxygen XML Developer team will participate, and more.
- The memory consumption, including the memory used by the application and the maximum amount that is allocated to the application.
- If the [Show memory status option \(on page 118\)](#) is selected, a  **Free unused memory** icon is displayed in the bottom-right corner and you can use this icon to free up unused memory.

Configuring the Layout of the Views and Editors

All of the side-views available in Oxygen XML Developer are *dockable* (on page 2268) and there are various ways to configure and arrange the layout of the views and editing panes. You can also [configure the layout of the toolbars](#) (on page 327).

To open a view, select it from the **Window > Show View** menu. You can hide a view by closing it with the **X** button at the top-right corner of the view, or with the **Window > Hide current view** action.

Arranging the Layout

You can drag any view to any margin of another view or editor inside the Oxygen XML Developer window. Once you create a layout that suits your needs, you can save it from **Window > Export Layout**. Oxygen XML Developer creates a layout file containing the preferences of the saved layout. To load a layout, go to **Window > Load Layout**. To reset it, select **Window > Reset Layout**.

**Note:**

The **Load Layout** menu lets you select between the default layout, a predefined layout, or a custom layout. The changes you make using the **Load Layout** menu are also reflected in the **Application Layout** preferences page.

The changes you make to any layout are preserved between working sessions. The predefined layout files are saved in the [preferences directory](#) (on page 115) of Oxygen XML Developer.

You can drag the editors and arrange them in any order, both horizontally and vertically.

The following image presents two editors arranged as horizontal tiles. To arrange them vertically, drag one of them on top of the other. In the following example, the `personal.xml` file was dragged over the `personal-schema.xml` file:

Figure 48. Drag and Drop Editors

Hide or Float Views

Hide

To gain more editing space in the Oxygen XML Developer window, click  **Toggle auto-hide** in any view. This button sets the view in the *auto-hide* state, making it visible only as a vertical tab, at the margins of the Oxygen XML Developer window. To display a view in the *auto-hide* state, hover its side-tab with your cursor, or click it to keep the view visible until you click elsewhere.

Float

A view can also be set to a floating state by using the  **Toggle floating** action, making it independent from the rest of the Oxygen XML Developer window.

Maximize the Editing Environment

You can configure the interface to maximize the editing area, leaving more vertical screen space available for the main editing pane. This is, for example, useful for presentations on low-resolution screens or for laptops

with small screen space. You can use the following two actions that are available in the **Window** menu to create a near full-screen editing environment:

Maximize Editor Area

If toggled on, all side views are minimized to give you more horizontal space in the editing pane.

Hide All Toolbars

If toggled on, all toolbar buttons are hidden to give you more vertical space in the interface.

Tile/Stack Editor Actions

You can also tile or stack all open editors using the following actions from the toolbar or **Window** menu:

Tile Editors Horizontally

Splits the editing area into horizontal tiles, one for each open file.

Tile Editors Vertically

Splits the editing area into vertical tiles, one for each open file.

Stack Editors

The reverse of the **Tile Editors Horizontally/Vertically** actions. Stacks all open editors.

Synchronous Scrolling

Select this action to scroll through the tiled editors at the same time.

Note:

When tiled, you can still drag and drop the editors, but note that they are docked in the same way as a window/view (instead of just tabs). You are actually rearranging the editor windows, so drag the editor tab and drop it to one of the sides of an editor (left/right/top/bottom). While dragging, you will see the dark gray rectangle aligned to one of the sides of the editor, or around the entire editor window. If you drop it to one of the sides, it will dock to that side of the editor. If you drop it when the rectangle is around the entire window of the editor, it will get stacked on top of that editor. You can also grab one of the stacked editors and tile it to one of the sides.

Split Editor Actions

You can divide the editing area vertically and horizontally using the following actions available in the toolbar and **Window** menu:

-  **Split Editor Horizontally** - Splits the editor horizontally so that two editor panes are displayed with one on top of the other. This is useful for comparing and merging content between two documents.
-  **Split Editor Vertically** - Splits the editor vertically so that two editor panes are displayed side by side. This is useful for comparing and merging content between two documents.
-  **Unsplit Editor** - Removes a split action on the editing area.

To maximize or restore the editors, go to **Window > Maximize Editing Area**.

Switch, Move, or Hide Editor Tabs

Each file that has been opened has a tab at the top of the editing pane and there are several ways to switch between tabs or move them, and you can even hide the tabs to only show the currently open file.

Note:

If multiple file tabs are left open when you close the application, upon startup, Oxygen XML Developer will not load the file content until you switch to the corresponding file tab. The tabs remain visible as placeholders until the focus is switched to them. This helps to improve the application's startup time. If you want to disable this feature (meaning that the previously open files will all be re-loaded at startup), deselect the **Load file content only when switching to its corresponding editor tab** option in the **Global** preferences page (*on page 117*).

Switching Editor Tabs

You can switch between editor tabs by using any of the following methods:

Mouse and Scroll Wheel

Of course, you can switch to a different editor tab by left-clicking the tab with your mouse, but when there are too many open tabs to fit on the screen, you can hover over the tab stripe and use the scroll wheel on your mouse to scroll to the left or right (same as using the two arrows on the far-right of the tab stripe).

Buttons on the Far-Right of the Tab Stripe (◀▶☰)

You can use the arrow buttons (◀▶) on the right side of the tab stripe to scroll to the left or right and the ☰ **Show List** button opens a pop-up window that displays all the open file tabs and allows you to select and switch to a specific open file.

Ctrl + Tab (Command + Tab on macOS) [NOTE: Ctrl + Page Down (Ctrl + Option + Right Arrow on macOS) does the same]

Switches to the next open tab in the order specified in the **Order of switching between editor tabs** option (*on page 118*).

Ctrl + Shift + Tab (Command + Shift + Tab on macOS) [NOTE: Ctrl + Page Up (Ctrl + Option + Left Arrow on macOS) does the same]

Switches to the previous open tab in the order specified in the **Order of switching between editor tabs** option (*on page 118*).

Window > Switch editor tab (Ctrl + F9 (Command + F9 on macOS))

This action opens a dialog box that allows you to switch to a particular editor tab by selecting it from a filterable list. This is especially helpful when you have a large amount of open file tabs and you want to switch to a certain tab this is not shown on the screen. It includes a search filter field and several options to help you find specific open file tabs.

Figure 49. Switch Editor Tab Dialog Box

The **Switch Editor Tab** dialog box contains the following options and features:

Search Filter

You can enter text in the filter field at the top of the dialog box to filter the list and search for specific open files. You can enter any number of terms, separated by space, and wildcards are allowed (for example, `*` to match any sequence of characters, or `?` to match a single character). This field also has a history dropdown that allows you to select previously used search terms.

Match all terms

If this option is selected, only the files that match all of your search terms will be displayed. If you use a wildcard in the search filter, this option is automatically disabled.

Include file paths

If this option is selected, the search is expanded to include file paths, and also the paths are displayed in this dialog box.

Case sensitive

If this option is selected, the search operation will be case-sensitive.

List of Open File Tabs

All files that are currently open are displayed in the upper part of the main pane of the dialog box, followed by recently closed files. Files that have been modified but not yet saved are prefixed by an asterisk. To switch to a particular file tab, double-click the file or select it and click **OK**.

Moving Editor Tabs

You can move editor tabs by using any of the following methods:

Mouse Drag

You can use your mouse to drag editor tabs to a new location on the tab stripe.

Ctrl + Alt + Comma

Moves the current file tab one position to the left.

Ctrl + Alt + Period

Moves the current file tab one position to the right.

Hiding Editor Tabs

If you want to hide all the file tabs and only show the currently open file, select **Hide editor tabs** from the **Window** menu. This does not close the other tabs, just hides them. You can still navigate between tabs using keyboard shortcuts (**Ctrl + Tab**, **Ctrl + Shift + Tab**, **Ctrl + F6**, **Ctrl + Shift + F6**) or by selecting **Next editor** or **Previous editor** from the **Window** menu.

Resources

For more information about configuring the interface of Oxygen XML Developer, watch our video demonstration:

<https://www.youtube.com/embed/anwjepfAdEk>

Tip:

To get more ideas for more advanced customization possibilities, watch our Webinar: **Working with DITA in Oxygen - Customizing the Editing Experience**. It offers a visual demonstration of how to customize actions, document validation, content completion, new document templates, **Author** mode rendering, and more.

Related information

[Configuring Toolbars \(on page 327\)](#)

Configuring Toolbars

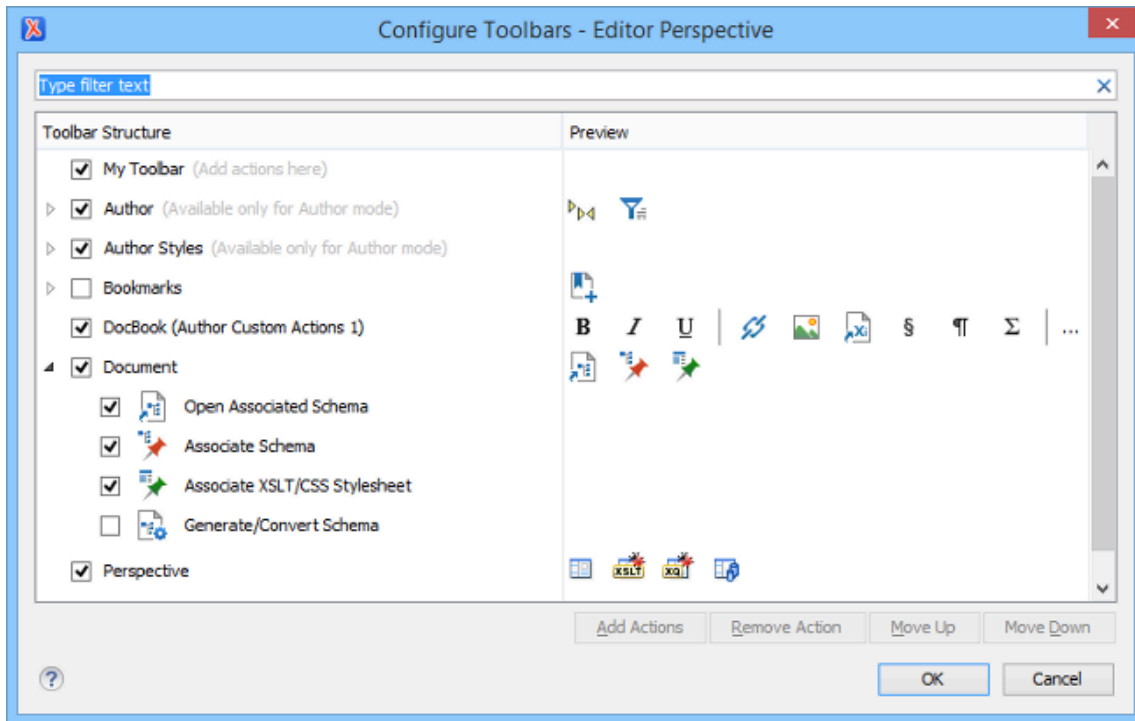

You can configure the toolbars in Oxygen XML Developer to personalize the interface for your specific needs. You can choose which toolbars to show or hide in the current editor mode (**Text**, **Design**, or **Grid**) and in the current *perspective* (on page 2271) (**Editor**, **XSLT Debugger**, **XQuery Debugger**, or **Database**). You can also

choose which actions to display in each toolbar, add actions to toolbars, and customize the layout of the toolbars.

To configure the toolbars, open the **Configure Toolbars** dialog box by doing one of the following:

- Right-click any toolbar and select **Configure Toolbars**.
- Select **Configure Toolbars** from the **Window** menu.

Figure 50. Configure Toolbars Dialog Box

The **Configure Toolbars** dialog box provides the following features:

Filter Text Box

You can use the filter text box at the top of the dialog box to search for a specific toolbar or action.

Show or Hide Toolbars

You can choose whether to show or hide a toolbar by using the checkbox next to the toolbar name. This checkbox is only available for toolbars that are available for the current *perspective* (on page 2271) and editing mode.

Show or Hide Actions in a Toolbar

To show or hide actions in a toolbar, expand it by clicking the arrow next to the toolbar name, then use the checkbox to select or deselect the appropriate actions. The toolbar configuration changes in the **Preview** column according to your changes.

Add Actions to a Toolbar

Use the **Add Actions** button to open the **Add Actions** dialog box that displays all the actions that can be added to any of the toolbars, with the exception of those that are contributed from *frameworks (on page 2269)* or 3rd party *plugins (on page 2271)*.

Remove Actions from a Toolbar

You can remove actions that you have previously added to toolbars by using the **Remove Action** button.

Move Actions in a Toolbar

Use the **Move Up** and **Move Down** actions to change the order of the actions in a toolbar.

The **Configure Toolbars** dialog box also provides a variety of other ways to customize the layout in Oxygen XML Developer.

Customize My Toolbar

You can customize the **My Toolbar** to include your most commonly used actions. By default, this toolbar is listed first. Also, it is hidden until you add actions to it and you can easily hide it with the **Hide "My Toolbar" Toolbar** action that is available when you right-click anywhere in the toolbar area.

Drop-down Menu Actions

Composite actions that are usually displayed as a drop-down menu can only be selected in one toolbar at a time. These actions are displayed in the **Configure Toolbars** dialog box with the name in brackets.

Configure External Tools Action

There is a  **Configure external tools** composite action that appears in the toolbar called **Tools**. It is a drop-down menu that contains any external tools that are configured in the **External Tools** preferences page.

Note:

If no external tools are configured, this drop-down menu is not shown in the toolbar.

Additional actions are available from the **Window** menu or contextual menu when invoked from a toolbar that allows you to further customize your layout. These actions include:

Reset Toolbars

To reset the layout of toolbars to the default setting, select the **Reset Toolbars** action from the contextual menu or **Window** menu.

Reset Layout

To reset the entire layout (including toolbars, editing modes, views, etc.) to the default setting, select **Reset Layout** from the contextual menu or **Window** menu.

Export Layout

You can use the **Export Layout** action that is available in the **Window** menu to export the entire layout of the application to share it with other users.

Hide Toolbars

You can use the **Hide Toolbar** action from the contextual menu to easily hide a displayed toolbar. When you right-click a toolbar it will be highlighted to show you which actions are included in that toolbar.

Related information

[Configuring the Layout of the Views and Editors \(on page 322\)](#)

Creating, Opening, Saving, and Closing Documents

Oxygen XML Developer includes various features, actions, and wizards to assist you with creating new files and working with existing files. This section explains many of these features, including information on creating new documents, opening, saving, and closing existing files, searching documents, viewing file properties, and more.

Creating New Documents and Templates

Oxygen XML Developer includes a helpful **New Document** wizard that allows you to customize and create new files from a large list of document types and built-in templates. You can also [create your own templates \(on page 339\)](#) and [share them with others \(on page 344\)](#).

To create a new document:

1. Click the  **New** button on the toolbar or select **File > New**.
2. Select the type of document that you want to create.

Tip:

You can use the text filter field at the top of the dialog box to search for a specific template.

3. Click the **Create** button at the bottom of the dialog box.

New Document Wizard

Oxygen XML Developer supports a wide range of document types. The **New Document** wizard presents the default associations between a file extension and the type of editor that opens the file. To customize these default associations, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **File Types (on page 263)**.

The **New Document** wizard creates a skeleton document that may contain a root element, the document prolog, and possibly other child elements depending on options that are specific for each schema type. You can also [create your own custom document templates \(on page 339\)](#) and select them from this wizard.

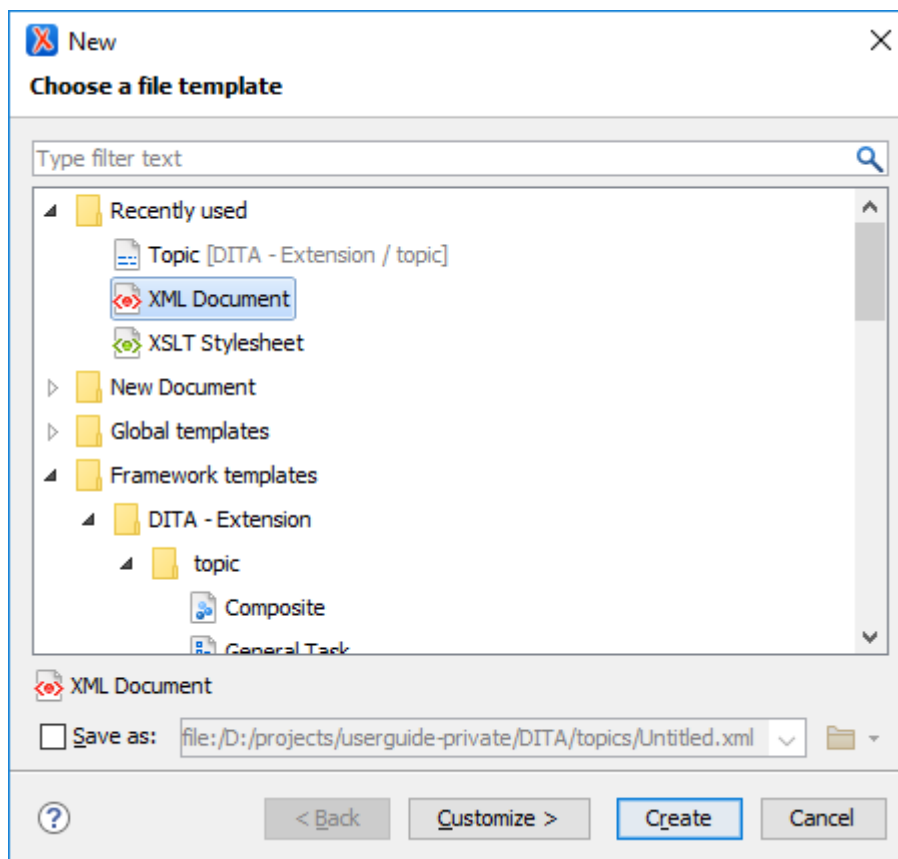

New Document Wizard

To create a new document using this wizard, follow these steps:

1. Click the  **New** button on the toolbar or select **File > New**.

Result: The **New Document** wizard is displayed:

Figure 51. New Document Wizard

The first page of the wizard displays the supported document types and groups them in the following categories:

Recently Used

Contains the list of the most recently used file types. To clear the history of this folder, right-click an entry and select  **Remove all** (or select an entry and press **Ctrl + Delete** on your keyboard). To remove a single entry, right-click and select  **Remove** (or select the entry and press **Delete** on your keyboard).

User-defined template directory

You can add your own custom templates by [creating template files \(on page 339\)](#) in a directory and then adding that directory to the list of template directories that Oxygen XML Developer uses in the [Document Templates preferences page \(on page 157\)](#). This user-defined directory will also appear in the **New Document** wizard.

Popular

Contains a list of popular framework templates. Each of these templates are marked as popular using a properties file that contains `popular` as one of the values for the `tags` property. For example, for the `OXYGEN_INSTALL_DIR/frameworks/dita/templates/topic/Topic.dita` template, there is a `Topic.properties` sibling file that contains `tags=popular`. Other document templates can also be added to the **Popular** category by [customizing them using a properties file for each one \(on page 340\)](#).

New Document

Contains the list of all supported document types. This list includes XML, XSL, XML Schema, Document Type Definition, Relax NG Schema, XQuery, Web Services Definition Language, Schematron Schema, CSS, Text, PHP, PowerShell, JavaScript, Java, C, C++, Batch, Shell, Properties, SQL, *XML Catalog*, PERL, JSON, and more.

Global Templates

Contains the list of built-in templates along with user-defined custom templates. You can [create your own custom document templates \(on page 339\)](#) and add them to the `templates` folder of the Oxygen XML Developer installation directory.

Framework Templates

Contains the list of templates defined in the **Document Type** configuration dialog box (**Templates** tab) [\(on page 153\)](#) for each *framework*.

2. Select the type of document that you want to create.

Tip:

You can use the text filter field at the top of the dialog box to search for a specific template.

3. If you want to change the default name and path of the file, select the **Save as** option and specify the file path (the **Show "Save as" option to save newly created documents in the "New" document wizard option (on page 170)** must be selected in the **Save** preferences page). Otherwise, the file will be opened in a new tab with a default *untitled* name and the document path will not exist until you save it.

Note:

For DITA documents, the dialog box includes some additional options for generating a title, file name, and root ID attribute.

4. If you want to use the default settings in the creation process, select **Create** at the bottom of the dialog box.

Result: The document is created using the default settings and the new file is opened in the appropriate editor.

5. If you want to configure properties before creating the file, select **Customize**. This action is available for XML, XML Schema, Schematron, and XSL documents.

Result: A new file configuration dialog box is opened that allows you to customize various options, depending on the document type you selected. After configuring the options in this wizard, click **Create** to create the file and open it in the appropriate editor.

XML Document Configuration Page

Figure 52. New XML Document Configuration Wizard Page

If you selected  **XML Document** for the type of file you want to create and selected the **Customize** option, the configuration dialog box will include the following options:

Schema URL

Specifies the path to the schema file. When you select a file, Oxygen XML Developer analyzes its content and tries to fill in the rest of the dialog box.

Schema Type

Allows you to select the schema type. The following options are available: XML Schema, DTD, RelaxNG XML syntax, RelaxNG compact syntax, and NVDL.

Public ID

Specifies the PUBLIC identifier declared in the document prolog.

Namespace

Specifies the document namespace.

Prefix

Specifies the prefix for the namespace of the document root.

Root Element

Populated with elements defined in the specified schema, enables selection of the element used as document root.

Description

A small description of the selected document root.

Add Optional Content

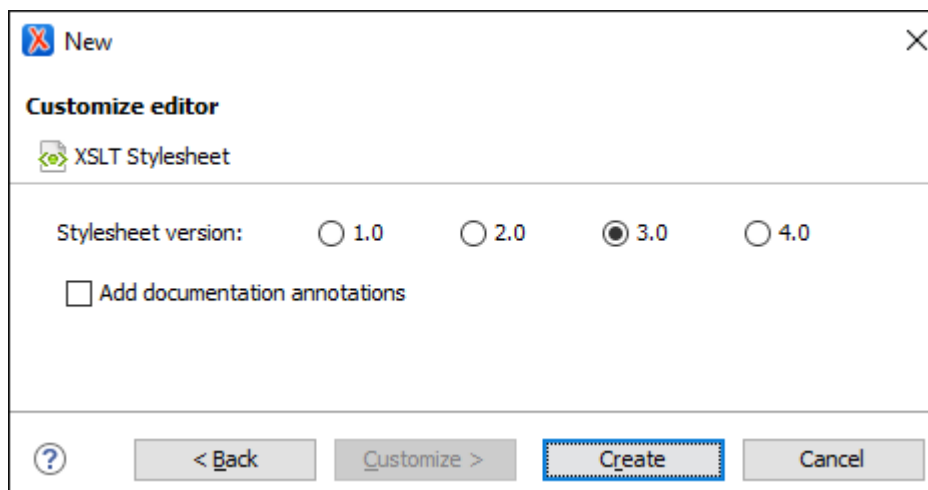

If you select this option, the elements and attributes defined in the XML Schema as optional are generated in the skeleton XML document.

Add First Choice Particle

If you select this option, Oxygen XML Developer generates the first element of an `<xs:choice>` schema element in the skeleton XML document. Oxygen XML Developer creates this document in a new editor panel when you click **OK**.

XSLT Document Configuration Page

Figure 53. New XSLT Stylesheet Configuration Wizard Page

If you selected  **XSLT Stylesheet** for the type of file you want to create and selected the **Customize** option, the configuration dialog box will include the following options:

Stylesheet version

Allows you to select the **Stylesheet version** number. You can select from: 1.0, 2.0, 3.0, and 4.0.

Add documentation annotations

Select this option to generate the stylesheet annotation documentation.

XML Schema Document Configuration Page

Figure 54. New XML Schema Configuration Wizard Page

If you selected  **XML Schema** for the type of file you want to create and selected the **Customize** option, the configuration dialog box will include the following options:

Default XML Schema version

Uses the XML Schema version defined in the [XML Schema preferences page \(on page 207\)](#).

XML Schema 1.0

Sets the `@minVersion` attribute to **1.0** and the `@maxVersion` attribute to **1.1**.

XML Schema 1.1

Sets the `@minVersion` attribute to **1.1**.

Target namespace

Allows you to specify the schema target namespace.

Namespace prefix declaration table

This table contains namespace prefix declarations. Table information can be managed using the **+ New** and **× Delete** buttons.

**Tip:**

For further details on how you can set the version of an XML Schema, go to [Setting the XML Schema Version \(on page 800\)](#).

Schematron Document Configuration Page

Figure 55. New Schematron Configuration Wizard Page

If you selected  **Schematron** for the type of file you want to create and selected the **Customize** option, the configuration dialog box will include the following option:

Schematron version

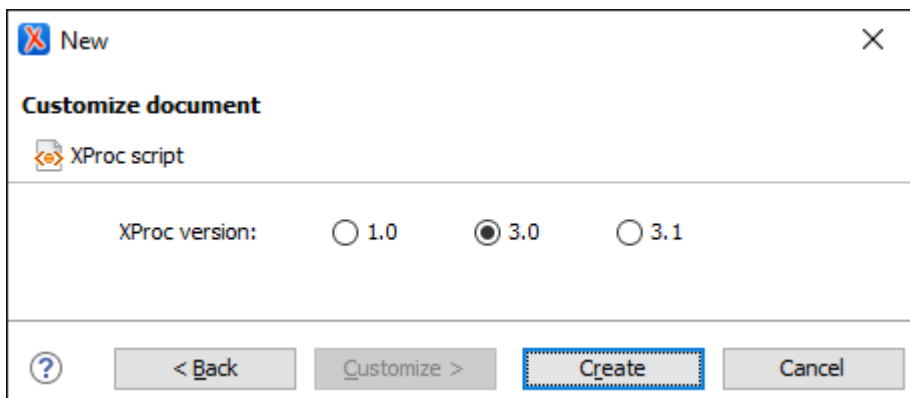

Specifies the Schematron version. Possible options: 1.5 (deprecated) and ISO.

**Note:**

Starting with version 16.0 of Oxygen XML Developer, the support for Schematron 1.5 is deprecated. It is recommended to use ISO Schematron instead.

XProc Configuration Page

Figure 56. New XProc Configuration Wizard Page

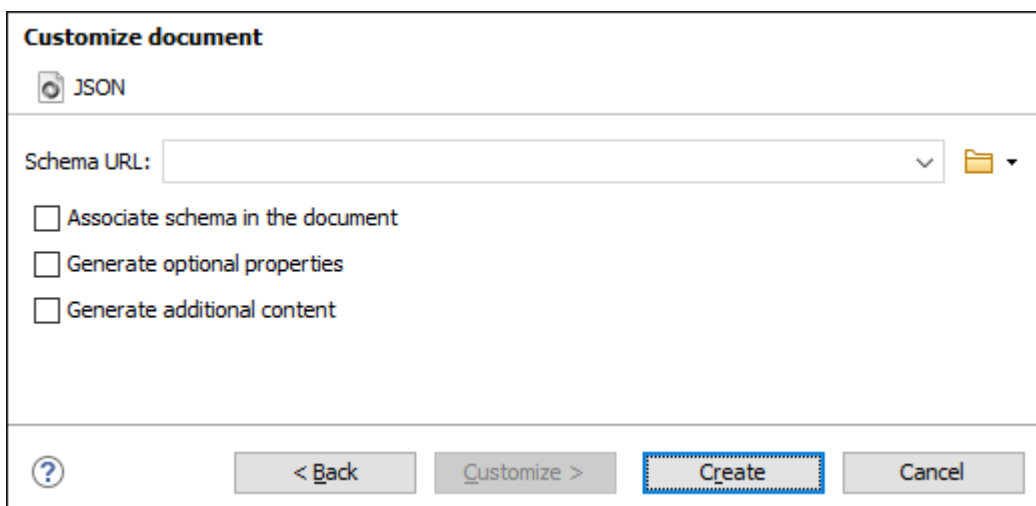

If you selected  **XProc script** for the type of file you want to create and selected the **Customize** option, the configuration dialog box will include the following option:

XProc version

Specifies the XProc version. Possible options: 1.0, 3.0 and 3.1.

JSON Document Configuration Page

Figure 57. New JSON Configuration Wizard Page

If you select  **JSON** for the type of file you want to create and select the **Customize** option, the configuration dialog box will include the following options:

Schema URL

Specifies the path to a JSON schema file that will be used to generate *key-value* pairs.

Associate Schema in the Document

If you select this option, the JSON instance will be generated with the JSON schema associated directly in the document.

Generate Optional Properties

If you select this option, the JSON instance will be generated with optional properties that are defined in the JSON schema. Otherwise, only the required properties will be generated.

Generate Additional Content

If you select this option, the JSON instance will be generated with additional properties that are defined in the JSON schema as `additionalProperties` and additional items that are defined as `additionalItems` (in the case of an array).

YAML Document Configuration Page

Figure 58. New YAML Configuration Wizard Page

The screenshot shows a dialog box titled "Customize document" for a "YAML" file. It includes a "Schema URL" field with a dropdown arrow and a folder icon. Below this are three checked checkboxes: "Associate schema in the document", "Generate optional properties", and "Generate additional content". There is also a "Property value:" dropdown menu currently set to "Default". At the bottom of the dialog, there are four buttons: a help icon (?), "< Back", "Customize >", and "Create" (which is highlighted with a dashed border), and "Cancel".

If you select  **YAML** for the type of file you want to create and select the **Customize** option, the configuration dialog box will include the following options:

Schema URL

Specifies the path to a JSON schema file that will be used to generate *key-value* pairs.

Associate Schema in the Document

If you select this option, the YAML instance will be generated with the JSON schema associated directly in the document.

Generate Optional Properties

If you select this option, the YAML instance will be generated with optional properties that are defined in the JSON schema. Otherwise, only the required properties will be generated.

Generate Additional Content

If you select this option, the YAML instance will be generated with additional properties that are defined in the JSON schema as `additionalProperties` and additional items that are defined as `additionalItems` (in the case of an array).

Property Value

Specifies the method of generating values for the properties. Possible values: **None**, **Default**, **Random**.

Creating New Document Templates

Oxygen XML Developer allows you to create your own custom document templates and they will appear in the **New document wizard** (*on page 330*).

Creating a New Document Template

To create your own custom document template and have it appear in the new document wizard, follow these steps:

1. Create a new file (whatever type of document you need) and customize it to become a starting point for creating new files of this type.

**Tip:**

You can use [editor variables](#) (*on page 289*) in the template file content and they will be expanded when the files are opened. Also, see [Customizing Document Templates](#) (*on page 340*) for other template customization tips (for example, you could [add placeholders or hints](#) (*on page 343*) to assist authors).

2. Save the new document template and reference that location in Oxygen XML Developer. There are several options for doing this:
 - **Saving the new template in a specific framework's directory** - Save the new template in a directory (for example, called `templates`) within that specific framework directory. Then open the **Document Type configuration dialog box** (*on page 130*) for that specific framework, go to the **Templates tab** (*on page 153*), and click the **+** button in the bottom-right corner to add your new directory to the list. It is recommended that the reference be made relative to the framework directory (for example, `${frameworkDir}/templates`). You can also remove any existing entries in the list that aren't applicable or won't be used in your custom framework. Click **OK** to close the configuration dialog box and then **OK** or **Apply** to save your changes.
 - **Saving the new template in the Oxygen installation directory** - Save the new template in the `templates` directory of the Oxygen XML Developer installation directory (`[OXYGEN_INSTALL_DIR]/templates`). Document templates saved in this directory will appear in the **Global templates** category in the **New document wizard** (*on page 330*).
 - **Saving the new template in a custom directory** - Save the new template in any directory of your choice and then add that directory to the list of templates in the **Document Templates preferences page** (*on page 157*). This user-defined directory will appear in the **New document wizard** (*on page 330*) along with all the new document templates that you save inside it. Click **OK** or **Apply** to save your changes.

**Tip:**

If you want to create a new template for a binary file (e.g. a zip archive), you need to add `.bin` to the end of the file name (for example, `*.zip.bin` or `*.epub.bin`). Otherwise, the files will be treated as XML/text documents and you will be prompted to choose the editor type.

**Attention:**

The name that you use to save the template will be the name that appears in the new document wizard, including capitalization, space, and characters (for example, `My Custom Template1.xml` will appear in the new file wizard as **My Custom Template1**). You can also configure the displayed name in a properties file by following the procedure found in the [Configure the Displayed Names for Document Templates \(on page 342\)](#) section.

3. Open the new document wizard ( **New** toolbar button or **File > New**) and you should see your custom template in the appropriate folder.

**Note:**

For DITA templates, they will also appear in the dialog box for creating new DITA topics, but if you [customize the template \(on page 340\)](#), you need to set the `type` property to **dita** in the corresponding properties file.

Related information

[Customizing Document Templates \(on page 340\)](#)

[Sharing Custom Document Templates \(on page 344\)](#)

Customizing Document Templates

Oxygen XML Developer allows you to customize certain aspects of built-in or custom document templates. For example, you can customize the icons or specify a prefix/suffix that will be used for the proposed file name in the **New document wizard (on page 330)**.

Customizing the Icons for a Document Template

If you want to customize the icons to be used for document templates, use a properties file to specify the icons using the following procedure:

1. Create a new properties file or edit an existing one following these guidelines:
 - a. If you want to create a new properties file, you can use the **Properties** template found in the **New Document** folder in the **New document wizard (on page 330)**. If you want to edit an existing template, you can find them within the subfolders in the `templates` folder for each framework (for example, the DITA topic properties file is located in: `OXYGEN_INSTALL_DIR/frameworks/dita/templates/topic/topic.properties`).

- b. Use the same name as your custom template file except with a `.properties` extension (for example, `MyTemplate.properties`).
- c. In this properties file, specify the paths to the icons that will be used in the new file wizard. The properties file should look like this:

```
type=general
smallIcon=../icons/Article_16.png
bigIcon=../icons/Article_48.png
```

**Tip:**

For DITA files, the `type` property must be set to **dita**. Otherwise, the template will not appear in the dialog box for creating new DITA topics. For all other types of files, set it to **general**. The icons specified in this properties file will only be used for the new file wizards and not in any other part of the interface.

**Important:**

If you created a new template and chose to use a custom directory for the new template (in [step 2 of the new template procedure \(on page 339\)](#)), make sure that the path to the icons is relative to that directory.

2. Save the properties file in the same directory as your custom template.
3. Open the new file wizard (**File > New**) and you should see your custom icons next to the document template in the appropriate folder.

Add a Prefix or Suffix to File Names for a Document Template

You can use a properties file for each document template to add a prefix or suffix to the file name that is proposed in certain dialog boxes when you create a new file from that template. This applies to the following new document dialog boxes:

- The new document dialog box that appears when you click the  **New** button on the toolbar (or **File > New**). The prefix or suffix is added to the name of the file in the **Save as** field.
- The new document dialog box that appears when you select **New > File** from the contextual menu in the [Project view \(on page 365\)](#). The prefix or suffix is added to the name of the file in the **File name** field.

To add a prefix or suffix to the file names for a document template, follow these steps:

1. Create a new properties file or edit an existing one.

- If you create a new properties file, use the same name as the template file except with a `.properties` extension (for example, `MyTemplate.properties`). This properties file specifies the prefix/suffix that will be used to propose the file name in the new file wizards.

When defining the prefix/suffix, the properties file should look something like this:

```
type=general
filenamePrefix=prod_
filenameSuffix=_test
```

Important:

For DITA files, the `type` property must be set to **dita**. For all other types of files, set it to **general**.

- If you edit an existing template, simply define the prefix/suffix as specified [above \(on page 342\)](#).
2. Save the properties file in the same directory as the document template.
 3. Open the new document wizard ([using the methods described above \(on page 341\)](#)) and when you select the appropriate template, you should see your prefix or suffix in the file name that is proposed in that dialog box.

Note:

The `filenamePrefix` and `filenameSuffix` properties can also have [editor variables \(on page 289\)](#) that do not require user interaction (i.e. editor variables that have `${ask()}` and `${answer()}` as values cannot be used).

Configure the Displayed Names for Document Templates

To change the name that is displayed for a document template, use the following procedure:

1. Create a new properties file or edit an existing one. If you create a new properties file, use the same name as the template file except with a `.properties` extension (for example, `MyTemplate.properties`).
2. Add a `displayName` property in the properties file:

```
displayName=My Template Name
```

Tip:

The names for [framework \(on page 2269\)](#)-specific document templates (such as DITA *Topic* or DocBook *Article*, as you would see in the **Framework templates** folder in the **New** file wizard) can be translated via the internationalization support. In this case, the properties file should contain something like:

`displayName=${i18n(tag)}`

where *tag* refers to an entry in the `translation.xml` file for that specific framework (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/i18n/translation.xml` for DITA).

3. Save the properties file in the same directory as the document template.
4. Open the new file wizard (**File > New**) and you should see the new name for the template.

Adding Placeholders or Hints in a Document Template

If a document template contains empty elements, it may not be clear to the Author what should be inserted in them. You can define placeholders in document templates that provide hints for Authors to help them understand what type of content should be added in any particular empty element within the document. The placeholder text is specified using a processing instruction and the placeholders are removed when the Author inserts content in the corresponding element.

To define placeholders in a document template to provide authors with hints, follow this procedure:

1. Edit the document template.
2. Add placeholders in the form of processing instructions within the elements where you want hints to be displayed when an Author creates a document from the template. For example:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE topic PUBLIC "-//OASIS//DTD DITA Topic//EN" "topic.dtd">
<topic id="pi">
  <title><?oxy-placeholder content="Enter a title"?></title>
  <shortdesc><?oxy-placeholder content="Writing short descriptions
  induces the writer to clarify the main thesis of the topic.
  We recommended a 50 word limit."?></shortdesc>
  <body>
    <p><?oxy-placeholder content="A paragraph element should be a self-contained
    unit dealing with one idea or point."?></p>
  </body>
</topic>
```

Important:

The elements that contain the placeholder processing instructions cannot contain other content/text, not even whitespace used for indentation. Otherwise, the placeholder will not be rendered properly.

3. Save the template file.
4. Use the **New** document wizard (*on page 330*) to create a new document using your customized template and you should see the hints in the open document.

To see a visual demonstration of how to customize document templates and to get more ideas for other advanced customization possibilities, watch our Webinar: [Working with DITA in Oxygen - Customizing the Editing Experience](#).

Related information

[Creating New Document Templates \(on page 339\)](#)

[Sharing Custom Document Templates \(on page 344\)](#)

Sharing Custom Document Templates

Your [custom document templates \(on page 339\)](#) can be shared with the other members of your team so that they all have access to the templates in the [New document wizard \(on page 330\)](#). The best way to share them is by integrating them in an extended [framework \(on page 2269\)](#) (document type) configuration and then sharing the whole framework with the other users.

Sharing Custom Document Templates

To share custom document templates with other members of your team:

1. Create a custom framework by extending an existing one, if you have not already done so.
2. [Create the new document template \(on page 339\)](#), if you haven't already done so.
3. Save the new template in a directory (for example, called `templates`) within your custom framework directory. Then open the [Document Type configuration dialog box \(on page 130\)](#) for that specific framework, go to the [Templates tab \(on page 153\)](#), and click the **+** button in the bottom-right corner to add your new directory to the list. It is recommended that the reference be made relative to the framework directory (for example, `${frameworkDir}/templates`). You can also remove any existing entries in the list that aren't applicable or won't be used in your custom framework.
4. Click **OK** to close the configuration dialog box and then **OK** or **Apply** to save your changes.
5. All that remains is to share the entire framework with anyone who needs to have access to the custom templates.

Opening Documents

To open a document in Oxygen XML Developer, do one of the following:

- Go to **File** >  **Open (Ctrl + O (Command + O on macOS))** or click the  **Open** toolbar button to display the **Open File** dialog box. The start folder of this dialog box can be either the last folder it visited or the folder of the currently selected file. This can be [configured in the Global preferences page. \(on page 116\)](#)
- Go to **File** > **Open URL** or click the  **Open URL** toolbar button to display a dialog box where you can specify a URL (defined by a protocol, host, resource path, and an optional port) or use the browsing actions in the  **Browse for remote file** drop-down menu.

- Click the  **Open/Find Resource** toolbar button to search for a file to open.
- Go to **File >  Reload** to load the last saved file content. All unsaved modifications are lost.
- Go to **File > Reopen** to reopen one of the recently opened document files. The list containing recently opened files can be emptied by invoking the **Clear history** action.
- Select the **Open** or **Open with** action from the contextual menu of the **Project view** (on page 365).

Related information

[Opening Local Files at Start-up \(on page 345\)](#)

Opening the Current Document in a System Application

To open the currently edited document in the associated system application, use the  **View in Browser/System Application** action that is available in the **File** menu and on the **File** toolbar. If you want to open XML files in a specific internet browser, instead of the associated system application, you can specify the internet browser to be used. To do so, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#), go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

Opening Local Files at Start-up

There are two possibilities for opening local files at startup from a command line by adding their file paths as parameters:

- **scriptName [pathToXMLFile1] [pathToXMLFile2]**
 - **scriptName** is the name of the startup script for your platform (`oxygenDeveloper.bat` on Windows, `oxygenDeveloper.sh` on macOS and Linux).
 - **pathToXMLFileN** is the name of a local XML file.
- An XML file and a schema file to be associated automatically to the file and used for validation and content completion:

```
scriptName -instance pathToXMLFile -schema pathToSchemaFile -schemaType XML_SCHEMA|DTD_SCHEMA|
RNG_SCHEMA|RNC_SCHEMA -dtName documentTypeName
```

- **scriptName** is the name of the startup script for your platform (`oxygen.bat` on Windows, or `oxygen.sh` on macOS and Linux).
- **pathToXMLFile** is the name of a local XML file.
- **pathToSchemaFile** is the name of the schema that you want to associate to the XML file, the four constants (XML_SCHEMA, DTD_SCHEMA, RNG_SCHEMA, RNC_SCHEMA) are the possible schema types (XML Schema, DTD, Relax NG schema in full syntax, Relax NG schema in compact syntax).
- **documentTypeName** specifies the name of the document type that has the schema defined. If the document type is already set in preferences, its schema and type are updated.

**Tip:**

You can use the `-h` or `--help` parameters to see more detailed information about possible values.

Related information

[Opening a Document at a Specific Location Using a Command-Line Interface \(on page 346\)](#)

Opening a Document at a Specific Location Using a Command-Line Interface

Oxygen XML Developer offers support for opening a file at a specific position using a command-line interface to transmit parameters to the Oxygen XML Developer application launching script file (`oxygenDeveloper.bat/oxygenDeveloper.sh`). The following methods are available, depending on how you identify the position that is needed:

1. Specific position values (line and column number, or character offset)

Oxygen XML Developer supports the following position parameters:

- **line** - The line number.
- **column** - The column number (has meaning if the `line` parameter is also defined).
- **char** - The character offset.

Examples for Windows:

The following examples show how you can open an XML document in Oxygen XML Developer from a Windows command-line interface:

```
developer.bat file:samples/personal.xml#line=4
developer.bat file:samples/personal.xml#line=4column=5
developer.bat file:samples/personal.xml#line=4;column=5
developer.bat file:samples/personal.xml#char=334
```

2. Simplified XPath index path

Oxygen XML Developer will open an XML file and select one of its elements identified by a simplified XPath index path. For example, an index path of the form `1/5/7` identifies the seventh child of the fifth child of the root element.

**Restriction:**

Oxygen XML Developer will display a selection that starts with the first character of the content of the identified element and spans until the end of the line.

Examples for Windows:

The following example shows how you can open an XML document in Oxygen XML Developer and select the third child of the root element using a Windows command-line interface:

```
developer.bat file:samples/personal.xml#element(1/3)
```

3. **Anchors identified by ID attribute values**

Oxygen XML Developer will open an XML file and select the element whose `@id` attribute value is an exact match of the [anchor \(on page 2267\)](#) attached to a command-line instruction.

Examples for Windows:

The following example shows how you can open an XML document in Oxygen XML Developer and select the element that has the `@id` set to `titleID` using a Windows command-line interface:

```
developer.bat file:samples/personal.xml#titleID
```

Related information

[Opening Local Files at Start-up \(on page 345\)](#)

Saving Documents

You can save the document you are editing with one of the following actions:

- **File >  Save.**
- ** Save** toolbar button - If the document was not yet saved, it displays the **Save As** dialog box.
- **File > Save As** - Displays the **Save As** dialog box, used either to name and save an open document to a file or to save an existing file with a new name.
- **File > Save To URL** - Displays a **Save to URL** dialog box that can be used to save a file identified by its URL (defined by a protocol, host, resource path, and an optional port). You can also use the browsing actions in the  **Browse for remote file** drop-down menu.
- **File > Save All** - Saves all open documents. If any document does not have a file, displays the **Save As** dialog box.

Auto Recover Documents

Oxygen XML Developer includes an *Auto Recover* feature to help prevent losing unsaved content if you encounter an application or system crash. The feature is enabled by default and it automatically saves documents you are working on to a specified auto-recover file location. At every specified interval, all documents that have been modified since the last auto-save are saved to the specified location.

This feature is controlled by two options in the **Save** preferences page. You can disable it, or configure how often content is saved by selecting the desired value in the drop-down list of the **Save auto-recover information every** option (on page 170), and you can specify the location of the saved documents in the **Auto-recover file location** option (on page 170).

In the event of an application or system crash, once you restart the application, Oxygen XML Developer looks for an auto-recover file for each document that is either automatically or manually reopened. If an auto-recover file is found, a dialog box is displayed with options for how to handle the recovered information.

Figure 59. Auto Recover Dialog Box

The dialog box offers the following choices:

- **Open recovered content in a new tab** - Opens the recovered document in a new tab.

**Tip:**

You can use the  **Compare Files** tool (available in the **Tools** menu) to compare the recovered content with the last saved version of the document.

- **Replace current file content with recovered content** - Replaces the content of the last saved version of the document with the content of the recovered version of the document and removes the auto-recover file from disk.
- **Use current file content and discard recovered content** - Discards the recovered document and retains the last saved version of the document.

**Notes About the Auto-Recover Feature:**

- The *Auto Recover* feature works for both local and remote files.
- For DITA projects, the *Auto Recover* feature also works for DITA maps opened in the **DITA Maps Manager**.
- The *Auto Recover* feature does NOT work if there is not enough space available on the disk where the [auto-recover file location is specified \(on page 170\)](#).
- The *Auto Recover* feature does NOT work on files opened in the *huge file editor (on page 430)* (if you select the **Optimize loading for huge files** option when opening large documents [\(on page 428\)](#)).

Closing Documents

To close open documents, you can simply click the close icon (✕) for the particular editor tab or use one of the following actions that are available by right-clicking the current editor tab (or from the **File** menu):

Close (Ctrl + W (Command + W on macOS))

Closes the currently selected editor.

Close Other Files

If multiple files are opened, this action is available to close all opened editors in the current group/stack of tabs except for the one you are currently viewing. If this action is selected from the **File** menu, it closes all opened editors in **all** groups/stacks of tabs except for the current one.

Close Files to the Right

Available only from the contextual menu of the current editor tab and it closes all opened editors to the right of the currently selected editor.

Close All

If multiple files are opened, this action is available to close all opened editors in the current group/stack of tabs. If this action is selected from the **File** menu, it closes all opened editors in **all** groups/stacks of tabs.

Working with Remote Documents

Oxygen XML Developer supports editing remote files, using the WebDAV, SharePoint, SharePoint Online for Office 365, or SFTP protocols. You can edit remote files in the same way you edit local files. For example, you can add remote files to a project, or use them in XSL and FO transformations.

You can open one or more remote files in [the Open URL dialog box \(on page 349\)](#).

A WebDAV resource can be locked when it is opened in Oxygen XML Developer by selecting the **Lock WebDAV files on open option (on page 270)** to prevent other users to modify it concurrently on the server. If a user tries to edit a locked file, Oxygen XML Developer displays an error message that contains the lock owner's name. The lock is released automatically when the editor for that resource is closed in Oxygen XML Developer.

To avoid conflicts with other users when you edit a resource stored on a SharePoint server, you can **Check Out** the resource.

To improve the transfer speed, the content exchanged between Oxygen XML Developer and the HTTP / WebDAV server is compressed using the GZIP algorithm.

The current [WebDAV Connection \(on page 1795\)](#) details can be saved by switching to the **Database perspective (on page 2271)** and then you can browse and manage the connection in the **Data Source Explorer view (on page 1748)**.

Open URL

To open this dialog box, go to **File >  Open URL** (or click the ** Open URL** toolbar button), then choose the ** Browse for remote file** option from the drop-down action list.

Figure 60. Open URL Dialog Box

The displayed dialog box is composed of the following:

Server Type

Specifies the type of server. You can choose between:

- **WebDav FTP** - For generic HTTP/SFTP/WebDav and other servers.
- **SharePoint Online** - For SharePoint Online servers.
- **SharePoint On-Premises** - For SharePoint (older version) servers.

Server URL

Specifies the protocol (HTTP, HTTPS, or SFTP) and the host name or IP of the server.

Tip:

When specifying a URL, follow these rules:

- To access a WebDAV server, write the path to the directory of the WebDAV repository along with the protocol and the host name. For example, `https://www.some-webdav-server.com:443/webdav-repository/.`

**Important:**

Make sure that the repository directory ends in a slash "/". For example,

`https://www.some-webdav-server.com:443/webdav-repository/`

Autoconnect

If selected, the browse action is performed every time when you open the dialog box.

User and Password

To browse for a file on a server, you have to specify the user and password for the server. This information is bound to the selected URL displayed in the **File URL** combo box, and used further in opening/saving the file.

**Note:**

Your password is well protected. If the options file is used on another machine by a user with a different username, the password will become unreadable since the encryption is dependent on the username. This is also true if you add URLs that contain a username and password to your project.

Save

If selected, the user and password are saved between editing sessions. The password is kept encrypted in the options file.

Browse

When you click this button, the directory listing will be shown in the main section of the dialog box. If the selected URL points to a SharePoint server, a dedicated SharePoint browsing component is presented.

Browser view

- If you are browsing a WebDAV or SFTP repository, the items are presented in a tree-like fashion. You can browse the directories, and make multiple selections. Additionally, you may use the **Rename**, **Delete**, and **New Folder** actions to manage the file repository.

**Note:**

The file names are sorted in a case-insensitive way.

- When you browse a SharePoint repository, a specialized component renders the SharePoint site content.

The left side navigation area presents the SharePoint site structure in a tree-like fashion with various node types (such as *sites*, *libraries*, and *folders*).

Depending on the type of node, a contextual menu offers customized actions that can be performed on that node. The contextual menu of a folder allows you to create new folders and documents, import folders and files, and to rename and delete the folder.

Note:

The rename and delete actions are not available for library root folders (folders located at first level in a SharePoint library).

Each library node displays a drop-down menu next to its name where you can select what you want to display for the current library node. This functionality is also available on the contextual menu of the node.

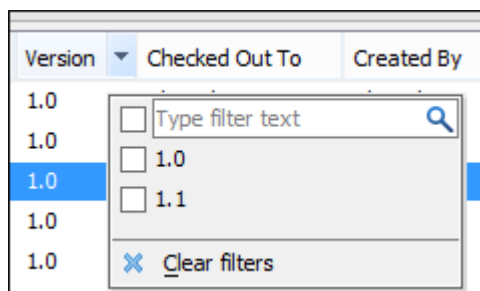

Figure 61. Drop-Down Menu to Select Which Items to Display

The content of a folder is displayed in a tabular form, where each row represents the properties of a folder or document. The list of columns and the way the documents and folders are organized depends on the currently selected view of the parent library.

You can filter and sort the displayed items. To display the available filters of a column, click the filter widget located on the column header. You can apply multiple filters at the same time.

Figure 62. Column Filter

File URL

You can use this combo box to directly specify the URL to be opened or saved. You can type a URL such as `http://some.site/test.xml` (if the file is accessible through normal HTTP protocol).

This combo box also displays the current selection when the user changes selection by browsing the tree of folders and files on the server.

WebDAV over HTTPS

If you want to access a WebDAV repository across a non-secure network, Oxygen XML Developer allows you to load and save the documents over the HTTPS protocol (if the server understands this protocol) so that any data exchange with the WebDAV server is encrypted.

When a WebDAV repository is first accessed over HTTPS, the server hosting the repository will present a security certificate as part of the HTTPS protocol, without any user intervention. Oxygen XML Developer will use this certificate to decrypt any data stream received from the server. For the authentication to succeed you should make sure the security certificate of the server hosting the repository can be read by Oxygen XML Developer. This means that Oxygen XML Developer can find the certificate in the key store of the Java Runtime Environment where it runs. You know the server certificate is not in the JRE key store if you get the error *No trusted certificate found* when trying to access the WebDAV repository.

Troubleshooting HTTPS

If Oxygen XML Developer cannot connect to an HTTPS-capable server and an error message appears stating that it is "unable to find a valid certification path to the requested target", the HTTPS server is most likely either configured to use a self-signed certificate or to use a certificate issued by an unknown authority that the *Java Runtime Environment (JRE)* used by Oxygen XML Developer does not trust.

Note:

For Windows, starting with version 26.0, by default, Oxygen XML Developer uses the trusted root certificates from the Windows certificate store instead of the JRE cacerts store. To trust a certificate, the root certificate should be imported in the Windows Trusted Root certificates store.

Tip:

To make Oxygen XML Developer accept a certificate even if it is invalid, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#), go to **Connection settings > HTTP(S)/WebDAV**, and select the **Automatically accept a security certificate, even if invalid** option.

To trust a certificate, follow this procedure:

1. Export a certificate into a local file using any HTTPS-capable web browser:

Chrome or Edge

- a. Navigate to the page that uses the certificate.
- b. Right-click the page and select **Inspect**.
- c. Select the **Security** tab.
- d. Click **View Certificate**. **Step Result:** A **Certificate** dialog box is displayed.
- e. Select the **Details** tab of the **Certificate** dialog box.
- f. Click the **Export** button.

- g. In the resulting dialog box, for the **Save as type** option, select **DER-encoded binary, single certificate (*.der)**.
- h. Save the certificate to the local file `server.der`.

Safari

- a. Navigate to the page that uses the certificate.
 - b. If there is a *"This connection is not private"* message, click **Show Details** and in the expanded panel, click **view the certificate**.
 - c. Otherwise, in the address bar, click the *padlock icon* on the left side of the website name and in the displayed pop-up, click **Show Certificate**.
 - d. Another pop-up box is displayed showing information about the **certificate**. Drag the large **certificate** icon to a *Finder* window. A `.cer` file will be created in the indicated folder from *Finder*.
2. Import the local file into the JRE running Oxygen XML Developer:
- a. Open a text-mode console with administrative rights. If Oxygen XML Developer has been installed in a user's home directory and includes a bundled JRE, administrative rights are not required. In all other cases, administrative rights will be required.
 - b. Go to the `lib/security` directory of the JRE running Oxygen XML Developer. You can find the home directory of the JRE in the `java.home` property that is displayed in the **About** dialog box (**System properties** tab).

Note:

On macOS, for the distribution of Oxygen XML Developer that bundles the JRE from Oracle, the JRE uses the `.install4j/jre.bundle/Contents/Home/jre/lib/security/cacerts` path within its installation directory.

- c. Run the following command:

```
..\..\bin\keytool -import -trustcacerts -file server.cer -keystore cacerts
```

The `server.cer` file contains the server certificate, created during the previous step. The `keytool` requires a password before adding the certificate to the JRE *keystore* (on page 2270). The default password is `changeit`. If someone changed the default password, then that person is the only one who can perform the import.

Tip:

If you need to import multiple certificates, you need to specify a different alias for each additional imported certificate with the `-alias` command-line argument, as in the following example:

```
..\..\bin\keytool -import -alias myalias1 -trustcacerts -file
server1.cer -keystore cacerts
```

```
..\..\bin\keytool -import -alias myalias2 -trustcacerts -file
server2.cer -keystore cacerts
```

3. Restart Oxygen XML Developer.

Related information

[HTTP\(S\)/WebDAV Preferences \(on page 269\)](#)

HTTP Authentication Schemes

Oxygen XML Developer supports the following HTTP authentication schemes:

- **Basic** - The *basic* authentication scheme defined in the [RFC2617 specifications](#).
- **Digest** - The *digest* authentication scheme defined in the [RFC2617 specifications](#).
- **NTLM** - The *NTLM* scheme is a proprietary Microsoft Windows Authentication protocol (considered to be the most secure among currently supported authentication schemes).

Note:

For NTLM authentication, the user name must be preceded by the name of the domain it belongs to, as in the following example:

```
domain\username
```

- **Kerberos (Deprecated)** ([on page 355](#)) - An authentication protocol that works on the basis of *tickets* to allow nodes communicating over a non-secure network to prove their identity to one another in a secure manner.

Single Sign-on (Deprecated)

Oxygen XML Developer implements the *Single sign-on* property (meaning that you can log on once and gain access to multiple services without being prompted to log on for each of them), based on the **Kerberos** protocol and relies on a *ticket-granting ticket (TGT)* that Oxygen XML Developer obtains from the operating system.

Restriction:

This *Single sign-on* support is not available for SharePoint integrations.

To turn on the **Kerberos**-based authentication, you need to add the following system property in the `.vmoptions` configuration file or start-up script:

```
-Djavax.security.auth.useSubjectCredsOnly=false
```

Switching, Moving, or Hiding Editor Tabs

Each file that has been opened has a tab at the top of the editing pane and there are several ways to switch between tabs or move them, and you can even hide the tabs to only show the currently open file.

Note:

If multiple file tabs are left open when you close the application, upon startup, Oxygen XML Developer will not load the file content until you switch to the corresponding file tab. The tabs remain visible as a placeholders until the focus is switched to them. This helps to improve the application's startup time. If you want to disable this feature (meaning that the previously open files will all be re-loaded at startup), deselect the **Load file content only when switching to its corresponding editor tab** option in the **Global preferences page** (*on page 117*).

Switching Editor Tabs

You can switch between editor tabs by using any of the following methods:

Mouse and Scroll Wheel

Of course, you can switch to a different editor tab by left-clicking the tab with your mouse, but when there are too many open tabs to fit on the screen, you can hover over the tab stripe and use the scroll wheel on your mouse to scroll to the left or right (same as using the two arrows on the far-right of the tab stripe).

Buttons on the Far-Right of the Tab Stripe (◀▶☰)

You can use the arrow buttons (◀▶) on the right side of the tab stripe to scroll to the left or right and the ☰ **Show List** button opens a pop-up window that displays all the open file tabs and allows you to select and switch to a specific open file.

Ctrl + Tab (Command + Tab on macOS) [NOTE: Ctrl + Page Down (Ctrl + Option + Right Arrow on macOS) does the same]

Switches to the next open tab in the order specified in the **Order of switching between editor tabs** option (*on page 118*).

Ctrl + Shift + Tab (Command + Shift + Tab on macOS) [NOTE: Ctrl + Page Up (Ctrl + Option + Left Arrow on macOS) does the same]

Switches to the previous open tab in the order specified in the **Order of switching between editor tabs** option (*on page 118*).

Window > Switch editor tab (Ctrl + F9 (Command + F9 on macOS))

This action opens a dialog box that allows you to switch to a particular editor tab by selecting it from a filterable list. This is especially helpful when you have a large amount of open file tabs and you want to switch to a certain tab this is not shown on the screen. It includes a search filter field and several options to help you find specific open file tabs.

Figure 63. Switch Editor Tab Dialog Box

The **Switch Editor Tab** dialog box contains the following options and features:

Search Filter

You can enter text in the filter field at the top of the dialog box to filter the list and search for specific open files. You can enter any number of terms, separated by space, and wildcards are allowed (for example, * to match any sequence of characters, or ? to match a single character). This field also has a history dropdown that allows you to select previously used search terms.

Match all terms

If this option is selected, only the files that match all of your search terms will be displayed. If you use a wildcard in the search filter, this option is automatically disabled.

Include file paths

If this option is selected, the search is expanded to include file paths, and also the paths are displayed in this dialog box.

Case sensitive

If this option is selected, the search operation will be case-sensitive.

List of Open File Tabs

All files that are currently open are displayed in the upper part of the main pane of the dialog box, followed by recently closed files. Files that have been modified but not yet saved are prefixed by an asterisk. To switch to a particular file tab, double-click the file or select it and click **OK**.

Moving Editor Tabs

You can move editor tabs by using any of the following methods:

Mouse Drag

You can use your mouse to drag editor tabs to a new location on the tab stripe.

Ctrl + Alt + Comma

Moves the current file tab one position to the left.

Ctrl + Alt + Period

Moves the current file tab one position to the right.

Hiding Editor Tabs

If you want to hide all the file tabs and only show the currently open file, select **Hide editor tabs** from the **Window** menu. This does not close the other tabs, just hides them. You can still navigate between tabs using keyboard shortcuts (Ctrl + Tab, Ctrl + Shift + Tab, Ctrl + F6, Ctrl + Shift + F6) or by selecting **Next editor** or **Previous editor** from the **Window** menu.

Contextual Menu of the Current Editor Tab

A contextual menu is available when you right-click the current editor tab label.

The actions that are available depend on the context and the number of files that are opened. The menu includes the following actions:

Close (Ctrl + W (Command + W on macOS))

Closes the currently selected editor.

Close Other Files

If multiple files are opened, this action is available to close all open editors in the current group/stack of tabs except for the one you are currently viewing.

Close Files to the Right

Closes all open editors to the right of the currently selected editor.

Close All

If multiple files are opened, this action is available to close all open editors.

Move editor tab to the left (Ctrl + Alt + Comma)

Moves the current editor tab one position to the left.

Move editor tab to the right (Ctrl + Alt + Period)

Moves the current editor tab one position to the right.

Reopen last closed editor Ctrl + Alt + T (Command + Option + T on macOS)

Reopens the last closed editor.

Maximize Editing Area

Collapses all the side views and spans the editing area to cover the entire width of the main window.

Add to project

Adds the file you are editing to the current project.

Add all to project

If multiple files are opened, this action is available to add all the open files in the current group/stack of tabs to the current project.

Copy Location

Copies the disk location of the file.

Show in Explorer (Show in Finder on macOS)

Opens the Explorer to the file path of the file.

Viewing File Properties

The **Properties** view displays information about the currently edited document. The information includes:

- Character encoding.
- Full path on the file system.
- Schema used for content completion and document validation.
- Document type name and path.
- Associated transformation scenario.
- Read-only state of a file.
- Bidirectional text (left to right and right to left) state.
- Total number of characters in the document.
- Line width.
- Indent with tabs state.
- Indent size.

The view can be accessed from **Window > Show View > Properties**.

To copy a value from the **Properties** view in the clipboard (for example, the full file path), use the **Copy** action available on the contextual menu of the view.

Simple Text Editor

Oxygen XML Developer specializes in XML-related technologies, you can also use it to create and edit various types of non-XML files. Non-XML files are opened in a simple text editor and many of the helpful features that are commonly used when editing XML files in the Oxygen XML Developer **Text** editing mode are available in this simple editor.

Types of Non-XML Files That are Supported in the Simple Text Editor

The types of files that can be created and edited in the simple text editor include:

- Java
- C++
- C
- Dockerfile
- PHP
- Perl
- Properties
- SQL
- PowerShell
- Batch
- Python
- Text

Features Available in the Simple Text Editor

When editing files in the simple text editor, the features that are available include the following:

- **Project Support** - The unique [features that are designed to help you work with projects \(on page 361\)](#) are available for all types of files.
- **Shortcut Actions** - Many of the shortcut actions that are available in **Text** mode are also available in the simple text editor.
- **Drag and Drop** - The normal drag and drop support is available in the simple text editor.
- **Content Selection Features** - The [content selection shortcuts \(on page 484\)](#) that are available in **Text** mode (including the *Rectangular Selection* feature) are also available in the simple text editor.
- **Bookmarks** - You can use [bookmarks to mark positions \(on page 474\)](#) in any type of file so that you can return to it later.
- **Convert Hexadecimal Characters** - You can [convert a sequence of hexadecimal characters to the corresponding Unicode character \(on page 523\)](#).
- **Encoding/Decoding Actions** - Contextual menu actions are available to [encode or decode Base 64, Base 32, and Hex schemes \(on page 524\)](#).
- **Code Templates** - You can define your own [code templates \(on page 491\)](#) for any type of file and use the [Content Completion Assistant \(on page 2267\)](#) to invoke them.
- **Syntax Highlighting** - Non-XML files also support syntax highlighting with dedicated coloring schemes. To customize them, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to

Editor > Syntax Highlight (on page 193). Select and expand the appropriate section in the top pane for the type of file you are editing and you can see the effects of your changes in the **Preview** pane.

- **Find/Replace** - You can use the  **Find/Replace action** (on page 394) to find or replace all the occurrences of a word or string of characters in any type of file that you are editing.
- **File Comparison Tool** - The **Compare Files tool** (on page 433) can also be used to compare non-XML files.

Using Projects to Group Documents

Oxygen XML Developer includes a **Project view** (on page 365) that helps you organize your projects. Oxygen XML Developer offers a variety of helpful features for working with projects and makes it easy to share your projects with other members of your team. This section presents various unique features that will help you to create and work with projects.

Tip:

There are several sample project templates available for DITA users that can be used as a starting point or for inspiration. These sample project templates are found in the **Framework templates > DITA** folder in the **New Project wizard**: (on page 362)

- **Sample DITA Project** - This is a basic DITA project meant to help new users see how a DITA project is structured.
- **Startup DITA Project** - This is a startup DITA project that imposes a custom set of options (e.g. spell check settings and custom dictionaries), a custom DITA framework extension (e.g. custom new file templates, custom actions, custom CSS used for visual editing) and a folder structure for a DITA project according to best practices. Once created, the project contains a `Readme.html` file that explains all customizations and their benefits. If you plan to start your own DITA project using a version control system (such as Git), you can use this startup DITA project template to customize various aspects of DITA editing and share them with your team.

Creating a New Project

Oxygen XML Developer allows you to organize your XML-related files into projects. This helps you manage and organize your files and also allows you to perform batch operations (such as validation and transformation) over multiple files. You can also [share your project settings and transformation/validation scenarios](#) (on page 378) with other users. Use the **Project view** (on page 365) to manage projects, and the files and folders contained within.

Creating a New Project

To create a new project, select  **New Project** from the **Project** menu, the **New** menu in the contextual menu, or the drop-down menu at the top-left of the **Project** view.

This opens a new project wizard:

Figure 64. New Project Wizard**Tip:**

There are several sample project templates available for DITA users that can be used as a starting point or for inspiration. These sample project templates are found in the **Framework templates > DITA** folder in the **New Project** wizard: (on page 362)

- **Sample DITA Project** - This is a basic DITA project meant to help new users see how a DITA project is structured.
- **Startup DITA Project** - This is a startup DITA project that imposes a custom set of options (e.g. spell check settings and custom dictionaries), a custom DITA framework extension (e.g. custom new file templates, custom actions, custom CSS used for visual editing) and a folder structure for a DITA project according to best practices. Once created, the project contains a [Readme.html](#) file that explains all customizations and their benefits. If you plan to start your own DITA project using a version control system (such as Git), you can use this startup DITA project template to customize various aspects of DITA editing and share them with your team.

With the exception of the *Default project* template, which is a pseudo-template and does not exist on the local disk (it is used only to create a new `.xpr` file), project templates are actually ZIP archives (with a `.zxpr` extension) and are stored within the file template directory structure (for example, `frameworks\dita\templates\sample-project\Sample DITA Project.zxpr`).

**Tip:**

Archives with a `.zxpr` extension can be edited in the **Archive Browser** view (on page 1741).

After selecting a project template, you can specify the following:

Project file name

Specifies the name of the new project file. Oxygen XML Developer provides a default proposal for the file name based on the following rules:

- If there is an `.xpr` file inside the archive, its name is used.
- Otherwise, the name of the template is used.

Project directory

Specifies the directory where the archive content will be extracted.

Note:

The archive should not contain an extra single folder as the root. For the **Project directory** path to work properly, the archive must have the `.xpr` file on the first level, along with the other resources (files and folders).

Once you are done, click the **Create** button to begin the creation process. Oxygen XML Developer extracts the content from the archive inside the path specified in the **Project directory** field.

Editor Variables in Project Templates

By default, the editor variables inside project resources created from a project template are not resolved. To start having them resolved, the project template *must be customized (on page 340)* by using the `expandEditorVariablesIncludeFilter` property. This filter determines the resources where the editor variables will be resolved. If you need to exclude a subset of resources from the set specified by the `expandEditorVariablesIncludeFilter` property, the `expandEditorVariablesExcludeFilter` property can be used.

Note:

Usually, project files (`*.xpr`), framework files (`*.framework`), and framework extension scripts (`*.exf`) should be excluded from the editor variable resolving process.

The values of the inclusion and exclusion filters can be file paths relative to the project directory that can use wildcards or simply wildcards. Each filter can have multiple values, separated by spaces.

Possible filter values:

- `./*` - Matches all resources from the first level in the project directory.
- `*` or `./**` - Matches all resources on all levels inside the project directory.
- `dir1/dir2/*.dita` - Matches all `.dita` files from `[PROJECT_DIR]/dir1/dir2`, but not from subdirectories of `dir2`.
- `dir1/dir2/**/*.dita` - Matches all `.dita` files from `[PROJECT_DIR]/dir1/dir2`, including those from subdirectories of `dir2`.
- `dir1/**/*.*` - Matches all resources on all levels inside `[PROJECT_DIR]/dir1`.

- `dir1/article1.xml, dir2/article2.xml` - Matches only the two `.xml` files.
- `./**/*_suffix.md, ./**/prefix_*.html` - Matches all `.md` files with names that end with `_suffix` and all `.html` files with names that start with `prefix_`.

Adding Items to the Project

To add items to the project, select any of the following actions that are available when invoking the contextual menu in the **Project** view:

New > **File**

Opens a **New** file dialog box that helps you create a new file and adds it to the project structure.

New > **Folder**

Opens a **New Folder** dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

The project itself is considered a logical folder. You can add a logical folder, or content to a logical folder, by using one of the following actions that are available in the contextual menu, when invoked from the *project root*.

New > **Logical Folder**

Creates a logical folder in the tree structure (the icon is a magenta folder on macOS - ).

New > **Logical Folders from Web**

Replicates the structure of a remote folder accessible over SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

Add Folder

Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon of this action is different on macOS - .

Add Files

Adds links to files on the local file system.

Add Edited File

Adds a link to the currently edited file in the project.

Using Linked Folders (Shortcuts)

Another easy way to organize your XML working files is to place them in a directory and then to create a corresponding linked folder in your project. If you add new files to that folder, you can simply use the  **Refresh (F5)** action from the project contextual menu and the **Project view** (on page 365) will display the existing files and subdirectories. If your files are scattered among several folders, but represent the same class of files, you might find it useful to combine them in a logical folder.

You can create linked folders (shortcuts) by dragging and dropping folders from the Windows Explorer (macOS Finder) to the project tree, or by selecting  **Add Folder** in the contextual menu from the *project root*. Linked folders are displayed in the **Project view** ([on page 365](#)) with bold text. To create a file inside a linked folder, select the **New >  File** action from the contextual menu. The linked files presented in the **Project view** ([on page 365](#)) are marked with a special icon.

**Note:**

Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

For more information on managing projects and their content, see [Project View](#) ([on page 365](#)).

For more details about how you can share projects with other users, see [Sharing a Project - Team Collaboration](#) ([on page 378](#)).

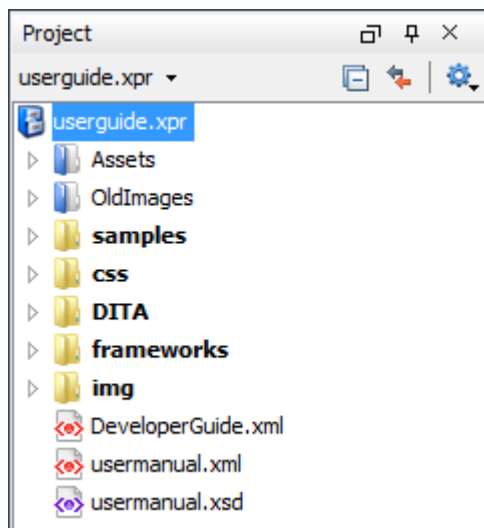

Related information

[Using Projects to Group Documents](#) ([on page 361](#))

Project View

The **Project** view is designed to assist you with organizing and managing related files grouped in the same XML project. The actions available in the contextual menu and on the toolbar associated to this panel allows you to create XML projects and provide shortcuts to various operations for the project documents.

Figure 65. Project View

By default, the view is positioned on the left side of Oxygen XML Developer, above the **Outline** view. If the view has been closed, it can be reopened at any time from the **Window > Show View** menu (or using the **Show Project View** action from the **Project** menu).

Project View Toolbar

The tree structure occupies most of the view area. In the upper left side of the view, there is a drop-down menu that contains all recently used projects and some actions to open a project or create a new one. You can use this history drop-down menu to quickly switch to a recently opened project. If you enable the **Remember layout changes for each project** option in the **Application Layout** preferences page (*on page 126*), the application will remember the layout, open files, and editing location for your session when you switch projects.

The following actions are grouped in the upper right corner:

Collapse All

Collapses all project tree folders. You can also collapse/expand a project tree folder if you select it and press the **Enter** key or **Left Arrow** to collapse and **Right Arrow** to expand.

Link with Editor

When selected, the currently edited file (from the main editor or from the DITA Maps Manager view) is highlighted in the project tree, if the file is found in the project.

Note:

This button is disabled automatically when you move to the **Debugger perspective** (*on page 2271*).

Settings

A submenu that contains the following actions:

Filters

Allows you to filter the information displayed in the **Project** view. Click the toolbar button to set filter patterns for the files you want to show or hide. Also, you can set filter patterns for the linked directories that are hidden.

Show Full Path

When selected, linked files and folders are presented with a full file path.

Enable Main Files Support

Select this option to enable the **Main Files** support (*on page 381*).

Change Search and Refactor operations scope

Allows you to change the collection of documents that define the context of the search and refactor operations.

- **Use only Main Files, if enabled** - Restricts Oxygen XML Developer to perform the search and refactor operations starting from the *main files* (*on page 2270*) that are defined for the current resource. This option is

available when you select **Project** in the **Select the scope for Search and Refactor operations** dialog box and the **Main Files** support is enabled.

- **Working sets** - Allows you to specify the set of files that will be used for the scope of the search and refactor operations.

File Explorer Area

The rest of the view is basically a file explorer similar to most other commonly used file explorers. The XML project (`.xpr` file) is a logical container with a collection of resources (folders and files). The types of resources displayed include:

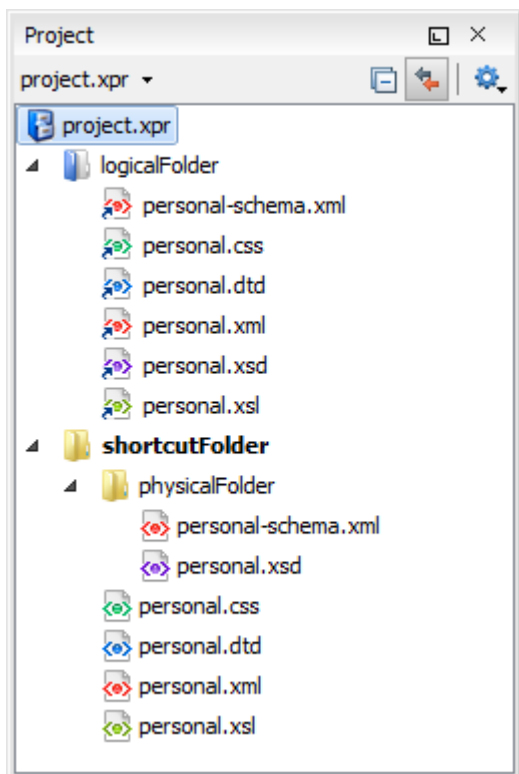

- **Logical folders with Linked folders/files** - Marked with a blue icon on Windows and Unix/Linux () and a magenta icon on macOS (), they help you group files within the project. This folder type is used as containers for linked resources (shortcuts). The icons for file shortcuts include a shortcut symbol () and names of folder shortcuts are displayed in bold text. The logical folders are created on the project root or inside other logical folders by using the contextual menu action **New > Logical Folder**, and the linked folders/files are added using **Add Files**, **Add Folder**, or by dragging and dropping files/folders from the view or the system file explorer.  **Remove from Project** can be used to remove them from the project and the  **Remove from Disk (Shift+Delete)** action can be used to remove them from both the project and the local file system.
- **Physical folders and files** - Marked with the operating system-specific icon for folders (usually a yellow icon on Windows and a blue icon on macOS). These folders and files are mirrors of real folders or files that exist in the local file system. They are created or added to the project by using contextual menu actions (such as **New > File**, **New > Folder**,  **Copy**, and  **Paste**) or by dragging and dropping files/folders from the view or the system file explorer. Also, the contextual menu action  **Remove from Disk (Shift+Delete)** can be used to remove them from the project and local file system.

Figure 66. Project View with Both Types of Resources

Creating New Projects

The following action is available from the **New** menu when right-clicking any item, the **Project** menu, or from the drop-down menu in the top-left of the **Project** view:

New Project

Opens a wizard that assists you with creating a new project. For more details, see [Creating a New Project \(on page 361\)](#).

Managing Project Contents

There are various contextual menu actions, shortcuts, and ways to organize the folders and files inside the project:

Creating New Folders and Files

Right-click any item > New > File

Opens a **New file wizard (on page 330)** that helps you create a new file and adds it to the project structure.

Right-click any item in a physical folder > New > Folder

Opens a **New Folder** dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

Right-click any item in a logical folder > New > Logical Folder

Creates a logical folder in the tree structure (the icon is a magenta folder on macOS )

Right-click on a logical folder > New > Logical Folders from Web

Replicates the structure of a remote folder accessible over SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

Adding Resources

You can add resources by using drag and drop (or  **Copy** and  **Paste**) actions from within the **Project** view or dragging them from the system file explorer. Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

Adding Resources to Logical Folders

You can add resources to logical folders by using the following actions available in the contextual menu when invoked on a logical folder (or the project's root container):

Add Folder

Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon for this action is different on macOS )

Add Files

Adds links to files on the local file system.

Add Edited File

Adds a link to the currently edited file in the project.

Removing Folders and Files

To remove logical folders or the linked resources inside them from the project, use  **Remove from Project** from the contextual menu (or press **Delete** on your keyboard).

To remove folders or files from both the project and the local file system, use  **Remove from Disk** from the contextual menu (or press **Shift+Delete** on your keyboard).

Moving Folders and Files

You can move the resources by using drag and drop actions from within the **Project** view (the **Enable drag-and-drop in Project view** option must be selected in the [View preferences page \(on page 272\)](#)).

You can also use the usual  **Cut**,  **Copy**, and  **Paste** actions to move resources in the project.

You can also move certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) or folders by using the **Refactoring > Move resource** action from the contextual menu.

This action opens the **Move resource** dialog box that includes the following options:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, based upon the selected scope. You can select or configure the scope by using the  button.

Renaming Folders and Files

There are several ways to rename a folder or file in the project (this works for both physical and linked resources):

- Select **Rename** from the contextual menu.
- Press **F2** on your keyboard.
- Select the item, then click the name, and type the new name.

You also can rename certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) or folders by using the **Refactoring > Rename resource** action from the contextual menu.

This action opens the **Rename resource** dialog box that includes the following options:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource** - Select this option to update the references to the resource you are renaming. You can select or configure the scope by using the  button.

Opening Files

There are several ways to open a file:

- Double-click the file.
- Select it and press **Enter** on your keyboard.
- Right-click the file and select **Open**.
- If there are no other files open in the editor area, you can drag the file from the project tree and drop it in the editor area.
- If you want to choose the application or location where to open it, you can right-click the file and select **Open with**.

Saving the Project

The project file is automatically saved every time the content of the **Project** view is saved or modified by actions such as adding or removing files and drag and drop.

Other Contextual Menu Actions

Numerous other actions are available in the contextual menu, depending on the type of file or folder where it is invoked from (some actions are available for multiple selected files):

Show in submenu

Explorer (Finder on macOS)

On Windows and macOS, the parent directory of the selected file or folder is presented in a specific Explorer/Finder window and the selected resource is highlighted. On Linux, the selected file or folder is not highlighted after opening its parent in the file explorer.

Terminal

Opens a console (terminal) at the location of the selected physical resource. If the resource is a file, it will start at the parent directory.

Copy Location

Copies an application-specific URL for the selected resource to the clipboard.

Refactoring submenu

Oxygen XML Developer includes some refactoring operations that help you manage the structure of your documents. The following actions are available from the contextual menu in the

Refactoring submenu:

Rename resource (Available for certain types of XML documents or folders)

Opens the **Rename resource** dialog box ([on page 375](#)) where you can change the name of a resource. It also includes an option to update the references to the renamed resource and you can choose between various scopes for the operation.

Move resource (Available for certain types of XML documents or folders)

Opens the **Move resource** dialog box ([on page 375](#)) where you can choose a destination and change the name of a resource. It also includes an option to update the references to the moved resource and you can choose between various scopes for the operation.

XML Refactoring

Opens the **XML Refactoring** tool wizard ([on page 607](#)) that presents refactoring operations to assist you with managing the structure of your XML documents.

Apply all default quick fix proposals

Opens the **Apply all default quick fix proposals** tool ([on page 644](#)) that can be used to apply quick fix proposals for all reported validation errors in the selected documents when one or more quick fix proposals have been detected for reported validation errors.

Other XML Refactoring Actions

For your convenience, the last 5 XML Refactoring tool operations (*on page 607*) that were finished or previewed will also appear in this submenu.

Show referenced resources

Opens the **Referenced/Dependent Resources** view (*on page 599*) that allows you to see the referenced resource hierarchy for an XML document.

Show dependent resources

Opens the **Referenced/Dependent Resources** view (*on page 599*) that allows you to see the resource dependencies for an XML document. When working with DITA XML projects, this action is available when right-clicking images to find direct references to them.

Refresh

Refreshes the content and the dependencies between the resources in the **Main Files** directory (*on page 381*).

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box (*on page 399*) that allows you to find and replace text in multiple files.

XPath in Files

Opens the **XPath/XQuery Builder** view (*on page 1735*) that allows you to compose XPath and XQuery expressions and execute them over the currently edited XML document.

Open/Find Resource

Opens the **Open/Find Resource** dialog box (*on page 388*).

Check Spelling in Files

Allows you to check the spelling of multiple files (*on page 420*).

Format and Indent Files

Opens the **Format and Indent Files** dialog box (*on page 515*) that allows you to configure the format and indent (*pretty-print* (*on page 2271*)) action that will be applied on the selected documents.

Open in SVN Client

Syncro SVN Client (*on page 2066*) tool is opened and it highlights the selected resource in its corresponding working copy.

Compare

Allows you to compare multiple files or directories and the order of your selection determines where they are opened in the **Compare Files** (*on page 433*) or **Compare Directories** (*on page 451*) tool. If you select two files or folders, your first selection will be opened in the left panel and the other one in the right panel.

You can also select 3 files and the tool will automatically be opened in the [three-way comparison mode](#) (on page 436). If you select three files, your first selection will be opened in the left panel, the second in the right panel, and the third selection will be the base (ancestor) file.

HTML to XML Well-formed (Available when selecting multiple resources)

Batch converts the selected HTML documents to be XML well-formed. This means that missing end tags will be added to applicable elements, unclosed tags will be properly closed, and quotes will be added to attribute values that were missing the quotes.

Notes:

- All selected HTML files are backed up before being processed (same path/name but with the ".bak" extension added at the end).
- Any detected conversion errors are grouped and listed in a dedicated tab in the **Results** pane at the bottom of the application.
- A brief report is displayed at the end of the operation.

Transform submenu

The currently selected files in the **Project** view can be transformed in one step with one of the following actions available from contextual menu in the **Transform** submenu:

Apply Transformation Scenario(s)

Obtains the output with one of the built-in scenarios.

Configure Transformation Scenario(s)

Opens a dialog box that allows you to configure pre-defined transformation scenarios.

Transform with

Allows you to select a transformation scenario to be applied to the currently selected files.

Validate submenu

The currently selected files in the **Project** view can be checked to be XML well-formed or validated against a schema (DTD, XML Schema, Relax NG, Schematron or NVDL) with one of the following contextual menu actions found in the **Validate** submenu:

Check Well-Formedness

Checks if the selected file or files are well-formed.

Validate

Validates the selected file or files against their associated schema. For EPUB files, this action triggers an **EPUB Validate and Check for Completeness** (*on page 1744*) operation.

Validate with Schema

Validates the selected file or files against a specified schema.

Configure Validation Scenario(s)

Allows you to configure and run a validation scenario.

Generate Documentation submenu

Generate Documentation > XML Schema Documentation

Opens the **XML Schema Documentation** dialog box (*on page 781*).

Generate Documentation > XSLT Stylesheet Documentation

Opens the **XSLT Stylesheet Documentation** dialog box (*on page 694*).

Generate Documentation > XQuery Documentation

Opens the **XQuery Documentation** dialog box (*on page 813*).

Generate Documentation > WSDL Documentation

Opens the **WSDL Documentation** dialog box (*on page 836*).

Properties

Displays the properties of the current file in a **Properties** dialog box.

Enable Main Files Support (Available from the project container)

Allows you to enable the **Main Files Support** (*on page 382*) for each project.

Detect Main Files (Available from the project container when Main Files Support is enabled)

Opens the **Detect Main Files** wizard (*on page 383*) that enables the automatic detection of *main files*.

Add to Main Files (Available when Main Files Support is enabled)

Adds the selected files to the Main Files folder (*on page 384*).

Project Menu Actions

The following actions are available in the **Project** menu:

New Project

Opens a wizard that assists you with creating a new project. For more details, see [Creating a New Project](#) (*on page 361*).

Open Project (Ctrl + F2 (Command + F2 on macOS))

Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Developer XPR project file from the file explorer into the **Project** panel.

**Notice:**

When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

Save Project As

Allows you to save the current project under a different name.

**Validate all project files**

Checks if the project files are well-formed and their mark-up conforms with the specified DTD, XML Schema, or Relax NG schema rules. It returns an error list in the message panel.

**Filters**

Opens the **Project filters** dialog box that allows you to decide which files and directories will be shown or hidden.

Enable Main Files Support

Allows you to enable the **Main Files Support** ([on page 382](#)) for each project you are working on.

**Change Search and Refactor operations scope**

Opens a dialog box that allows you to define the context of search and refactor operations.

Show Project View

Displays the **Project** view.

Reopen Project

Contains a list of links of previously used projects. This list can be emptied by invoking the **Clear history** action.

Moving/Renaming Resources in the Project View

The **Refactoring** submenu in the contextual menu of the **Project view** ([on page 365](#)) provides actions for moving or renaming certain types of XML resources in the current project while offering the option to update the references to the resources.

Moving Resources

You can move certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) by using the **Refactoring > Move resource** action from the contextual menu. This action opens the **Move resource** dialog box that includes the following options:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, based upon the selected scope. You can select or configure the scope by using the  button.

Renaming Resources

You can rename certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) by using the **Refactoring > Rename resource** action from the contextual menu. This action opens the **Rename resource** dialog box that includes the following options:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource** - Select this option to update the references to the resource you are renaming. You can select or configure the scope by using the  button.

Problems Updating References of Moved/Renamed Resources

In some cases, the references of a moved or a renamed resource cannot be updated. For example, when a resource is resolved through an *XML Catalog (on page 2273)* or when the path to the moved or renamed resource contains entities. For these cases, Oxygen XML Developer displays a warning dialog box.

Figure 67. Problems Dialog Box

Batch Validation and Transformation

Oxygen XML Developer provides support for batch validation and batch transformation. Actions are available in the **Project** view that provide the ability to validate or transform one or more files attached to a project.

Batch Validation

To batch validate files, select the files (or directories), right-click, and choose one of the following actions from the **Validate** submenu:

Check Well-Formedness

Checks if the selected file or files are well-formed.

Validate

Validates the selected file or files against their associated schema. For EPUB files, this action triggers an **EPUB Validate and Check for Completeness** (on page 1744) operation.

Validate with Schema

Validates the selected file of files against a specified schema.

Configure Validation Scenario(s)

Allows you to configure and run a validation scenario.

Batch Transformation

To batch transform files, select the files (or directories), right-click, and choose one of the following actions from the **Transform** submenu:

Apply Transformation Scenario(s)

Obtains the output with one of the built-in scenarios.

Configure Transformation Scenario(s)

Opens a dialog box that allows you to configure pre-defined transformation scenarios.

Transform with

Allows you to select a transformation scenario to be applied to the currently selected files.

[Quick Validation and Transformation for Main Files \(on page 385\)](#)

Sharing a Project - Team Collaboration

You can use XML projects to make team collaboration and synergy efficient and effective. Not only can you share the project files and folders, but Oxygen XML Developer also allows you to store preferences, transformation scenarios, and validation scenarios at [project level \(on page 2272\)](#) in a *project file* (.xpr file extension). It can be saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, so that your team has access to the same resources stored in the project file.

Sharing Preferences (Creating a Project-Level Options File)

To share options that are configured in certain preferences pages, you can store them in a *project file* (.xpr file extension) that can easily be shared with others. To do so, follow these steps:

1. [Recommended] You may want to use a fresh install for this procedure to ensure that you do not copy personal or local preferences.
2. In the **Project view** ([on page 365](#)), create a project or open an existing one.
3. Open the **Preferences** dialog box (**Options > Preferences**) ([on page 114](#)).
4. Configure the options in each preferences page that you want to be included in the project file and switch the storage preference to **Project Options** ([on page 2272](#)) in each page.

Note:

Some pages do not have the **Project Options** button, since the options they host might contain sensitive data (such as passwords, for example) that is unsuitable for sharing with other users.

5. Click **OK** and close the **Preferences** dialog box.

All explicitly set values are now saved in the project file. You can then share the project file so that your team will have the same option configuration that you stored in the project file.

**Note:**

The project file extension (`.xpr`) must be preserved when the file is distributed to others.

**Notice:**

When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

Sharing Transformation Scenarios

To share created and edited transformation scenarios, you can store them in a *project file* (`.xpr` file extension) by following these steps:

1. In the **Project view** ([on page 365](#)), create a project or open an existing one.
2. When you [create a new transformation scenario \(on page 1129\)](#) or [edit an existing one \(on page 1237\)](#), there is a **Storage** option. Switch the storage preference to **Project Options** ([on page 2272](#)) in each transformation scenario you want to be included in the project file.
3. Click **OK** to store the scenario in the project file.

You can then share the project file so that your team will have access to the same transformation scenarios that you stored in the project file. When you create a scenario at the project level, the URLs from the scenario become relative to the project URL.

**Note:**

The project file extension (`.xpr`) must be preserved when the file is distributed to others.

**Notice:**

When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

Sharing Validation Scenarios

To share created and edited validation scenarios, you can store them in a *project file* (`.xpr` file extension) by following these steps:

1. In the **Project view** ([on page 365](#)), create a project or open an existing one.
2. When you create a new validation scenario or edit an existing one, there is a **Storage** option. Switch the storage preference to **Project Options** ([on page 2272](#)) in each validation scenario you want to be included in the project file.
3. Click **OK** to store the scenario in the project file.

You can then share the project file so that your team will have access to the same validation scenarios that you stored in the project file. When you create a scenario at the project level, the URLs from the scenario become relative to the project URL.

**Note:**

The project file extension (`.xpr`) must be preserved when the file is distributed to others.

**Notice:**

When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

Using Git for Collaboration

To assist you with team collaboration, sharing projects, and version control, an add-on is available that contributes a built-in Git client directly in Oxygen XML Developer. The **Git Client** is developed independent of the normal **Oxygen** release cycle, so it is updated and improved more frequently than the main application. It is an optional tool so it needs to be installed as an add-on. Once installed, a **Git Staging** view is available that includes various actions that perform common Git commands, such as *push*, *pull*, *change branch*, *commit*, and more. It also includes a built-in tool for comparing and merging changes.

For more details, see [Git add-on](#).

Using Subversion (SVN) for Collaboration

Oxygen XML Developer also includes an embedded SVN (Subversion) Client. Even if you start developing a new project, or you want to migrate an existing one to Subversion, the Syncro SVN Client allows you to easily share it with the rest of your team. It can be accessed from the **Tools** menu and can be used for synchronizing your working copy with a central repository. It can also be started by selecting the  **Open in SVN Client** action from the contextual menu of the **Project view** ([on page 365](#)). This action opens the Syncro SVN Client and shows the selected project file in the **Working Copy** view.

Minimize Differences Between Versions Saved on Multiple Computers

The number of differences between versions of the same file saved by multiple content authors on multiple computers can be minimized by imposing the same set of formatting options when saving the file, for all the content authors. An example, the following procedure can be used to minimize the differences:

1. Create an Oxygen XML Developer project file (.xpr) that will be shared by all content authors.
2. Configure your own formatting preferences. To do this, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#), go to **Editor > Format**, configure the appropriate options in this page, then go to **Editor > Format > XML** and configure the options there.
3. Save the configured options into your project file by selecting [Project Options \(on page 2272\)](#) in both of the preferences pages.
4. Save the project and commit the project file to your versioning system so all the content authors can use it.
5. Make sure the project is opened in the [Project view \(on page 365\)](#).
6. Open and save your XML files in the **Author** mode.
7. Commit the saved XML files to your versioning system.

When other content authors change the files, only the changed lines will be displayed in your diff tool instead of one big change that does not allow you to see the changes between two versions of the file.

Contextual Project Operations Using 'Main Files' Support

Oxygen XML Developer allows you to define [Main Files \(on page 2270\)](#) at project level. These *main files* are automatically used by Oxygen XML Developer to determine the context for operations such as validation, transformation, content completion, refactoring, or searches for XML, XSD, XSL, WSDL, and RNG modules. Oxygen XML Developer maintains the hierarchy of the *main files*, helping you to determine the editing context.

Resources

For more information about the *Main Files* support for XML documents, watch our video demonstrations:

Main Files Benefits

Using the *Main Files* support in Oxygen XML Developer includes the following benefits:

- When the *main file* is validated, Oxygen XML Developer automatically identifies the modules included in the *main file* and validates all of them.
- When the *main file* is transformed, Oxygen XML Developer automatically identifies the modules included in the *main file* and transforms them accordingly.
- The [Content Completion Assistant \(on page 2267\)](#) presents all the components that are collected from the *main files* for the modules they include.
- The [Outline view \(on page 494\)](#) displays all the components that are defined in the *main files* hierarchy.
- The *main files* that are defined for the current module determines the [scope of the search and refactoring actions \(on page 598\)](#). Oxygen XML Developer performs the search and refactoring actions in the context that the *main files* determine, thus improving the speed of execution.

Enabling the Main Files Support

Oxygen XML Developer stores the *main files* in a folder located in the [Project view \(on page 365\)](#), as the first child of the project root. The *Main Files Support* is disabled by default and Oxygen XML Developer allows you to enable or disable the *Main Files Support* for each project you are working on.

To enable *Main Files* support, do one of the following:

- Select **Enable Main Files Support** from the  **Settings** menu in the top-right corner of the [Project view \(on page 365\)](#).
- Select **Enable Main Files Support** from the contextual menu of the project root folder in the [Project view \(on page 365\)](#). If a disabled *Main Files* folder exists, you can also select that option from its contextual menu.
- Click the **Enable** button in the tooltip located at the bottom of the [Project view \(on page 365\)](#). This tooltip window is displayed when the *Main Files* support is disabled. Clicking the **Read more** link takes you to the user guide. Clicking the **Enable** button opens the **Enable Main Files** dialog box. This dialog box contains general information about the **Main Files Support** and allows you to enable it. You can also use the **Detect and Enable** button in this dialog box to detect the *main files* from the current project.

Warning:

Once you close this window tip, Oxygen XML Developer hides it for all projects. You can make the window tip reappear by [resetting Oxygen XML Developer to its default settings \(on page 279\)](#). However, doing so will result in you losing your customized options.

Related information[Detecting Main Files \(on page 383\)](#)[Adding or Removing Files/Folders in the Main Files Directory \(on page 384\)](#)

Detecting Main Files

Oxygen XML Developer allows you to detect the *main files* using the  **Detect Main Files** option. This action applies to the folders you select in the project.

To detect *main files* over the entire project, do one of the following:

- Right-click the root of the project and select  **Detect Main Files**.
- Use the  **Detect Main Files from Project** option, available in the contextual menu of the **Main Files** folder.

Both of these options display the **Detect Main Files** wizard. In the first panel you can select the type of *main files* you want Oxygen XML Developer to detect. In the subsequent panel the detected *main files* are presented in a tree-like fashion. The resources are grouped into three categories:

- **Possible main files** - The files presented on the first level in this category are not imported or included from other files. These files are most likely to be set as *main files*.

**Note:**

For DITA projects, only *DITA Maps (on page 2268)* are reported as possible *main files*.

- **Cycles** - The files that are presented on the first level have circular dependencies between them. Any file presented on the first level of a cycle is a possible *main file*.
- **Standalone** - Files that do not include or import other files and are also not included or imported themselves. It is not necessary to set them as *main files*.

To set them as *main files*, simply select their checkboxes. Oxygen XML Developer marks all the children of a *main file* as modules. Modules are rendered in gray and their tool-tip presents a list of their *main files*. A module can be accessed from multiple *main files*.

The next panel displays a list with the selected *main files*. Click the **Finish** button to add the *main files* in the **Main Files** folder.

You can use the **Select Main Files** option to automatically mark all *main files*. This action sets all the resources from the **Possible Main Files** category and the first resource of each **Cycle** as *main files*. The **Deselect All** button simply removes all of your selections.

**Tip:**

It is recommended that you only add top-level files (files that are at the root of the include/import graph) in the **Main Files** directory.

**Attention:**

If the **Main Files Support** is disabled, the **Main Files** directory is rendered only if it contains *main files*.

Related information

[Enabling the Main Files Support \(on page 382\)](#)

[Adding or Removing Files/Folders in the Main Files Directory \(on page 384\)](#)

Adding or Removing Files/Folders in the Main Files Directory

Adding Files/Folders to the Main File Directory

The **Main Files** directory can contain logical folders, linked folders, or linked files.

To add files in the **Main Files** directory, use one of the following methods:

- Right-click a file from your project and select  **Add to Main Files** from the contextual menu.
- Select  **Add Files** or  **Add Edited File** from the contextual menu of the **Main Files** directory.
- Drag and drop files into the **Main Files** directory.
- From the contextual menu of the **Referenced/Dependent Resources** view (on page 599), use the  **Add to Main Files** action.

To add folders in the **Main Files** directory, use one of the following methods:

- Right-click **Main Files** directory and select **Add Folder** from the contextual menu.
- Drag and drop folders into the **Main Files** directory.

You can view the *main files* for the current resource by selecting  **Properties** from the contextual menu (on page 374) of the **Project** view (on page 365) and the *main files* for the current editor in the **Properties** (on page 359) and **Information** (on page 467) views.

Removing Files/Folders from the Main Files Directory

The main files that are already defined in the project are automatically marked in the tree. To disable a main file or folder, remove it from the **Main Files** folder (for example, right-click and select  **Remove from Main Files**). Removing files or folders from the **Main Files** folder does NOT delete the files from disk. It just removes the logical files from that logical folder in the project.

Related information

[Enabling the Main Files Support \(on page 382\)](#)

[Detecting Main Files \(on page 383\)](#)

Quick Validation and Transformation for Main Files

If *Main Files Support* is enabled (on page 382), you can hover the cursor over the Main Files directory, or a node within the directory, and Oxygen XML Developer will display inline  **Validate** and  **Transform** buttons that can be used to quickly run a validation or transformation over the directory or node. For nodes within the Main Files directory, hovering over the  **Validate** and  **Transform** buttons also displays the most recently used validation or transformation scenario. To change the assigned validation or transformation scenario, right-click the node and select **Validate** >  **Configure Validation Scenario(s)** or **Transform** >  **Configure Transformation Scenario(s)**, respectively.

Search and Find/Replace Features

Oxygen XML Developer includes advanced search capabilities to help you locate documents and resources. The search features are powered by [Apache Lucene](#). Apache Lucene is a free open source information retrieval software library. You can perform simple text searches or more complex searches using the [Apache Lucene - Query Parser Syntax](#).

Note:

When Oxygen XML Developer performs the indexing of resources, referenced content is not taken into account. For example, when DITA documents are indexed, the content referenced in a `@conref` or `@conkeyref` attribute is not parsed. The files that make up the index are stored on disk in the `[user_home_directory]\AppData\Roaming\com.oxygenxml.developer\lucene` folder.

Open/Find Resource View

The **Open/Find Resource** view is designed to offer advanced search capabilities either by using a simple text search or by using the [Apache Lucene - Query Parser Syntax](#). By default, the view is presented in the left side of the Oxygen XML Developer layout, next to the **Project view** (on page 365). If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 68. Open/Find Resource View

You can use this view to find a file in the current Oxygen XML Developer project by typing only a few letters of the file name of a document or a fragment of the content you are searching for. The **Open/Find Resource** view also supports searching in document edits (comments, tracked change insertions/deletions, and highlighted content) by selecting the **In reviews** option (*on page 387*).

Search Results

Search results are presented instantly, after you finish typing the content. The matching fragments of text are highlighted in the results list displayed in the dialog box. When you open one of the documents from the results list, the matching fragments of text are highlighted in the editing area. To remove the highlighting from your document, close the corresponding tab in the **Results view** (*on page 503*) view at the bottom of the editor. To display the search history, position the cursor in the search field and press **Ctrl + DownArrow** (**Command + DownArrow on macOS**) or **Ctrl + UpArrow** (**Command + UpArrow on macOS**) on your keyboard. Pressing only the **DownArrow** key moves the selection to the list of results.

Note:

Searches are not case-sensitive. For example, if you search for `car` you get the same results as when you search for `Car`.

**Tip:**

Suffix searches are also supported, both for searching in the content of your resources and in their name. For this, you can use wildcards. If you search for `*ing` with the **in content** option selected, you will find documents that contain the word *presenting*. If you search for `*/samples/*.gif` with the **in file paths** option selected, you will find all the *gif* images from the `samples` directory.

Options Available in the View

The **Open/Find Resource** view offers the following options:

-  **Settings** - Drop-down menu that includes the following settings for the view:
 - **Clear Index** - Clears the index.
 - **Show description** - Presents the search results in a more compact form, displaying only the title and the location of the resources.
 - **Options** - Opens the **Open/Find Resource preferences page (on page 264)** where you can configure various search options. For example, you can specify a **Content language** that differs from the default UI language in case your document contains multiple languages.
- **In file paths (on page 394)** - Select this option to search for resources by their name or by its path (or a fragment of its path).
- **In content (on page 391)** - Select this option to search through the content of your resources.
- **In reviews (on page 394)** - Select this option to search through the comments, *tracked change* insertions/deletions, or highlights in your resources.
- **Reindex** - Use this option to reindex your resources.

Contextual Menu Actions

A contextual menu is available on each search result and provides actions applicable to that particular document. These actions include:

- **Open** - Opens the document in one of Oxygen XML Developer internal editors.
- **Open with** - Allows you to choose to open the document in the **Internal editor** or an external **System application**.
- **Show in Explorer** - Identifies the document in the system file explorer.
- **Copy Location** - Copies the file path and places it in the clipboard.

Indexing Process

The content of the resources used to search in is parsed from an index. The indexing is performed both automatically and on request. Automatic indexing is performed when you modify, add, or remove resources in the currently indexed project. If the index was never initialized, the index is not updated on project changes.

To improve performance, the indexing process skips the following set of common English words (the so-called **stop words**): *a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with*. This means that if you are searching for any of these

words, the indexing process will not be able to match any of them. However, you can configure the list of **stop words** in the **Open/Find Resource** preferences page (*on page 264*).

Caching Mechanism

When you perform a search, a caching mechanism is used to gather the paths of all files linked in the current project. When the first search is performed, all project files are indexed and added to the cache. The next search operation uses the information extracted from the cache, thus improving the processing time. The cache is kept for the currently loaded project only, so when you perform a search in a new project, the cache is rewritten. Also, the cache is reset when you click the **Reindex** button.

Important:

Files larger than 2GB are not indexed.

If there is no file found that matches your file pattern or text search, a possible cause is that the file you are searching for was added to the Oxygen XML Developer project after the last caching operation. In this case, re-indexing the project files with the **Reindex** button enables the file to be found. The date and time of the last index operation are displayed below the file list.

Opening the Results

Once you find the files that you want to open, select them in the list and click the **Open** button (or double-click them). Each of the selected files is opened in the editor associated with the type of the file (*on page 263*).

Note:

You can drag a resource from the **Open/Find Resource** view and drop it in a DocBook, DITA, TEI or XHTML document to create a link to that resource.

Resources

For more information about the **Open/Find Resource** feature and its search capabilities, watch our video demonstration:

<https://www.youtube.com/embed/PENoDNdaGao>

Related information

[Open/Find Resource Dialog Box \(on page 388\)](#)

Open/Find Resource Dialog Box

The **Open/Find Resource** dialog box offers advanced search capabilities. To open the dialog box, go to **Find > Open/Find Resource (Ctrl + Shift + R (Command + Shift + R on macOS))**. You can also click the  **Open/Find Resource** toolbar button or use the  **Search for file** action that is available in some URL input fields.

Figure 69. Open/Find Resource Dialog Box

You can use this dialog box to find a file in the current Oxygen XML Developer project by typing a few letters of the file name or a fragment of the content you are searching for. The **Open/Find Resource** dialog box also supports searching in document edits (comments, tracked change insertions/deletions, and highlighted content).

Search Results

Search results are presented instantly, after you finish typing the content. The matching fragments of text are highlighted in the results list displayed in the dialog box. When you open one of the documents from the results list, the matching fragments of text are highlighted in the editing area. To remove the highlighting from your document, close the corresponding tab in the **Results view** (on page 503) view at the bottom of the editor. To display the search history, position the cursor in the search field and press **Ctrl + DownArrow** (**Command + DownArrow on macOS**) or **Ctrl + UpArrow** (**Command + UpArrow on macOS**) on your keyboard. Pressing only the **DownArrow** key moves the selection to the list of results.

Note:

Searches are not case-sensitive. For example, if you search for `car` you get the same results as when you search for `Car`.

**Tip:**

Suffix searches are also supported, both for searching in the content of your resources and in their name. For this, you can use wildcards. If you search for `*ing` with the **in content** option selected, you will find documents that contain the word *presenting*. If you search for `*/samples/*.gif` with the **in file paths** option selected, you will find all the *gif* images from the `samples` directory.

Options Available in the Dialog Box

The **Open/Find Resource** dialog box includes the following options:

- **In file paths** (*on page 394*) - Select this option to search for resources by their name or by its path (or a fragment of its path).
- **In content** (*on page 391*) - Select this option to search through the content of your resources.
- **In reviews** (*on page 394*) - Select this option to search through the comments, *tracked change* insertions/deletions, or highlights in your resources.
- **Options** - Opens the **Open/Find Resource preferences page** (*on page 264*) where you can configure various search options. For example, you can specify a **Content language** that differs from the default UI language in case your document contains multiple languages.
- **Clear Index** - Clears the index.
- **Reindex** - Use this option to reindex your resources.

Contextual Menu Actions

A contextual menu is available on each search result and provides actions applicable to that particular document. These actions include:

- **Open** - Opens the document in one of Oxygen XML Developer internal editors.
- **Open with** - Allows you to choose to open the document in the **Internal editor** or an external **System application**.
- **Show in Explorer** - Identifies the document in the system file explorer.
- **Copy Location** - Copies the file path and places it in the clipboard.

Indexing Process

The content of the resources used to search in is parsed from an index. The indexing is performed both automatically and on request. Automatic indexing is performed when you modify, add, or remove resources in the currently indexed project. If the index was never initialized, the index is not updated on project changes.

To improve performance, the indexing process skips the following set of common English words (the so-called **stop words**): *a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with*. This means that if you are searching for any of these words, the indexing process will not be able to match any of them. However, you can configure the list of **stop words** in the **Open/Find Resource preferences page** (*on page 264*).

Caching Mechanism

When you perform a search, a caching mechanism is used to gather the paths of all files linked in the current project. When the first search is performed, all project files are indexed and added to the cache. The next search operation uses the information extracted from the cache, thus improving the processing time. The cache is kept for the currently loaded project only, so when you perform a search in a new project, the cache is rewritten. Also, the cache is reset when you click the **Reindex** button.

Important:

Files larger than 2GB are not indexed.

If there is no file found that matches your file pattern or text search, a possible cause is that the file you are searching for was added to the Oxygen XML Developer project after the last caching operation. In this case, re-indexing the project files with the **Reindex** button enables the file to be found. The date and time of the last index operation are displayed below the file list.

Opening the Results

Once you find the files that you want to open, select them in the list and click the **Open** button (or double-click them). Each of the selected files is opened in [the editor associated with the type of the file \(on page 263\)](#).

Resources

For more information about the **Open/Find Resource** feature and its search capabilities, watch our video demonstration:

<https://www.youtube.com/embed/PENoDNdaGao>

Related information

[Open/Find Resource View \(on page 385\)](#)

[Open/Find Resource Preferences Page \(on page 264\)](#)

Searching in Content

To perform a search through the content of your resources, open the **Open/Find Resource** dialog box ([on page 388](#)) (from the **Find** menu or with **Ctrl + Shift + R (Command + Shift + R on macOS)**) or the **Open/Find Resource view** ([on page 385](#)) (by default, located on the left side of the editor), select the **in content** option, and in the search field enter the terms that you want to search for.

The **Open/Find Resource** feature is powered by [Apache Lucene](#). Apache Lucene is a free open source information retrieval software library.

You can use the **Open/Find Resource** feature to either perform a simple text search or a more complex search using the [Apache Lucene - Query Parser Syntax](#).

Complex Query Patterns Using Lucene Syntax

Using the [Apache Lucene - Query Parser Syntax](#) means you can perform any of the following searches:

- **Term Searches**

Searching for plain text:

```
Garden Preparation
```

- **Element-Specific Searches**

Searching for content that belongs to a specific element:

```
title:"Garden Preparation"
```

- **Wildcard Searches**

Using wildcards to make your search more permissive:

```
Garden Prepar?tion
```

- **Fuzzy Searches**

If you are not sure of the exact form of a term that you are interested in, use the fuzzy search to find the terms that are similar to the search term. To perform a fuzzy search, use the `~` symbol after the word that you are not sure of:

```
Garden Preparing~
```

- **Proximity Searches**

Use proximity searches to find words that are within a specific distance away. To perform a proximity search, use the `~` symbol at the end of your search. For example, to search for the word **Garden** and the word **Preparation** within 6 words of each other use:

```
"Garden Preparation"~6
```

- **Range Searches**

Use range searches to match documents whose element values are between the lower and upper bound specified in the range query. For example, to find all documents whose titles are between **Iris** and **Lilac**, use:

```
title:{Iris TO Lilac}
```

The curly brackets denote an exclusive query. The results you get when using this query are all the documents whose titles are between **Iris** and **Lilac**, but not including **Iris** and **Lilac**. To create an inclusive query use square brackets:

```
title:[Iris to Lilac]
```

• Term Boosting Searches

Use term prioritising searches if the fragment of text that you are searching for contains certain words that are more important to your search than the rest of them. For example, if you are searching for **Autumn Flower**, a good idea is to prioritize the word **Autumn** since the word **Flower** occurs more often. To prioritize a word use the \wedge symbol:

```
Autumn^6 Flower
```

• Searches Using Boolean Operators

You can use the **AND**, **+**, **OR**, **-**, and **NOT** operators.

To search for documents that contain both the words **Garden** and **Preparation**, use:

```
Garden AND Preparation
```

To search for documents that must contain the word **Garden** and may contain the word **Preparation**, use:

```
+Garden Preparation
```

To search for documents that contain either the word **Garden** or the word **Preparation**, use:

```
Garden OR Preparation
```

To search for documents that contain **Garden Preparation** but not **Preparation of the Flowers**, use:

```
"Garden Preparation" - "Preparation of the Flowers"
```

• Searches Using Grouping

To search either for the word **Garden** or **Preparation**, and the word **Flowers**, use:

```
(Garden OR Preparation) AND Flowers
```

• Searches Using Element Grouping

To search for a title that contains both the word **Flowers** and the phrase **Garden Preparation**, use:

```
title:(+Flowers +"Garden Preparation")
```

• Searching for Special Characters

Sometimes you might need to search your content for special character, such as:

```
+ - && || ! ( ) { } [ ] ^ ~ * ? : \
```

In this case, you should surround your search query with quotes. For example, to search for **(Hydrogen + Oxygen)=Water**, use:

```
"(Hydrogen + Oxygen)=Water"
```

Searching in File Paths

To perform a search in the file paths of your resources, open the **Open/Find Resource** dialog box (on page 388) (from the **Find** menu or with **Ctrl + Shift + R (Command + Shift + R on macOS)**) or the **Open/Find Resource view** (on page 385) (by default, located on the left side of the editor), select the **In file paths** option, and in the search field enter the terms that you want to search for.

The **Open/Find Resource** feature allows you to search for a resource either by its name or by its path (or by a fragment of its path).

You can use wildcards when you perform such searches:

- Use "*" to match any sequence of characters.
- Use "?" to match any single character.

For example, if you search for ***-preferences-page** you will find all the resources that contain the *-preferences-page* fragment in their name. If you search for ***/samples/*.gif**, you will find all the *.gif* images from the *samples* directory.

Searching in Reviews

To perform a search in the edits of your resources, open the **Open/Find Resource** dialog box (on page 388) (from the **Find** menu or with **Ctrl + Shift + R (Command + Shift + R on macOS)**) or the **Open/Find Resource view** (on page 385) (by default, located on the left side of the editor), select the **In reviews** option, and in the search field enter the terms that you want to search for.

The following options are available:

- **Type** - Specifies whether you want to search for content in comments, tracked change insertions/deletions, or highlighted content.
- **Author** - Displays all the authors of the edits in your resources. The authors are collected when indexing. You can set a specific author for your search or search all of them.
- **Time** - Specifies the time when the edits that you are searching through were created.

Both the view and the dialog box display the edits that contain the search results and their parent topics along with a short description. To hide this description, go to **Settings** and deselect the **Show Description** option.

Find/Replace Dialog Box

To open the **Find/Replace** dialog box, use the  **Find/Replace** action that is available in the **Find** menu, on the toolbar, or by pressing **Ctrl + F (Command + F on macOS)**. It is also invoked by the **Find/Replace** contextual menu action found in certain views.

You can use the **Find/Replace** dialog box to perform the following operations:

- Replace occurrences of target defined in the **Find** area with a new fragment of text defined in **Replace with** area.
- Find all the occurrences of a word or string of characters (that can span over multiple lines) in the document you are editing. This operation also takes into account all the whitespaces contained in the fragment you are searching for. The **Find/Replace** dialog box counts the number of occurrences of the text you are searching for and displays it at the bottom of the dialog box, above the **Close** button. This number is also displayed in the **Results view** (*on page 503*) view after you click the **Find All** button.

The *find* operation works on multiple lines, meaning that a find match can cover characters on multiple lines of text. To input multiple-line text in the **Find** and **Replace with** areas, do one of the following:

- Press **Ctrl + Enter** (**Command + Enter on macOS**) on your keyboard.
- Use the **Insert newline** contextual menu action.

You can use [Perl-like regular expressions syntax](#) (*on page 409*) to define patterns. A content completion assistance window is available in the **Find** and **Replace with** areas to help you edit regular expressions. It is activated every time you type `\` (backslash key) or on-demand if you press **Ctrl + Space** on your keyboard.

The *replace* operation can bind regular expression capturing groups (`$1`, `$2`, etc.) from the find pattern.

**Tip:**

To replace the `<tag-name>` start tag and its attributes with the `<new-tag-name>` tag use as **Find** the expression `<tag-name(ls+)(.*)>` and as **Replace with** the expression `<new-tag-name$1$2>`.

Find/Replace Dialog Box

Figure 70. The Find/Replace Dialog Box

The **Find/Replace** dialog box contains the following options:

Find text area box

This is where you enter the character string to search for. You can search for Unicode characters specified in the `\uNNNN` format. Also, hexadecimal notation (`\xNNNN`) and octal notation (`\0NNNN`) can be used. In this case you have to select the **Regular expression** option (on page 398). For example, to search for a space character you can use the `\u0020` code.

You can use the  **History** button to select from a list of the most recently used expressions. Use the  **Clear history** action from the bottom of the lists to remove these expressions.

Replace with text area box

The character string with which to replace the target. The string for replace can be on a line or on multiple lines. It can contain Perl notation capturing groups, only if the search expression is a regular expression and the **Regular expression** option (on page 398) is selected.

**Note:**

Some regular expressions can indefinitely block the application. If the execution of the regular expression does not end in about 5 seconds, the application displays a dialog box that allows you to interrupt the operation.

**Tip:**

Special characters such as *newline* and *tab* can be inserted in the **Find** and **Replace with** text boxes using dedicated actions in the contextual menu (**Insert newline** and **Insert tab**).

Unicode characters in the `\uNNNN` format can also be used in the **Replace with** area.

You can use the  **History** button to select from a list of the most recently used expressions.

Use the  **Clear history** action from the bottom of the lists to remove these expressions.

XPath

The XPath 2.0 expression you input in this combo is used for restricting the search scope. The cursor position does not affect the result of the XPath evaluation. The context of the XPath expression evaluation from the **Find/Replace** dialog box is the XML document root. The XPath is used for determining the intervals to be searched from the document, so the XPath result must be a node-set.

**Tip:**

You can use the *Content Completion Assistant (on page 2267)* to help you input XPath expressions that are valid in the current context. See *Working with XPath Expressions (on page 1732)* for more information and some common examples of how to write XPath expressions.

Clicking the  **XPath Options** button opens a preferences page where you can configure some XPath-related options.

Direction

Specifies if the search direction is from current position to end of file (**Forward**) or to start of file (**Backward**).

Scope

Specifies whether the **Find/Replace** operation is executed over the entire content of the edited document (**All** option), or over the selected content/lines.

Options section**Case sensitive**

When selected, the search operation follows the exact letter case of the text entered in the **Find** field.

Incremental

The search operation is started every time you type or delete a letter in the **Find** text box.

Wrap around

When the end of the document is reached, the search operation is continued from the start of the document, until its entire content is covered.

Ignore extra whitespaces

If selected, the application normalizes the content (collapses any sequence of whitespace characters into a single space) and trims its leading and trailing whitespaces when performing the search operation. This is helpful when searching for spaced-separated words since line breaks and indentation between words will not affect the results. This option is automatically disabled if the **Regular expression** option is selected.

Whole words only

Only entire occurrences of a word are included in the search operation. This option is automatically disabled if the **Regular expression** option is selected.

Regular expression

When this option is selected, you can use regular expressions in [Perl-like regular expressions syntax \(on page 409\)](#) to look for specific pieces of text.

- **Dot matches all** - A dot used in a regular expression also matches end of line characters.
- **Canonical equivalence** - If selected, two characters will be considered a match if, and only if, their full *canonical (on page 2267)* decompositions match. For example, the ã symbol can be inserted as a single character or as two characters (the a character followed by the tilde ~ character). This option is not selected by default.

Find button

Executes a find operation for the next occurrence of the target. It stops after highlighting the find match in the editor panel.

Replace/Find button

Executes a replace operation for the target followed by a find operation for the next occurrence.

Replace button

Executes a replace operation for the target without going to the next occurrence.

Find All button

Executes a find operation and displays all results in the **Results view** (*on page 503*) view.

Replace All button

Executes a replace operation in the entire scope of the document.

Replace to End button

Executes a replace operation starting from current target until the end of the document, in the direction specified by the current selection of the **Direction** switch (**Forward** or **Backward**).

Find/Replace in Multiple Files

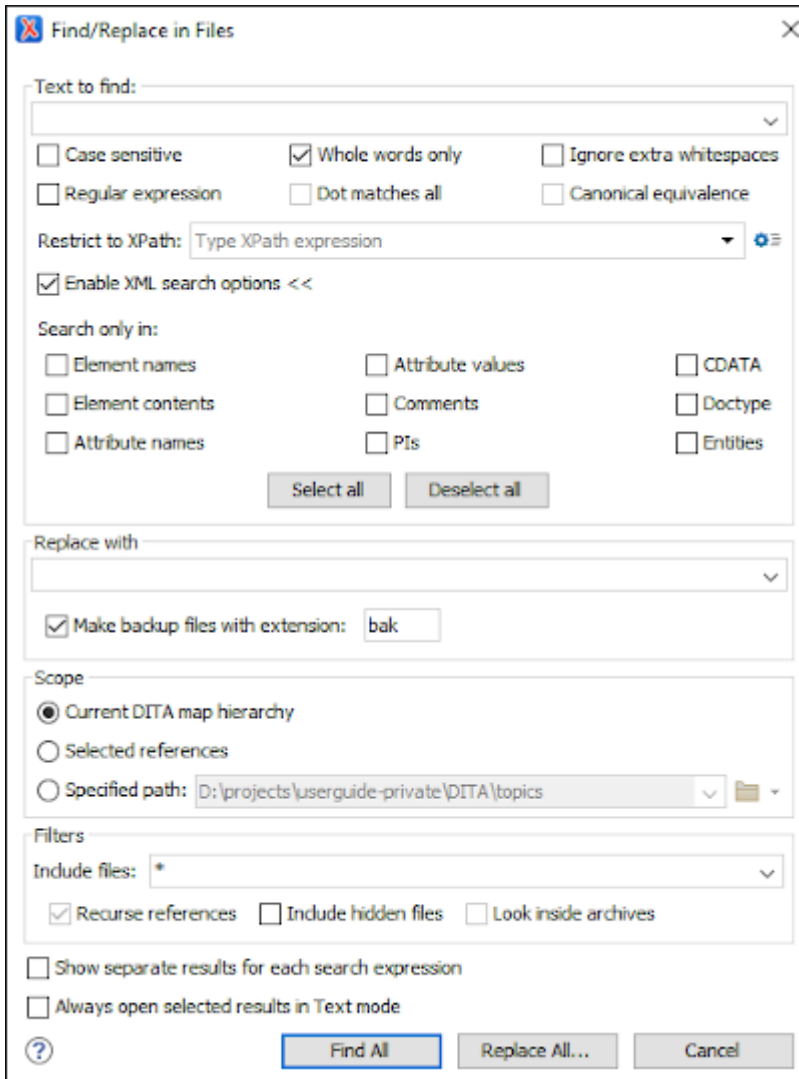

The **Find/Replace in Files** feature enables you to define *Search for* or *Search for and Replace* operations across multiple files. To open the **Find/Replace in Files** dialog box, use the  **Find/Replace in Files** action that is available in the following locations:

- The **Find** menu.
- The  **Find/Replace in Files** button on the main toolbar.
- The contextual menu of the **Project view** (*on page 365*).
- The contextual menu of the **Data Source Explorer view** (*on page 1748*) for most types of database connections.

The operation works on both local and remote files from an SFTP, WebDAV, or CMS server.

Find/Replace in Files Dialog Box

Figure 71. Find / Replace in Files Dialog Box (When Opened from the Toolbar Button)

The dialog box contains the following options:

Text to Find section

The first text field is where you enter the character string to search for. You can search for Unicode characters specified in the `\uNNNN` format. Also, hexadecimal notation (`\xNNNN`) and octal notation (`\oNNNN`) can be used. In this case you have to select the **Regular expression** option. For example, to search for a space character you can use the `\u0020` code.

The rest of the options in this section can be used to refine your search:

Case sensitive

When selected, the search operation follows the exact letter case of the value entered in the **Text to find** field.

Whole words only

Only entire occurrences of a word are included in the search operation. This option is automatically disabled if either the **Ignore extra whitespaces** or **Regular expression** options are selected.

Ignore extra whitespaces

If selected, the application normalizes the content (collapses any sequence of whitespace characters into a single space) and trims its leading and trailing whitespaces when performing the search operation. This is helpful when searching for spaced-separated words since line breaks and indentation between words will not affect the results. This option is automatically disabled if the **Regular expression** option is selected.

Regular expression

When this option is selected, you can use regular expressions in [Perl-like regular expressions syntax \(on page 409\)](#) to look for specific pieces of text.

- **Dot matches all** - A dot used in a regular expression also matches end of line characters.
- **Canonical equivalence** - If selected, two characters will be considered a match if, and only if, their full [canonical \(on page 2267\)](#) decompositions match. For example, the ã symbol can be inserted as a single character or as two characters (the a character followed by the tilde ~ character). This option is not selected by default.

Restrict to XPath

The XPath 2.0 expression you input in this combo is used for restricting the search scope. The XPath is used for determining the intervals to be searched from the document, so the XPath result must be a node-set.

Example: Use the XPath filter expression `//*[not(local-name() = 'uicontrol')]` to skip over the contents of any `<uicontrol>` element.

Tip:

You can use the [Content Completion Assistant \(on page 2267\)](#) to help you input XPath expressions that are valid in the current context. See [Working with XPath Expressions \(on page 1732\)](#) for more information and some common examples of how to write XPath expressions.

Clicking the  **XPath Options** button opens a preferences page where you can configure some XPath-related options.

Enable XML search options

This option is only available when editing in **Text** mode. It provides access to a set of options that allow you to search specific XML component types:

- **Element names** - Only the element names are included in the search operation that ignores XML-tag notations ('<', '/', '>'), attributes or white-spaces.
- **Element contents** - Search in the text content of XML elements.
- **Attribute names** - Only the attribute names are included in the search operation, without the leading or trailing white-spaces.
- **Attribute values** - Only the attribute values are included in the search operation, without single quotes(') or double quotes(").
- **Comments** - Only the content of comments is included in the search operation, excluding the XML comment delimiters ('<!--', '-->').
- **PIs (Processing Instructions)** - Only the content is searched, skipping '<?...?>' (for example, `<?processing instruction?>`).
- **CDATA** - Searches inside content of CDATA sections.
- **DOCTYPE** - Searches inside content of DOCTYPE sections.
- **Entities** - Only the entity names are searched.

The two buttons **Select All** and **Deselect All** allow a simple activation and deactivation of all types of XML components.

Note:

Even if you select all options of the **Enable XML search options** section, the search is still XML-aware. If you want to perform the search over the entire file content, deselect **Enable XML search options**.

Replace with section

Use the text field in this section to specify a character string to replace the target with. It may contain regular expression group markers if the search expression is a regular expression and the **Regular expression** checkbox is selected.

Tip:

If you want to change the XML structure, you could use the [built-in XML refactoring operations \(on page 611\)](#). You can even [customize your own refactoring operations \(on page 623\)](#).

Make backup files with extension

In the replace process Oxygen XML Developer makes backup files of the modified files. The default extension is `.bak`, but you can change the extension as you prefer.

Scope section

The options available in this section depend on the context (how the dialog box was opened). Select one of the listed options to specify the scope for the operation. The possible options include:

Selected project resources

Searches only in the selected files.

Project files

Searches in all files from the current project.

All opened files

Searches in all files opened in Oxygen XML Developer. You are prompted to save all modified files before any operation is performed.

Current file directory

The search is done in the directory of the file opened in the current editor panel. If there is no open file, this option is not available.

Opened archive (only available if opened from the Archive Browser view)

The search is done in an archive opened in the [Archive Browser \(on page 1741\)](#) view.

Specified path

Use this option to specify the search path.

Filters section

The options available in this section depend on the context (how the dialog box was opened) and they can be used to filter the search operation. The possible options include:

Include files

Narrows the scope of the operation only to the files that match the given filters. For example, you can choose to filter the search to only include files with a certain file extension (such as `*.xml`).

Recurse subdirectories

When selected, the search is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to **All opened files**.

Include hidden files

When selected, the search is also performed in the hidden files.

Include archives

When selected, the search is also done in all individual file entries from all supported ZIP-type archives.

Show separate results for each search expression

When selected, the application opens a new tab to display the result of each new search expression. When the option is unchecked, the search results are displayed in the *Find in Files* tab, replacing any previous search results.

Always open selected results in Text mode

If selected, double-clicking results will always open the documents in **Text** mode (even if the particular document type is set to open in **Author** mode, by default). If not selected (default state), double-clicking results will open the documents in whatever editing mode is specified as the default for that document type. For example, by default, DITA documents will open in **Author** mode (as specified in the default framework configuration for DITA document types). Specialized XML documents such as XSLT or XML Schema will continue being opened in the **Text** editing mode.

Find All

Use the **Find All** button to execute the search operation. The results are displayed in a view that allows grouping the results as a tree with two levels.

Replace All

Use the **Replace All** button to execute the search operation and replace all occurrences with the specified string. When you replace a fragment of text, Oxygen XML Developer offers an option to preview of the changes you make. The **Preview** dialog box is divided in two sections. The first section presents a list of all the documents containing the fragment of text you want to modify. The second section offers a view of the original file and a view of the final result. It also allows you to highlight all changes using the vertical bar from the right side of the view. The **Next change** and **Previous change** buttons allow you to navigate through the changes displayed in the **Preview** dialog box.

CAUTION:

Use the **Replace All** option with caution. Global searches may result in matching strings being replaced in instances that were not originally intended.

Note:

- You can use [Perl-like regular expression syntax \(on page 409\)](#) to match patterns in text content. The *replace* operation can bind regular expression capturing groups (\$1, \$2, etc.) from the find pattern.
- Exclusion patterns are accepted. For example, `*.java, !*Test.java` would search for all files with a `.java` extension, with the exception of any file whose name ends in `Test`.
- To replace the `<tag-name>` start tag and its attributes with the `<new-tag-name>` tag use as **Text to find** the expression `<tag-name(ls+)(.*)>` and as **Replace with** the expression `<new-tag-name $1$2>`.

- The encoding used to read and write the files is detected from the XML header or from the BOM. If a file does not have an XML header or BOM Oxygen XML Developer uses by default the UTF-8 encoding for files of type XML, that is for files with one of the extensions: `.xml`, `.xsl`, `.fo`, `.xsd`, `.rng`, `.nvd1`, `.sch`, `.wsdl` or an extension associated with the XML editor type (on page 263). For the other files it uses the encoding configured for non-XML files (on page 158).
- You can cancel a long operation at any time by pressing the **Cancel** button of the progress dialog box or in the status bar, but doing so will not revert any replacements that have been processed up to that point.
- Since the content of read-only files cannot be modified, the **Replace** operation does not process those files. For every such file, a warning message is displayed in the message panel.

[Custom Refactoring Operations \(on page 623\)](#)

Find All Elements Dialog Box

To open the **Find All Elements** dialog box, go to **Find > Find All Elements** (**Ctrl + Shift + E** (**Command + Shift + E on macOS**)) or from the shortcut **Find All Elements** that is available in the **Find / Replace** dialog box (on page 394). It assists you in defining XML element / attribute search operations in the current document.

Figure 72. Find All Elements Dialog Box

The dialog box can perform the following actions:

- Find all the elements with a specified name.
- Find all the elements that contain, or does not contain, a specified string in their text content.
- Find all the elements that have a specified attribute.
- Find all the elements that have an attribute with, or without, a specified value.

You can combine all of these search criteria to filter your results.

The following fields are available in the dialog box:

- **Element name** - The qualified name of the target element to search for. You can use the drop-down menu to find an element or enter it manually. It is populated with valid element names collected from the associated schema. To specify *any* element name, leave the field empty.

Note:

Use the qualified name of the element (`<namespace prefix>:<element name>`) when the document uses this element notation.

- **Element text** - The target element text to search for. The drop-down menu beside this field allows you to specify whether you are looking for an exact or partial match of the element text. For *any* element text, select **contains** from the drop-down menu and leave the field empty. If you leave the field empty but select **equals** from the drop-down menu, only elements with no text will be found. Select **not contains** to find all elements that do not include the specified text.
- **Attribute name** - The name of the attribute that must be present in the element. You can use the drop-down menu to select an attribute or enter it manually. It is populated with valid attribute names collected from the associated schema. For *any* or no attribute name, leave the field empty.

Note:

Use the qualified name of the attribute (`<namespace prefix>:<attribute name>`) when the document uses this attribute notation.

- **Attribute value** - The drop-down menu beside this field allows you to specify that you are looking for an exact or partial match of the attribute value. For *any* or no attribute value, select **contains** from the drop-down menu and leave the field empty. If you leave the field empty but select **equals** from the drop-down menu, only elements that have at least an attribute with an empty value will be found. Select **not contains** to find all elements that have attributes without a specified value.
- **Case sensitive** - When this option is selected, operations are case-sensitive.

When you select **Find All**, Oxygen XML Developer tries to find the items that match all the search parameters. The results of the operation are presented as a list in the message panel.

Find and Invoke Actions

Oxygen XML Developer includes a **Find action** feature that provides a quick way to find actions that are available throughout the application. You can also assign shortcuts for particular actions and invoke actions using this feature.

The **Find action** operation is available in the **Find** or **Help** menus and it opens a pop-up window where all the actions are presented in a sortable, filterable table.

Figure 73. Find Action Pop-Up Window

This pop-up window includes the following features, options, and controls:

Search Field

You can use the search field at the top to search for a specific action and it includes a history drop-down menu for quickly performing recently-used search criteria. You can use the **X Delete** button to the right of the search field to clear the current text from the search field. You can also search for actions using certain keyboard shortcuts (excluding the common editing commands such as **Delete**, **Home**, **End**, **Delete**, **Ctrl+A**, **Ctrl+C**, **Ctrl+V**, etc.)

Filtering Options

All actions

Filters the table to display all available actions.

Actions in editing context

Filters the table to display available actions based on the current editing context where the application is focused (for example, if the current focus is a particular side-view, the table displays actions that are available in that side-view).

Disabled actions

Filters the table to also display actions that are currently disabled.

Double-Click

You can double-click an action in the table (or select an action and press **Enter**) to execute the particular action. Some actions will not have an effect if they are not allowed in the current editing context.

Accessibility Shortcuts

The following keyboard shortcuts can be used to enjoy this feature using only a keyboard:

- **Ctrl + Alt + K** - Opens the **Find action** pop-up window feature.
- **Up arrow / Down arrow** - Navigates the table vertically and switches from the search field to the table, and vice versa.
- **Tab / Shift + Tab** - Navigates between the radio filtering options and the checkbox option.
- **Left arrow / Right arrow** - Toggles the selection for the radio filtering options.
- **Space** - Toggles the checkbox option.
- **Enter** - Executes the selected action.
- **Ctrl + Enter** - Opens a dialog box where you can assign a keyboard shortcut for the selected action.
- **Ctrl + Up arrow / Ctrl + Down arrow** - Accesses the history drop-down when the search field is in focus.
- **Esc** - Closes the **Find action** pop-up window feature.

Actions Table

Displays the available actions based on the selected filtering options or search criteria. Some actions might be disabled/deactivated depending on the current editing context. When the **Disabled action** filtering option is selected, the disabled actions are displayed at the end of the results in the table.

Note:

It is possible for certain actions not to be displayed in the actions table if they are created and implemented in other ways (for example, if they are implemented only to be available in a contextual menu).

Quick Find Toolbar

A reduced version of the **Find / Replace dialog box** ([on page 394](#)) is available as a **dockable toolbar** ([on page 322](#)). To display it, press the **Alt + Shift + F (Command + Option + F on macOS)** key combination or select the **Find > Quick Find** action. By default, the toolbar is displayed at the bottom of the Oxygen XML Developer window, above the status bar, but can be changed at any time by dragging (and docking) it to a different location. To hide the toolbar, use the **Close** button.

All matches are highlighted in the current editor.

Figure 74. Quick Find Toolbar

The toolbar offers the following controls:

- **Search input box** - This is where you can insert the text you want to search for. The input box keeps a history of the last used search text. The background color of the input box turns red when no match is found.
- **Next** - Advances to the next match. You can also use the **Enter** key to jump forward to the next match.

- **Previous** - Jumps to the previous match. You can also use **Shift+Enter** to jump backward to the previous match.
- **All** - Highlights all matches of the search string in the current document.
- **Incremental** - If selected, the search operation is started every time you type or delete a character in the search input box.
- **Case sensitive** - If selected, the search operation follows the exact letter case of the search text.
-  **Find/Replace** - Opens the **Find/Replace** dialog box (on page 394).
-  **Find/Replace in Files** - Opens the **Find/Replace in Files** dialog box (on page 399).
- **Close** - Closes the **Quick Find** toolbar.

Keyboard Shortcuts for Finding the Next and Previous Match

Navigating from one match to the next or previous one is very easy to perform using the **F3** and **Shift + F3** (**Command + Shift + G on macOS**) keyboard shortcuts. They are useful for quickly repeating the last find action performed in the **Find / Replace dialog box** (on page 394), taking into account the same find options.

Restriction:

These shortcuts only take XPath expressions into account if the **Find / Replace** dialog box remains opened. Once you close it, the XPath expressions are no longer considered.

Regular Expressions Syntax

Oxygen XML Developer uses the [Java regular expression syntax](#). It is **similar** to that used in Perl 5, with several exceptions. Thus, Oxygen XML Developer does not support the following constructs:

- The conditional constructs `(?{X})` and `(?(condition)X|Y)`.
- The embedded code constructs `(?{code})` and `(??{code})`.
- The embedded comment syntax `(?#comment)`.
- The preprocessing operations `\l`, `\u`, `\L`, and `\U`.

When using regular expressions, note that some sets of characters from [XPath/XML Schema/Schematron](#) are slightly different than the ones used by Oxygen XML Developer/Java in the text searches from the **Find/Replace dialog box** (on page 394) and **Find/Replace in Files dialog box** (on page 399). The most common example is with the `\w` and `\W` set of characters. To ensure consistent results between the two, it is recommended that you use the following constructs in the **Find/Replace dialog box** (on page 394) and **Find/Replace in Files dialog box** (on page 399):

- `/w` - `[#x0000-#x10FFFF]-[\p{P}\p{Z}\p{C}]` instead of `\w`
- `/W` - `[\p{P}\p{Z}\p{C}]` instead of `\W`

There are some other notable differences that may cause unexpected results, including the following:

- In Perl, the `^` character matches at the beginning of the string, while in Java, it matches the beginning of a line.
- In Perl, the `$` character matches at the end of the string, while in Java, it matches the end of a line.
- In Perl, `\1` through `\9` are always interpreted as back references. A backslash-escaped number greater than 9 is treated as a back reference if at least that many sub-expressions exist. Otherwise, it is interpreted, if possible, as an octal escape. In this class octal escapes must always begin with a zero. In Java, `\1` through `\9` are always interpreted as back references, and a larger number is accepted as a back reference if at least that many sub-expressions exist at that point in the regular expression. Otherwise, the parser will drop digits until the number is smaller or equal to the existing number of groups or it is one digit.
- Perl uses the `g` flag to request a match that resumes where the last match left off.
- In Perl, embedded flags at the top level of an expression affect the whole expression. In Java, embedded flags always take effect at the point where they appear, whether they are at the top level or within a group. In the latter case, flags are restored at the end of the group just as in Perl.
- Perl is forgiving about malformed matching constructs, as in the expression `*a`, as well as dangling brackets, as in the expression `abc]`, and treats them as literals. This class also accepts dangling brackets but is strict about dangling meta-characters such as `+`, `?` and `*`.

Spell Checking

Oxygen XML Developer includes an [automatic \(as-you-type\) spell checking feature \(on page 419\)](#), as well as a manual spell checking action to open a **Spelling** dialog box that offers a variety of options.

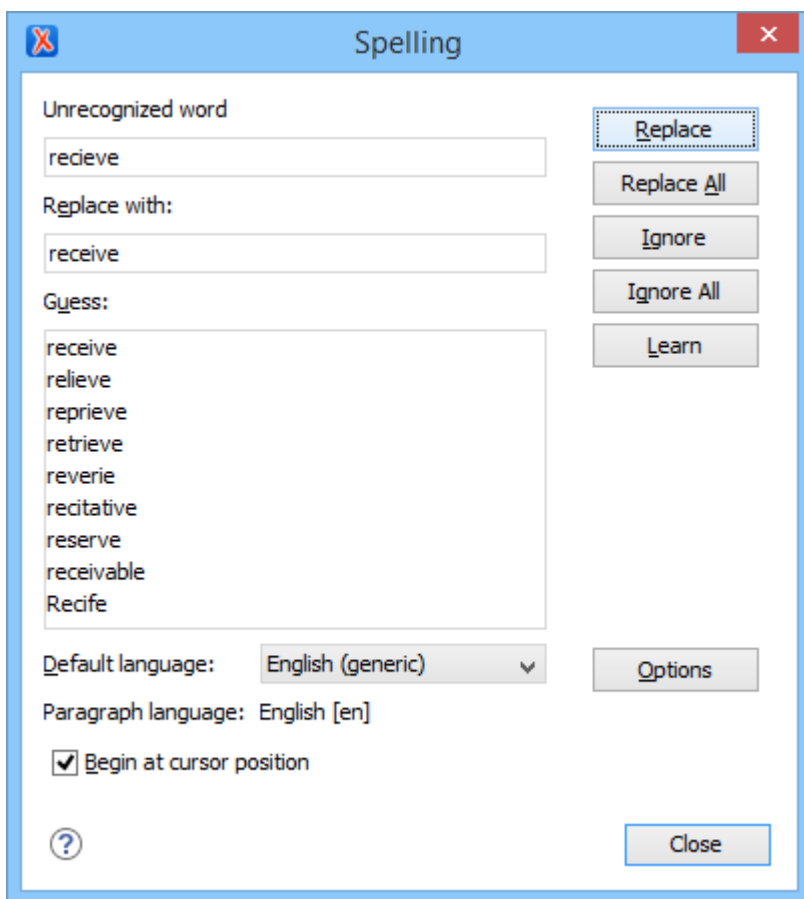

To manually check spelling in the current document, use the  **Check Spelling** action on the toolbar or from the **Edit** menu.

Figure 75. Check Spelling Dialog Box

The **Spelling** dialog box contains the following:

Unrecognized word

Displays the word that cannot be found in the selected dictionary. The word is also highlighted in the XML document.

Replace with

The character string that will replace the misspelled word.

Guess

Displays a list of suggested words to replace the unknown word. Double-click a word to automatically insert it in the document and resume the spell checking process.

Default language

Allows you to select the default language dictionary used by the spelling engine.

Paragraph language

In an XML document, you can mix content written in multiple languages. You can set the language code in the `@lang` or `@xml:lang` attribute for any particular section and Oxygen XML Developer will automatically instruct the spell checker engine to apply the appropriate language dictionary for that section.

Begin at cursor position

Instructs the spell checker to begin checking the document starting from the current cursor position.

Action Buttons

Replace

Use this button to replace the unrecognized word with the selected word from the **Replace with** field.

Replace All

Use this button to replace all occurrences of the unrecognized word with the selected word from the **Replace with** field, starting from the cursor's position to the end of the document.

Note:

This action is case-sensitive.

Ignore

Ignores the first occurrence of the unrecognized word and allows you to continue checking the document. Oxygen XML Developer skips the content of the XML elements [marked to be ignored \(on page 419\)](#).

Ignore All

Ignores all instances of the unrecognized word in the current document.

Learn

Adds the unrecognized word to the list of valid words.

Options

Opens the [Spell Check preferences page \(on page 198\)](#) where you can configure various options regarding the feature.

Spell Check Dictionaries and Term Lists

Oxygen XML Developer uses the **Hunspell** engine for the spell checking feature. The Hunspell spell checking engine is open source and has an LGPL license. It is designed for languages with rich morphology and complex compounding or character encoding. Each language-country variant combination have their own specific dictionaries. Oxygen XML Developer includes the following built-in dictionaries for the spell checker:

- English (US) [en_US]
- English (UK) [en_GB]
- French [fr]
- German [de_DE]
- Spanish [es_ES]

Other Hunspell Dictionaries

You can also download Hunspell dictionaries for other languages and add them to the Oxygen XML Developer spell checker. An example of a website that includes numerous dictionary files is: <http://extensions.services.openoffice.org/dictionary>.

If you cannot find a Hunspell dictionary that is already built for your language, you can build the dictionary you need. To build a full Hunspell dictionary, follow [these instructions](#) and then add the dictionary to the Oxygen XML Developer spell checker by following [this procedure \(on page 414\)](#).

Personalized Term Lists

Authoring in certain areas of expertise (for example, the pharmaceutical or automobile industries) might require the use of specific terms that are not part of the standard spell checker dictionary. To avoid marking these terms as errors, Oxygen XML Developer provides a way of [adding personalized term lists \(on page 416\)](#) to the spell check engine. This involves creating a term list file that the spell checker will recognize and it is similar to the file Oxygen XML Developer uses for storing [learned words \(on page 418\)](#).

The term list files are specific for each language and can be specific to each domain or area of expertise (for example, *legal*, *medical*, *automotive*). They can also be used to control forbidden words.

Related information

[Adding Custom Spell Check Dictionaries \(on page 414\)](#)

[Adding Custom Spell Check Term Lists \(on page 416\)](#)

[Building and Testing Hunspell Dictionaries](#)

Adding Custom Dictionaries and Term Lists

The Oxygen XML Developer spell checker allows you to add customized Hunspell dictionaries and personalized term lists. The Hunspell dictionary mechanism requires a dictionary file (with a `.dic` file extension) and an affix file (with the `.aff` file extension). The personalized term lists are custom files (with the `.tdi` file extension) that you can create to include specialized terms or specify forbidden words in the Oxygen XML Developer spell checker.

You can [add dictionaries \(on page 414\)](#) and [personalized term lists \(on page 416\)](#) to the default folder where they are stored or specify your own custom locations. You can view the default storage location in the [Spell Check Dictionaries preferences page \(on page 200\)](#) and the [Include dictionaries and term list from option \(on page 200\)](#) allows you to choose a custom storage location. All the dictionaries and term lists for a particular language that are found in either location are merged and used by the spell checker in Oxygen XML Developer.

Related information

[Replacing a Spell Check Dictionary \(on page 417\)](#)

[Editing the Spell Checking Dictionaries](#)

Adding Custom Spell Check Dictionaries

There are three possible scenarios for adding Hunspell dictionaries to the Oxygen XML Developer spell checker:

- You can download a pre-built Hunspell dictionary and add it to the spell checking mechanism.
- You can create a custom Hunspell dictionary file that defines your own list of words and add it to the spell checking mechanism.
- You can build your own full Hunspell dictionary and add it to the spell checking mechanism.

Download and Add a Pre-Built Hunspell Dictionary

To add a downloaded pre-built dictionary, follow these steps:

1. Download the files needed for your dictionary. You will need a *dictionary* file (with a `.dic` file extension) and an *affix* file (with the `.aff` file extension). If the dictionary does not include an affix file (`.aff`), you can create one and leave it empty, but it is needed for the mechanism to work properly. An example of a website that includes numerous dictionary files is: <http://extensions.services.openoffice.org/dictionary>.

Important:

The name of the files should begin with a two letter prefix for the language code, followed by an underscore or hyphen, then two letters that indicate the country code, followed by another underscore or hyphen, and then a descriptive name (for example, `en_US_medical.dic` for a medical dictionary in the US version of the English language, or for a less specific English medical dictionary, you could omit the country code like this: `en_medical.dic`). For a list of language codes, see https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes.

2. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Editor > Spell Check > Dictionaries** (on page 200).
3. Choose one of the following two options for adding the downloaded files.
 - a. Copy both files (`.dic` and `.aff`) to the default directory displayed in the **Dictionaries and term lists default folder** option (on page 200).
 - b. Copy both files (`.dic` and `.aff`) to any other directory, select the **Include dictionaries and term list from** option (on page 200), and select that directory. If you choose this option, make sure you read [this important note](#) (on page 201).
4. Restart the application for the spell checker to start using the new dictionary.

Create a Custom Hunspell Dictionary that Defines a List of Words

To create a custom Hunspell dictionary that defines your own list of words, follow these steps:

1. Create a *dictionary* file (with a `.dic` file extension) and an *affix* file (with the `.aff` file extension). The affix file (`.aff`) can be left empty, but it is needed for the mechanism to work properly.

Important:

The name of the files should begin with a two letter prefix for the language code, followed by an underscore or hyphen, then two letters that indicate the country code, followed by another underscore or hyphen, and then a descriptive name (for example, `en_US_medical.dic` for a medical dictionary in the US version of the English language, or for a less specific English medical dictionary, you could omit the country code like this: `en_medical.dic`). For a list of language codes, see https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes.

2. In the dictionary file (`.dic` extension), add the words you want to be included in your custom dictionary. Add one word per row and the first line needs to contain the number of words, as in the following example:

```
2
parabola
asimptotic
```

Tip:

Words stored in dictionaries are not handled as case-sensitive. Therefore, you do not need to include both uppercase and lowercase versions of the words.

Note:

If you save the `.dic` file using UTF-8 encoding, then the corresponding `.aff` file should specify the encoding as a property inside it (if you do not specify the encoding, the default platform encoding will be used):

```
SET UTF-8
```

3. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Editor > Spell Check > Dictionaries** (on page 200).
4. Choose one of the following two options for saving the files.
 - a. Save both files (`.dic` and `.aff`) to the default directory displayed in the **Dictionaries and term lists default folder** option (on page 200).
 - b. Save both files (`.dic` and `.aff`) to any other directory, select the **Include dictionaries and term list from** option (on page 200), and select that directory. If you choose this option, make sure you read [this important note](#) (on page 201).
5. Restart the application for the spell checker to start using the new dictionary.

Build and Add a Full Hunspell Dictionary

To build and add a full Hunspell dictionary, follow these steps:

1. Create your Hunspell dictionary. For more information on how to do this, see: [Editing the Spell Checking Dictionaries](#).

Step Result: You should end up with a *dictionary* file (with a `.dic` file extension) and an *affix* file (with an `.aff` file extension). The affix file (`.aff`) can be empty, but it is needed for the mechanism to work properly.

Important:

The name of the files should begin with a two letter prefix for the language code, followed by an underscore or hyphen, then two letters that indicate the country code, followed by another underscore or hyphen, and then a descriptive name (for example, `en_US_medical.dic` for a medical dictionary in the US version of the English language, or for a less specific English medical dictionary, you could omit the country code like this: `en_medical.dic`). For a list of language codes, see https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes.

2. Open the **Preferences** dialog box (**Options > Preferences**) (*on page 114*) and go to **Editor > Spell Check > Dictionaries** (*on page 200*).
3. Choose one of the following two options for saving the files.
 - a. Save both files (`.dic` and `.aff`) to the default directory displayed in the **Dictionaries and term lists default folder** option (*on page 200*).
 - b. Save both files (`.dic` and `.aff`) to any other directory, select the **Include dictionaries and term list from** option (*on page 200*), and select that directory. If you choose this option, make sure you read [this important note](#) (*on page 201*).
4. Restart the application for the spell checker to start using the new dictionary.

Related information

[Adding Custom Spell Check Term Lists](#) (*on page 416*)

[Editing the Spell Checking Dictionaries](#)

Adding Custom Spell Check Term Lists

You can create personalized term lists that are used to store specialized terms or control forbidden words. They can then be added to one of the directories that store the spell check dictionaries, and the spell checker will merge them with all the dictionaries and other term lists for a particular language.

Create and Add Personalized Term Lists

To create and add a personalized term list, follow these steps:

1. Create a *term list* file (with the `.tdi` file extension). The name of the file must begin with a two letter prefix that indicates the language it should be attached to, followed by an underscore or hyphen, and then a descriptive name (for example, `en_US_myterms.tdi` for term list in the US version of the English language or `en_myterms.tdi` for a less specific English term list). For a list of language codes, see https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes.

- In the term list file (`.tdi` extension), add the terms you want to be included in your custom dictionary. If you need to specify forbidden terms, those words simply need to be preceded by an asterisk. Add one word per row, as in the following example:

```
parabola
asimptotic
*hyperbola
```

Note:

Words stored in term lists are not handled as case-sensitive. Therefore, you do not need to include both uppercase and lowercase versions of the words.

- Open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Editor > Spell Check > Dictionaries** (on page 200).
- Choose one of the following two options for saving the file.
 - Save the file (`.tdi`) to the default directory displayed in the **Dictionaries and term lists default folder** option (on page 200).
 - Save the file (`.tdi`) to any other directory, select the **Include dictionaries and term list from** option (on page 200), and select that directory. If you choose this option, make sure you read [this important note](#) (on page 201).
- Restart the application for the spell checker to start using the new term list.

Related information

[Adding Custom Spell Check Dictionaries](#) (on page 414)

Replacing a Spell Check Dictionary

There are several possible scenarios for replacing an existing Hunspell dictionary for the Oxygen XML Developer spell checker:

- You can download a pre-built Hunspell dictionary and replace an existing dictionary with it.
- You can build your own full Hunspell dictionary and replace an existing dictionary with it.

Download a Pre-Built Hunspell Dictionary and Replace an Existing One

To replace an existing dictionary with a downloaded pre-built dictionary, follow these steps:

- Download the files needed for your dictionary. You will need a *dictionary* file (with a `.dic` file extension) and an *affix* file (with the `.aff` file extension). If the dictionary does not include an affix file (`.aff`), you can create one and leave it empty, but it is needed for the mechanism to work properly. An example of a website that includes numerous dictionary files is: <http://extensions.services.openoffice.org/dictionary>.
- Open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Editor > Spell Check > Dictionaries** (on page 200).
- Choose one of the following two options to replace existing files.

- a. Replace the existing files (`.dic` and `.aff`) for the particular language in the default directory displayed in the **Dictionaries and term lists default folder** option (on page 200). Leave the **Include dictionaries and term list from** option deselected.
- b. Replace existing files (`.dic` and `.aff`) for the particular language in a directory specified in the **Include dictionaries and term list from** option (on page 200). If you choose this option, make sure you read [this important note](#) (on page 201).

Important:

Do not alter the naming convention. The name of the files must begin with a two letter prefix that indicates the language it should be attached to (for example, `en_US.dic` for a US English dictionary or `en.dic` for a less specific English dictionary). For a list of language codes, see https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes.

4. Restart the application for the spell checker to start using the new dictionary.

Build a Full Hunspell Dictionary and Replace an Existing One

To replace an existing dictionary with a full Hunspell dictionary that you build, follow these steps:

1. Follow these instructions: [Building and Testing Hunspell Dictionaries](#).

Step Result: You should end up with a *dictionary* file (with a `.dic` file extension) and an *affix* file (with the `.aff` file extension). The affix file (`.aff`) can be empty, but it is needed for the mechanism to work properly.

2. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Editor > Spell Check > Dictionaries** (on page 200).
3. Choose one of the following two options to replace existing files.
 - a. Replace the existing files (`.dic` and `.aff`) for the particular language in the default directory displayed in the **Dictionaries and term lists default folder** option (on page 200). Leave the **Include dictionaries and term list from** option deselected.
 - b. Replace existing files (`.dic` and `.aff`) for the particular language in a directory specified in the **Include dictionaries and term list from** option (on page 200). If you choose this option, make sure you read [this important note](#) (on page 201).
4. Restart the application for the spell checker to start using the new dictionary.

Related information

[Adding Custom Dictionaries and Term Lists](#) (on page 413)

Learned Words

Spell checker engines rely on dictionaries to decide if a word is spelled correctly. To instruct the spell checker engine that an unknown word is actually correctly spelled, you need to add that word to a list of learned words. There are two ways to do this:

- Invoke the contextual menu on an unknown word, then select **Learn word**.
- Click the **Learn** button from the **Spelling** dialog box (*on page 410*) that is invoked by using the  **Check Spelling** action on the toolbar.

**Note:**

To delete items from the list of learned words, use the **Delete learned words** option in the **Editor > Spell Check > Dictionaries** preferences page (*on page 200*).

Related information

[Adding Custom Spell Check Term Lists](#) (*on page 416*)

Ignored Words (Elements)

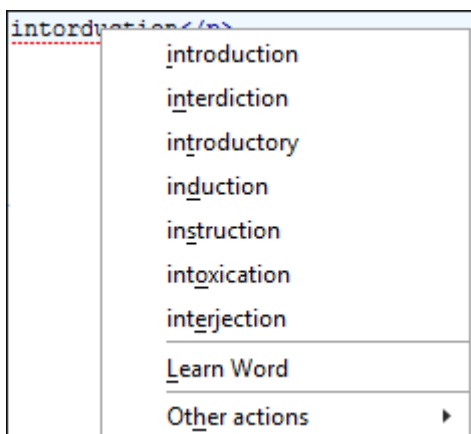

You may want the content of certain XML elements to always be skipped during the spell check process (for example, `<programlisting>`, `<codeblock>`, `<codeph>`, `<filepath>`, or `<screen>`). This can be done in one of several ways:

- You can skip through them manually, word by word, using the **Ignore** button in the **Spelling** dialog box (*on page 410*) that is invoked by using the  **Check Spelling** action on the toolbar.
- You can automatically skip the content of certain elements by maintaining a set of known element names that should never be checked. You can manage this set of element names by using the **Ignore elements** section (*on page 200*) in the **Spell Check** preferences page.

Automatic Spell Check

Oxygen XML Developer includes an option to automatically check the spelling as you type. This feature is disabled by default, but it can be enabled and configured in the **Spell Check preferences page** (*on page 198*). When the **Automatic Spell Check option** (*on page 198*) is selected, unknown words are underlined and some actions are available in the contextual menu to help you correct the word or prevent the word from being reported in the future.

Figure 76. Automatic Spell Checking in Text Mode

The contextual menu includes the following actions:

Delete Repeated Word

Allows you to delete words that were repeated in consecutive order.

List of Suggestions

A list of words suggested by the spell checking engine as possible replacements for the unknown word.

Learn Word

Allows you to add the current unknown word to the persistent dictionary of [learned words \(on page 418\)](#).

Other actions

This submenu give you access to all the usual contextual menu actions.

Related information

[Learned Words \(on page 418\)](#)

Spell Check Multiple Files

The  **Check Spelling in Files** action allows you to check the spelling on multiple local or remote documents. This action is available in the following locations:

- The **Edit** menu.
- The contextual menu of the **Project view (on page 365)**.

This action opens the **Check Spelling in Files** dialog box that allows you to define the scope and several other options. After you configure the settings for the operation, click the **Check All** button to check the spelling in all specified files. The spelling corrections are displayed in the **Results view (on page 503)** view at the bottom of the editor and you can group the reported errors as a tree with two levels.

Tip:

If you want to instruct the spell checking engine to not report a particular word as being a spelling error in the future, use the **Learn Word(s)** action from the contextual menu in the **Results** view.

Figure 77. Check Spelling in Files Dialog Box (Invoked from Project View)

The following scopes are possible, depending on where the action was invoked:

- **All opened files** - The spell check is performed in all open files.
- **Current file directory** - All the files in the folder of the currently edited file.
- **Current DITA map hierarchy** - Option available when the dialog is invoked from the **DITA Maps Manager** view. Checks the spelling in all references contained in the DITA map.
- **Project** - All files from the current project.
- **Selected project resources** - The selected files from the current project.
- **Specified path** - Checks the spelling in the files located at a path that you specify.

The **Options** section includes the following options:

- **File filter** - Allows you to filter the files from the selected scope.
- **Recurse subdirectories** - When selected, the spell check is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to **All opened files**.
- **Include hidden files** - When selected, the spell check is also performed in the hidden files.
- **Spell Check Options** - The spell check processor uses the options available in the [Spell Check preferences page \(on page 198\)](#).

Working with Special Characters and Encoding

While regular characters make up the English and European alphabets and the corresponding basic set of figures and symbols, there are many other *special characters* that belong to various other language representations, such as Arabic, Indian, Japanese, Chinese, or Korean. Oxygen XML Developer provides support for special characters in various ways:

Opening and Saving Documents

The [Unicode standard](#) provides support for all the character symbols in all known languages and Oxygen XML Developer [provides support for all Unicode characters \(on page 422\)](#). There are various encoding options and features to help determine how to handle [documents with unsupported characters \(on page 423\)](#).

Fonts

Oxygen XML Developer provides the ability to [choose the fonts to be used in the various editing modes \(on page 123\)](#). In some cases, changing the font may be a solution when special characters are not rendered as expected.

For special characters that are not included in any of the default fonts, Oxygen XML Developer tries to find that symbol in a [fallback font \(on page 424\)](#).

Tip:

For documents written in languages that use special characters (such as Japanese or Chinese), change the font to one that supports the specific characters (a Unicode font). For the Windows platform, *Arial Unicode MS* or *MS Gothic* is recommended. To change the font in Oxygen XML Developer, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#), go to **Appearance > Fonts**. You can select a font for each editing mode in this preferences page.

Navigation and Layout

Oxygen XML Developer supports bidirectional text, such as Arabic, Hebrew, and certain Asian languages, or other special characters that are combined into a single glyph. In **Text** mode, you can enable or disable the support for special characters. See [Special Character Support in Text Mode \(on page 518\)](#) for details about which option to choose.

Editing

Oxygen XML Developer includes a contextual menu action that [converts a sequence of hexadecimal characters to the corresponding Unicode character \(on page 523\)](#).

If you do not have a special way of inserting special characters using your keyboard, you can [insert special characters using the Character Map feature \(on page 425\)](#).

Unicode Support

Unicode is a standard for providing consistent encoding, representation, and handling of text. There is a unique Unicode number for every character, independent of the platform and language. Unicode is internationally recognized and is required by modern standards (such as XML, Java, JavaScript, LDAP, CORBA 3.0, WML, etc.).

Oxygen XML Developer provides support for the Unicode standard, enabling your XML application to be targeted across multiple platforms, languages, and countries without re-engineering. Internally, the Oxygen XML Developer uses 16-bit characters covering the Unicode Character set.

**Note:**

Oxygen XML Developer may not be able to display characters that are not supported by the operating system (either not installed or unavailable).

**Tip:**

On windows, you can enable the support for **CJK** (Chinese, Japanese, Korean) languages from **Control Panel / Regional and Language Options / Languages / Install files for East Asian languages**.

Related information

[Unicode Fallback Font Support \(on page 424\)](#)

[Inserting Special Characters with the Character Map \(on page 425\)](#)

Opening and Saving Documents with Unsupported Characters

When loading documents, Oxygen XML Developer reads the document prolog to determine the specified encoding type. This encoding is then used to instruct the Java Encoder to load support for and to save the document using the specified code chart. When the encoding type cannot be determined, Oxygen XML Developer displays the **Available Java Encodings** dialog box that provides a list of all encodings supported by the Java platform.

Opening Documents with Unsupported Characters

When opening a document in Oxygen XML Developer, if it contains characters that are not supported by the specified encoding standard (these unrecognized characters are rendered as an empty box) , the application determines how to handle them based upon the setting specified in the **Encoding Errors Handling** option in the **Encoding preferences page (on page 159)**. The default setting is **REPORT**, which means an error message is displayed for characters that cannot be represented in the specified encoding. If the option is set to **REPLACE**, the character is replaced with a standard replacement character for the particular encoding. If the option is set to **IGNORE**, the error is ignored and the character is not rendered.

Saving Documents with Unsupported Characters

When saving a document edited in the **Text**, **Grid**, or **Design** modes, if it contains characters that are not supported by the encoding declared in the document prolog, Oxygen XML Developer displays a notification that you need to resolve the conflict before saving the document.

When saving a document with UTF-16 encoding, the saved document has a Byte Order Mark (BOM) that specifies the byte order of the document content. The default byte order is platform-dependent. That means that a UTF-16 document created on a Windows platform (where the default byte order mark is *UnicodeLittle*)

has a different BOM than one created on a macOS platform (where the byte order mark is *UnicodeBig*). The byte order and the BOM of an existing document are preserved when the document is edited and saved. This behavior can be changed in Oxygen XML Developer from the [Encoding preferences page \(on page 158\)](#).

Unicode Fallback Font Support

Oxygen XML Developer provides fonts for most common Unicode ranges. However, if you [use special symbols or characters \(on page 425\)](#) that are not included in the default fonts, they will be rendered as small rectangles. A *fallback* font is a reserve typeface that contains symbols for as many [Unicode characters \(on page 422\)](#) as possible. When a display system encounters a character that is not part of the range of any of the available fonts, Oxygen XML Developer will try to find that symbol in a *fallback* font.

Example of a Scenario Where a Fallback Font is Needed

Suppose that you need to insert the wheelchair symbol (♿ - U+267F) into your content in a Windows operating system. By default, Oxygen XML Developer does not render this symbol correctly since it is not included in any of the default fonts. It is included in **Segoe UI Symbol**, but this font is not part of the default fonts that come with Oxygen XML Developer. To allow Oxygen XML Developer to recognize and render the symbol correctly, you can add **Segoe UI Symbol** as a *fallback* font.

Adding a Fallback Font in Windows (7 or Later)

To add a fallback font to the Oxygen XML Developer installation, use the following procedure:

1. Start Windows Explorer and browse to the `[OXYGEN_INSTALL_DIR]/jre/lib/fonts` directory.
2. Create a directory called `fallback` (if it is not already there).
3. Copy a font file (True Type Font - TTF) that includes the special characters into this directory.

**Tip:**

You could, for example, copy the *Segoe UI Symbol Regular* font from `C:\Windows\Fonts`.

4. Restart Oxygen XML Developer for the changes to take full effect.

Result: Whenever Oxygen XML Developer finds a character that cannot be rendered using its standard fonts, it will look for the glyph in the fonts stored in the `fallback` folder.

Adding a Fallback Font in Other Platforms

For macOS or other platforms, you could use the following approach:

1. Use a font editor (such as [FontForge](#)) to combine multiple true type fonts into a single custom font.
2. Install the font file into the dedicated font folder of your operating system.
3. In Oxygen XML Developer, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#), go to **Appearance > Fonts**.

4. Click the **Choose** button for the particular editing mode (**Editor** for **Text** mode) and select your custom font from the drop-down list in the subsequent dialog box.
5. Restart Oxygen XML Developer for the font changes to take full effect.

Related information

[Unicode Support \(on page 422\)](#)

[Inserting Special Characters with the Character Map \(on page 425\)](#)

Inserting Special Characters with the Character Map

Oxygen XML Developer includes a **Character Map** for inserting special characters. It can also be used to find the decimal, hexadecimal, or *character entity* equivalent for a particular character or symbol.

Inserting Special Characters

To insert a special character at the current location within a document, follow these steps:

1. Open the **Character Map** dialog box (on page 426) by selecting **More symbols** from the  **Symbols** drop-down menu on the toolbar (if this button is not displayed, right-click in the toolbar area, select **Configure Toolbars** and chosen to display the **Symbols** toolbar (on page 327)).
2. Find the symbol you want to insert and double-click it (or select it and click **Insert**).

Tip:

The most recently used characters and some of the most common characters are listed when you click the  **Symbols** drop-down button so you can easily insert any of those characters by simply selecting it from the drop-down.

Finding the Decimal, Hexadecimal, or Character Entity Equivalent

You can see the hexadecimal value for any character that is already inserted in your document by placing the cursor right after the character and you can see its value in the status bar at the bottom of the application.

For other characters, or to find the decimal equivalent, or even the *character entity* equivalent, following these steps:

1. Open the **Character Map** dialog box (on page 426) by selecting **More symbols** from the  **Symbols** drop-down menu on the toolbar (if this button is not displayed, right-click in the toolbar area, select **Configure Toolbars** and chosen to display the **Symbols** toolbar (on page 327)).
2. Find the symbol and select it. You can use the filters and the **Search** field at the top of the dialog box to narrow the search.
3. Click the **Details** tab on top of the preview window to see the decimal, hexadecimal, and description of the character. The *character entity* equivalent (both its decimal and hexadecimal values) are displayed at the bottom of the dialog box.

Character Map Dialog Box

Figure 78. Character Map Dialog Box

The **Character Map** dialog box allows you to visualize all characters that are available in a particular font, pick the character you need, and insert it in the document you are editing. It includes the following fields and sections:

Font

Use this drop-down list to choose the font that will have characters displayed.

Unicode Block

Use this drop-down list to only see a certain range of characters. This will filter the number of characters displayed, showing only a contiguous range of characters corresponding to the selected block. Unassigned characters are displayed as empty squares.

Search

Use this filter to search for a character by one of the following attributes:

- hexadecimal
- decimal

- **description**

**Note:**

Selecting **description** opens the **Details** tab (*on page 427*). If you enter a character description in the **Search** field, the **description** is selected automatically.

Character Table Section

The characters that are available to be inserted are listed in two tabs:

- **Compact** - Matrix-like table that displays a visual representation of the characters.
- **Details** - Displays the available characters in a tabular format, presenting their decimal and hexadecimal value along with their description.

Recently Used Characters Section

Displays the symbols that you have used recently and you can also select one from there to insert it in the current document.

Character Mode Section

The next section of the dialog box allows you to select how you want the character to appear in your document. You can choose between the following:

- **Character**
- **Character entity - decimal**
- **Character entity - hexadecimal**

You can see the character or code that will be inserted in your document next to the selections in this section. You can also see the name and range name of a character either at the bottom of the dialog box, or in a tooltip when hovering the cursor over the character.

Click the **Insert** button to insert the selected character in the current editor at the cursor position. You will see the character in the editor if *the editor font (on page 123)* is able to render it. The **Copy** button copies it to the clipboard without inserting it in the editor.

**Note:**

The **Character Map** dialog box cannot be used to insert Unicode characters in the **Grid editor (on page 316)**. Accordingly, the **Insert** button of the dialog box will be disabled if the current document is edited in **Grid** mode.

Related information

[Working with Special Characters and Encoding \(on page 421\)](#)

Image Preview

Images and SVG files can be previewed in a separate pane. The supported image types are GIF, JPEG/JPG, PNG, BMP.

There are several ways to open an image in the **Image Preview** pane:

- In the **Project view** ([on page 365](#)), double-click the image name.
- In the **Project view** ([on page 365](#)), right-click an image and select **Preview**.
- In **Text** mode, **Ctrl + Mouse Click** or **Ctrl + Enter** with the cursor located within the image file path.

Once the image is displayed in the **Image Preview** pane, you have access to some contextual menu actions by right-clicking anywhere in the **Image Preview** pane. You can scale the image to its original size (by selecting the **1:1** action) or scale it down to fit in the pane (by selecting the **Scale to fit** action). Other actions include **Open in System Application**, **Print preview**, and **Print**.

If the image is an **SVG file** ([on page 1034](#)), the **Image Preview** pane also includes the following other contextual menu actions: **Zoom in**, **Zoom out**, **Rotate**, and **Refresh**.

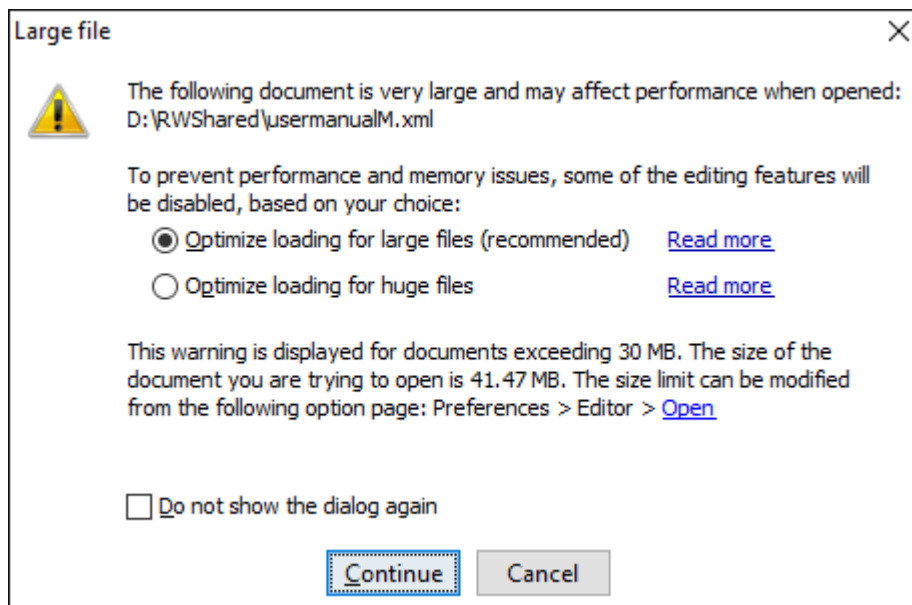

While the **Image Preview** view is visible, selecting an image in the **Project view** ([on page 365](#)) will automatically display the resource in the view. Also, as long as the  **Link with Editor** toggle action (located on the **Project** view's toolbar) is enabled, focusing on the image in the **Image Preview** view will select the image file in the **Project** view.

**Tip:**

You can drag an image from the **Image Preview** view and drop it in a DITA, DocBook, or TEI document.

Loading Large Documents

When you open a document with a file size larger than the limit configured in **Open preferences** ([on page 169](#)), Oxygen XML Developer prompts you to choose whether you want to optimize the loading of the document for large files or for huge files.

Figure 79. Large File Prompt Dialog Box

If your file has a size smaller than 300 MB, the recommended approach is **Optimize loading for large files** (*on page 429*). For documents that exceed 300 MB, the recommended approach is **Optimize loading for huge files** (*on page 430*).

Optimize Loading for Large Files

If you open a document that exceeds the limit configured in **Open preferences** (*on page 169*) (the default limit is 30 MB), a **dialog box will be displayed** (*on page 428*) prompting you to choose whether you want to optimize the loading of the document for large files or for huge files. If you choose the **Optimize loading for large files** option (typically recommended for files smaller than 300 MB), a special memory optimization is implemented so that the total memory allocated for the application is not exceeded. A temporary buffer file is created on disk and the available free disk space needs to be at least double the size of the file you want to open.

When opening a large file in this optimized editing environment, some editing features are disabled, including:

- The file can only be opened in **Text** mode.
- The automatic validation is not available.
- The XPath filter is disabled in the **Find/Replace dialog box** (*on page 394*).
- The bidirectional Unicode support (right-to-left writing) is disabled.
- The **Format and indent the document on open** option (*on page 171*) is automatically deselected for non-XML documents. For XML documents, the formatting is done while optimizing the memory usage by ignoring the options set in the **Format preferences page** (*on page 171*).
- Localizations for the results of an XPath expression will be less precise.

Related information

[Optimize Loading for Huge Files](#) (*on page 430*)

Optimize Loading for Huge Files

If you open a document that exceeds the limit configured in **Open preferences** (*on page 169*) (the default limit is 30 MB), a **dialog box will be displayed** (*on page 428*) prompting you to choose whether you want to optimize the loading of the document for large files or for huge files. If you choose the **Optimize loading for huge files** option (typically recommended for files larger than 300 MB), the file is split in multiple pages (each approximately 1MB in size). Each page is individually loaded (and edited) in **Text** mode by using a special horizontal slider located at the top of the editing area.

Figure 80. Huge File Editor Horizontal Slider

When opening a file in this special huge file editor, some editing features are disabled, including:

- For XML files, the UTF-8, UTF-16, ASCII, Windows-1252, and ISO 8859-1 encodings are supported. No other encoding is supported.
- The file can only be opened in **Text** editing mode.
- The automatic validation is disabled.
- The XPath filter is disabled in the **Find/Replace dialog box** (*on page 394*).
- The bidirectional Unicode support (right-to-left writing) is disabled.
- The **Format and indent the document on open** option (*on page 171*) is automatically deselected for non-XML documents. For XML documents, the formatting uses less memory by ignoring the options set in the **Format preferences page** (*on page 171*).
- The **Outline** view is not supported.
- The file content is soft wrapped by default.
- The **Find/Replace dialog box** (*on page 394*) only supports the **Find** action.
- Saving changes is only possible if the **Safe save option** (*on page 170*) (in the **Save preferences page**) is enabled.
- The **undo** operation is not available if you go to other pages and come back to the modified page.

Related information

[Optimize Loading for Large Files](#) (*on page 429*)

Documents with Long Lines

When working with documents that contain lines of text that exceed the boundaries of your monitor, you might want to see the text wrapped. To do so, use one of the following methods:

- Press **Ctrl + Shift + Y (Command + Shift + Y on macOS)** to toggle the line wrap feature for the current document only.
- Select the **Line wrap** (*on page 163*) option in the **Text preferences page** to apply the line wrap to all documents.

Features that Might be Affected by Wrapping Lines of Text

Documents that contain thousands of characters per line can affect the performance of Oxygen XML Developer **Text** mode. When a certain line length limit is reached (controlled from the [Optimize loading for documents with lines longer than \(Characters\) \(on page 169\)](#) option), Oxygen XML Developer prompts you to wrap the lines of text. By doing so, the following features may be affected to maintain a reasonable level of productivity:

- The editor uses the `Monospaced` font.
- You cannot set font styles.
- Automatic validation is disabled.
- [Automatic spell checking \(on page 419\)](#) is disabled.
- When editing XML documents, the **XPath** field is disabled in the [Find/Replace dialog box \(on page 394\)](#).
- Less precise localization for executed XPath expressions in XML documents. The XPath executions use SAX sources for a smaller memory footprint. It is recommended to use XPath 2.0 instead of XPath 1.0 because it features an increased execution speed and uses a smaller memory footprint. Running an XPath expression requires additional memory of about 2 or 3 times the size of the document on disk.

Handling Read-Only Files

If a file marked as read-only is opened in Oxygen XML Developer you can by default perform modifications to it. This behavior is controlled by the [Can edit read only files option \(on page 160\)](#). When attempting to save such files you will be prompted to save them to another location.

You can check out the read-only state of the file by looking in the [Properties view \(on page 359\)](#). If you modify the file properties from the operating system and the file becomes writable, you can modify it on the spot without having to reopen it.

The read-only state is marked with a lock decoration that appears in the editor tab and specified in the tooltip for a certain tab.

Scratch Buffer

The **Scratch Buffer** view can be used for storing fragments of arbitrary text during the editing process. It can be used to drop bits of paragraphs (including arbitrary XML markup fragments) while rearranging and editing the document and also to drag and drop fragments of text from the Scratch Buffer to the editor panel. The **Scratch Buffer** is basically a text area offering XML syntax highlight. The view's contextual menu contains basic edit actions such as **Cut**, **Copy**, and **Paste**.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Compare Files or Directories

Oxygen XML Developer provides a simple means of performing file and folder comparisons. You can see the differences in your files and folders and merge the changes. You can also use the file comparison to compare fragments or files inside zip-based archives.

There are two types of comparison tools: **Compare Directories** or **Compare Files**. These utilities are available from the **Tools** menu or can be opened as stand-alone applications from the Oxygen XML Developer installation folder (`diffDirs.exe` and `diffFiles.exe`).

Starting the Tools from a Command Line

The comparison tools can also be started by using command-line arguments. In the installation folder there are two executable shells (`diffFiles.bat` and `diffDirs.bat` on Windows, `diffFiles.sh` and `diffDirs.sh` on macOS and Linux). To specify files or directories to compare, you can pass command-line arguments to each of these shells. The arguments can point to file or folder paths in directories or archives (supported formats: *zip*, *docx*, and *xlsx*).

Directory Comparison Example

To start a [comparison between the two directories \(on page 451\)](#), use the following construct:

```
diffDirs.bat/diffDirs.sh [directory path 1] [directory path 2]
```

If you pass only one argument, you are prompted to manually choose the second directory or archive.

For example, to start a comparison between two Windows directories, the command line would look like this:

```
diffDirs.bat "c:\documents new" "c:\documents old"
```

Tip:

If there are spaces in the path names, surround the paths with quotes.

File Comparison Example

To start a [comparison between 2 or 3 files \(on page 433\)](#), use the following construct: `diffFiles.bat/`

```
diffFiles.sh [path to left file] [path to right file] [path to base file].
```

If three files are specified, the tool will start in the [3-way comparison mode \(on page 436\)](#). If only two files are specified, the tool will start in the [2-way comparison mode \(on page 433\)](#). The first specified file will be added to the left panel in the comparison tool, the second file to the right panel, and the optional third file will be the base (ancestor) file used for a 3-way comparison. If you pass only one argument, you are prompted to manually choose another file.

For example, to do a 3-way comparison on Windows, the command line would look like this:

```
diffFiles.bat "c:\docs\file 1" "c:\docs\file 2" c:\docs\basefile
```

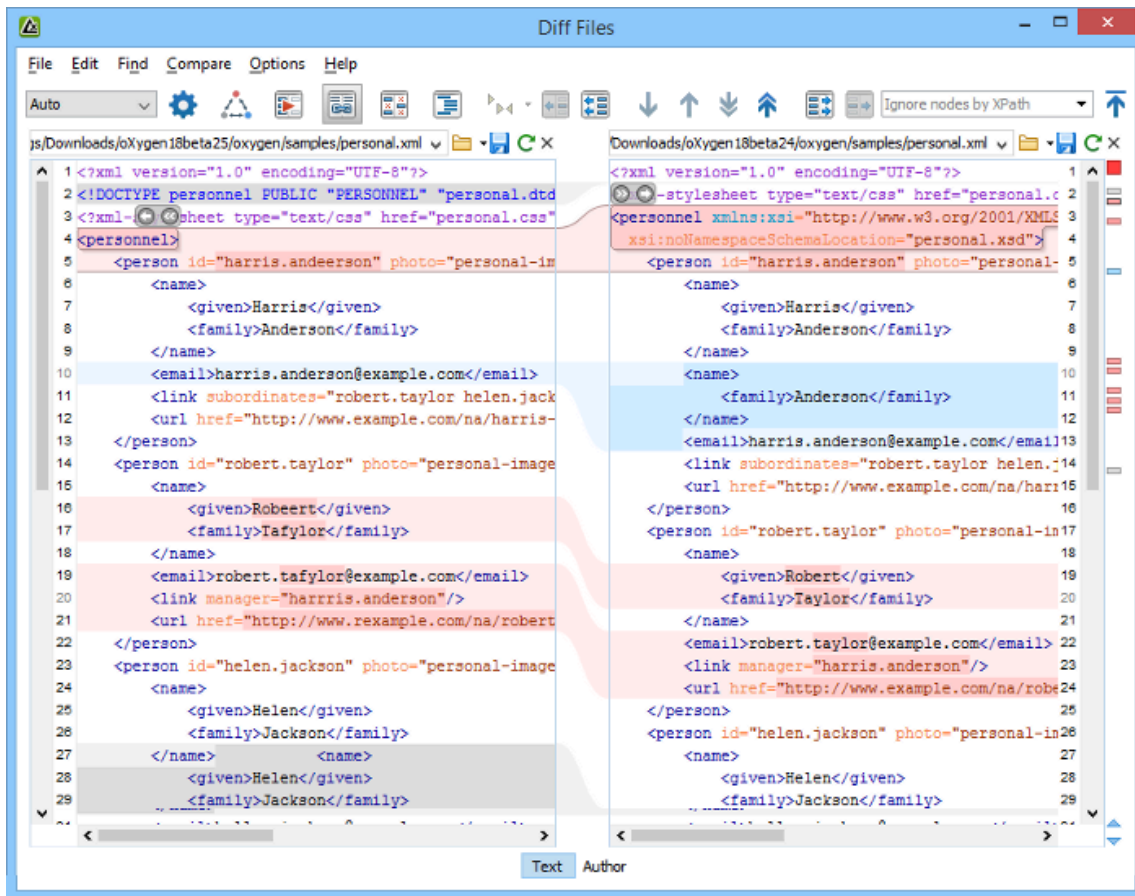

**Tip:**

If there are spaces in the path names, surround the paths with quotes.

Compare Files Tool

The built-in **Compare Files** tool can be used to compare files or XML file fragments. The tool provides a mechanism for comparing two files or fragments, as well as the mechanism for a three-way comparison. The utility is available from the **Tools > Comparison Tools** menu or can be opened as a stand-alone application from the Oxygen XML Developer installation folder (`diffFiles.exe`).

Figure 81. Compare Files Tool

Two-Way Comparisons

The **Compare Files** tool can be used to compare the differences between two files or XML fragments.

Compare Files

To perform a two-way comparison, follow these steps:

1. Open a file in the left panel and the file you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the browsing actions in the  **Browse** drop-down menu.

Step Result: The selected files are opened in the two side-by-side editors. A text editing mode is used to offer a better view of the differences.

2. To highlight the differences between the two files, click the  **Perform File Differencing** button from the toolbar.
3. You can use the drop-down menu on the left side of the toolbar to change the [algorithm \(on page 435\)](#) for the operation.
4. You can also use the  **Diff Options** button to access the **Files Comparison** preferences page where you can choose to ignore certain types of markup and configure various options.
5. If you are comparing XML documents using the **XML Fast** or **XML Accurate** algorithms, you can enter an XPath 2.0 expression in the **Ignore nodes by XPath** text field to ignore certain nodes from the comparison.

The resulting comparison will show you differences between the two files. The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes. This layout allows you to easily identify and focus on a group of related changes.

Figure 82. Two-Way Differences

Highlighting Colors

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the [Files Comparison / Appearance preferences page \(on page 254\)](#), but the default colors and their shades mean the following:

- **Pink** - Identifies modifications on either side.
- **Gray** - Identifies an addition of a node in the left side (your outgoing changes).
- **Blue** - Identifies an addition of a node in the right side (incoming changes).
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

Comparing Fragments (Copy/Paste)

To compare XML file fragments, you need to copy and paste the fragments you want to compare into each side, without selecting a file. If a file is already selected, you need to close it using the  **Close (Ctrl + W (Command + W on macOS))** button, before pasting the fragments. Other notes for pasting fragments:

- As long as the fragment is more than 10 characters, the application will attempt to automatically detect the content type. It can detect the following types: XML, DTD, CSS, JSON, and Markdown (if it starts with #). If one of those content types is detected, the fragments will be displayed with syntax highlights.
- If you save modified fragments, a dialog box opens that allows you to save the changes as a new document.

Navigate Differences

To navigate through differences, do one of the following:

- Use the navigation buttons on the toolbar (or in the **Compare** menu).
- Select a block of differences by clicking its small colored marker in the overview ruler located in the right-most part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.
- Click a colored area in between the two text editors.

Editing Actions

You can edit the files directly in either editing pane. The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the  **Perform File Differencing** button.

A variety of actions are available on the [toolbar \(on page 444\)](#) and in the [various menus \(on page 447\)](#) (these same actions are also available in the contextual menu in both editing panes). The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

Append left change to right and Append right change to left

Copies the content of the selected change from one side and appends it on the other, according to the content of the corresponding change. As a result, the side where the arrow points to will contain the changes from both sides.

Copy change from left to right and Copy change from right to left

Replaces the content of a change from one side with the content of the corresponding change from the other side.

Remove change

Rejects the change on the particular side and preserves the particular content on the other side.

Two-Way Diff Algorithms

Oxygen XML Developer offers the following two-way diff algorithms to compare files or fragments:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters.

- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **Syntax Aware** - Computes differences for known file types or fragments. This algorithm splits the files or fragments into sequences of *tokens* and computes the differences between them. The meaning of a *token* depends on the type of compared files or fragments.

Known file types include those listed in the **New** dialog box, such as XML file types (XSLT files, XSL-FO files, XSD files, RNG files, NVDL files, etc.), XQuery file types (`.xquery`, `.xq`, `.xqy`, `.xqm` extensions), DTD file types (`.dtd`, `.ent`, `.mod` extensions), TEXT file type (`.txt` extension), or PHP file type (`.php` extension).

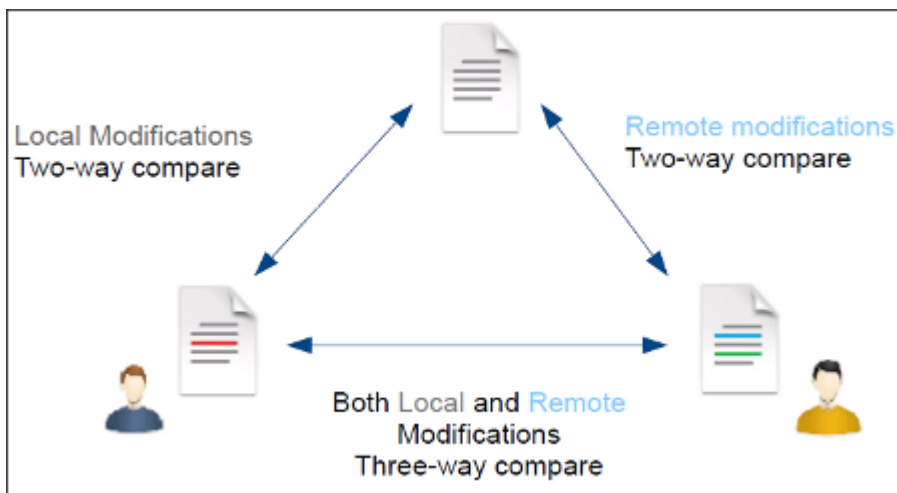

For example:

- When comparing XML files or fragments, a token can be one of the following:
 - The name of an XML tag
 - The < character
 - The /> sequence of characters
 - The name of an attribute inside an XML tag
 - The = sign
 - The " character
 - An attribute value
 - The text string between the start tag and the end tag (a text node that is a child of the XML element corresponding to the XML tag that encloses the text string)
- When comparing plain text, a token can be any continuous sequence of characters or any continuous sequence of whitespaces, including a new line character.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Three-Way Comparisons

Oxygen XML Developer also includes a three-way comparison feature to help you solve conflicts and merge changes between multiple modifications. It is especially helpful for teams who have multiple authors editing and committing the same documents. It provides a comparison between a local change, another change, and the original base revision. Some additional advantages include:

- Visualize and merge content that was modified by you and another member of your team.
- Marks differences correctly even when the document structure is rearranged.
- Allows you to merge XML-relevant modifications.

Figure 83. Three-Way Comparison

Compare Files

To perform a three-way comparison, follow these steps:

1. Open a file in the left panel and the file you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the browsing actions in the **Browse** drop-down menu.

Step Result: The selected files are opened in the two side-by-side editors. A text editing mode is used to offer a better view of the differences.

2. Click the **Three-Way Comparison** button on the toolbar and select the base (original) file in the **Base** field. You can specify the path by using the text field, the history drop-down, or the browsing actions in the **Browse** drop-down menu.
3. To highlight the differences, click the **Perform File Differencing** button on the toolbar.
4. You can use the drop-down menu on the left side of the toolbar to change the [algorithm \(on page 435\)](#) for the operation.
5. You can also use the **Diff Options** button to access the **Files Comparison** preferences page where you can choose to ignore certain types of markup and configure various options.

The resulting comparison will show you differences between the two files, as well as differences between either of them and the base (original) file. The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes.

Figure 84. Three-Way Differences

7	<code><given>Robert</given></code>	<code><given>Helen</given></code>	8
8	<code><family>Taylor</family></code>	<code><family>Jackson</family></code>	9
9	<code></name></code>	<code></name></code>	10
10	<code><email>robert.taylor@example</code>	<code><email>helen.jackson@example</code>	11

Highlighting Colors

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the [Files Comparison / Appearance preferences page \(on page 254\)](#), but the default colors and their shades mean the following:

- **Pink** - Identifies blocks of changes that include conflicts.
- **Gray** - Identifies your outgoing changes that do not include conflicts.
- **Blue** - Identifies incoming changes that do not include conflicts.
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

Navigate Differences

To navigate through differences, do one of the following:

- Use the navigation buttons on the toolbar (or in the **Compare** menu).
- Select a block of differences by clicking its small colored marker in the overview ruler located in the right-most part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.
- Click a colored area in between the two text editors.

Editing Actions

You can edit the files directly in either editing pane. The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the  **Perform File Differencing** button.

A variety of actions are available on the [toolbar \(on page 444\)](#) and in the [various menus \(on page 447\)](#) (these same actions are also available in the contextual menu in both editing panes). The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

Append left change to right and **Append right change to left**

Copies the content of the selected change from one side and appends it on the other, according to the content of the corresponding change. As a result, the side where the arrow points to will contain the changes from both sides.

Copy change from left to right and **Copy change from right to left**

Replaces the content of a change from one side with the content of the corresponding change from the other side.

Remove change

Rejects the change on the particular side and preserves the particular content on the other side.

Three-Way Diff Algorithms

Oxygen XML Developer offers the following three-way diff algorithms to compare files:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Second-Level Comparisons

For both two-way and three-way comparisons, Oxygen XML Developer automatically performs a second-level comparison for the **Lines**, **XML Fast**, and **XML Accurate** algorithms. After the first comparison is finished, the second-level comparison for the **Lines** algorithm is processed on text nodes using a word level comparison, meaning that it looks for identical words. For the **XML Fast** and **XML Accurate** algorithms, the second-level comparison is processed using a *syntax-aware comparison (on page 436)*, meaning that it looks for identical *tokens*. This second-level comparison makes it easier to spot precise differences and you can merge or reject the precise modifications.

Figure 85. Second-Level Diff Comparison

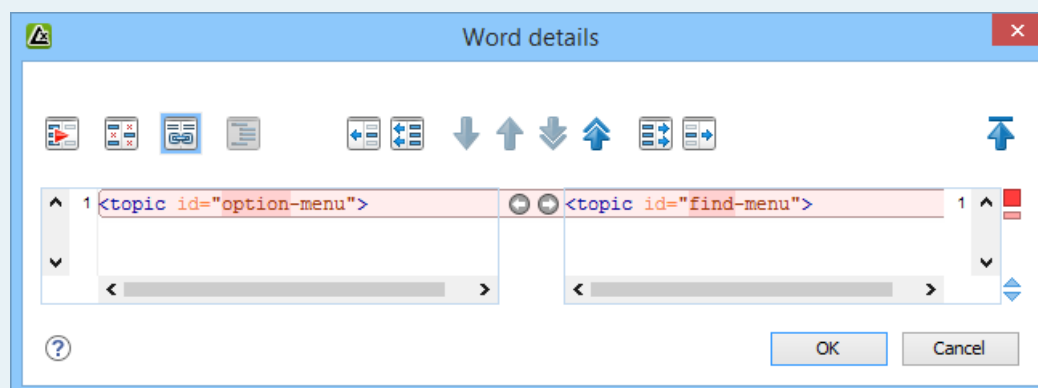

Note:

If a modified text fragment contains XML markup (such as processing instructions, XML comments, CDATA, or elements), the second-level comparison will not automatically be performed. In this case you can manually select a second-level comparison by doing a word level or character level comparison.

To do a word level comparison, select **Show word level details** from the contextual menu or **Compare** menu.

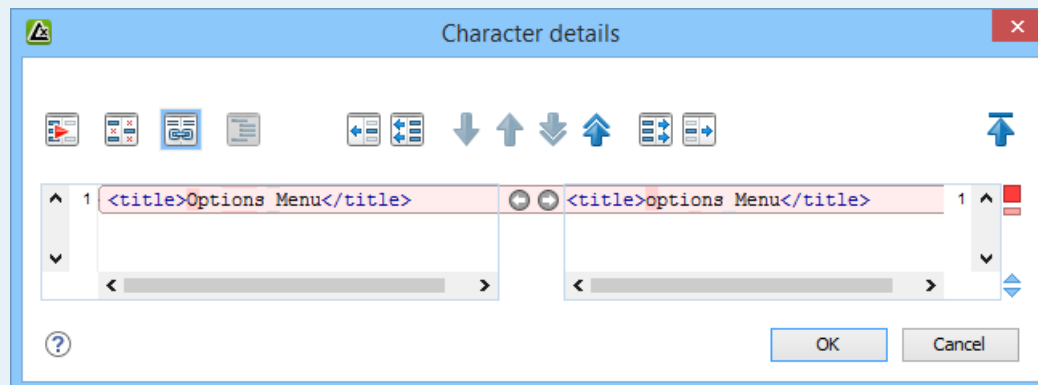

Figure 86. Word Level Comparison

To do a character level comparison, select **Show Character Level details** from the contextual menu or **Compare** menu.

Figure 87. Character Level Comparison

Related information

[Files Comparison Preferences Page \(on page 252\)](#)

[Compare Directories Tool \(on page 451\)](#)

[Toolbar and Contextual Menu Actions of the Compare Files Tool \(on page 444\)](#)

Starting File Comparison Tool from a Command Line

The file comparison tool can be started by using command-line arguments. In the installation folder there is an executable shell (`diffFiles.bat` on Windows, `diffFiles.sh` on macOS and Linux). To specify the files to compare, you can pass command-line arguments using the following construct: `diffFiles.bat/diffFiles.sh [path to left file] [path to right file] [path to 3-way base file]`.

If three files are specified, the tool will start in the [3-way comparison mode \(on page 436\)](#). If only two files are specified, the tool will start in the [2-way comparison mode \(on page 433\)](#). The first specified file will be added to the left panel in the comparison tool, the second file to the right panel, and the optional third file will be the base (ancestor) file used for a 3-way comparison. If you pass only one argument, you are prompted to manually choose another file.

If you want to launch the file comparison tool from an external application with specified files and you want the file browsing buttons at the top of both panels to be hidden, you should use the `-ext` argument as the first command. There are some additional arguments that are allowed and to see all the details for the command-line construct, type `diffFiles.bat --help` in the command line.

Example:

To do a 3-way comparison, the command line might look like this:

Windows

```
diffFiles.bat "c:\docs\file 1" "c:\docs\file 2" c:\docs\basefile
```

**Tip:**

If there are spaces in the path names, surround the paths with quotes.

Linux

```
diffFiles.sh home/file1 home/file2 home/basefile
```

macOS

```
diffFiles.sh documents/file1 documents/file2 documents/basefile
```

How to Integrate the File Comparison Tool with Git

The file comparison tool can be integrated with Git clients. It requires that you configure your `.gitconfig` file and then you can simply start the tool from the command line.

To integrate the **Compare Files** tool with your Git client, follow this procedure:

1. Use one of the following methods to instruct your Git client to use the *Oxygen Compare Files* tool:
 - **Manual Configuration** - Locate your Git user-specific configuration file (`.gitconfig`) and edit it with a text editor (for example, in Windows, the `.gitconfig` file is most likely located in your user home directory). Add (or replace) the following lines:

```
[diff]
    tool = oxygendiff

[merge]
    tool = oxygendiff

[difftool "oxygendiff"]
    cmd = '[pathToOxygenInstallDir]/diffFiles.exe' -ext $REMOTE $LOCAL $LOCAL

[mergetool "oxygendiff"]
    cmd = '[pathToOxygenInstallDir]/diffFiles.exe' -ext $LOCAL $REMOTE $BASE $MERGED
    trustExitCode = true

[difftool]
    prompt = false
```

**Note:**

For macOS, the `cmd` lines would start with something like: `sh "/Applications/Oxygen XML Editor/diffFiles.sh"`. For Linux, the `cmd` lines would start with something like: `sh "/Oxygen XML Editor/diffFiles.sh"`.

**Tip:**

On Redhat 7, the following command would work, where the whole command is quoted and then inside that, the path to `diffFiles.sh` is quoted:

```

i [difftool "oxygendiff"]

    cmd = '/home/user/Oxygen XML Editor 21/diffFiles.sh' -ext $REMOTE $LOCAL $LOCAL

[mergetool "oxygendiff"]

    cmd = '/home/user/Oxygen XML Editor 21/diffFiles.sh' -ext $LOCAL $REMOTE $BASE

    $MERGED trustExitCode = true

```

- **Command Line Configuration** - To automatically configure the `.gitconfig` file, you can run the following commands from a command line:

```

git config --global diff.tool oxygendiff

git config --global difftool.oxygendiff.cmd '[Oxygen install dir]/diffFiles.exe -ext
$REMOTE $LOCAL $LOCAL'

git config --global merge.tool oxygendiff

git config --global mergetool.oxygendiff.cmd '[Oxygen install dir]/diffFiles.exe
-ext $LOCAL $REMOTE $BASE $MERGED'

git config --global mergetool.oxygendiff.trustExitCode true

```

**Note:**

For macOS, the *Oxygen* file comparison tool would be specified in the second and fourth commands with something like: `sh "/Applications/Oxygen XML Editor/diffFiles.sh"`. For Linux, it would be something like: `sh "/Oxygen XML Editor/diffFiles.sh"`.

2. To start the **Compare Files** tool and see a comparison of changes for a particular file, run the following command from a command line:

```
git difftool [PathToFile]
```

**Tip:**

If the file you want to compare has conflicts, you can start the **Compare Files** tool as a *merge conflict resolution* tool by running the following command:

```
git mergetool [PathToFile]
```

For more information about the Git *difftool* syntax, see <https://git-scm.com/docs/git-difftool>.

For more information about the Git *mergetool* syntax, see <https://git-scm.com/docs/git-mergetool>.

How to Integrate the File Comparison Tool with Sourcetree

The file comparison tool can be integrated with Sourcetree so that you can use it to compare changes. The *Oxygen Compare Files* tool provides the following advantages when using it with Sourcetree:

- The files are presented side-by-side to make it much easier to determine real changes.
- XML comparison algorithms are available.

- Various options can be used to configure the comparison.
- You can navigate through changes, one by one.

To integrate the **Compare Files** tool with Sourcetree, use the following procedure, depending on your operating system:

Windows

1. In Sourcetree, go to **Tools > Options**.
2. Go to the **Diff** tab.
3. In the **External Diff/Merge** section, configure the settings as follows:
 - **External Diff Tool** - Select **Custom**.
 - **Diff Command** - Enter the path of the *Oxygen diffFiles.exe* file (for example: `c:\Programs\Oxygen XML Editor\diffFiles.exe`).
 - **Arguments** - Enter `-ext $REMOTE $LOCAL $LOCAL`.
 - **Merge Tool** - Select **Custom**.
 - **Diff Command** - Enter the path of the *Oxygen diffFiles.exe* file (for example: `c:\Programs\Oxygen XML Editor\diffFiles.exe`).
 - **Arguments** - Enter `-ext $LOCAL $REMOTE $BASE $MERGED`.
4. Click **OK**.

Result: In Sourcetree, you can now compare file changes with the *Oxygen Compare Files* tool by simply selecting **External Diff** from the contextual menu, **Actions** menu, or **Ctrl+D**.

macOS

1. In Sourcetree, go to **Sourcetree > Preferences**.
2. Go to the **Diff** tab.
3. In the **External Diff/Merge** section, configure the settings as follows:
 - **External Diff Tool** - Select **Custom**.
 - **Diff Command** - Enter a command-line argument to launch the *Oxygen diffFiles.sh* file (for example: `sh "/Applications/Oxygen XML Editor/diffFiles.sh"`).
 - **Arguments** - Enter `-ext $REMOTE $LOCAL $LOCAL`.
 - **Merge Tool** - Select **Custom**.
 - **Diff Command** - Enter a command-line argument to launch the *Oxygen diffFiles.sh* file (for example: `sh "/Applications/Oxygen XML Editor/diffFiles.sh"`).
 - **Arguments** - Enter `-ext $LOCAL $REMOTE $BASE $MERGED`.
4. Close the preferences dialog box.

Result: In Sourcetree, you can now compare file changes with the *Oxygen Compare Files* tool by simply selecting **External Diff** from the contextual menu or **Actions** menu.

Toolbar and Contextual Menu Actions of the Compare Files Tool

The toolbar of the **Compare Files** tool contains operations that can be performed on the source and target files or XML fragments. Many of the actions are also available in the contextual menu.

Figure 88. Compare Toolbar

The following actions are available:

Algorithm

This drop-down menu allows you to select one of the following diff algorithms (depending on whether it is a two-way or three-way comparison):

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters.
- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **Syntax Aware** - Computes differences for the file types or fragments known by Oxygen XML Developer, taking the syntax (the specific types of tokens) into consideration.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Diff Options

Opens the [Files Comparison preferences page \(on page 252\)](#) where you can configure various options.

Three-Way Comparison

Toggle action that allows you to perform a three-way comparison between the two files displayed in the two editing panes and a base (ancestor) file.

Perform Files Differencing

Looks for differences between the two files displayed in the left and right side panels.

Synchronized scrolling

Toggles synchronized scrolling on or off so that a selected difference can be seen on both sides of the application window. This option is on by default.

Ignore Whitespaces

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

Format and Indent Both Files (**Ctrl + Shift + P** (**Command + Shift + P** on macOS))

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

Note:

When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.

Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

Copy All Changes from Right to Left

Copies all changes from the file in the right panel to the file in the left panel.

Next Block of Changes (**Ctrl + Period** (**Command + Period** on macOS))

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

Note:

A change block groups one or more consecutive lines that contain at least one change.

Previous Block of Changes (**Ctrl + Comma** (**Command + Comma** on macOS))

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

Next Change (**Ctrl + Shift + Period** (**Command + Shift + Period** on macOS))

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

Previous Change (**Ctrl + Shift + Comma** (**Command + Shift + M** on macOS))

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

**Copy All Changes from Left to Right**

Copies all changes from the file in the left panel to the file in the right panel.

**Copy Change from Left to Right**

Copies the selected difference from the file in the left panel to the file in the right panel.

Ignore Nodes by XPath

You can use this text field to enter an *XPath expression* ([on page 1732](#)) to ignore certain nodes from the comparison. It will be processed as XPath version 2.0. You can also enter the name of the node to ignore all nodes with the specified name (for example, if you want to ignore all ID attributes from the document, you could simply enter `@id`). This field is only available when comparing XML documents using the **XML Fast** or **XML Accurate** algorithms.

**Note:**

If an XPath expression is specified in the **ignore nodes by XPath option** ([on page 254](#)) in the **Diff / File Comparison** preferences page, that one is used as a default when the application is started. If you then enter an expression in this field on the toolbar, this one will be used instead of the default. If you delete the expression from this field, neither will be used.

**First Change (Ctrl + B (Command + B on macOS))**

Jumps to the first change.

Base

Available for *three-way comparisons* ([on page 436](#)). It is the base file that will be compared with the files opened in the left and right editors. You can specify the path to the file by using the text field, its history drop-down, or the browsing actions in the **Browse** drop-down menu.

Left-Side (Source) File

You can specify the path to the file to be compared on the left side (source) by using the text field, its history drop-down, or the browsing actions in the **Browse** drop-down menu.

**Save**

Saves the changes made in the source (left-side) file.

**Reload**

Reloads the source (left-side) file.

**Close**

Closes the source (left-side) file.

Right-Side (Target) File

You can specify the path to the file to be compared on the right side (target) by using the text field, its history drop-down, or the browsing actions in the  **Browse** drop-down menu.

 **Save**

Saves the target (right-side) file.

 **Reload**

Reloads the target (right-side) file.

 **Close**

Closes the target (right-side) file.

Compare Files Tool Menus

The menus in the **Compare Files** tool contain some of the same actions that are on the toolbar, as well as some common actions that are identical to the same actions in the Oxygen XML Developer menus. The menu actions include:

File Menu

Source >  **Open**

Browses for a file that will be displayed in the left panel.

Source >  **Open URL**

Browses for a remote file that will be displayed in the left panel.

Source >  **Open File from Archive**

Browses an archive for a file that will be displayed in the left panel.

Source >  **Reload**

Reloads the file in the left panel.

Source >  **Save**

Saves the changes made to the file in the left panel.

Source > **Save As**

Allows you to choose a destination to save the file in the left panel.

Source >  **Close**

Closes the file in the left panel.

Target >  **Open**

Browses for a file that will be displayed in the right panel.

Target >  **Open URL**

Browses for a remote file that will be displayed in the right panel.

Target >  Open File from Archive

Browses an archive for a file that will be displayed in the right panel.

Target >  Reload

Reloads the file in the right panel.

Target >  Save

Saves the changes made to the file in the right panel.

Target > Save As

Allows you to choose a destination to save the file in the right panel.

Target >  Close

Closes the file in the right panel.

Base >  Open

Browses for a file that will be compared with both files in a [three-way comparison \(on page 436\)](#).

Base >  Open URL

Browses for a remote file that will be compared with both files in a [three-way comparison \(on page 436\)](#).

Base >  Open File from Archive

Browses an archive for a file that will be compared with both files in a [three-way comparison \(on page 436\)](#).

 Save Results as HTML (Available in Text mode only)

Generates an HTML file that contains detailed information about the comparison result. See an [example of what the generated report look like in the Generate HTML Report for Directory Comparison topic \(on page 466\)](#).

Save Comparison as Document with Tracked Changes (Available for two-way comparison in Author mode only)

Allows you to merge two compared documents based on the differences detected and save the results as a specified file that includes the special change tracking marks. You can load the resulting file in **Oxygen's Author** mode to review the changes that resulted from the merge process and you can accept or reject them. Note that if the documents to be compared already contain tracked changes, they will be automatically accepted before generating the output file.

Close (Ctrl + W (Command + W on macOS))

Closes the application.

Edit Menu

 Cut

Cut the selection from the currently focused editor panel to the clipboard.

Copy

Copy the selection from the currently focused editor panel to the clipboard.

Paste

Paste content from the clipboard into the currently focused editor panel.

Select all

Selects all content in the currently focused editor panel.

Undo

Undo changes in the currently focused editor panel.

Redo

Redo changes in the currently focused editor panel.

Find Menu

Find/Replace

Perform *find/replace* operations in the currently focused editor panel.

Find Next

Go to the next match using the same options as the last *find* operation. This action runs in both editor panels.

Find Previous

Go to the previous match using the same options as the last *find* operation. This action runs in both editor panels.

Compare Menu

Three-Way Comparison

Toggle action that allows you to perform a three-way comparison between the two files displayed in the two editing panes and a base (ancestor) file.

Perform Files Differencing

Looks for differences between the two files displayed in the left and right side panels.

Next Block of Changes (**Ctrl + Period** (**Command + Period** on macOS))

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

Note:

A change block groups one or more consecutive lines that contain at least one change.

Previous Block of Changes (Ctrl + Comma (Command + Comma on macOS))

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

Next Change (Ctrl + Shift + Period (Command + Shift + Period on macOS))

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

Previous Change (Ctrl + Shift + Comma (Command + Shift + M on macOS))

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

Last Change (Ctrl + E (Command + E on macOS))

Jumps to the last change.

First Change (Ctrl + B (Command + B on macOS))

Jumps to the first change.

Copy All Changes from Right to Left

Copies all changes from the file in the right panel to the file in the left panel.

Copy All Changes from Left to Right

Copies all changes from the file in the left panel to the file in the right panel.

Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

Copy Change from Left to Right

Copies the selected difference from the file in the left panel to the file in the right panel.

Show Word Level Details

Provides a word-level comparison of the selected change.

Show Character Level Details

Provides a character-level comparison of the selected change.

Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on macOS))

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

Note:

When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.

Options Menu

Preferences

Opens the preferences dialog box that includes numerous pages of options that can be configured.

Menu Shortcut Keys

Opens the **Menu Shortcut Keys** option page where you can configure keyboard shortcuts available for menu items.

Reset Global Options

Resets options to their default values. Note that this option appears only when the tool is executed as a stand-alone application.

Import Global Options

Allows you to import an options set that you have previously exported.

Export Global Options

Allows you to export the current options set to a file.

Help Menu

Help (F1)

Opens a **Help** dialog box that displays the User Manual at a section that is appropriate for the context of the current cursor position.

Use Online Help

If this option is selected, when you select Help or press F1 while hovering over any part of the interface, Oxygen XML Developer attempts to open the help documentation in online mode. If this option is not selected or an internet connection fails, the help documentation is opened in offline mode.

Report problem

Opens a dialog box that allows the user to write the description of a problem that was encountered while using the application. You can change the URL where the reported problem is sent by using the `com.oxygenxml.report.problems.url` system property. The report is sent in XML format through the `report` parameter of the POST HTTP method.

Support Center

Opens the Oxygen XML Developer Support Center web page in a browser.

Compare Directories Tool

The **Compare Directories** tool can be used to compare and manage changes to files and folders within the structure of your directories. The utility is available from the **Tools > Comparison Tools** menu or can be opened as a stand-alone application from the Oxygen XML Developer installation folder (`diffDirs.exe`).

Figure 89. Diff Directories Dialog Box

Starting the Tool from a Command Line

The directory comparison tool can also be started by using command-line arguments. In the installation folder there is an executable shell (`diffDirs.bat` on Windows, `diffDirs.sh` on macOS and Linux). To specify the directories to compare, you can pass command-line arguments using the following construct:

```
diffDirs.bat/diffDirs.sh [directory path 1] [directory path 2].
```

If you pass only one argument, you are prompted to manually choose the second directory or archive.

Example:

To do a comparison between two directories, the command line would look like this:

Windows

```
diffDirs.bat "c:\documents new" "c:\documents old"
```

Tip:

If there are spaces in the path names, surround the paths with quotes.

Linux

```
diffDirs.sh home/documents1 home/documents2
```

macOS

```
diffDirs.sh documents1 documents2
```

Directory Comparisons

To perform a directory comparison, follow these steps:

1. Select a folder in the left panel and the folder you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the **Browse for local directory** action in the  **Browse** drop-down menu.

Step Result: The selected directory structures are opened in the two side-by-side panels.

2. To highlight the differences between the two folders, click the  **Perform Directories Differencing** button from the toolbar.
3. You can also use the  **Diff Options** button to access the [Directories Comparison preferences page \(on page 255\)](#) where you can configure various options.

To compare the content of two archives, follow these steps:

1. Use the **Browse for archive file** action in the  **Browse** drop-down menu to select the archives in the left and right panels.
2. By default, the supported archives are not treated as directories and the comparison is not performed on the files inside them. To make Oxygen XML Developer treat supported archives as directories, select the **Look in archives** option (on page 256) in the **Directories Comparison** preferences page.
3. To highlight the differences, click the  **Perform Directories Differencing** button from the toolbar.

The directory comparison results are presented using two tree-like structures showing the files and folders, including their name, size, and modification date. A column that contains graphic symbols separates the two tree-like structures. The graphic symbols can be one of the following:

- An **X** symbol, when a file or a folder exists in only one of the compared directories.
- A **≠** symbol, when a file exists in both directories but the content differs. The same sign appears when a collapsed folder contains differing files.

The color used for the symbol and the directory or file name can be customized in the [Directories Comparison / Appearance preferences page \(on page 256\)](#). You can double-click lines marked with the **≠** symbol to open a **Compare Files** window, which shows the differences between the two files.

The directories that contain files that differ are expanded automatically so that you can focus directly on the differences. You can merge the contents of the directories by using the copy actions. If you double-click (or press **Enter**) on a line with a pair of files, Oxygen XML Developer starts a [file comparison \(on page 433\)](#) between the two files, using the **Compare Files** tool.

Related information

[Compare Files Tool \(on page 433\)](#)

[Compare Directories Script \(on page 2251\)](#)

Toolbar and Contextual Menu Actions of the Compare Directories Tool

The toolbar of the **Compare Directories** tool contains operations that can be performed on the compared directory structure. Some of the toolbar actions are also available in the contextual menu.

Figure 90. Compare toolbar

Toolbar Actions

Perform Directories Differencing

Looks for differences between the two directories displayed in the left and right side of the application window.

Perform Files Differencing

Opens the **Compare Files** tool ([on page 433](#)) that allows you to compare the currently selected files.

Copy Change from Right to Left

Copies the selected change from the right side to the left side (if there is no file/folder in the right side, the left file/folder is deleted).

Copy Change from Left to Right

Copies the selected change from the left side to the right side (if there is no file/folder in the left side, the right file/folder is deleted).

Binary Compare

Performs a byte-level comparison on the selected files.

Diff Options

Opens the **Directory Comparison preferences page** ([on page 255](#)) where you can configure various options.

Show Only Modifications

Displays a more uncluttered file structure by hiding all identical files.

Save Results as HTML

Generates an HTML file that contains detailed information about the comparison result.

File and folder filters

Differences can be filtered using three combo boxes: **Include files**, **Exclude files**, and **Exclude folders**. They come with predefined values and are editable to allow custom values. All of them accept multiple comma-separated values and the * and ? wildcards. For example, to filter out

all JPEG and GIF image files, edit the **Exclude files** filter box to read ***.jpeg, *.png**. Each filter includes a drop-down menu with the latest 15 filters applied.

Contextual Menu Actions

Perform Files Differencing

Opens the **Compare Files** tool ([on page 433](#)) that allows you to compare the currently selected files.

Binary Compare

Performs a byte-level comparison on the selected files.

Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

Copy Change from Left to Right

Copies the selected difference from the file in the left panel to the file in the right panel.

Open

If the action is invoked on a file, the selected file is opened in Oxygen XML Developer. If the action is invoked on a directory, the selected directory is opened in the default file browser for your particular operating system.

Open in System Application

Opens the selected file in the system application that is associated with that type of file. The action is available when launching the **Compare Directories** tool from the **Tools** menu in Oxygen XML Developer.

Show in Explorer

Opens the default file browser for your particular operating system with the selected file highlighted.

Compare Directories Tool Menus

The menus in the **Compare Directories** tool contain some of the same actions that are on the toolbar, as well as some common actions that are identical to the same actions in the Oxygen XML Developer menus. The menu actions include:

File Menu

Save Results as HTML

Generates an HTML file that contains detailed information about the comparison result. See an [example of what the generated report look like in the Generate HTML Report for Directory Comparison topic \(on page 466\)](#).

Close (**Ctrl + W** (**Command + W** on macOS))

Closes the application.

Compare Menu

Perform Directories Differencing

Looks for differences between the two directories displayed in the left and right side of the application window.

Perform Files Differencing

Opens the **Compare Files** tool (*on page 433*) that allows you to compare the currently selected files.

Copy Change from Right to Left

Copies the selected change from the right side to the left side (if there is no file/folder in the right side, the left file/folder is deleted).

Copy Change from Left to Right

Copies the selected change from the left side to the right side (if there is no file/folder in the left side, the right file/folder is deleted).

Options Menu

Preferences

Opens the preferences dialog box that includes numerous pages of options that can be configured.

Menu Shortcut Keys

Opens the **Menu Shortcut Keys** option page where you can configure keyboard shortcuts available for menu items.

Reset Global Options

Resets options to their default values. Note that this option appears only when the tool is executed as a stand-alone application.

Import Global Options

Allows you to import an options set that you have previously exported.

Export Global Options

Allows you to export the current options set to a file.

Help Menu

Help (F1)

Opens a **Help** dialog box that displays the User Manual at a section that is appropriate for the context of the current cursor position.

Use Online Help

If this option is selected, when you select Help or press F1 while hovering over any part of the interface, Oxygen XML Developer attempts to open the help documentation in online mode. If this option is not selected or an internet connection fails, the help documentation is opened in offline mode.

Report problem

Opens a dialog box that allows the user to write the description of a problem that was encountered while using the application. You can change the URL where the reported problem is sent by using the `com.oxygenxml.report.problems.url` system property. The report is sent in XML format through the `report` parameter of the POST HTTP method.

Support Center

Opens the Oxygen XML Developer Support Center web page in a browser.

Compare Images

You can use the **Compare Directories** tool to compare images. If you double-click a line that contains two different images, the **Compare images** window is displayed. This dialog box presents the images in the left and right sides, scaled to fit the available view area. You can use the contextual menu actions to scale the images to their original size or scale them down to fit in the view area.

The supported image types are: *GIF, JPG, JPEG, PNG, and BMP*.

Compare Directories Against a Base (3-Way) Tool

The **Compare Directories Against a Base (3-way)** tool allows you to perform three-way comparisons on directories to help you identify and merge changes between multiple modifications of the same directory structure. It is especially helpful for teams that have multiple authors contributing documents to the same directory system. It offers information about conflicts and changes, and includes actions to easily merge, accept, overwrite, or ignore changes to the directory system.

How to Perform 3-Way Directory Comparisons

To perform a 3-way directories comparison, follow these steps:

1. Select  **Compare Directories Against a Base (3-way)** from the **Tools > Comparison Tools** menu.

Step Result: This opens a dialog box that allows you to select the 3 file sets that will be used for the comparison.

Figure 91. Compare Directories Against a Base File Set Chooser

2. Select the file sets to be compared:

- **Base directory** - This is the original (base) file set before any modifications were made by you or others.
- **Directory with your changes** - This is the file set with changes that you have made. This file set will be displayed in the left panel in the comparison tool.
- **Directory with changes made by others** - This is the file set with changes made by others that you want to merge with your changes. This file set will be displayed in the right panel in the comparison tool.

3. Click the **Compare** button to compare the file sets and open the comparison and merge tool.

4. Use the features and actions described in the next section to identify and merge the changes.

3-Way Directory Comparison and Merge Tool

Figure 92. Comparison and Merge Tool

The 3-way directory comparison and merge tool includes the following information, features, and actions:

Number of Changes and Conflicts

The first thing you see in the top-left corner of the tool is the grand total of all the changes made by others, changes made by you, and the number of conflicts.

Filter Buttons

In the top-right corner you can use the toggle buttons to filter the list of modifications:

⇆ Show all files

Use this button to show all modified and unmodified files, as well as conflicts.

⇆ Show only files modified by you and others

Filters the list to show all files that have been modified, including conflicts.

⇆ Show only files modified by others

Filters the list to only show the files that were modified by others.

⇆ Show only files modified by you

Filters the list to only show the files that were modified by you.

Show only conflicting files

Filters the list to only show files that contain conflicts.

List of Files Panel

This panel shows the list of files in the compared file sets based upon the filter button that is selected. This panel includes the following sortable columns:

- **Name** - The file names.
- **Status** - An icon that represents the file status. Red icons indicate some sort of conflict. Gray icons indicate modifications made by you. Blue icons indicate modifications made by others.
- **Description** - A description of the file status.
- **Merge Action** - This column provides a drop-down menu for each file that allows you to choose some merge actions depending upon its status. A default action is always set to **Automatically merge** the changes made by others with your changes. If there is a conflict, the default is **<Select action>** and you are required to make a selection. Click this column to access the drop-down menu where you can make a selection. The same actions are available in the contextual menu.

Tip:

If the solution proposed in the **Merge Action** column for any particular file is not satisfactory, you can change it directly in that column (even if that file is not selected) without automatically re-triggering the comparison (except for in certain cases where re-triggering the comparison is necessary).

You can click a file to open it in the file comparison panel (the file from your file set is shown in the left panel while the file from the file set with changes made by others is shown in the right panel). For image files, the comparison panel shows a preview of the image. For other binary files, a preview is not available and you will just see its status.

File Comparison Panels

If you click a file in the top panel, the file is opened in this file comparison section. The file from your file set is shown in the left panel and the file from the other file set is shown in the right panel.

Note:

If Oxygen XML Developer does not recognize the file type, a dialog box will be displayed that allows you to select the type of editor you want it to be associated with for this comparison (if you want Oxygen XML Developer to remember this association, you can select the **Associate file type with editor** option at the bottom of the dialog box).

This panel includes the following information and toolbar actions:

File Path

The first thing you see in this panel is the file path where merge actions will be applied if you make changes.

✕ Close

Closes the file comparison panel.

Algorithm Drop-down Menu

This drop-down menu allows you to select one of the following diff algorithms to be used for file comparisons:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Diff Options

Opens the [Files Comparison preferences page \(on page 252\)](#) where you can configure various options.

Perform Files Differencing

Looks for differences between the two files displayed in the left and right side panels.

Synchronized scrolling

Toggles synchronized scrolling. When toggled on, a selected difference can be seen in both panels.

Ignore Whitespaces

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

Copy All Changes from Right to Left

Copies all changes from the file in the right panel to the file in the left panel.

Next Block of Changes (Ctrl + Period (Command + Period on macOS))

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

Note:

A change block groups one or more consecutive lines that contain at least one change.

Previous Block of Changes (Ctrl + Comma (Command + Comma on macOS))

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

Next Change (Ctrl + Shift + Period (Command + Shift + Period on macOS))

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

Previous Change (Ctrl + Shift + Comma (Command + Shift + M on macOS))

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

First Change (Ctrl + B (Command + B on macOS))

Jumps to the first change.

Left-Side File (Your changes)

Above the panel you can see the file path and the following two buttons:

Save

Saves changes made to the file.

Reload

Reloads the file.

Right-Side File (Changes made by others)

Above the panel you can see the file path and the following two buttons:

Reload

Reloads the file.

Displaying Changes in the File Comparison Panels

The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes.

Figure 93. File Comparison Panels

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the [Files Comparison / Appearance preferences page \(on page 254\)](#), but the default colors and their shades mean the following:

- **Pink** - Identifies modifications on either side.
- **Gray** - Identifies an addition of a node in the left side (your outgoing changes).
- **Blue** - Identifies an addition of a node in the right side (incoming changes).
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

Direct Editing Actions in the File Comparison Panels

In addition to selecting merge actions from the drop-down menus in the **Merge Action** column in the top panel, you can also edit the files directly in the left pane (your local changes). The two editors are constantly synchronized and the differences are refreshed when you save the modified document ( **Save** button or **Ctrl+S**) or when you click the  **Perform File Differencing** button.

A variety of actions are available in the contextual menu in both editing panes. The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

Append right change to left

Copies the content of the selected change from the right side and appends it on the left side.

Copy change from right to left

Replaces the content of a change in the left side with the content of the change in the right side.

Remove change

Removes the change from the left side.

Anytime you save manual changes ( **Save** button or **Ctrl+S**), the selection in the **Merge Action** column in the top panel automatically changes to **Use merged** and a copy of the original file is kept so that you can revert to the original file if necessary. To discard your manual changes and revert to your original changes, select a different action in the **Merge Action** drop-down menu.

Open Merged Files

If you select this option, all the files that will be modified by the merge operation will be opened in the editor after the operation is finished.

Applying Changes

When you click the **Apply** button, all the merge actions you have selected and the changes you have made will be processed.

If there are unresolved conflicts (conflicts where no merge action is selected in the **Merge Action** drop-down menu), a dialog box will be displayed that allows you to choose how to solve the conflicts. You can choose between the following:

- **Keep your changes** - If you select this option and then click **Apply**, your local changes will be preserved for the unresolved conflicts.
- **Overwrite your changes** - If you select this option and then click **Apply**, your local changes will be overwritten with the changes made by others, for the unresolved conflicts.
- **Cancel** - You can click the **Cancel** button to go back to the merge tool to resolve the conflicts individually.

Canceling Changes

If you click the **Cancel** button at the bottom of the merge tool, all the changes you made in the tool will be lost.

Generate HTML Report for Directory Comparison

The **Generate HTML report for directory comparison** tool can be used to generate a report in the form of an HTML file that contains the results of a directory comparison (for either 2-way or 3-way comparisons).

The **Generate HTML report for directory comparison** action for invoking the tool can be found in the **Tools > Comparison Tools** menu. It opens a dialog box where you can specify the directories to compare as well as some other options.

Figure 94. Generate HTML Report for Directory Comparison Dialog Box

The **Generate HTML report for directory comparison** dialog box contains the following options:

Base directory

Specifies the path of the base directory that the other two directories will be compared against in a 3-way comparison. This field should be left empty for 2-way comparisons.

First directory

Specifies the path of the first directory to be included in the comparison.

Second directory

Specifies the path of the second directory to be included in the comparison.

Diff options

Specifies which option set to use for generating the comparison report. If you choose **Use the current settings from Preferences**, the options set in the **Directories Comparison preferences page (on page 255)** and the **include/exclude filter options in the Compare Directories tool (on page 454)** are taken into account when generating the comparison result. You can also click the **Diff options** button to open the **Directories Comparison preferences page** where you can see or modify the current settings. If you choose **Use the default settings**, the default values for all settings are used.

Generate additional file comparison reports

Generates further comparison reports for all non-binary modified file pairs and provides links to them in the main report (in the middle cells of the results table). *See the example below (on page 467)*. These additional file comparison reports are saved to a directory that will have the

same parent directory and the same name as the output file provided, suffixed by **"-OXY-FC-REPORTS"**. The links created in the main report are relative to this directory. If the main HTML report is later copied or moved to another location, to retain full functionality in the browser, the directory with the additional file comparison reports must also be copied/moved to the same location.

 **Note:**
Generating additional file comparison reports could significantly increase the execution time. A progress tracker for the whole operation is available.

 **Tip:**
An XPath expression specified in the **Ignore nodes by XPath** text field within the **Files Comparison preferences page (on page 252)** is now taken into account if you enable the **Generate additional file comparison reports** option.

Output file

Specifies the path for an output file to save the comparison results file.

Open in Browser/System Application

Opens the comparison results file in the browser or system application that is associated with HTML files.

After clicking the **Generate report** button, a report in the form of an HTML file is generated with details about the comparison results.

[Compare Directories Against a Base \(3-Way\) Tool \(on page 457\)](#)

[Compare Files Tool \(on page 433\)](#)

Viewing Status Information

Status information generated by operations such as *schema detection*, *manual validation*, *automatic validation*, and *transformations* are fed into the **Information** view, allowing you to monitor how the operation is being executed.

Figure 97. Information view messages

Messages contain a timestamp, the name of the thread that generated it, and the actual status information. The number of displayed messages can be controlled with the **Maximum number of lines** option (*on page 272*) in the **Views** preference page.

To make the view visible, select **Window > Show View > Information**.

Editor Highlights

An *editor highlight* is a text fragment emphasized by a colored background.

Highlights are generated when the following actions generate results:

- **Find/Replace in Files** (*on page 399*)
- **Find/Replace** (*on page 394*)
- **Open/Find Resource** (*on page 388*)
- **Find All**
- **Find All Elements** (*on page 405*)
- **XPath in Files** (*on page 372*)
- **Search References** (*on page 531*)
- **Search Declarations** (*on page 532*)

By default, Oxygen XML Developer uses a different color for each type of highlight (*XPath in Files, Find/Replace, Search References, Search Declarations, etc.*) You can customize these colors and the maximum

number of highlights displayed in a document on the [Editor preferences page \(on page 159\)](#). The default maximum number of highlights is 10000.

You can navigate the highlights in the current document by using the following methods:

- Clicking the markers from the range ruler, located at the right side of the editor pane.
- Clicking the **Next** and **Previous** buttons () from the bottom of the range ruler, located at the right side of the editor pane.

Note:

When there are multiple types of highlights in the document, the **Next** and **Previous** buttons () navigate through highlights of the same type.

- Clicking the messages displayed in the [Results view \(on page 503\)](#) view at the bottom of the editor.

To remove the highlights, you can do the following:

- Click the  **Remove all** button from bottom of the range ruler, located at the right side of the editor pane.
- Close the results tab at the bottom of the editor that contains the output of the action that generated the highlights.
- Click the  **Remove all** button on the right side of the [Results view \(on page 503\)](#) view at the bottom of the editor.

Note:

Use the  **Highlight all results in editor** button (on the right side of the **Results** panel) to either display all the highlights or hide them.

Printing a Document

Printing is supported in **Text** and **Grid** modes.

The **Print (Ctrl + P (Command + P on macOS))** action that is available from **File** menu displays a series of dialog boxes that allow you to configure print settings. After defining the settings in each dialog box, click **OK** to continue to the next one.

A **Print Preview** action is also available in the **File** menu. It first opens a **Page Setup** dialog box where you can define some paper, orientation, and margin settings. After you click **OK**, it displays the **Print Preview** dialog box where you can see a preview of how the document will look when it is printed..

Figure 98. Print Preview Dialog Box

The main window is split in three sections:

- **Preview area** - Displays the formatted document page as it will appear on printed paper.
- **Left stripe** - The left-side stripe that displays a list of thumbnail pages. Clicking any of them displays the page content in the main preview area.
- **Toolbar** - The toolbar area at the top that contains controls for printing, page settings, page navigation, print scaling, and zoom.

Other Printing Features

- If you are printing a document that is opened in **Text** mode and line numbers are displayed (the **Show line numbers option** (*on page 162*) is selected), the printed output will include the line numbers.
- If you are printing an XML document that is opened in **Text** mode and the *folding* support is activated (the **Enable folding option** (*on page 163*) is selected), the printed output will include the current *folded* state. Note that this applies to printing an entire document and not selections within the document.
- If you are printing an XML document that is opened in **Text** mode and a block of content is selected, you have the ability to print only the selection of text rather than the entire document. When you invoke the print action with a block of content selected in **Text** mode, a dialog box will be presented that offers you the choice to print the selection or the entire document.

8.

Editing Supported Document Types

Oxygen XML Developer includes *built-in frameworks* for the most popular XML document types (DITA, DocBook, TEI, XHTML, JATS) (*on page 1070*) with a full set of features (full editing support, document templates, enhanced CSS rendering, specific actions, validation, content completion, transformation scenarios, and more). In addition, Oxygen XML Developer provides support for editing numerous other types of documents (all XML document types and even some non-XML formats).

Each type of document has unique features and options and this chapter includes a large amount of information about editing numerous types of documents and various editing features that are provided in Oxygen XML Developer, including general information about *editing XML documents in Text mode* (*on page 471*), and *Grid mode* (*on page 534*).

Related information

[Built-in Frameworks \(Document Types\) \(on page 1070\)](#)

Editing XML Documents

The structure of an XML document and the required restrictions on its elements and their attributes are defined with an XML schema. For more information about schema association, see [Associating a Schema to XML Documents \(on page 582\)](#).

Oxygen XML Developer includes fully supported built-in *frameworks* (*on page 2269*) for the most popular XML document types (DITA, DocBook, TEI, XHTML, JATS) (*on page 1070*) with a full set of features. These built-in *frameworks* are defined according to a set of rules and a variety of settings that improve editing capabilities for its particular file type.

This section includes information about the user interface components and actions that are available in the various editing modes and numerous features to help you edit XML documents in any mode.

[Text Editing Mode \(on page 316\)](#)

[Grid Editing Mode \(on page 316\)](#)

[Built-in Frameworks \(Document Types\) \(on page 1070\)](#)

Editing XML Documents in Text Mode

This section includes topics that describe how to work with XML documents in **Text** mode, including various features, actions that are available, and much more.

The Oxygen XML Developer **Text** editing mode is designed to be a simple, yet powerful, XML source editor. You can use this mode to edit XML code, markup, and text and it provides support to help you transform, and debug XML-based documents. It is similar to other common text editors, but Oxygen XML Developer also includes numerous specialized editing actions, a powerful *Content Completion Assistant (on page 486)*, a helpful *Outline view (on page 494)*, and many other unique features.

To switch to this mode, select **Text** at the bottom of the editing area.

Navigating the Document Content in Text Mode

Oxygen XML Developer includes some useful features to help you navigate XML documents in **Text** mode.

Navigation Keyboard Shortcuts

Ctrl + CloseBracket (Command + CloseBracket on macOS)

Navigate to the next XML node.

Ctrl + OpenBracket (Command + OpenBracket on macOS)

Navigate to the previous XML node.

Ctrl + RightArrow (Command + RightArrow on macOS)

Navigate one word forward.

Ctrl + LeftArrow (Command + LeftArrow on macOS)

Navigate one word backward.

Ctrl + Home (Command + Home on macOS)

Position the cursor at the beginning of the document.

Ctrl + End (Command + End on macOS)

Position the cursor at the end of the document.

Navigating to a Modification

Oxygen XML Developer includes some actions that help you to quickly navigate to a particular modification. These navigation buttons are available in the main toolbar (they can also be accessed from the **Find** menu):

Last Modification

Navigates to the last modification in any open tab.

Back

Navigates to the last selected editor tab or to the last selected element/content in the current tab. You can also go back after clicking on links in **Text** or **Author** mode.

Forward

Available after you use the **Back** button at least once, and it navigates in the opposite direction as the **Back** button.

Navigating with the Outline View

Oxygen XML Developer includes an **Outline view** (on page 494) that displays a hierarchical tag overview of the currently edited XML Document.

You can use this view to quickly navigate through the current document by selecting nodes in the outline tree. It is synchronized with the editor area, so when you make a selection in the **Outline** view, the corresponding nodes are highlighted in the editor area.

Figure 99. Outline View Navigation in Text Mode

Using the Breadcrumb to Navigate

A *breadcrumb* on the top stripe indicates the path from the document root element to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.

Figure 100. Breadcrumb in Text Mode

The last element listed in the *breadcrumb* is the element at the current cursor position. The current element is also highlighted by a thin light blue bar for easy identification. Clicking an element from the *breadcrumb* selects the entire element and navigates to it in the editor area.

Navigating with the Go To Dialog Box

In **Text** mode, you can navigate precisely to a location in the document you are editing by using the **Go to** dialog box. To open this dialog box, press (**Ctrl+L (Command+L on macOS)**) or select **Find > Go to**.

Figure 101. Go to Dialog Box

The dialog box includes the following fields for specifying a specific navigation location:

- **Line** - Destination line in the current document.
- **Column** - Destination column in the current document.
- **Offset** - Destination offset relative to the beginning of document.

Navigating with Bookmarks

By using *bookmarks*, you can mark positions in an edited document so that you can return to it later. This is especially helpful for navigating through large documents or while editing multiple documents. You can place up to nine distinct *bookmarks* in any document. Shortcut keys are available to navigate to any of the marked positions (**Ctrl+1** through **Ctrl+9**). There are also shortcuts for creating bookmarks (**Ctrl+Shift+1** through **Ctrl+Shift+9**). You can also configure these shortcut keys in the **Options > Menu Shortcut Keys** (on page 260) menu.

Figure 102. Editor Bookmarks

1	86	<xsl:template name="customizePageTop">
	87	<xsl:param name="page"/>
	88	<xsl:param name="chapter"/>
	89	<xsl:param name="linksection"/>
	90	<xsl:param name="siteElement"/>
2	91	<xsl:param name="element"/>
	92	<xsl:param name="product"/>

To insert a *bookmark* in **Text** mode, do any of the following:

- Click in the vertical stripe on the left side of the editor (to the left of the line number).
- Press **F9** on your keyboard or use any of the specific bookmark creation shortcuts (**Ctrl+Shift+1** through **Ctrl+Shift+9**).
- Select the  **Create Bookmark** action from the **Edit > Bookmarks** menu.

To remove *bookmark* in **Text** mode, do either of the following:

- Left-click its icon in the vertical stripe.
- Right-click its icon on the vertical stripe and select **Remove** or **Remove all** (**Ctrl+F7** (**Command+F7** on macOS)).

To navigate to a specific *bookmark*, do either of the following:

- Use any of the specific bookmark navigation shortcuts (**Ctrl+1** through **Ctrl+9**).
- Use one of the actions available on the **Edit > Bookmarks > Go to** menu.

Tip:

The navigation shortcuts work even if the document where the bookmark was inserted has been closed. In this case, using the shortcut will automatically re-open the document.

Smart Editing in Text Mode

Oxygen XML Developer includes *smart editing* features to help you edit XML documents in **Text** mode. The following smart editing features are included:

- **Closing tag auto-expansion** - This feature helps save some keystrokes by automatically inserting a closing tag when you insert a complete start tag and the cursor is automatically placed in between the start and end tags. For instance, after entering a start `<tag>`, the corresponding closing `</tag>` is automatically inserted and the cursor is placed between the two (`<tag>|</tag>`).
- **Auto-rename matching tag** - When you edit the name of a start tag, Oxygen XML Developer will mirror-edit the name of the matching end tag. This feature can be controlled from the **Content Completion** option page (on page 179).
- **Auto-breaking the edited line** - The **Hard line wrap** option (on page 173) automatically breaks the edited line when its length exceeds the maximum line length defined for the format and indent operation (on page 173).
- **Indent on Enter** - The **Indent on Enter** option (on page 172) indents the new line inserted when you press **Enter**.
- **Smart Enter** - The **Smart Enter** option (on page 172) inserts an empty line between the start and end tags. If you press **Enter** between a start and end tag, the action places the cursor in an indented position on the empty line between the lines that contain the start and end tag.
- **Double-click** - A double-click selects certain text, depending on the position of the click in the document:
 - If the click position is on a start tag or end tag, then the element name is selected.
 - If the click position is immediately after the opening quote or immediately before the closing quote of an attribute value, then the entire attribute value is selected.
 - Otherwise, a double-click selects contiguous text.
- **Triple-click** - A triple-click selects entire regions of text, depending on the click position:
 - If the click position is on a start or end tag, then the entire tag is selected, including the start and end tags, and the content in between.
 - If the click position is after a start tag or before an end tag, then the entire content of the element without the start and end tags is selected.
 - If the click position is before a start tag or after an end tag, then the entire tag is selected, including the start and end tags, and the content in between.
 - If the click position is immediately before an attribute, then the entire attribute and its value are selected.
 - If the click position is in between the opening and closing quotes of an attribute value, then the entire attribute value is selected.
 - Otherwise, it selects the entire current line.

Shortcut Actions in Text Mode

Oxygen XML Developer includes numerous shortcut actions to help you edit content in the **Text** editing mode.

Changing the Font Size (Zoom)

The font size of the editor panel can be changed with the following actions that are available with shortcuts or in the **Document > Font size** menu:

Increase editor font (Ctrl + NumPad+ (Command + NumPad+ on macOS) or Ctrl + MouseWheelForward (Windows/Linux))

Increases the font size (zooms in) with one point for each execution of the action.

Note:

For macOS, if you activate the **Enable mouse-wheel zooming** option (*on page 161*) in the **Editor** preferences page, you can use **Command + MouseWheelForward** to increase the font size (zoom in). It is disabled by default due to the way inertia affects the mouse wheel on macOS.

Decrease editor font (Ctrl + NumPad- (Command + NumPad- on macOS) or Ctrl + MouseWheelBackwards (Windows/Linux))

Decreases the font size (zooms out) with one point for each execution of the action.

Note:

For macOS, if you activate the **Enable mouse-wheel zooming** option (*on page 161*) in the **Editor** preferences page, you can use **Command + MouseWheelBackwards** to decrease the font size (zoom out). It is disabled by default due to the way inertia affects the mouse wheel on macOS.

Normal editor font (Ctrl + 0 (Command + 0 on macOS))

Resets the font size to the value of the editor font set in the **Fonts** preferences page (*on page 123*).

Undo/Redo Actions

The typical undo and redo actions are available with shortcuts or in the **Edit** menu:

Undo (Ctrl + Z (Command + Z on macOS))

Reverses a maximum of 200 editing actions (configurable with the **Undo history size** option (*on page 160*) in the **Editor** preferences page) to return to the preceding state.

Note:

Complex operations such as **Replace All** or **Indent selection** count as single undo events.

Redo (Ctrl + Y (Command + Shift + Z on macOS, Ctrl + Shift + Z on Linux/Unix))

Recreates a maximum of 100 editing actions that were undone by the **Undo** function.

Copy and Paste Actions

The typical copying and pasting actions are available with shortcuts or in the contextual menu (or the **Edit** menu):

Cut (Ctrl + X (Command + X on macOS))

Removes the currently selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on macOS))

Places a copy of the currently selected content in the clipboard.

Paste (Ctrl + V (Command + V on macOS))

Inserts the current clipboard content into the document at the cursor position.

Select All (Ctrl + A (Command + A on macOS))

Selects the entire content of the current document.

Moving XML Nodes

You can use the following shortcuts to move XML elements or XSLT variables up or down in **Text** mode:

Ctrl + Alt + UpArrow (Command + Option + UpArrow on macOS)

Moves the node up one line.

Ctrl + Alt + DownArrow (Command + Option + DownArrow on macOS)

Moves the node down one line.

Note:

The requirements for these node moving actions to work are as follows:

- The mechanism is designed to work without a selection. If you use these actions on a selection of content, it moves the entire selection. To make this mechanism work as intended, simply position the cursor somewhere on the line that you want to move.
- A start tag must be the first text occurrence on the line where the cursor is positioned.
- On the line where the element ends, only whitespaces are allowed after the end tag.

Miscellaneous Shortcut Actions in Text Mode

Oxygen XML Developer also includes the following other miscellaneous shortcut actions in **Text** mode:

Ctrl + Delete (Command + Delete on macOS)

Deletes the next word.

Ctrl + Backspace (Command + Backspace on macOS)

Deletes the previous word.

Ctrl + W (Command + W on macOS)

Cuts the previous word.

Ctrl + K (Command + K on macOS)

Cuts to end of line.

Ctrl + Single-Click (Command + Single-Click on macOS)

Use this shortcut to open any of the following:

- Any absolute URL (URLs that have a protocol), regardless of their location in the document.
- URI attributes such as: `@schemaLocation`, `@noNamespaceSchemaLocation`, `@href` and others.
- Open the target for DITA references (such as a `@conref`, `@conkeyref`, `@keyref`, and more).
- Processing instructions used for associating resources, xml-models, xml-stylesheets.

Ctrl + Shift + Y (Command + Shift + Y on macOS) (Document > Edit > Toggle Line Wrap)

Enables or disables line wrapping. When enabled, if text exceeds the width of the displayed editor, content is wrapped so that you do not have to scroll horizontally.

Editing XML Markup in Text Mode

Oxygen XML Developer includes some useful actions that allow you to easily edit XML markup in **Text** mode. These actions are available in the **Refactoring** submenu of the contextual menu and in the **Document > Markup** menu, and many of the actions can also be done with simple keyboard shortcuts.

Using the Breadcrumb

A *breadcrumb* on the top stripe indicates the path from the document root element to the current element. It can also be used as a helpful tool to insert and edit specific elements in the document structure.

Figure 103. Breadcrumb in Text Mode

The last element listed in the *breadcrumb* is the element at the current cursor position. The current element is also highlighted by a thin light blue bar for easy identification. Clicking an element in the *breadcrumb* selects the entire element in the editor area. Also, each element provides a contextual menu with access to the following actions:

Append Child

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it as a child of the current element.

Insert Before

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately before the current element, as a sibling.

Insert After

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately after the current element, as a sibling.

Edit Attributes

Opens an editing window that allows you to edit the attributes of the currently selected element.

Toggle Comment

Encloses the currently selected element in a comment, if the element is not already commented. If it is already commented, this action will remove the comment.

Cut

Removes the selected element and copies it to the clipboard.

Copy

Copies the selected element to the clipboard.

Delete

Deletes the currently selected element.

Move Nodes

You can easily move XML nodes in the current document by using the following shortcut keys:

Alt + UpArrow (Option + UpArrow on macOS)

Moves the current node or selected nodes in front of the previous node.

Alt + DownArrow (Option + DownArrow on macOS)

Moves the current node or selected nodes after the subsequent node.

Rename Elements

You can rename elements by using the following actions in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

Rename Prefix (Alt + Shift + P (Command + Shift + P on macOS))

The prefix of the element from the cursor position, and any elements with the same prefix, can be renamed according with the options from the **Rename** dialog box.

- If you select the **Rename current element prefix** option, the application will recursively traverse the current element and all its children. *For example*, to change the `xmlns:p1="ns1"` association in the current element to `xmlns:p5="ns1"`, if the `xmlns:p1="ns1"` association is applied on the parent element, then Oxygen XML Developer will introduce `xmlns:p5="ns1"` as a new declaration in the current element and will change the prefix from `p1` to `p5`. If `p5` is already associated with another namespace in the current element, then the conflict will be displayed in a dialog box. By pressing **OK**, the prefix is modified from `p1` to `p5` without inserting a new declaration.
- If you select the **Rename current prefix in all document** option, the application will apply the change on the entire document.
- To also apply the action inside attribute values, select the **Rename also attribute values that start with the same prefix** checkbox.

Surround Content with Tags (Wrap)

You can surround a selection of content with tags (*wrap* the content) by using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

Surround with submenu

Presents a drop-down menu that allows you to choose a tag to surround a selected portion of content.

Surround with Tags (**Ctrl + E** (**Command + E** on macOS))

Allows you to choose a tag that encloses a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags** option (*on page 180*) is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags** option (*on page 180*) is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround with '[tag]' (**Ctrl + ForwardSlash** (**Command + ForwardSlash** on macOS))

Surround the selected content with the last tag used.

Unwrap the Content of Elements

You can unwrap the content of an element by using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

Delete element tags (**Alt + Shift + X** (**Command + Option + X** on macOS))

Deletes the start and end tag of the current element.

Join or Split Elements

You can join or split elements in the current document by using the following actions in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

Join elements (Alt + Shift + J (Command + Option + J on macOS))

Joins the left and right elements relative to the current cursor position. The elements must have the same name, attributes, and attributes values.

Split element (Alt + Shift + D (Ctrl + Option + D on macOS))

Split the element from the cursor position into two identical elements. The cursor must be inside the element.

Other Refactoring Actions

You can also manage the structure of the markup by using the other specific XML refactoring actions that are available in the **Refactoring** submenu of the contextual menu:

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

[Frequently Used Shortcut Keys \(on page 36\)](#)

Folding XML Elements in Text Mode

When working with a large document, the *folding* (on page 2269) support in Oxygen XML Developer can be used to collapse some element content leaving only those that you need to edit in focus. Expanding and collapsing works on individual elements. Expanding an element leaves the child elements unchanged.

By default, the *folding* (on page 2269) feature is enabled in Oxygen XML Developer, but it can be disabled in the **Text** preferences page with the **Enable folding** option (on page 163).

Figure 104. Folding of XML Elements in Text Mode

The fact that the folds are persistent is a unique feature of Oxygen XML Developer. The next time you open the document the folds are restored to its last state.

Folding Actions in Text Mode

Element folds are marked with a small triangle (▾ / ▸) in the left stripe. To toggle the fold, simply click the icon. Also, if you right-click the icon, the following actions are available:

Collapse Other Folds

Folds all the elements except the current element.

Collapse Child Folds

Folds the child elements that are indented one level inside the current element.

Expand Child Folds

Unfolds all child elements of the currently selected element.

Expand All

Unfolds all elements in the current document.

Resources

For more information about the *folding* support in Oxygen XML Developer, watch our video demonstration:

https://www.youtube.com/embed/eR9HfN_peAE

Drag and Drop in Text Mode

To move a whole region of text to other location in the same edited document, just select the text, drag the selection by holding down the left mouse button and drop it to the target location.

You can also copy content from other applications and paste it into the document.

Selecting Content in Text Mode

Oxygen XML Developer includes a variety of keyboard shortcuts that allow you to select content in **Text** mode. These include numerous standard continuous selection possibilities that are common to many text editors, as well as a selection feature that allows you to select a rectangular area within a document in **Text** mode.

Standard Continuous Selection Shortcuts

Ctrl + A (Meta + A on macOS)

Selects all content in the document.

Shift + Left/Right Arrow Keys

Begins a continuous selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys.

Shift + Up/Down Arrow Keys

Begins a continuous selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys.

Ctrl + Shift + Left/Right Arrow Keys (Meta + Shift + Left/Right Arrow Keys on macOS)

Begins a continuous selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

Shift + Home

Begins a continuous selection at the cursor position and extends it to the beginning of the current line (on macOS, it extends to the beginning of the document).

Shift + End

Begins a continuous selection at the cursor position and extends it to the end of the current line (on macOS, it extends to the end of the document).

Ctrl + Shift + Home

Begins a continuous selection at the cursor position and extends it to the beginning of the document.

Ctrl + Shift + End

Begins a continuous selection at the cursor position and extends it to the end of the document.

Shift + PageUp

Begins a continuous selection at the cursor position and extends it up one screen page.

Shift + PageDown

Begins a continuous selection at the cursor position and extends it down one screen page.

Double-Click

Selects certain text, depending on the position of the click in the document. See [Smart Editing: Double-Click \(on page 475\)](#) for the specifics.

Triple-Click

Selects entire regions of text, depending on the position of the click in the document. See the [Smart Editing: Triple-Click \(on page 475\)](#) for the specifics.

Right-Click > Select > Element

Selects the entire element at the current cursor position.

Right-Click > Select > Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Right-Click > Select > Attributes

Selects all the attributes of the element at the current cursor position.

Right-Click > Select > Parent

Selects the entire parent element at the current cursor position.

Rectangular Selection Shortcuts

Oxygen XML Developer also includes some keyboard shortcuts that allow you to select a rectangular block of content in **Text** mode and you can then copy, cut, paste, delete, or edit the selection.

**Attention:**

The rectangular selection shortcuts will not work if the [Line Wrap option \(on page 163\)](#) is selected in the **Text** preferences page.

The following shortcuts can be used to create a rectangular selection:

Alt + Mouse Click + Mouse Movement (Option + Meta + Mouse Click + Mouse Movement on macOS)

Begins a rectangular selection at the mouse click position and extends it in the direction that you move the mouse. Release **Alt (Alt + Meta on macOS)** to enter the [in-place editing mode \(on page 486\)](#).

Shift + Alt + Left/Right Arrow Keys (Shift + Option + Meta + Left/Right Arrow Keys on macOS)

Begins a rectangular selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys (you can also use the mouse to extend the selection).

Shift + Alt + Up/Down Arrow Keys (Shift + Option + Meta + Up/Down Arrow Keys on macOS)

Begins a rectangular selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys (you can also use the mouse to extend the selection).

Ctrl + Shift + Alt + Left/Right Arrow Keys (Ctrl + Shift + Option + Meta + Left/Right Arrow Keys on macOS)

Begins a rectangular selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

Shift + Alt + Home (Shift + Option + Meta + Home on macOS)

Begins a rectangular selection at the cursor position and extends it to the beginning of the current line.

Shift + Alt + End (Shift + Option + Meta + End on macOS)

Begins a rectangular selection at the cursor position and extends it to the end of the current line.

Shift + Alt + PageUp (Shift + Option + Meta + PageUp on macOS)

Begins a rectangular selection at the cursor position and extends it up one screen page.

Shift + Alt + PageDown (Shift + Option + Meta + PageDown on macOS)

Begins a rectangular selection at the cursor position and extends it down one screen page.

You can then use standard editing actions to copy, cut, paste, or delete the entire selection.

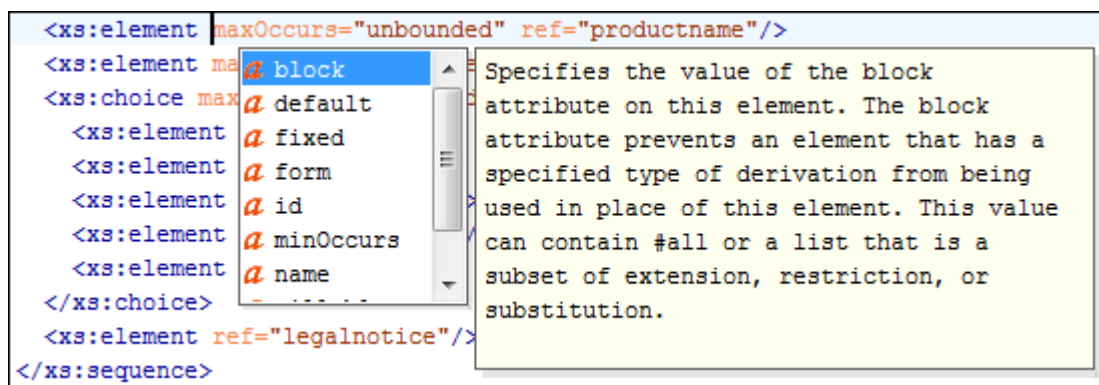

In-Place Editing Mode

To edit the content of the rectangular selection, you can enter an in-place editing mode by releasing the **Alt** key (on macOS, release both **Alt** & **Meta**). Once you are in the editing mode, you can simply use your keyboard to edit the entire selection of content, or click anywhere inside the selection to edit the content at the cursor position for all lines within the selection at once (as if the rectangular selection is a selection of columns). To exit the editing mode, press either **Enter** or **Esc**.

Content Completion Assistant in Text Mode

Oxygen XML Developer includes an intelligent *Content Completion Assistant (on page 2267)* that offers proposals for inserting structured language elements, attributes, and attribute values that are valid in the current editing context.

The *Content Completion Assistant* is enabled by default. To disable it, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#), go to **Editor > Content Completion**, and deselect the **Enable content completion** option [\(on page 179\)](#).

Figure 105. Content Completion Assistant

Content Completion and the Associated Schema

The *Content Completion Assistant* feature is schema-driven and the list of proposals in the *Content Completion Assistant* (on page 2267) depend on the associated schemas (DTD, XML Schema, Relax NG, or NVDL schema). For information about the various ways to associate a schema and the order of their precedence, see the *Associating a Schema to XML Documents* (on page 582) section.

Using the Content Completion Assistant in Text Mode

The feature is activated in **Text** mode in the following situations:

- After you enter the `<` character when inserting an element, it is automatically activated after a short delay. You can adjust the activation delay with the **Activation delay of the proposals window (ms)** option (on page 181) from the **Content Completion** preferences page.
- After typing a partial element or attribute name, you can manually activate it by pressing **Ctrl + Space** or **Alt + ForwardSlash (Command + Option + ForwardSlash on macOS)**. If there is only one valid proposal at the current location, it is inserted without displaying the list of proposals.

You can navigate through the list of proposals by using the **Up** and **Down** keys on your keyboard. In some cases, the *Content Completion Assistant* displays a documentation window with information about the particular proposal and some of them have links to additional information (for example, DITA elements might have a link to the DITA Style Guide). You can also change the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal in **Text** mode, do one of the following:

- Press **Enter** or **Tab** to insert both the start and end tags and position the cursor inside the start tag in a position suitable for inserting attributes.
- Press **Ctrl + Enter (Command + Enter on macOS)** to insert both the start and end tags and positions the cursor between the tags in a position where you can start typing content.

**Note:**

When the DTD, XML Schema or RELAX NG schema specifies required child elements for the newly added element, they are inserted automatically only if the **Add Element Content** option (on page 180) (in the **Content Completion** preferences page) is selected. The *Content Completion Assistant* can also add optional content and first choice particle, as specified in the DTD, XML Schema, or RELAX NG schema. To activate these features, select the **Add optional content** (on page 180) and **Add first Choice particle** (on page 180) options in the **Content Completion** preferences page.

After inserting an element, the cursor is positioned:

- Before the > character of the start tag, if the element allows attributes, to allow rapid insertion of any of the attributes supported by the element. Pressing the space bar displays the Content Completion list once again. This time it contains the list of allowed attribute names. If the attribute supports a fixed set of parameters, the assistant list displays the list of valid parameters. If the parameter setting is user-defined and therefore variable, the assistant is closed to allow manual insertion. The values of the attributes can be learned from the same elements in the current document.
- After the > character of the start tag, if the element has no attributes.

Where the Content Completion Assistant is Displayed

The *Content Completion Assistant* is displayed:

- Anywhere within a tag name or at the beginning of a tag name in an XML document, XML Schema, DTD, or Relax NG (full or compact syntax) schema.
- Anywhere within an attribute name or at the beginning of an attribute name in any XML document with an associated schema.
- Within attribute values or at the beginning of attribute values in XML documents where lists of possible values have been defined for that element in the schema associated with the document.

Types of Proposals Listed in the Content Completion Assistant

The following things are considered for determining the proposals that are listed in the content completion window:

Element Structure Specified in DTD or Schema

The proposals that populate the *Content Completion Assistant* depend on the element structure specified in the DTD, XML Schema, Relax NG (full or compact syntax) schema, or NVDL schema associated with the edited document.

**Note:**

The *Content Completion Assistant* is able to offer elements defined both by XML Schemas version 1.0 and 1.1.

Current Cursor Position

The number and type of elements displayed by the *Content Completion Assistant* is dependent on the cursor's current position in the structured document. The child elements displayed within a given element are defined by the structure of the specified DTD, XML Schema, Relax NG (full or compact syntax) schema, or NVDL schema.

Unique ID Attribute Values

A schema may declare certain attributes as *ID* or *IDREF/IDREFS*. When the document is validated, Oxygen XML Developer checks the uniqueness and correctness of the `@id` attributes. It also collects the attribute values declared in the document to prepare the list of proposals. This is available for documents that use DTD, XML Schema, and Relax NG schema.

Values for *xml:id* Attributes

Values of all the `@xml:id` attributes are handled as `@id` attributes. They are collected and displayed by the *Content Completion Assistant* as possible values for *anyURI* attributes defined in the schema of the edited document. This works only for XML Schema and Relax NG schemas.

Links/References in DITA

When entering values for the various types of links and references in DITA (for example, values for `@href` or `@conref` elements), the *Content Completion Assistant* will propose potential targets when you use the forward slash key (*/*).

ID Values for DITA Key References

In DITA, when inserting key references (`@keyref`) or content key references (`@conkeyref`), the ID values that are defined in the key reference are presented as possible targets. The *Content Completion Assistant* will only propose targets that are valid in the current context.

Element and Attribute Values

For documents that use an XML Schema or Relax NG schema, the *Content Completion Assistant* offers proposals for attribute and element values as long as the allowed values are defined in the schema. Also, if a default value or fixed value is defined in the schema, then that value is offered in the *Content Completion Assistant*.

Schema Annotations in Text Mode

A schema annotation is a documentation snippet associated with the definition of an element or attribute in a schema. If such a schema is associated with an XML document, the annotations are displayed in:

- The *Content Completion Assistant* (on page 2267).
- A small tooltip window shown when the mouse hovers over an element or attribute. The tooltip window can be invoked at any time by using the **F2** shortcut.

The schema annotations support is available if the schema type is one of the following:

- XML Schema
- Relax NG

- NVDL schema
- DTD

This feature is enabled by default, but you can disable it by deselecting the **Show annotations in Content Completion Assistant** (on page 185) option in the **Annotations** preferences page.

Styling Annotations with HTML

You can use HTML format in the annotations you add in an XML Schema or Relax NG schema. This improves the visual appearance and readability of the documentation window displayed when editing XML documents validated against such a schema. An annotation is recognized and displayed as HTML if it contains at least one HTML element (such as `<div>`, `<body>`, `<p>`, `
`, `<table>`, ``, or ``).

The HTML rendering is controlled by the **Show annotations using HTML format, if possible** (on page 185) option in the **Annotations** preferences page. When this option is deselected, the annotations are converted and displayed as plain text and if the annotation contains one or more HTML tags (`<p>`, `
`, ``, ``), they are rendered as an HTML document loaded in a web browser. For example, `<p>` begins a new paragraph, `
` breaks the current line, `` encloses a list of items, and `` encloses an item of the list.

Collecting Annotations from XML Schemas

In an XML Schema, the annotations are specified in an `<xs:annotation>` element like this:

```
<xs:annotation>
  <xs:documentation>
    Description of the element.
  </xs:documentation>
</xs:annotation>
```

If an element or attribute does not have a specific annotation, then Oxygen XML Developer looks for an annotation in the type definition of that element or attribute.

Collecting Annotations from Relax NG Schemas

For Relax NG schema, element and attribute annotations are made using the `<documentation>` element from the `http://relaxng.org/ns/compatibility/annotations/1.0` namespace like this:

```
<define name="person" >
  <element name="person">
    <a:documentation xmlns:a="http://relaxng.org/ns/compatibility/annotations/1.0">
      Information about a person. </a:documentation>
    <ref name="name" />
    <zeroOrMore>
    <ref name="email" />
    </zeroOrMore>
  </element>
</define>
```

However, any element outside the Relax NG namespace (<http://relaxng.org/ns/structure/1.0>) is handled as annotation and the text content is displayed in the annotation window. To activate this behavior, select the **Use all Relax NG annotations as documentation** ([on page 186](#)) option in the **Annotations** preferences page.

Collecting Annotations from Relax NG Compact Syntax Schemas

For Relax NG Compact Syntax schema, annotations are made using comments like this:

```
## Information about a person.
element person { name, email* }
```

Collecting Annotation from DTDs

For DTD, Oxygen XML Developer defines a custom mechanism for annotations using comments enabled by the **Prefer DTD comments that start with "doc:" as annotations** ([on page 185](#)) option in the **Annotations** preferences page. The following is an example of a DTD annotation:

```
<!--doc:Description of the element. -->
```

Content Completion Helper Views (Text Mode)

Information about the current element being edited is also available in various *dockable* ([on page 2268](#)) views, such as the **Model view** ([on page 499](#)), **Attributes view** ([on page 497](#)), **Elements view** ([on page 501](#)), and **Entities view** ([on page 501](#)). By default, they are located on the right-hand side of the main editor window. These views, along with the powerful **Outline view** ([on page 494](#)), provide spatial and insight information about the edited document and the current element. If any particular view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Code Templates

Code templates are code fragments that can be inserted quickly at the current editing position. Oxygen XML Developer includes a set of built-in code templates for CSS, Schematron, XSL, XQuery, JSON, HTML, and XML Schema document types. You can also define your own code templates for any type of file and share them with others.

Code templates are displayed with a  symbol in the content completion list (**Enter** in **Author** mode or **Ctrl + Space** in **Text** mode). Also, in **Text** mode you can press **Ctrl + Shift + Space** to see a complete list of the available code templates. To enter the code template at the cursor position, select it from the content completion list or type its code and press **Enter**. If a shortcut key has been assigned to the code template, you can also use the shortcut key to enter it.

How to Create Code Templates

To create a code template, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Editor > Content Completion > Code Templates**.
2. Click **New** to open a code template configuration dialog box.

**Tip:**

You can use one of the existing code templates as a starting point by selecting that template and clicking **Duplicate**.

Figure 106. Code Template Configuration Dialog Box

3. Configure your template using the fields in the code template configuration dialog box:
 - **Name** - The name of the code template.
 - **Description** - [Optional] The description of the code template that will appear in the **Code Templates** preferences page and in the tooltip message when selecting it from the **Content Completion Assistant** (on page 2267). HTML markup can be used for better rendering.
 - **Associate with** - You can choose to set the code template to be associated with a specific type of editor or for all editor types.
 - **Shortcut key** - [Optional] If you want to assign a shortcut key that can be used to insert the code template, place the cursor in the **Shortcut key** field and press the desired key combination on your keyboard. Use the **Clear** button if you make a mistake. If the **Enable platform-independent shortcut keys** checkbox is selected, the shortcut is platform-independent and the following modifiers are used:
 - **M1** represents the **Command** key on macOS, and the **Ctrl** key on other platforms.
 - **M2** represents the **Shift** key.

- **M3** represents the **Option** key on macOS, and the **Alt** key on other platforms.
- **M4** represents the **Ctrl** key on macOS, and is undefined on other platforms.
- **Content** - Text box where you define the content that is used when the code template is inserted.
An *editor variable* ([on page 289](#)) can be inserted in the text box using the  **Insert Editor Variables** button.

4. Click **OK** to save your new code template.

Result: Your code template can now be selected using the *Content Completion Assistant* ([on page 2267](#)) (**Enter** in **Author** mode or **Ctrl + Space** in **Text** mode). The code templates are displayed with a  symbol.

How to Share Code Templates

There are two ways to easily share all of your code templates with other members of your team:

Method 1: Export/Import

1. Open the **Preferences** dialog box (**Options > Preferences**) ([on page 114](#)) and go to **Editor > Templates > Code Templates**.
2. Click the **Export** button to export all of your code templates into an XML file.
3. Save the XML file.
4. Share the XML file with other members of your team.
5. Instruct them to [open the Preferences dialog box \(Options > Preferences\)](#) ([on page 114](#)), go to **Editor > Templates > Code Templates**, click the **Import** button, and select the file you sent them.

Result: The code templates will be now available in their content completion list.

Method 2: Share Project

1. Open the **Preferences** dialog box (**Options > Preferences**) ([on page 114](#)) and go to **Editor > Templates > Code Templates**.
2. Select **Project Options** at the bottom of the dialog box. This stores the preferences in the project file (`.xpr`).
3. Share the project file with the other members of your team. For example, you can commit it to your version control system and have them update their working copy.

Result: When they open the updated project file in their , the code templates will be available in their content completion list.

Text Mode Views

There is a variety of *dockable* ([on page 2268](#)) helper views that are displayed by default in **Text** mode.

There are also a large selection of additional views available in the **Window > Show View** menu. This section presents some of the most helpful views for editing in **Text** mode.

Outline View for XML Documents

The **Outline** view displays a general tag overview of the currently edited XML document. When you edit a document, the **Outline** view dynamically follows the changes that you make, displaying the node that you modify. This functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.

Outline View Features

The **Outline** view allows you to:

- Quickly navigate through the document by selecting nodes in the **Outline** tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the **Outline** view, and vice versa.
- View document errors, as they are highlighted in the **Outline** view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

Outline View Interface

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as `*` or `?`) and separate multiple patterns with commas.

It also includes a  **Settings** menu in the top-right corner that presents a variety of options to help you filter the view even further.

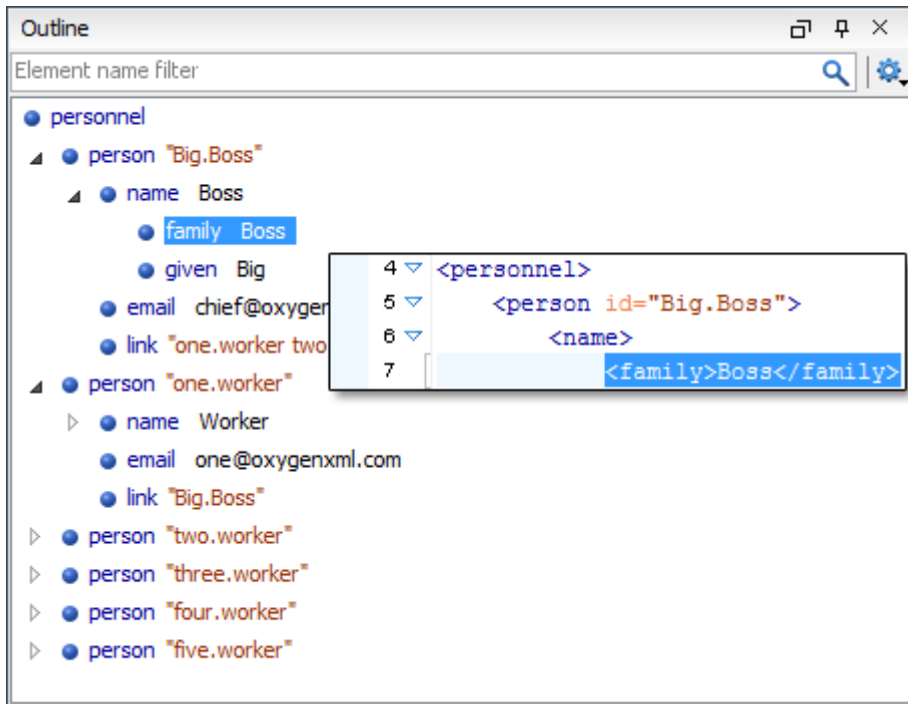

Drag and Drop Actions in the Outline View

Entire XML elements can be moved or copied in the edited document using only the mouse in the **Outline** view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the **Outline** view and drop it on another node, then the dragged element will be moved after the drop target element.
- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.

- You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
- If you hold down the **Ctrl (Command on macOS)** key after dragging, a copy operation will be performed instead of a move.

Figure 107. Outline View

Outline View Filters

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as * or ?) and separate multiple patterns with commas.

The following actions are available in the  **Settings** menu of the **Outline** view:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

Selection update on cursor move (Available in Text mode)

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

 **Show element name**

Show/hide element name.

 **Show text**

Show/hide additional text content for the displayed elements.

 **Show attributes**

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the [Outline preferences panel](#) (*on page 272*).

 **Configure displayed attributes**

Displays the [XML Structured Outline preferences page](#) (*on page 272*).

Outline View Contextual Menu Actions

The contextual menu of the **Outline** view contains the following actions:

 **Edit Attributes**

Displays an in-place attributes editor that allows you to edit the attributes of a selected node.

Append Child

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection as a child of the current element.

Insert Before

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately before the current element, as a sibling.

Insert After

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately after the current element, as a sibling.

 **Cut**,  **Copy**,  **Paste**,  **Delete common editing actions**

Executes the typical editing actions on the currently selected elements. The **Cut** and **Copy** operations preserve the styles of the copied content.

 **Toggle Comment**

Encloses the currently selected element in a comment, if the element is not already commented. If it is already commented, this action will remove the comment.

Expands the structure tree of the currently selected element.

 **Collapse All**

Collapses all of the structure tree of the currently selected node.

**Tip:**

You can copy, cut or delete multiple nodes in the **Outline** by using the contextual menu after selecting multiple nodes in the tree.

Attributes View in Text Mode

The **Attributes** view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

You can use the **Attributes** view to insert attributes, edit their values, or add values to existing attributes.

The attributes are rendered differently depending on their state:

- The names of the attributes are rendered with a bold font, and their values with a plain font.
- Default values are rendered with a plain font, painted gray.
- Empty values display the text "[empty]", painted gray.
- Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the **Value** column. If the possible values of the attribute are specified as `list` in the schema of the edited document, the **Value** column acts as a combo box that allows you to either select the value from a list or manually enter it.

You can sort the attributes table by clicking the **Attribute** column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

Figure 108. Attributes View

Expand/Collapse Button

There is an **Expand/Collapse** () button at the top-right of the view. When expanded, this presents the following additional combo boxes:

Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view. You can use the

 **Remove** button to delete an attribute and its value from the selected element.

Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the  **Browse** button to select a URL for the value of an attribute. You can also press **Ctrl + Space** to open a content completion window that offers a list of possible choices and allows you to select multiple values. After you have entered or selected a value, use the  **Update** button (or press **Enter**) to add the value to the attribute.

Note:

For built-in frameworks, if the selected attribute in the **Name** field is an `@id` attribute, the  **Browse** button is replaced by a  **Generate Unique ID Value** button. Clicking this button will automatically generate a unique ID for the selected element.

Contextual Menu Actions in the Attributes View

The following actions are available in the contextual menu of the **Attributes** view when editing in **Text** mode:

Add

Allows you to insert a new attribute.

Set empty value

Specifies the current attribute value as empty.

Remove

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the **Delete** or **Backspace** keys.

Copy

Copies the `attrName="attrValue"` pair to the clipboard. The `attrValue` can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

Paste

Depending on the content of the clipboard, the following cases are possible:

- If the clipboard contains an attribute and its value, both of them are introduced in the **Attributes** view. The attribute is selected and its value is changed if they exist in the **Attributes** view.
- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the **Attributes** view and you can start editing it. The attribute is selected and you can start editing it if it exists in the **Attributes** view.
- If the clipboard only contains text, the value of the selected attribute is modified.

Model View

The **Model** view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 109. Model View

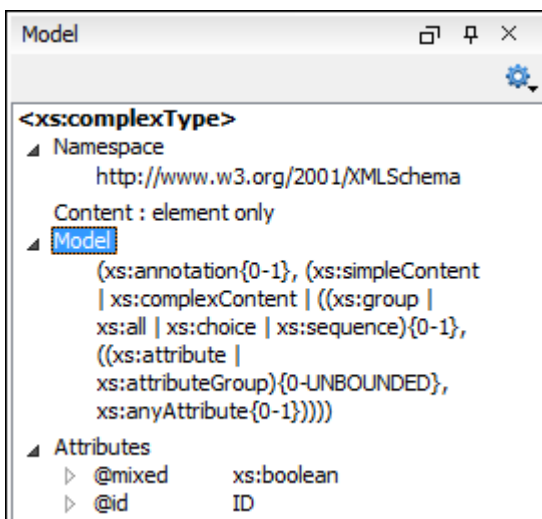

The **Model** view is comprised of two sections, an element structure panel and an annotations panel.

Element Structure Panel

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

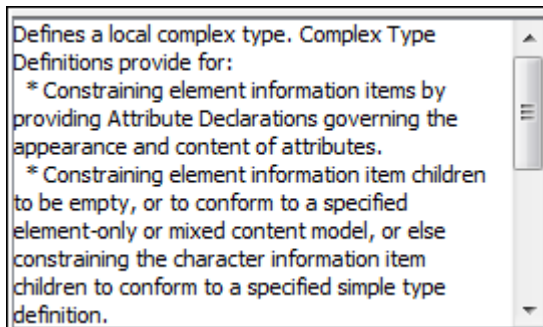

Figure 110. Element Structure Panel

Annotation Panel

The **Annotation** panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

Figure 111. Annotation panel

Elements View in Text Mode

The **Elements** view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Double-clicking any of the listed elements inserts that element into the edited document, at the current cursor position. Pressing **F2** with an element selected will display information about that particular element.

Figure 112. Elements View in Text Mode

Entities View

Entities provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An *entity* is defined using the `ENTITY` statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- **Predefined** - Entities that are part of the predefined XML markup (<, >, &, ', ").
- **Internal** - Defined in the DOCTYPE declaration header of the current XML.
- **External** - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

**Note:**

If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The **Entities** view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

Figure 113. Entities View

Name	Value
lt	<
gt	>
amp	&
apos	'
quot	"
abbrev-d-att	(topic abbrev-d)
concept-att	(topic concept)
hazard-d-att	(topic hazard-d)
hi-d-att	(topic hi-d)
included-domains	&concept-att; ...
indexing-d-att	(topic indexing-d)
nbs	
pr-d-att	(topic pr-d)
sw-d-att	(topic sw-d)
ui-d-att	(topic ui-d)
ut-d-att	(topic ut-d)

The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

**Note:**

When entering filters, you can use the ? and * wildcards. Also, you can enter multiple filters by separating them with a comma.

Results View

The **Results** view displays the messages generated as a result of user actions such as validations, transformations, search operations, and others. Each message is a link to the location related to the event that triggered the message. Double-clicking a message opens the file containing the location and positions the cursor at the location offset. The **Results** view is automatically opened when certain actions generate result messages. By default, the view normally opens at the bottom of the editor, but it is *dockable* (on page 2268), so it can be moved to another UI location alongside other side views.

**Tip:**

To shift focus to the open **Results** view without using the mouse, there is an action in the **Window > Results** menu called **Focus Results** that can be used for this purpose and you can [assign a keyboard shortcut](#) (on page 260) to this action.

The actions that contribute messages to this view include:

- **Validation** actions (on page 546)
- **Transformation** actions (on page 1098)
- **Check Spelling in Files** action (on page 420)
- **Find All** action from the **Find/Replace** dialog box (on page 394)
- **Find/Replace in Files** dialog box (on page 399)
- **Search References** action (on page 680)
- XPath expression results (on page 1733)
- SQL results (on page 1800)

Figure 114. Results View

<ul style="list-style-type: none"> <ul style="list-style-type: none"> <title>The XPath Results View</title> 	oxygen-xpath-view.dita	12:30

Results View Toolbar Actions

The view includes a toolbar with the following actions:

Settings drop-down menu

This drop-down menu also includes the following options:

Group by "Severity"

Groups the results based upon the severity of the validation issues.

Group by "Resource"

Groups the results based upon the type of resource.

Group by "System ID"

Groups the results based upon the system ID of the resource.

Group by "Operation description"

Groups the results based upon the description of the validation issue.

Ungroup all

Removes the grouping rules so that the messages are presented in a continuous list.

Show group columns

If any of the **Group by** options are selected, you can use this option to show or hide grouping columns.

Restore default grouping

Restores the column size for each column and the grouping rules that were saved in the user preferences the last time when this view was used. If it is the first time this view is used, the action sets an initial default column size for each column and a grouping rule that is appropriate for the type of messages. For example:

- Group the messages by the path of the validated file if there are error messages from a validation action or spelling errors reported by the **Check Spelling in Files** action (*on page 420*).
- No grouping rule for the results of **applying an XPath expression** (*on page 1732*).

Include problem ID in description

If this option is selected, validation issues will include the problem ID (as provided by the validation engine) in the **Description** column.

Show Ignored Problems

If you have **ignored validation problems** (*on page 578*), you can deselect this option to hide the ignored problems. Likewise, you can select this option to show the ignored problems.

Highlight all results in editor

Oxygen XML Developer highlights all matches obtained after executing an XPath expression, or performing one of the following operations: **Find All**, **Find in Files**, **Search References**, and **Search Declarations**. Click **Highlight all results in editor** again to turn off highlighting.

**Note:**

To customize highlighting behavior, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **Editor > Highlights category**. You can do the following customizations:

- Set a specific color of the highlights depending on the type of action you make.
- Set a maximum number of highlights that the application displays at any given time.

✕ Remove selected

Removes the current selection from the view. This can be helpful if you want to reduce the number of messages, or remove those that have already been addressed or not relevant to your task.

✕ Remove all

Removes all messages from the view.

Results View Contextual Menu Actions

The following actions are available when the contextual menu is invoked in this view:

Learn Word(s) (Available when spelling errors are reported in the Results view)

Adds the word(s) to a list of learned words to instruct the spell checker engine to not report the word(s) as spelling errors in the future.

Show message

Displays a dialog box with the full error message, which is useful for a long message that does not have enough room to be displayed completely in the view.

↑ Previous message

Navigates to the message above the current selection.

↓ Next message

Navigates to the message below the current selection.

Apply all default quick fix proposals

This action is available for the tabs in the **Results** view that displays the problems reported after a single file or batch validation operation. In the first phase, the quick fix proposals associated with the presented validation errors are automatically identified and mapped to the

corresponding document (if multiple quick fix proposals are available for the same validation error, only the first one is considered). Depending on the number of quick fixes to be applied, the next phase analyzes the impact of their application and may take some time (an operation progress tracker shows the status).

Once complete, a preview dialog box is presented that provides an overview of the content changes that will be made for each document. The comparison panel also informs you of any problems encountered. In addition, you can choose to exclude certain files from the set of files that the quick fixes will be applied to if you do not agree with the proposed changes to be made. If you do agree with the changes presented, click **Apply** to trigger the procedure of applying the quick fixes and updating the contents of the documents.

**Important:**

Oxygen XML Developer does not provide an automatic means for reverting changes made by this action so make sure you agree with the previewed changes for applying them.

✖ Remove selected

Removes selected messages from the view.

✖ Remove all

Removes all messages from the view.

**Copy**

Copies information associated with the selected messages. For example:

- The file path of the document that triggered the output message.
- The path of the *main file* ([on page 2270](#)) (in the case of a *validation scenario* ([on page 554](#)), it is the path of the file where the validation starts and can be different from the validated file).
- Error severity (error, warning, info message, etc.)
- Name of validating processor.
- Name of *validation scenario* ([on page 554](#)).
- The line and column in the file that triggered the message.

Copy Description

Copies the description values for all selected items. It is possible to [assign a shortcut key](#) ([on page 262](#)) for this action.

Select All

Extends the selection to all the messages from the view.

Print Results

Sends the complete list of messages to a printer. For each message, the included details are the same as the ones for the **Copy action** ([on page 506](#)). This action is also available in the **Window > Results** menu.

Save Results

Saves the complete list of messages in a file in text format. For each message, the included details are the same as the ones for the **Copy action** ([on page 506](#)). This action is also available in the **Window > Results** menu.

Save Results as XML

Saves the complete list of messages in a file in XML format. For each message, the included details are the same as the ones for the **Copy action** ([on page 506](#)).

Save Results as HTML

Saves the complete list of messages in a file in HTML format. For each message, the included details are the same as the ones for the **Copy action** ([on page 506](#)).

Group by

A set of **Group by** toggle actions that allow you to group the messages according to a selected criteria so that they can be presented in a hierarchical layout. The criteria used for grouping can be the severity of the errors (error, warning, info message, etc.), the resource name, the description of the message, and so on.

Ungroup all

Removes the grouping rules so that the messages are presented in a continuous list.

Show group columns

If any of the **Group by** options are selected, you can use this option to show or hide grouping columns.

Restore default grouping

Restores the column size for each column and the grouping rules that were saved in the user preferences the last time when this view was used. If it is the first time this view is used, the action sets an initial default column size for each column and a grouping rule that is appropriate for the type of messages. For example:

- Group the messages by the path of the validated file if there are error messages from a validation action or spelling errors reported by the **Check Spelling in Files** action ([on page 420](#)).
- No grouping rule for the results of [applying an XPath expression](#) ([on page 1732](#)).

Expand All

Expands all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

Collapse All

Collapses all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

Making a Persistent Copy of Results

The **Results** view (on page 503) displays the results from the following operations:

- Document validation (on page 545)
- Checking the form of documents (on page 544)
- XSLT or FO transformations (on page 1098)
- Finding all occurrences of a string in a file (on page 394)
- Finding all occurrences of a string in multiple files (on page 399)
- Applying an XPath expression to the current document (on page 1735)

To make a persistent copy of the **Results** view (on page 503), use one of these actions:

File > Save Results

Displays the **Save Results** dialog box, used to save the result list of the current message tab. The action is also available on the right-click menu of the **Results** panel.

File > Print Results

Displays the **Page Setup** dialog box used to define the page size and orientation properties for printing the result list of the current **Results** panel. The action is also available on the right-click menu of the **Results** panel.

Save Results as XML from the contextual menu

Saves the content of the **Results** panel in an XML file with the format:

```
<Report>
  <Incident>
    <engine>The engine reporting the error.</engine>
    <severity>The severity level</severity>
    <Description>Description of output message.</Description>
    <SystemID>The location of the file linked to the message.</SystemID>
    <Location>
      <start>
        <line>Start line number in file.</line>
        <column>Start column number in file</column>
      </start>
      <end>
        <line>End line number in file.</line>
        <column>End column number in file</column>
      </start>
    </Location>
```

```
</Incident>  
</Report>
```

Syntax Highlighting in XML Documents

Oxygen XML Developer supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for XML files, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114).
2. Go to **Editor > Syntax Highlight** (on page 193).
3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XML** tab in the **Preview** pane to see the effects of your changes.

**Tip:**

Oxygen XML Developer also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the **Editor > Syntax Highlight > Elements/Attributes by Prefix** preferences page (on page 193).

Related Information:

[Customize Syntax Highlight colors \(on page 193\)](#)

Syntax Highlight Depending on Namespace Prefix

The [syntax highlight scheme of an XML file type \(on page 193\)](#) allows the configuration of a color per each type of token that can appear in an XML file. Distinguishing between the XML tag tokens based on the namespace prefix brings additional visual help in editing some XML file types. For example, in XSLT stylesheets, elements from various namespaces (such as XSLT, XHTML, XSL:FO, or XForms) are inserted in the same document and the editor panel can become cluttered. [Marking tags with different colors based on the namespace prefix \(on page 193\)](#) allows easier identification of the tags.

Figure 115. Example of Coloring XML Tags by Prefix

```

3 <xsl:template match="name">
4   <fo:list-item>
5     <fo:list-item-label end-indent="label-end()">
6       <fo:block text-align="end" font-weight="bold">Full Name</fo:block>
7     </fo:list-item-label>
8     <fo:list-item-body start-indent="body-start()">
9       <xsl:apply-templates select="*" />
10    </fo:list-item-body>
11  </fo:list-item>
12 </xsl:template>

```

[Changing the colors displayed in the Text Mode Editor \(on page 193\)](#)

Formatting and Indenting XML Documents

In **Text mode** (on page 316), you can decide how the XML file is formatted and indented. In the other modes, and when you switch between modes, Oxygen XML Developer automatically formats and indents the XML.

You can trigger a format and indent operation for your XML document (in **Text mode**) using one of the following actions:

-  **Format and Indent** toolbar button - Formats and indents the current document.
- **Document > Source >  Format and Indent** - Formats and indents the whole document.
- **Document > Source >  Indent Selection** - Indents the current selection (but does not add line breaks). This action is also available in the **Source** submenu of the contextual menu.
- **Document > Source >  Format and Indent Element** - Formats and indents the current element (the inmost nested element that currently contains the cursor) and its child-elements. This action is also available in the **Source** submenu of the contextual menu.

Various settings affect how Oxygen XML Developer formats and indents XML. Many of these settings have to do with how whitespace is handled.

Significant and Insignificant Whitespace in XML

XML documents are text files that describe complex documents. Some of the white space (spaces, tabs, line feeds, etc.) in the XML document belongs to the document it describes (such as the space between words in a paragraph) and some of it belongs to the XML document (such as a line break between two XML elements). Whitespace belonging to the XML file is called *insignificant whitespace*. The meaning of the XML would be the same if the insignificant whitespace were removed. Whitespace belonging to the document being described is called *significant whitespace*.

Knowing when whitespace is significant or insignificant is not always easy. For instance, a paragraph in an XML document might be laid out like this:

```
<p>NO Free man shall be taken or imprisoned, or be stripped of his Freedom,
or Liberties, or free Customs, or be outlawed, or exiled, or any otherwise
destroyed; nor will we not pass upon him, nor condemn him, but by lawful
judgment of his Peers, or by the <xref
href="http://en.wikipedia.org/wiki/Law_of_the_land" format="html"
scope="external">Law of the land</xref>.
We will sell to no man, we will not deny to any man either Justice or Right.</p>
```

By default, XML considers a single whitespace between words to be significant, and all other whitespace to be insignificant. The paragraph above could have been written on one line because the XML parser would see it as exactly the same paragraph since all multiple consecutive whitespaces will be replaced with a single whitespace. Removing the insignificant space in markup like this is called *normalizing space*.

In some cases, all the spaces inside an element should be treated as significant. For example, in a code sample:

```
<codeblock>
class HelloWorld
{
    public static void main(String args[])
    {
        System.out.println("Hello World");
    }
}
</codeblock>
```

Here every whitespace character between the `<codeblock>` tags should be treated as significant.

How Oxygen XML Developer Determines When Whitespace is Significant

When Oxygen XML Developer formats and indents an XML document, it introduces or removes insignificant whitespace to produce a layout with reasonable line lengths and elements indented to show their place in the hierarchy of the document. To correctly format and indent the XML source, Oxygen XML Developer needs to know when to treat whitespace as significant and when to treat it as insignificant. However it is not always possible to tell this from the XML source file alone. To determine what whitespace is significant, Oxygen XML Developer assigns each element in the document to one of four categories:

Ignore space

In the ignore space category, all whitespace is considered insignificant. This generally applies to content that consists only of elements nested inside other elements, with no text content.

Normalize space

In the normalize space category, a single whitespace character between character strings is considered significant and all other spaces are considered insignificant. Therefore, all

consecutive whitespaces will be replaced with a single space. This generally applies to elements that contain text content only.

Mixed content

In the mixed content category, a single whitespace between text characters is considered significant and all other spaces are considered insignificant.

Notes:

- Whitespace between two child elements embedded in the text is normalized to a single space (rather than to zero spaces as would normally be the case for a text node with only whitespace characters, or the space between elements generally).
- The lack of whitespace between a child element embedded in the text and either adjacent text or another child element is considered significant. That is, no whitespace can be introduced here when formatting and indenting the file.

For example:

```
<p>The file is located in <i>HOME</i><i>USER</i>/hello.  

  This is a <strong>big</strong>  

<emphasis>deal</emphasis>.  

</p>
```

In this example, whitespace should not be introduced around the `i` tags as it would introduce extra significant whitespace into the document. The space between the end `` tag and the beginning `<emphasis>` tag should be normalized to a single space, not zero spaces.

Preserve space

In the preserve space category, all whitespace in the element is regarded as significant. No changes are made to the spaces in elements in this category. However, child elements may be in another category, and may be treated differently.

Attribute values are always in the preserve space category. The spaces between attributes in an element tag are always in the default space category.

Oxygen XML Developer evaluates several pieces of information to assign an element to one of these categories. An element is always assigned to the most restrictive category (from Ignore to Preserve) that it is assigned to by any of the sources Oxygen XML Developer consults. For instance, if the element is named on the **Default elements** list (as described below) but it has an `@xml:space="preserve"` attribute in the source file, it will be assigned to the preserve space category. If an element has the `@xml:space="default"` attribute in the source, but is listed on the **Mixed content** elements list, it will be assigned to the mixed content category.

To assign elements to these categories, Oxygen XML Developer consults information from the following sources:

xml:space

If the XML element contains the `@xml:space` attribute, the element is promoted to the appropriate category based on the value of the attribute.

Schema-aware formatting

If a schema is available for the XML document, Oxygen XML Developer can use information from the schema to promote the element to the appropriate category. For example:

- If the schema declares an element to be of type `xs:string`, the element will be promoted to the preserve space category because the string built-in type has the whitespace facet with the value preserve.
- If the schema declares an element to be mixed content, it will be promoted to the mixed content category.

Schema-aware formatting can be turned on and off.

- To turn it on or off for the **Text** editing mode, open the **Preferences** dialog box (**Options > Preferences**) (on page 114), go to **Editor > Format > XML**, and select/deselect the **Schema-aware format and indent** option (on page 176).

Preserve space elements list

If an element is listed in the **Preserve space** tab of the **Element Spacing** list (on page 175) in the **XML formatting preferences** (on page 174), it is promoted to the preserve space category.

Default space elements list

If an element is listed in the **Default space** tab of the **Element Spacing** list (on page 175) in the **XML formatting preferences** (on page 174), it is promoted to the default space category.

Mixed content elements list

If an element is listed in the **Mixed content** tab of the **Element Spacing** list (on page 175) in the **XML formatting preferences** (on page 174), it is promoted to the mixed content category.

Element content

If an element contains mixed content, that is, a mix of text and other elements, it is promoted to the mixed content category. (Note that, in accordance with these rules, this happens even if the schema declares the element to have element only content.)

If an element contains text content, it is promoted to the default space category.

Text node content

If a text node contains any non-whitespace characters then the text node is promoted to the normalize space category.

How Oxygen XML Developer formats and indents XML

You can control how Oxygen XML Developer formats and indents XML documents. This can be particularly important if you store your XML document in a version control system, as it allows you to limit the number of trivial changes in spacing between versions of an XML document. The following preference pages include options that control how XML documents are formatted:

- **Format** preferences page (*on page 171*)
- **XML Formatting** preferences page (*on page 174*)
- **Whitespaces** preferences page (*on page 177*)

When Oxygen XML Developer formats and indents XML

Oxygen XML Developer formats and indents a document, or part of it, on the following occasions:

- In **Text** mode when you select one of the format and indent actions (**Document > Source > Format and Indent**, **Document > Source > Indent Selection**, or **Document > Source > Format and Indent Element**).
- When saving documents in **Design** mode.
- When switching from **Design** mode to another mode.
- When saving or switching to **Text** mode from **Grid** mode, if the **Format and indent when passing from grid to text or on save** option (*on page 165*) is selected in the **Grid** preferences page.

Setting an Indent Size to Zero

Oxygen XML Developer will automatically *format and indent* (*on page 510*) documents at certain times. This includes indenting the content from the margin to reflect its structure. In some cases, you may not want your content indented. To avoid your content being indented, you can set an indent size of zero.

Note:

Changing the indent size does not override the rules that Oxygen XML Developer uses for handling whitespace when formatting and indenting XML documents. Therefore, changing the indent size will have no effect on elements that require whitespaces to be maintained.

There are two cases to consider.

Maintaining zero indent in documents with zero indent

If you have existing documents with zero indent and you want Oxygen XML Developer to maintain a zero indent when editing or formatting those documents:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Editor > Format** (on page 171).
2. Select **Detect indent on open**.
3. Select **Use zero-indent if detected**.

Oxygen XML Developer will examine the indent of each document as it is opened and if the indent is zero for all lines, or for nearly all lines, a zero indent will be used when formatting and indenting the document. Otherwise, Oxygen XML Developer will use the indent closest to what it detects in the document.

Enforcing zero indent for all documents

If you want all documents to be formatted with zero indent, regardless of their current indenting:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Editor > Format** (on page 171).
2. Deselect **Detect indent on open**.
3. Set **Indent size** to 0.

All documents will be formatted and indented with an indent of zero.

Warning:

Setting the indent size to zero can change the meaning of some file types, such as Python source files.

Format and Indent (Pretty-Print) Multiple Files

Oxygen XML Developer provides support for formatting and indenting (*pretty-print* (on page 2271)) multiple files at once. This action is available for any document in XML format, as well as for XQuery, CSS, JavaScript, and JSON documents.

To format and indent multiple files, use the  **Format and Indent Files** action that is available in the contextual menu of the **Project view** (on page 365) or from the **Tools** menu. This opens the **Format and Indent Files** dialog box that allows you to configure options for the action.

Figure 116. Format and Indent Files Dialog Box

The **Scope** section allows you to choose from the following scopes:

- **All opened files** - The *pretty-print (on page 2271)* is performed in all opened files.
- **Directory of the current file** - All the files in the folder of the currently edited file.
- **Project files** - All files from the current project.
- **Selected project files** - The selected files from the current project.
- **Specified path** - the *pretty-print (on page 2271)* is performed in the files located at a specified path.

The **Options** section includes the following options:

- **File filter** - Allow you to filter the files from the selected scope.
- **Recurse subdirectories** - When selected, the *pretty-print (on page 2271)* is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to **All opened files**.
- **Include hidden files** - When selected, the *pretty-print (on page 2271)* is also performed in the hidden files.
- **Make backup files with extension** - When selected, Oxygen XML Developer makes backup files of the modified files. The default extension is `.bak`, but you can change the extension as you prefer.

Managing Highlighted Content

While working with XML documents you often have frequent changes to the structure and content. You are often faced with a situation where you need to make a slight change in multiple places in the same document. Oxygen XML Developer includes a feature, **Manage Highlighted Content**, that is designed to help you achieve this.

When you are in **Text** mode and you perform a search operation or apply an XPath that highlights multiple results, you can access the **Manage Highlighted Content** submenu by right-clicking any of the highlights in the editing pane. If the results are displayed only in the **Results** panel at the bottom of the screen, you can use the  **Highlight all results in editor** button (on the right side of the **Results** panel) to display all the highlights in the editor (then you can access the **Manage Highlighted Content** submenu from the contextual menu of any highlight).

The following options are available in the **Manage Highlighted Content** submenu:

Modify All

Use this option to modify (in-place) all the occurrences of the selected content. When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Note:

If you select a very large number of highlights that you want to modify using this feature, a dialog box informs you that you may experience performance issues. You have the option to either use the **Find/Replace operation** (*on page 394*), or continue the operation.

Surround All

Use this option to surround the highlighted content with a specific tag. This option opens the **Tag** dialog box. The **Specify the tag** drop-down menu presents all the available elements that you can choose from.

Remove All

Removes all the highlighted content.

If you right-click content in another part of the document, other than a highlight, you have the option to select the following option:

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Adjusting the Transparency of XML Markup

Most of the time you want the content of a document displayed on screen with zero transparency. However, if you want to focus your attention only on editing text content inside XML markup, Oxygen XML Developer offers the option of reducing the visibility of the markup by increasing their transparency when displayed in

Text mode. To change the level of transparency, use the  **Tags Transparency Selector** drop-down menu that is available from the **Source** toolbar. By default, this drop-down menu is not visible. You can add it to the toolbar by using [the Configure Toolbars action \(on page 327\)](#). There are several levels of transparency that can be adjusted to make the content more or less visible:

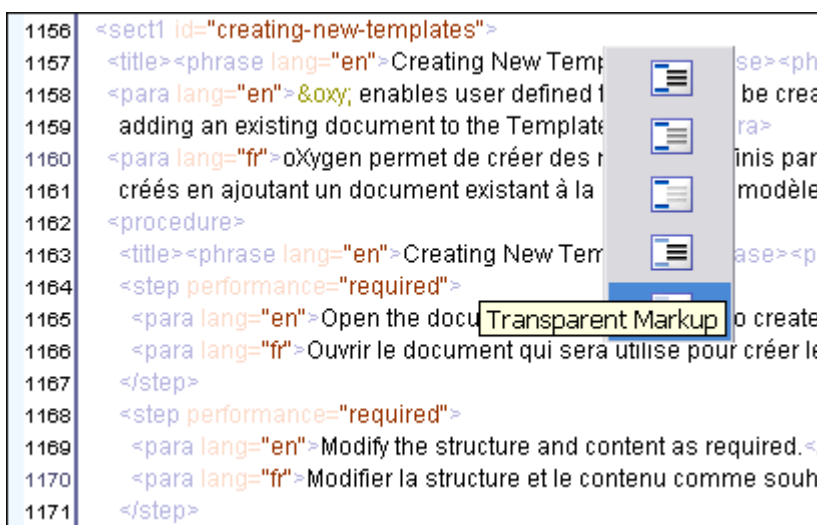

-  **Normal Contrast** - Resets the transparency level back to normal.
-  **Semi-transparent Text** - Slightly reduces the visibility of text to place greater emphasis on the visibility of the XML markup.
-  **Transparent Text** - Greatly reduces the visibility of text to place even greater emphasis on the visibility of the XML markup.
-  **Semi-transparent Markup** - Slightly reduces the visibility of the XML markup to place greater emphasis on the visibility of the text.
-  **Transparent Markup** - Greatly reduces the visibility of the XML markup to place even greater emphasis on the visibility of the text.

Figure 117. Tags Transparency Selector

Locking and Unlocking XML Markup

For documents with fixed markup, such as forms that do not allow the XML tags to be modified (only their text content), the possibility to edit the XML tag names can be toggled on or off with the  **Lock / Unlock the XML tags** action available in **Text** editing mode from the **Source** submenu from the contextual menu (or **Document > Source** menu).

You can set the default lock state for all opened editors using the [Lock the XML tags option in the Text preferences page \(on page 163\)](#).

Special Character Support in Text Mode

If bidirectional text, such as Arabic or Hebrew languages, certain Asian languages (such as Devanagari, Bengali, Gurmukhi, Gujarati, Oriya, Tamil, Telugu, Kannada, Malayalam, Sinhala, Thai, Khmer), or other special

characters (such as combining characters) are detected in a document, Oxygen XML Developer displays a **Special Characters Detected** dialog box that prompts you to **Enable** or **Disable** support for these special characters (you can also enable or disable the support for special characters in the [Open preferences page \(on page 168\)](#)).

Enabled

If you choose to enable support for special characters and as long as you [chose a font \(on page 123\)](#) that supports the particular special characters, this means that the *glyphs* will be rendered properly in **Text** mode and the cursor navigation mechanism will recognize them as they are shown.

Example: The Â glyph could be inserted using a consecutive combination of two characters (**U+00C2** followed by **U+0323**). With the special characters support enabled and the **SansSerif** font chosen, that glyph will be rendered properly (a capital letter A with a circumflex above it and a dot below) and you can navigate through the glyph in one step (pressing the right/left arrow key once).

Restriction:

When support for special characters is enabled, the [folding support \(on page 483\)](#) is not available.

Disabled

If you choose to disable support for special characters, it may affect text rendering, cursor navigation, and text management operations. However, this is helpful if you need to open [very large documents \(on page 428\)](#) since disabling the bidirectional editing support can enhance performance.

Example: The Â glyph could be inserted using a consecutive combination of two characters (**U+00C2** followed by **U+0323**). With the special characters support disabled, that glyph may or may not be rendered properly and when navigating through the glyph, it would take two steps (pressing the right/left arrow key twice).

Restriction:

Bidirectional content in the **Text** mode cannot be rendered using **Bold** or **Italic**.

[Inserting Special Characters with the Character Map \(on page 425\)](#)

Inserting or Opening a File at Cursor Location

When editing content in **Text** mode, the following actions (with regard to inserting, opening, or comparing files) are available in the **Document > File** menu:

Insert File

Inserts the content of the file with the specified file path into the current document at the current position of the cursor.

Open File at Cursor

Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a **Create new file** button that starts the **New document** wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel. If the file is an image file, it will be opened in the **Image Preview pane** (*on page 428*).

Open File at Cursor in System Application

Opens the file (identified by its link) or web page (identified by a web link) found at the cursor position. The target is opened in the default system application associated with that file type.

Compare

Opens the current file in [the Compare Files tool](#) (*on page 433*).

Ctrl + Single-Click (Command + Single-Click on macOS)

Use this shortcut to open any of the following:

- Any absolute URL (URLs that have a protocol), regardless of their location in the document.
- URI attributes such as: `@schemaLocation`, `@noNamespaceSchemaLocation`, `@href` and others.
- Open the target for DITA references (such as a `@conref`, `@conkeyref`, `@keyref`, and more).
- Processing instructions used for associating resources, xml-models, xml-stylesheets.

Quick Assist Support for IDs and IDREFS

The *Quick Assist support* (*on page 2272*) is activated automatically when you place the cursor inside an ID or IDREF in **Text** mode. To access it, click the yellow bulb help marker placed on the current line, in the line number stripe of the editor. You can also invoke the *Quick Assist* menu from the contextual menu or by pressing **Alt+1 (Command+Alt+1 on macOS)** on your keyboard.

The following actions are available:

Rename in

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation. For a preview of the changes you are about to make, click **Preview**. This opens the **Preview** dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

Search Declarations

Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the **Select the scope for the Search and Refactor operations** dialog box, this scope will be used instead.

Search References

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the **Select the scope for the Search and Refactor operations** dialog box, this scope will be used instead.

Change scope

Opens the **Select the scope for the Search and Refactor operations** (*on page 598*) dialog box.

Rename in File

Renames the ID you are editing and all its occurrences from the current file.

Search Occurrences

Searches for the declaration and references of the ID located at the cursor position in the current document.

Related Information:

[Modular Contextual XML Editing Using 'Main Files' Support](#) (*on page 596*)

Highlight ID Occurrences in Text Mode

To see the occurrences of an ID in an XML document in the **Text** mode, place the cursor inside the ID declaration or reference. The occurrences are marked in the vertical side bar at the right of the editor. Click a marker on the side bar to jump to the occurrence that it corresponds to. The occurrences are also highlighted in the editing area.

Note:

Highlighted ID declarations are rendered with a different color than highlighted ID references.

To customize these colors or disable this feature, open the **Preferences** dialog box (**Options > Preferences**) (*on page 114*) and go to **Editor > Mark Occurrences** (*on page 194*).

Related Information:

[Modular Contextual XML Editing Using 'Main Files' Support](#) (*on page 596*)

Contextual Menu Actions in Text Mode

When editing XML documents in **Text** mode, Oxygen XML Developer provides the following actions in the contextual menu (many of them also appear in the submenus of the **Document** menu):

 **Cut**,  **Copy**,  **Paste**

Executes the typical editing actions on the currently selected content.

Copy XPath

Copies the XPath expression of the current element or attribute (or property for JSON documents) to the clipboard.

Toggle Line Wrap (**Ctrl + Shift + Y (Command + Shift + Y on macOS)**)

Enables or disables line wrapping. When enabled, if text exceeds the width of the displayed editor, content is wrapped so that you do not have to scroll horizontally.

→! Toggle Comment (**Ctrl + Shift + Comma (Command + Shift + M on macOS)**)

Comments the current selection of the current editor. If the selection already contains a comment the action removes the comment from around the selection. If there is no selection in the current editor and the cursor is not positioned inside a comment, the current line is commented. If the cursor is positioned inside a comment, then the commented text is uncommented.

Go to submenu

This submenu includes the following actions:

Go to Matching Tag (**Ctrl + Shift + G (Command + Shift + G on macOS)**)

Moves the cursor to the end tag that matches the start tag, or vice versa.

Go after Next Tag (**Ctrl + CloseBracket (Command + CloseBracket on macOS)**)

Moves the cursor to the end of the next tag.

Go after Previous Tag (**Ctrl + OpenBracket (Command + OpenBracket on macOS)**)

Moves the cursor to the end of the previous tag.

Select submenu

This submenu allows you to select the following:

Element

Selects the entire element at the current cursor position.

Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Attributes

Selects all the attributes of the element at the current cursor position.

Parent

Selects the parent element at the current cursor position.

Source submenu

This submenu includes the following actions:

 **Shift Right (Tab)**

Shifts the currently selected block to the right.

 **Shift Left (Shift + Tab)**

Shifts the currently selected block to the left.

 **Indent selection (Ctrl + I (Command + I on macOS))**

Corrects the indentation of the selected block of lines if it does not follow the current [indenting preferences \(on page 171\)](#).

 **Escape Selection**

Escapes a range of characters by replacing them with the corresponding character entities.

 **Unescape Selection**

Replaces the character entities with the corresponding characters.

 **Format and Indent Element (Ctrl + Shift + I (Command + Shift + I on macOS))**

Pretty-prints (on page 2271) the element that surrounds the current cursor position.

To Upper Case

Converts the selected content to upper case characters. This works with contiguous and multiple selections.

To Lower Case

Converts the content selection to lower case characters. This works with contiguous and multiple selections.

Capitalize Lines

It capitalizes the first letter found on every new line that is selected. Only the first letter is affected, the rest of the line remains the same. If the first character on the new line is not a letter then no changes are made.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + X (Command + Shift + X on macOS))

Converts a sequence of hexadecimal characters to the corresponding [Unicode character \(on page 422\)](#). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the `0x` or `0X` prefix. Examples of valid sequences and the characters they will be converted to:

- 0x0045 will be converted to E
- 0x0125 to h
- 265 to u
- 2190 to —

**Note:**

For more information about finding the hexadecimal value of a character, see [Finding the Decimal, Hexadecimal, or Character Entity Equivalent](#) (on page 425).

Base64 Encode/Decode submenu

This submenu include the following actions for encoding or decoding **base 64** schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions](#) option in the [Encoding](#) preferences page (on page 159) will be used. Likewise, the same is true if the [Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions](#) option is not selected in the [Messages](#) preference page (on page 273).

Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions](#) option in the [Encoding](#) preferences page (on page 159) will be used. Likewise, the same is true if the [Show the dialog box for choosing](#)

the encoding for Base64, Base 32, Hex conversions option is not selected in the **Messages** preference page (*on page 273*).

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Base32 Encode/Decode submenu

This submenu include the following actions for encoding or decoding **base32** schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page (*on page 159*) will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page (*on page 273*).

Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page (*on page 159*) will be used. Likewise, the same is true if the **Show the dialog box for choosing**

the encoding for Base64, Base 32, Hex conversions option is not selected in the **Messages** preference page (*on page 273*).

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Hex Encode/Decode submenu

This submenu include the following actions for encoding or decoding **hex** schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page (*on page 159*) will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page (*on page 273*).

Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page (*on page 159*) will be used. Likewise, the same is true if the **Show the dialog box for choosing**

the **encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page (*on page 273*).

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Join and Normalize Lines (**Ctrl + J** (**Command + J** on macOS))

For the current selection, this action joins the lines by replacing the *line separator* with a single space character. It also normalizes the whitespaces by replacing a sequence of such characters with a single space.

Insert new line after (**Ctrl + Alt + Enter** (**Command + Option + Enter** on macOS))

This action has the same result as moving the cursor to the end of the current line and pressing the *ENTER* key.

Insert XInclude

Displays a dialog box that allows you to browse and select the content to be included and automatically generates the corresponding XInclude instruction.

Note:

In the **Author** mode, this dialog box presents a preview of the inserted document as an author page in the **Preview** tab and as a text page in the **Source** tab. In the **Text** mode, the **Source** tab is presented.

Import entities list

Displays a dialog box that allows you to select a list of files as sources for external DTD entities. The internal subset of the DOCTYPE declaration of your document will be updated with the chosen entities. For instance, choosing the files `chapter1.xml` and `chapter2.xml` inserts the following section in the DOCTYPE:

```
<!ENTITY chapter1 SYSTEM "chapter1.xml">
<!ENTITY chapter2 SYSTEM "chapter2.xml">
```

Lock / Unlock the XML Tags

Disables or enables the ability to edit XML tags.

Canonicalize

Opens the **Canonicalize** dialog box that allows you to select a *canonicalization (on page 2267)* algorithm to standardize the format of the document.

Sign

Opens the **Sign** dialog box that allows you to configure a digital signature for the document.

Verify Signature

Allows you to specify the location of a file to verify its digital signature.

Manage Highlighted Content submenu

This submenu is available from the contextual menu when it is invoked from a highlight after you perform a search operation or apply an XPath expression that highlights more than one result. The following options are available in this submenu:

Modify All

Allows you to modify (in-place) all the occurrences of the selected content. A thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Surround All

Surround the highlighted content with a specific tag. This option opens the **Tag** dialog box. The **Specify the tag** drop-down menu presents all the available elements that you can choose from.

Remove All

Removes all the highlighted content.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Go to Definition (Ctrl + Shift + Enter)

Navigates to the definition of the current element or attribute in the schema (DTD, XML Schema, Relax NG schema) associated with the edited XML document. If the current attribute is a *“type”* belonging to the *“<http://www.w3.org/2001/XMLSchema-instance>”* namespace, the cursor is moved in the XML schema to the definition of the type referenced in the value of the attribute. For JSON documents, it navigates to the definition of the current JSON property in the associated JSON Schema.

Refactoring submenu

This submenu includes the following actions:

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

Rename Prefix (Alt + Shift + P (Command + Shift + P on macOS))

The prefix of the element from the cursor position, and any elements with the same prefix, can be renamed according with the options from the **Rename** dialog box.

- If you select the **Rename current element prefix** option, the application will recursively traverse the current element and all its children. *For example*, to change the `xmlns:p1="ns1"` association in the current element to `xmlns:p5="ns1"`, if the `xmlns:p1="ns1"` association is applied on the parent element, then Oxygen XML Developer will introduce `xmlns:p5="ns1"` as a new declaration in the current element and will change the prefix from `p1` to `p5`. If `p5` is already associated with another namespace in the current element, then the conflict will be displayed in a dialog box. By pressing **OK**, the prefix is modified from `p1` to `p5` without inserting a new declaration.
- If you select the **Rename current prefix in all document** option, the application will apply the change on the entire document.
- To also apply the action inside attribute values, select the **Rename also attribute values that start with the same prefix** checkbox.

Surround with submenu

Presents a drop-down menu that allows you to choose a tag to surround a selected portion of content.

Surround with Tags (Ctrl + E (Command + E on macOS))

Allows you to choose a tag that encloses a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags** option (*on page 180*) is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags** option (*on page 180*) is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround with '[tag]' (Ctrl + ForwardSlash (Command + ForwardSlash on macOS))

Surround the selected content with the last tag used.

Delete element tags (Alt + Shift + X (Command + Option + X on macOS))

Deletes the start and end tag of the current element.

 **Split element (Alt + Shift + D (Ctrl + Option + D on macOS))**

Split the element from the cursor position into two identical elements. The cursor must be inside the element.

 **Join elements (Alt + Shift + J (Command + Option + J on macOS))**

Joins the left and right elements relative to the current cursor position. The elements must have the same name, attributes, and attributes values.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Manage IDs submenu

This submenu is available for XML documents that have an associated DTD, XML Schema, or Relax NG schema (not available for DITA). It includes the following actions:

 **Rename in**

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation. For a preview of the changes you are about to make, click **Preview**. This opens the **Preview** dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

Rename in File

Renames the ID you are editing and all its occurrences from the current file.

 **Search References**

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the **Select the scope for the Search and Refactor operations** dialog box, this scope will be used instead.

Search References in

Searches for the references of the ID. Selecting this action opens the **Select the scope for the Search and Refactor operations** (on page 598).

Search Declarations

Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the **Select the scope for the Search and Refactor operations** dialog box, this scope will be used instead.

Search Declarations in

Searches for the declaration of the ID reference. Selecting this action opens the **Select the scope for the Search and Refactor operations** (on page 598).

Search Occurrences in file

Searches for the declaration and references of the ID in the current document.

Quick Fix/Assist (**Alt + 1 (Command + Option + 1 on macOS)**)

When the cursor is inside the value of an `@id` or `@idref` attribute, this action opens the *Quick Fix/Assist* (on page 2272) window with some search and refactoring actions available for the ID or IDREF. When the contextual menu is invoked on an error where Oxygen XML Developer can provide a *Quick Fix* (on page 580), this action opens the *Quick Fix/Assist* (on page 2272) window with a list of quick fix suggestions to choose from.

Apply all default quick fix proposals

This action is available when invoking the contextual menu (right-click) on a document that has one or more quick fix proposals detected for reported validation errors. If multiple quick fixes are available for the same validation error, the default quick fix defined in the Schematron validation schema using the `sqf:default-fix` attribute is automatically selected to be applied. If no default quick fix is explicitly specified, the first quick fix proposal in the list is considered. All quick fix proposals are then automatically executed in bulk, one after the other.

Important Notes to Consider:

- To maintain the accuracy of the initially calculated error validation ranges, the quick fix proposals are applied in the reverse order of their selection.
- If two or more quick fixes act on the same "area" within the document, only one is applied (no changes can be made to changes already made).

- Quick fixes that involve "user-entered values" that normally present a dialog box to facilitate data entry will not be executed (the automatic process of applying all selected quick fixes cannot be interrupted by the presence of the respective dialog boxes).

Once the analysis of the impact of applying the quick fixes on the content is complete, a preview dialog box is presented that provides an overview of the content changes that will be made, according to the quick fixes that will be applied. If you agree with the changes presented, click **Apply** to trigger the quick fixes and update the content.

**Tip:**

This action is also available in the contextual menu when right-clicking the status bar at the bottom of the editor (if the currently highlighted validation issue has at least one detected quick fix suggestion available). Specific quick fix suggestions that are defined for the particular validation issue are also available in this menu.

Open submenu

The following actions are available in this submenu:

Open File at Cursor

Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a **Create new file** button that starts the **New document** wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel. If the file is an image file, it will be opened in the **Image Preview pane** (*on page 428*).

Open File at Cursor in System Application

Opens the file (identified by its link) or web page (identified by a web link) found at the cursor position. The target is opened in the default system application associated with that file type.

Compare

Opens the current file in the **Compare Files** tool (*on page 433*).

Show referenced resources

Opens the **Referenced/Dependent Resources** view (*on page 599*) that allows you to see the referenced resource hierarchy for an XML document.

Show dependent resources

Opens the **Referenced/Dependent Resources** view (on page 599) that allows you to see the resource dependencies for an XML document.

Editing XML Documents in Grid Mode

This section includes topics that describe how to work with XML documents in **Grid** mode, including various features, actions that are available, and much more.

The **Grid** mode in Oxygen XML Developer displays the XML document as a structured grid of nested tables where the text content can be modified without directly interacting with the XML markup. This is helpful for non-technical users who want to edit text content without modifying the XML markup.

To switch to this mode, select **Grid** at the bottom of the editing area. 

You can easily expand or collapse elements within the table and the document structure can be changed with simple contextual menu actions, drag/drop, or copy/paste operations. The text content can be modified simply by editing the value of cells that contain the text and a useful *Content Completion Assistant* (on page 2267) is also available to help you edit or insert XML elements.

Resources

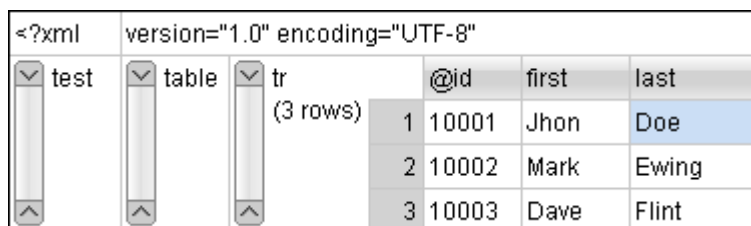

For more information about some of the features available in the **Grid** editor, watch our video demonstration:

<https://www.youtube.com/embed/PoYm2VqisWk>

Layouts: Grid and Tree

The **Grid** editor offers two layout modes. The default one is the grid layout. This smart layout detects the recurring elements in the XML document and creates tables having the children (including the attributes) of these elements as columns. This way, it is possible to have tables nested in other tables, reflecting the structure of your document.

Figure 118. Grid Layout

<?xml		version="1.0" encoding="UTF-8"				
test	table	tr	(3 rows)	@id	first	last
				1 10001	Jhon	Doe
				2 10002	Mark	Ewing
				3 10003	Dave	Flint

The other layout mode is tree-like. It does not create any tables and it only presents the structure of the document.

Figure 119. Tree Layout

<?xml		version="1.0" encoding="UTF-8"	
test	table	tr	@id 10001
			first Jhon
			last Doe
		tr	@id 10002
			first Mark
			last Ewing
		tr	@id 10003
			first Dave
			last Flint

To switch between the two modes, select **Document > Grid Layout > Grid mode/Tree mode**.

Grid Mode Navigation

When you first open a document in **Grid** mode, the content is collapsed. Only the root element and its attributes are displayed. An arrow sign () displayed at the left of the node name indicates that this node has child nodes. To display the children, click this arrow sign. To collapse a node, click the reverse arrow sign (). The expand/collapse actions can also be invoked with the **NumPad+** and **NumPad-** keys, or from the **Expand/Collapse** submenu of the contextual menu or from **Document > Grid Expand/Collapse**.

Expand/Collapse Submenu

The following actions are available on the **Expand/Collapse** submenu:

Expand All

Expands the selection and all its children.

Collapse All

Collapses the selection and all its children.

Expand Children

Expands all the children of the selection but not the selection.

Collapse Children

Collapses all the children of the selection but not the selection.

Collapse Others

Collapses all the siblings of the current selection but not the selection.

Keyboard Shortcuts

A variety of other keyboard shortcuts are also available in **Grid** mode:

Table 4. Shortcuts in the Grid Mode

Key	Action
<u>Tab</u>	Moves the cursor to the next editable value in a table row.
<u>Shift + Tab</u>	Moves the cursor to the previous editable value in a table row.
<u>Enter</u>	Begins editing and lets you insert a new value. Also commits the changes after you finish editing.
<u>UpArrow/PageUp</u>	Navigates toward the beginning of the document.
<u>DownArrow/PageDown</u>	Navigates toward the end of the document.
<u>Shift</u>	Used in conjunction with the navigation keys to create a continuous selection area.
<u>Ctrl (Command on macOS) key</u>	Used in conjunction with the mouse cursor to create discontinuous selection areas.

The following key combinations can be used to scroll the grid:

- **Ctrl + UpArrow (Command + UpArrow on macOS)** - scrolls the grid upwards.
- **Ctrl + DownArrow (Command + DownArrow on macOS)** - scrolls the grid downwards.
- **Ctrl + LeftArrow (Command + LeftArrow on macOS)** scrolls the grid to the left.
- **Ctrl + RightArrow (Command + RightArrow on macOS)** scrolls the grid to the right.

Related Information:

[Editing Actions in Grid Mode \(on page 536\)](#)

Editing Actions in Grid Mode

Since **Grid** mode presents XML content in a structured grid of nested tables, editing content in this mode can be done with a combination of the [Content Completion Assistant \(on page 541\)](#) and actions that allow you to work with the structure or content of the nested tables much like you would with any table. Oxygen XML Developer provides ways to edit content in the cells of the nested tables or to edit the structure of the tables.

Tip:

There are two different types of layouts available in **Grid** mode. Most people prefer to leave it on the default **Grid mode** layout, but there is also a **Tree mode** layout that presents the structure of the document in more of a vertical tree-like manner. You can switch between the two layouts to see which one works best for you particular situation from the **Document > Grid Layout** menu.

Expanding/Collapsing Nodes

An arrow sign () displayed at the left of a node indicates that it has child nodes. To display the children, click this arrow sign. To collapse a node, click the reverse arrow sign (). The expand/collapse actions

can also be invoked with the **NumPad+** and **NumPad-** keys, or from the **Expand/Collapse** submenu of the contextual menu.

To expand all child nodes, right-click the cell that contains the parent node and select  **Expand All** from the **Expand/Collapse** submenu. To collapse all node, right-click any cell and select  **Collapse All** from the **Expand/Collapse** submenu.

Editing Elements or Attributes

To edit elements or attributes in **Grid** mode, simply double-click the cell that contains the element or attribute (or select the cell and press **Enter**) to invoke the *Content Completion Assistant (on page 541)*. This opens a pop-up window that offers a list of proposals that are valid for that particular node.

Editing Text Content in Cells

To edit the text value of a cell, simply select the grid cell and press **Enter** (or double-click the cell), and start editing.

To stop editing a cell value, press **Enter** again.

To cancel the editing without saving the current changes in the document, press the **Esc** key.

Editing the Structure of the Nested Tables

To edit the structure of the nested tables in **Grid** mode, Oxygen XML Developer provides the following actions in the contextual menu (many of them also appear in the submenus of the **Document** menu, or the toolbar):

 **Cut**,  **Copy**,  **Paste**,  **Delete** common editing actions

Executes the typical editing actions on the currently selected elements. The **Cut** and **Copy** operations preserve the styles of the copied content.

Paste as Child

Pastes the copied content as the last child of the current selection.

Duplicate

Creates a new node by duplicating the currently selected one.

Insert Before

Offers a list of valid nodes, depending on the context, and inserts your selection before the currently selected node, as a sibling.

Insert After

Offers a list of valid nodes, depending on the context, and inserts your selection after the currently selected node, as a sibling.

Append Child

Offers a list of valid nodes, depending on the context, and appends your selection as a child of the currently selected node.

 Sort Ascending,  Sort Descending

The sorting result depends on the data type of the column content. It could be a numerical sorting for numbers or an alphabetical sorting for text information. The editor automatically analyzes the content and decides what type of sorting to apply. When a mixed set of values is present in the sorted column, a dialog box is displayed that allows you to choose the desired type of sorting between *numerical* and *alphabetical*.

 Insert Row

Inserts a new row below the current selection. To insert a new row, you could also select the row header (the zone to the left of the row that holds the row number) and press **Enter**.

 Insert Column

Inserts a column after the current selection.

Clear Content

Removes all content from the current cell.

Expand/Collapse >  Expand All

Expands the selection and all its children.

Expand/Collapse >  Collapse All

Collapses the selection and all its children.

Expand/Collapse > Expand Children

Expands all the children of the selection but not the selection.

Expand/Collapse > Collapse Children

Collapses all the children of the selection but not the selection.

Expand/Collapse > Collapse Others

Collapses all the siblings of the current selection but not the selection.

 Refresh Selected

Forces the layout to be recomputed.

Related Information:

[Grid Mode Navigation \(on page 535\)](#)

[Copy and Paste in the Grid Editing Mode \(on page 539\)](#)

[Drag and Drop in the Grid Editing Mode \(on page 538\)](#)

[Content Completion Assistant in Grid Mode \(on page 541\)](#)

Drag and Drop in the Grid Editing Mode

You can easily arrange sections in your XML document in the **Grid** mode by using drag and drop actions.

You can do the following with drag and drop:

- Copy or move a set of nodes.
- Change the order of columns in the tables.
- Move the rows from the tables.

These operations are available for both single and multiple selections. To deselect one of the selected fragments, use **Ctrl + Single-Click (Command + Single-Click on macOS)**.

While dragging, the editor paints guide-lines showing the locations where you can drop the nodes. You can also drag nodes outside the **Grid** editor and text from other applications into the **Grid**.

Tip:

When using drag and drop to reorganize the document, the resulting layout can be different from what you expected. For instance, the layout can contain a set of sibling tables that can be joined together.

To force the layout to be recomputed, you can use the  **Refresh Selected** action that is available in the contextual menu and in the **Document > Grid Edit** menu.

Copy and Paste in the Grid Editing Mode

Selecting content in the **Grid** mode is similar to working with any table with a little more complexity. Specifically, depending on the type of node, when you select a cell, the selection may automatically include additional cells that are implied by the currently selected node. For example, if you click a node that contains any child nodes, all cells that contain the parent and child nodes will be selected. In this case, the currently selected cell is painted with a color that is different from the rest of the selection.

You can also select discontinuous regions of nodes and place them in the clipboard with the copy action. To deselect one of the selected fragments, use **Ctrl + Single-Click (Command + Single-Click on macOS)**.

Pasting Content Within Grid Mode

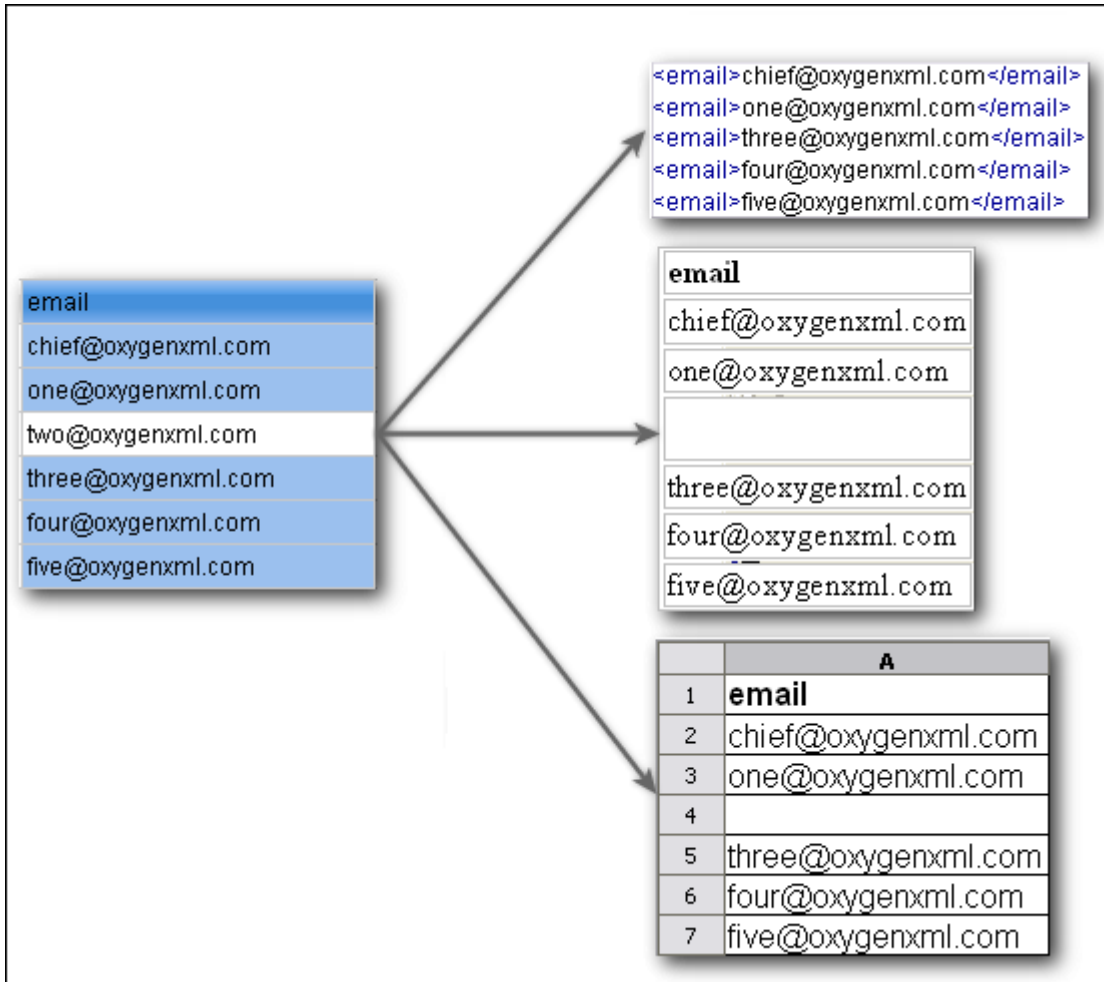

You can paste copied nodes relative to the currently selected cell using one of the following actions (available in the contextual menu):

-  **Paste (Ctrl + V (Command + V on macOS))** - Pastes copied content, as a sibling, just below (after) the current selection.
- **Paste as Child** - Pastes copied content as the last child of the current selection.

Pasting Content from Grid Mode to Other Editors

Nodes that are copied from the **Grid** editor can also be pasted into **Text** mode or other external applications. When pasting copied content from **Grid** mode, the inserted string represents the nodes serialization. The nodes from tables can be copied using HTML or RTF in table format. The resulting cells contain only the concatenated values of the text nodes.

Figure 120. Copying from Grid to Other Editors

Pasting Content from Other Editors into Grid Mode

You can also paste well-formed XML content or tab-separated values from other editors into the **Grid** editor. If you paste XML content, the result will be the insertion of the nodes obtained by parsing this content.

Figure 121. Pasting XML Data into Grid

If the pasted text contains multiple lines of tab-separated values, it can be considered as a matrix of values. By pasting this matrix of values into the **Grid** editor, the result will be a matrix of cells. If the operation is performed inside existing cells, the existing values will be overwritten and new cells will be created when needed.

Figure 122. Pasting Tab-Separated Values into Grid

Id1	Email1
Id2	Email2
Id3	Email3

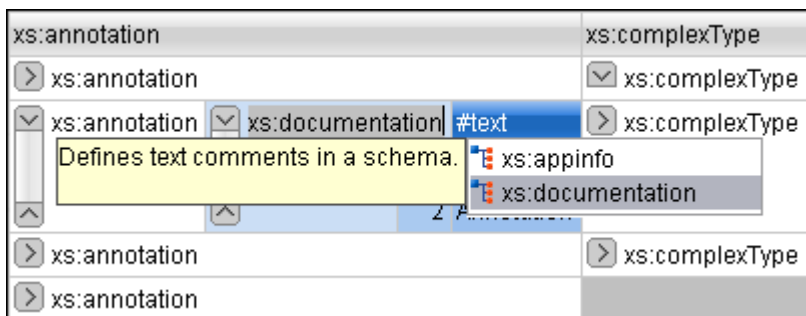

@id	email
1 Big.Boss	chief@oxygenxml.com
2 Id1	Email1
3 Id2	Email2
4 Id3	Email3

If you need to add copied content to your existing content (rather than overwriting existing cells), you need to first insert new cells by using the **Insert row** or **Insert column** actions from the contextual menu. This is useful, for example, when trying to transfer data from spreadsheet-like editors to the **Grid** editor.

Content Completion Assistant in Grid Mode

If the edited document is associated with a schema (DTD, XML Schema, Relax NG, etc.), the **Grid** editing mode offers a *Content Completion Assistant* (on page 2267) for the names and values of elements and attributes. If you choose to insert an element that has required content, the sub-tree of needed elements and attributes are also automatically included.

To display the content completion pop-up menu, simply double-click a cell that contains an element or attribute (or press **Enter** on your keyboard).

Figure 123. Content Completion in Grid Editing Mode

Special Character Support in Grid Mode

If you are editing documents with a bidirectional text orientation or other special characters (such as combining characters), you can change the way the text is rendered and edited in the grid cells by using the **Change Text Orientation** (**Ctrl + Shift + O** (**Command + Shift + O** on macOS)) action that is available from the **Edit** menu in the **Grid** editing mode. Use this action to switch from the default left to right text orientation to the right to left orientation, and vice versa.

Note:

This change applies only to the text from the cells, and not to the layout of the grid editor.

Figure 124. Default left to right text orientation

<?xml	version="1.0" encoding="UTF-8"
sample	#text
(9 rows)	
1	عندما يريد العالم أن يتكلم، فهو يتحدث بلغة يونيكود.
2	Quan el món vol conversar, parla Unicode
3	כאשר העולם רוצה לדבר, הוא מדבר ב-Unicode
4	Ha a világ beszélni akar, azt Unicode-ul mondja
5	Quando il mondo vuole comunicare, parla Unicode
6	世界的に話すなら、Unicode です。
7	세계를 향한 대화, 유니코드로 하십시오
8	Når verden vil snakke, snakker den Unicode
9	Når verda ønskjer å snakke, talar ho Unicode

Figure 125. Right to left text orientation

[Inserting Special Characters with the Character Map \(on page 425\)](#)

Exporting XML Content to Excel

For use-cases where you have XML content that needs to be exported to Excel (or any other spreadsheet application) but the content is not already in some sort of table format, **Grid** mode offers you a way to display the content of an XML document as a structured grid of nested tables and you can work with the cells in those tables much like you would with any spreadsheet application. This makes it possible to export content to Excel by copying cells that contain the specific content and then pasting the copied cells in Excel the same as you would when working with any table or spreadsheet.

To export XML content from **Grid** mode to Excel or other spreadsheet applications, follow this procedure:

1. Open the XML document in Oxygen XML Developer and switch to **Grid** mode.
2. [Expand the nodes \(on page 536\)](#) to gain access to the particular nested table that contains the content you want to export.
3. Copy the cells that contain the content you want to export ( **Copy** from the contextual menu or **Ctrl +C**).
4. Switch to your spreadsheet application and paste the copied cells.
5. You may need to make some manual adjustments depending on the complexity of the structure in the original XML document.

Note that Oxygen XML Developer also supports the reverse scenario (copying cells from a spreadsheet application and pasting them in **Grid** mode). For more information, see [Import from MS Excel Files – Grid Mode Method \(on page 1823\)](#).

Validating XML Documents

The W3C XML specification states that a program should not continue to process an XML document if it finds a validation error. The reason is that XML software should be easy to write and all XML documents should be compatible. With HTML, for example, it is possible to create documents with lots of errors (for instance, when you forget an end tag). One of the main reasons that various HTML browsers have performance and compatibility problems is that they have different methods of figuring out how to render a document when an HTML error is encountered. Using XML helps to eliminate such problems.

Even when creating XML documents, errors are easily introduced. When working with large projects or a large number of files, the probability that errors will occur is even greater. Preventing and solving errors in your projects can be time consuming and frustrating. Fortunately, Oxygen XML Developer provides validation functions that allow you to easily identify errors and their location.

Checking XML Well-Formedness

A *Well-formed XML* document is a document that conforms to the XML syntax rules. A *Namespace Well-Formed XML* document is a document that is *Well-formed XML* and is also *Namespace-wellformed* and *Namespace-valid*.

Well-Formedness Rules

The XML Syntax rules for *Well-formed XML* include:

- All XML elements must have a closing tag.
- XML tags are case-sensitive.
- All XML elements must be properly nested.
- All XML documents must have a root element.
- Attribute values must always be quoted.
- With XML, whitespace is preserved.

The *Namespace-wellformed* rules include:

- All element and attribute names contain either zero or one colon.
- No entity names, processing instruction targets, or notation names contain any colons.

The *Namespace-valid* rules include:

- The *xml* prefix is by definition bound to the namespace name: <http://www.w3.org/XML/1998/namespace>. It MAY be declared, but MUST NOT be undeclared or bound to any other namespace name. Other prefixes MUST NOT be bound to this namespace name.
- The *xmlns* prefix is used only to declare namespace bindings and is by definition bound to the namespace name: <http://www.w3.org/2000/xmlns/>. It MUST NOT be declared or undeclared. Other prefixes MUST NOT be bound to this namespace name.
- All other prefixes beginning with the three-letter sequence *x*, *m*, *l*, in any case combination, are reserved. This means that users SHOULD NOT use them except as defined by later specifications and processors MUST NOT treat them as fatal errors.
- The namespace prefix (unless it is *xml* or *xmlns*) MUST have been declared in a namespace declaration attribute in either the start tag of the element where the prefix is used or in an ancestor element (for example, an element in whose content the prefixed markup occurs). Furthermore, the attribute value in the innermost such declaration MUST NOT be an empty string.

Check for Well-Formedness

To check if a document is *Namespace Well-Formed XML* and *Namespace-valid*:

- Select the  **Check Well-Formedness (Ctrl + Shift + W (Command + Shift + W on macOS))** action from the  **Validation** drop-down menu on the toolbar (or the **Document > Validate** menu).
- A selection of files can be checked for well-formedness by selecting the  **Check Well-Formedness** action from the **Validate** submenu when invoking the contextual menu in the **Project view** (on page 365).

Result: If any errors are found, the result is displayed in the message panel at the bottom of the editor. Each error is displayed as one record in the result list and is accompanied by an error message. Clicking the record will open the document containing the error and highlight its approximate location.

Example: A non *Well-formed XML Document*

```
<root><tag></root>
```

When the **Check Well-Formedness** action is performed, the following error is displayed:

```
The element type "tag" must be terminated by the matching end-tag "</tag>"
```

To resolve the error, click the record in the resulting list and it will locate and highlight the approximate position of the error. In this case, identify the tag that is missing an end tag and insert `</tag>`.

Example: A non *Namespace-wellformed Document*

```
<prefix:elem></prefix:elem>
```

When the **Check Well-Formedness** action is performed, the following error is displayed:

```
The prefix "prefix" for element "prefix:elem" is not bound.
```

Example: A non *Namespace-valid Document*

```
<x:y></x:y>
```

When the **Check Well-Formedness** action is performed, the following error is displayed:

```
The prefix "x" for element "x:y" is not bound.
```

Validating XML Documents Against a Schema

A *Valid XML* document is a *Well-Formed XML* document that also conforms to the rules of a schema that defines the legal elements of an XML document. The schema type can be: XML Schema, Relax NG (full or compact syntax), Schematron, Document Type Definition (DTD), or Namespace-based Validation Dispatching Language (NVDL).

The purpose of the schema is to define the legal building blocks of an XML document. It defines the document structure with a list of legal elements.

This section contains topics that explain the automatic and manual validation possibilities in Oxygen XML Developer, how validation errors are presented, and information about built-in and custom validation scenarios.

For information about how to associate a schema for the purposes of validation (and content completion), see the [Associating a Schema to XML Documents \(on page 582\)](#) section.

Automatic Validation

By default, Oxygen XML Developer automatically checks for validation errors as you are editing a document. The **Enable automatic validation** option (on page 195) in the **Document Checking** preferences page (on page 194) controls whether or not all validation errors and warnings will automatically be highlighted in the editor panel.

The automatic validation starts parsing the document and marking the errors after a [configurable delay \(on page 195\)](#) from the last key typed. Errors are highlighted with underline markers in the main editor panel and small rectangles on the right side ruler of the editor panel. Hovering over a validation error presents a tooltip message with more details about the error.

If the error message is long and it is not displayed completely in the error line at the bottom of the editing area, double-clicking the error icon at the left of the error line or on the error line displays an information dialog box with the full error message. You can use the arrow buttons in this dialog box to navigate through the errors issued by the Automatic Validation feature.

Related Information:

[Manual Validation Actions \(on page 546\)](#)

[Presenting Validation Errors in Text Mode \(on page 548\)](#)

Manual Validation Actions

You can choose to validate documents at any time by using the manual validation actions that are available in Oxygen XML Developer.

Tip:

Status information generated by certain operations (such as *validation*) are fed into the **Information** view. This could be helpful for troubleshooting problems encountered during such operations. To open this view, select **Window > Show View > Information**.

Manual Validation Actions

To manually validate the currently edited document, use one of the following actions:

Validate

Available from the  **Validation** drop-down menu on the toolbar, the **Document > Validate** menu, or from the **Validate** submenu when invoking the contextual menu in the **Project view (on page 365)**.

An error list is presented in the message panel at the bottom of the editor. Markup of the current document is checked to conform with the specified DTD, XML Schema, or Relax NG schema

rules. This action also re-parses the [XML Catalogs \(on page 2273\)](#) and resets the schema used for content completion.

Validate (cached)

Available from the  **Validation** drop-down menu on the toolbar or the **Document > Validate** menu.

This action caches the schema, allowing it to be reused for the next validation. Markup of the current document is checked to conform with the specified DTD, XML Schema, or Relax NG schema rules.

Note:

Automatic validation also caches the associated schema.

Validate with

Available from the  **Validation** drop-down menu on the toolbar, (or **Document > Validate** menu).

This action opens a dialog box that allows you to [specify a schema for validating the current document \(on page 586\)](#).

You can use this action to validate the current document using a schema of your choice (XML Schema, DTD, Relax NG, NVDL, Schematron schema), other than the associated one. An error list is presented in the message panel at the bottom of the editor. Markup of current document is checked to conform with the specified schema rules.

Note:

The **Validate with** action does not work for files loaded through a [custom protocol plugin \(on page 1879\)](#) developed independently and added to Oxygen XML Developer after installation.

Validate with Schema

Available from the **Validate** submenu when invoking contextual menu in the [Project view \(on page 365\)](#).

This action opens a dialog box that allows you to [specify a schema for validating all selected files \(on page 587\)](#).

Other Validation Options

To quickly open the schema used for validating the current document, select the  **Open Associated Schema** action from the toolbar (or **Document > Schema** menu).

The  **Validation options** button, available in the **Document > Validate** menu, allows you to quickly access to the [validation options \(on page 205\)](#) for the built-in validator in the Oxygen XML Developer preferences page.

Tip:

If a large number of validation errors are detected and the validation process takes too long, you can limit the maximum number of reported errors in the **Document Checking** preferences page ([on page 194](#)).

Related information

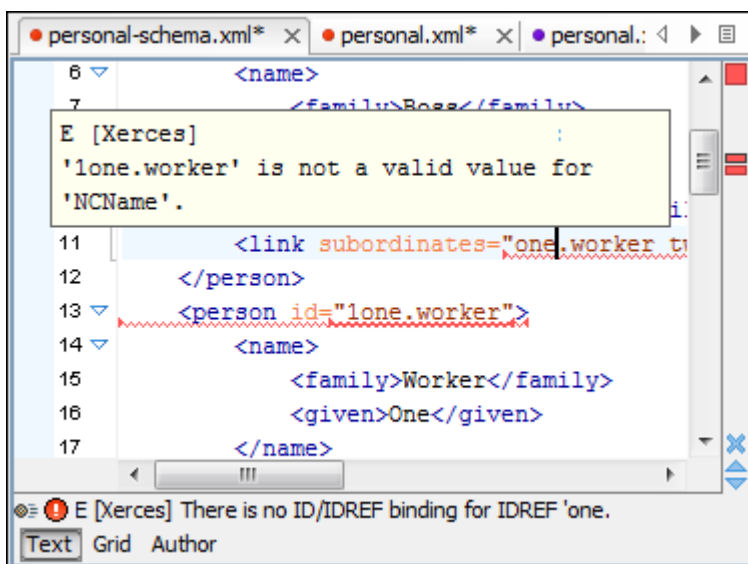

[Automatic Validation \(on page 546\)](#)

[Presenting Validation Errors in Text Mode \(on page 548\)](#)

Presenting Validation Errors in Text Mode

By default, Oxygen XML Developer [automatically validates documents \(on page 546\)](#) while editing in the **Text** mode, and actions are also available to [manually validate documents \(on page 546\)](#) on-request.

Figure 126. Presenting Validation Errors in Text Mode

Validation Marker Locations

In **Text** mode, validation issues are marked in the following locations:

- In the main editing pane, with the issue underlined in a color according to the type of issue.
- In the right-side vertical stripe, with a marker that is colored according to the type of issue.
- For attributes with detected issues, in the [Attributes view \(on page 497\)](#), with the attribute and its value colored according to the type of issue.

Validation Marker Colors

The colors for each type of issue are as follows:

- **Validation Errors** [Red] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in red.
- **Validation Warnings** [Yellow] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in yellow.
- **Validation Info** [Blue] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in blue.

You can configure the color for each type in the [Document Checking preferences page \(on page 194\)](#).

Validation Markers in the Right-Side Stripe

Also, the stripe on the right side of the editor panel is designed to display the issues found during the validation process and to help you locate them in the document. The stripe contains the following:

Upper Part of the Stripe

A success indicator square will turn green if the validation is successful or only info messages are found, red if validation errors are found, or yellow if only validation warnings are found. More details about the issues are displayed in a tooltip when you hover over indicator square. If there are numerous problems, only the first three are presented in the tooltip.

Middle Part of the Stripe

Errors are presented with red markers, warnings with yellow markers, and info message with blue markers. If you want to limit the number of markers that are displayed, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#), go to **Editor > Document checking**, and specify the desired limit in the **Maximum number of validation highlights** option [\(on page 195\)](#).

Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tooltip (when hovering over the marker) and in the message area on the bottom of the editor panel (clicking the  **Document checking options** button opens the [Document Checking preferences page \(on page 194\)](#)).

Bottom Part of the Stripe

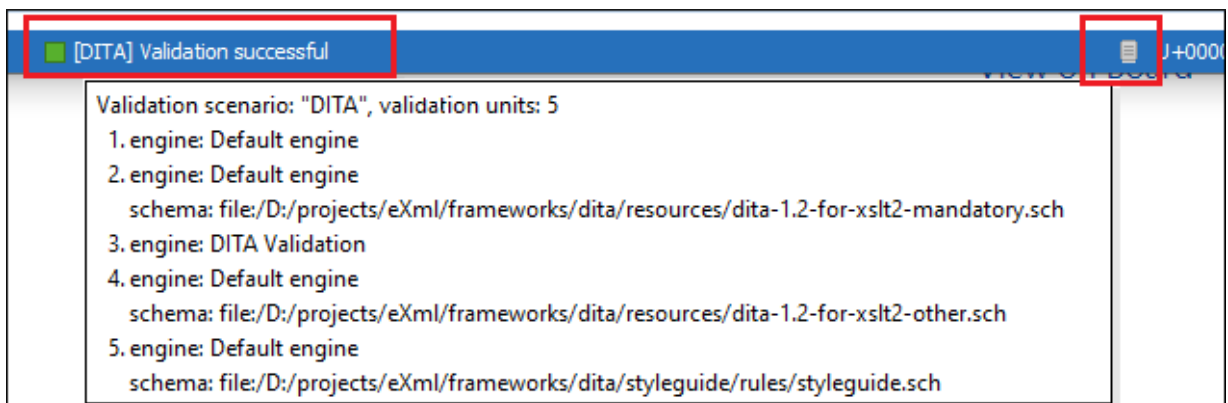

Two navigation arrows ( ) can be used to jump to the next or previous issue. The same actions can be triggered from **Document > Automatic validation > Next Error/Highlight (Ctrl + Period (Command + Period on macOS))** and **Document > Automatic validation > Previous Error/Highlight (Ctrl + Comma (Command + Comma on macOS))**. Also, the  **Remove All** button can be used to clear all the validation markers.

Hovering Over Validation Issues

Hovering over a validation issue presents a tooltip message with more details about the problem and [possible quick fixes \(on page 580\)](#) (if available for that issue). Also, when hovering over an issue, pressing **F2** will change the focus to the tooltip where you can use **Tab** and **Shift + Tab** to navigate between quick fixes and **Space** to trigger them.

Details About Validation Issues

- Information about the issue is also displayed in the message area on the bottom of the editor panel (clicking the  **Document checking options** button opens the [Document Checking preferences page \(on page 194\)](#) where you can configure some validation options (such as the colors used to present the validation issues). Some validation messages have an icon () and clicking it opens a dialog box with additional information and a link to specifications.
- When a validation is processed, information about the validation scenario is displayed in the stripe at the very bottom of the application. It includes the name of the validation scenario and its status. If you hover over the information, a tooltip is presented with more information. You can also click the  button to open the [Information view \(on page 467\)](#), where even more details are displayed.

- If you want to see all the validation messages grouped in the [Results view \(on page 503\)](#) view, use the  **Validate** action from the toolbar or **Document > Validate** menu. To see more information about a validation message, right-click the item in the **Results** view and select **Show message**. Some validation messages have an icon () in the **Info** column and clicking it opens a dialog box with additional information and a link to specifications.

Related Information:

[Validating XML Documents Against a Schema \(on page 545\)](#)

[Presenting Schematron Validation Issues \(on page 990\)](#)

Customizing Assert Error Messages

To customize the error messages that the Xerces or Saxon validation engines display for the `<assert>` and `<assertion>` elements, set the `@message` attribute on these elements.

- For Xerces, the `@message` attribute has to belong to the `http://xerces.apache.org` namespace.
- For Saxon, the `@message` attribute has to belong to the `http://saxon.sf.net/` namespace.

The value of the `@message` attribute is the error message displayed if the assertion fails.

Custom Validators

If you need to validate the edited document with a validation engine that is different from the built-in engine, you can configure external validators in the [Custom Validation Engines preferences page \(on page 195\)](#). After a custom validation engine is [properly configured \(on page 195\)](#), it can be applied on the current document by selecting it from the list of custom validation engines in the  **Validation** toolbar drop-down menu. The document is validated against the schema declared in the document.

Some validators are configured by default but there are third-party processors that do not support the [output message format \(on page 552\)](#) of Oxygen XML Developer for linked messages:

- **Saxon-EE** - Included in Oxygen XML Developer. It is associated to XML Editor and XSD Editor. It is able to validate XML Schema schemas and XML documents against XML Schema schemas. The validation is done according to the W3C XML Schema 1.0 or 1.1. This can be [configured in Preferences \(on page 207\)](#).
- **MSXML 4.0 (Deprecated)** - Included in Oxygen XML Developer (Windows edition only). It is associated to XML Editor, XSD Editor and XSL Editor. It is able to validate the edited document against XML Schema, internal DTD (included in the XML document), external DTD or a custom schema type.
- **MSXML.NET (Deprecated)** - Included in Oxygen XML Developer (Windows edition only). It is associated to XML Editor, XSD Editor and XSL Editor. It is able to validate the edited document against XML Schema, internal DTD (included in the XML document), external DTD or a custom schema type.
- **LIBXML** - Not included in Oxygen XML Developer and, depending on your operating system, the libraries need to be downloaded and installed separately from <http://xmlsoft.org/downloads.html>. Afterward, the `PATH` environment variable needs to be updated to contain the parent folder of the `xmllint` executable. Alternatively, you can go to **Options > Preferences > Editor > Custom Validation Engines**, edit the **LIBXML** validation engine and set a custom path to the `xmllint` executable.

The LIBXML validator is associated with the XML Editor. It is able to validate the edited document against XML Schema, Relax NG schema full syntax, internal DTD (included in the XML document) or a custom schema type. Support for [XML Catalogs \(on page 2273\)](#) (the `--catalogs` parameter) and XInclude processing (`--xinclude`) are enabled by default in the preconfigured LIBXML validator. The `--postvalid` parameter is also set by default and it allows LIBXML to validate correctly the main document even if the XInclude fragments contain IDREFS to ID's located in other fragments.

For validation against an external DTD specified by URI in the XML document, add the `--dtdvalid` `#{ds}` parameter manually to the DTD validation command line. `#{ds}` represents the detected DTD declaration in the XML document.

CAUTION:

File paths containing spaces are not handled correctly in the LIBXML processor. For example, the built-in [XML Catalog \(on page 2273\)](#) files of the built-in document types (DocBook, TEI, DITA, etc.) are not handled by LIBXML if Oxygen XML Developer is installed in the default location on Windows (`C:\Program Files`) because the built-in *XML catalog* files are stored

in the `frameworks` subfolder of the installation folder and in this case, the file path contains at least one space character.

**Attention:**

On macOS, if the full path to the LIBXML executable file is not specified in the **Executable path** text field, some errors may occur during validation against a W3C XML Schema, such as:

```
Unimplemented block at ... xmlschema.c
```

To avoid these errors, specify the full path to the LIBXML executable file.

A custom validator cannot be applied on files loaded through an [Oxygen XML Developer custom protocol plugin \(on page 1879\)](#) developed independently and added to Oxygen XML Developer after installation.

Linked Output Messages of an External Engine

Validation engines display messages in an output view at the bottom of the Oxygen XML Developer window. If such an output message (**warning**, **error**, **fatal error**, etc) spans between three to six lines of text and has the format specified below, then the message is linked to a location in the validated document. Clicking the message in the output view highlights the location of the message in an editor panel containing the file referenced in the message. This behavior is similar to the linked messages generated by the default built-in validator.

Linked messages have the following format:

- **Type:** [F|E|W] (the string *Type:* followed by a letter for the type of the message: fatal error, error, warning). This property is optional in a linked message.
- **SystemID:** A system ID of a file (the string `SystemID:` followed by the system ID of the file that will be opened for highlighting when the message is clicked in the output message - usually the validated file, the schema file or an included file).
- **Line:** A line number (the string *Line:* followed by the number of the line that will be highlighted).
- **Column:** A column number (the string *Column:* followed by the number of the column where the highlight will start on the highlighted line). This property is optional in a linked message.
- **EndLine:** A line number (the string **EndLine:** followed by the number of the line where the highlight ends). This property is optional in a linked message.
- **EndColumn:** A column number (the string **EndColumn:** followed by the number of the column where the highlight ends on the end line). This property is optional in a linked message.

**Note:**

The **Line/Column** pair works in conjunction with the **EndLine/EndColumn** pair. Thus, if both pairs are specified, then the highlight starts at **Line/Column** and ends at **EndLine/EndColumn**. If the **EndLine/EndColumn** pair is missing, the highlight starts from the beginning of the line identified by the **Line** parameter and ends at the column identified by the **Column** parameter.

- **AdditionalInfoURL:** The URL string pointing to a remote location where additional information about the error can be found - this line is optional in a linked message.
- **Description:** Message content (the string *Description:* followed by the content of the message that will be displayed in the output view).

Example:

Example of how a custom validation engine can report an error using the format specified above:

```
Type: E
SystemID: file:///c:/path/to/validatedFile.xml
Line: 10
Column: 20
EndLine: 10
EndColumn: 35
AdditionalInfoURL: http://www.host.com/path/to/errors.html#errorID
Description: custom validator message
```

Using Saxon Integrated Extension Functions

Saxon, the transformation and validation engine used by Oxygen XML Developer, can be customized by adding custom functions (called [Integrated Extension Functions](#)) that can be called from XPath.

To define such a function, follow these steps:

1. Create a file with a Java class that extends `net.sf.saxon.lib.ExtensionFunctionDefinition`. Here is an example:

```
private static class ShiftLeft extends ExtensionFunctionDefinition {

    @Override
    public StructuredQName getFunctionQName() {
        return new StructuredQName("eg", "http://example.com/saxon-extension", "shift-left");
    }

    @Override
    public SequenceType[] getArgumentTypes() {
        return new SequenceType[] {SequenceType.SINGLE_INTEGER, SequenceType.SINGLE_INTEGER};
    }

    @Override
    public SequenceType getResultType(SequenceType[] suppliedArgumentTypes) {
        return SequenceType.SINGLE_INTEGER;
    }

    @Override
```

```

public ExtensionFunctionCall makeCallExpression() {
    return new ExtensionFunctionCall() {
        public SequenceIterator call(SequenceIterator[] arguments, XPathContext context)
            throws XPathException {
            long v0 = ((IntegerValue)arguments[0].next()).longValue();
            long v1 = ((IntegerValue)arguments[1].next()).longValue();
            long result = v0<<v1;
            return Value.asIterator(Int64Value.makeIntegerValue(result));
        }
    };
}

```

2. Compile the class and add it to a JAR file.
3. Add a file called **net.sf.saxon.lib.ExtensionFunctionDefinition** that contains the fully qualified name of the Java class in the `META-INF/services/` folder of the JAR file.

Note:

To add more function definitions in the same JAR file, you need to add their fully qualified names on different lines.

To enable Oxygen XML Developer to pick up your custom function definition, the JAR file should be added to the classpath of the transformer. Here are some possibilities:

- If you develop a framework, you just need to link the JAR file in the **Classpath** tab (*on page 134*).
- In a **validation scenario** (*on page 555*), you can use the **Extensions** button to open a dialog box where you can add libraries.
- In a transformation scenario, you can use the **Extensions** button in the **XSLT** tab (*on page 1132*) to open a dialog box where you can add libraries.
- You can also create a plugin that **contributes** such a JAR file in the classpath (*on page 1863*).

Validation Scenarios

A complex XML document is split in smaller interrelated modules. These modules do not make much sense individually and cannot be validated in isolation due to interdependencies with other modules. Oxygen XML Developer validates the main module of the document when an imported module is checked for errors.

A typical example is the chunking of a DocBook XSL stylesheet that has `chunk.xsl` as the main module and `param.xsl`, `chunk-common.xsl`, and `chunk-code.xsl` as imported modules. `param.xsl` only defines XSLT parameters. The module `chunk-common.xsl` defines an XSLT template with the name `chunk`. `Chunk-code.xsl` calls this template. The parameters defined in `param.xsl` are used in the other modules without being redefined.

Validating `chunk-code.xsl` as an individual XSLT stylesheet generates misleading errors regarding parameters and templates that are used but undefined. These errors are only caused by ignoring the context in which this module is used in real XSLT transformations and validations. To validate such a module, define a validation scenario to set the main module of the stylesheet and the validation engine used to find the errors. Usually this engine applies the transformation during the validation process to detect the errors that the transformation generates.

You can validate a stylesheet with several engines to make sure that you can use it in various environments and have the same results. For example, an XSLT stylesheet may be applied with Saxon 12 or Saxon 6.5 engines in different production systems.

Other examples of documents that can benefit from a validation scenario include:

- A complex XQuery file with a main module that imports modules developed independently but validated in the context of the main module of the query. In an XQuery validation scenario, the default validator of Oxygen XML Developer (Saxon 12) or any connection to a database that supports validation (eXist XML Database, MarkLogic version 5 or newer) can be set as a validation engine.
- An XML document where the *main file* (on page 2270) includes smaller fragment files using XML entity references.

**Note:**

If a *main file* is associated with the current file, the validation scenarios defined in the *main file*, along with any Schematron schema defined in the default scenarios for that particular *framework*, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular *framework*. For more information on *main files*, see [Contextual Project Operations Using 'Main Files' Support \(on page 381\)](#) or [Modular Contextual XML Editing Using 'Main Files' Support \(on page 596\)](#).

**Tip:**

Status information generated by certain operations (such as *validation*) are fed into the **Information** view. This could be helpful for troubleshooting problems encountered during such operations. To open this view, select **Window > Show View > Information**.

Related information

[Validating XML Documents Against a Schema \(on page 545\)](#)

[Presenting Validation Errors in Text Mode \(on page 548\)](#)

Creating a New Validation Scenario

To create a validation scenario, follow these steps:

1. Select the  **Configure Validation Scenario(s)** from the  **Validation** toolbar drop-down menu, or from the **Document > Validate** menu (or the **Validate** submenu when invoking the contextual menu on a file in the **Project view** (on page 365)).

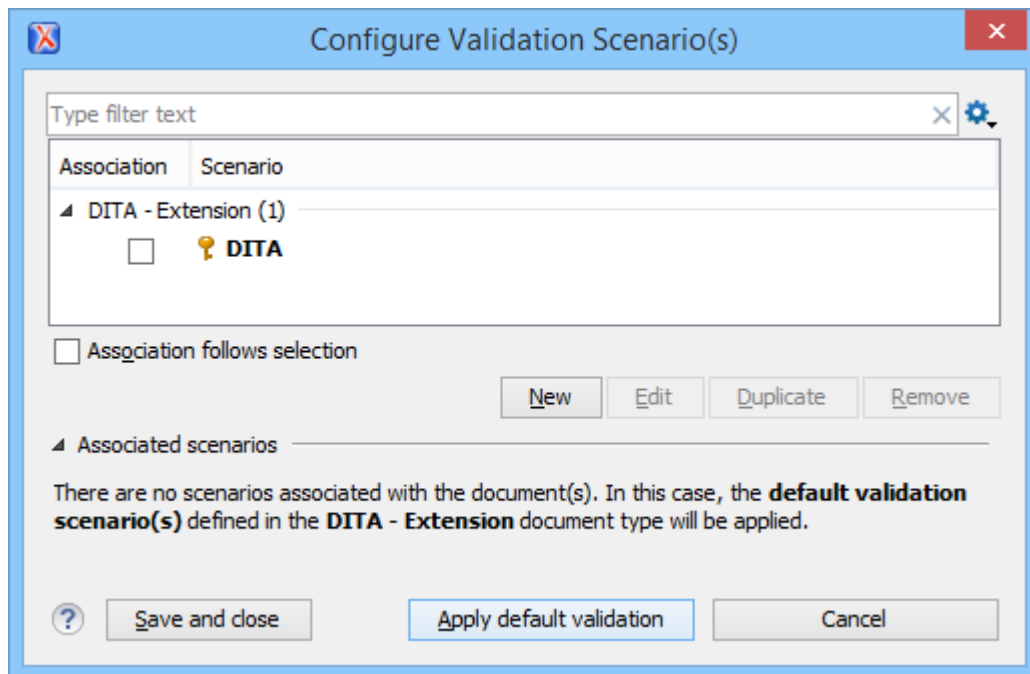

The **Configure Validation Scenario(s)** dialog box is displayed. It contains built-in and user-defined scenarios. The built-in scenarios are organized in categories depending on the type of file they apply to and you can identify them by a yellow key icon that marks them as *read-only*. The user-defined scenarios are organized under a single category. The default scenarios for the particular *framework* (on page 2269) are rendered in bold.

Note:

If a *main file* is associated with the current file, the validation scenarios defined in the *main file*, along with any Schematron schema defined in the default scenarios for that particular *framework*, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular *framework*. For more information on *main files*, see [Contextual Project Operations Using 'Main Files' Support \(on page 381\)](#) or [Modular Contextual XML Editing Using 'Main Files' Support \(on page 596\)](#).

Figure 127. Configure Validation Scenario Dialog Box

The top section of the dialog box contains a filter that allows you to search through the scenarios list and the  **Settings** button allows you to configure the following options:

Show all scenarios

Select this option to display all the available scenarios, regardless of the document they are associated with.

Show only the scenarios available for the editor

Select this option to only display the scenarios that Oxygen XML Developer can apply for the current document type.

Show associated scenarios

Select this option to only display the scenarios associated with the document you are editing.

Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the **scenarios** file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Developer ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

Note:

When you keep both scenarios, Oxygen XML Developer adds **imported** to the name of the imported scenario.

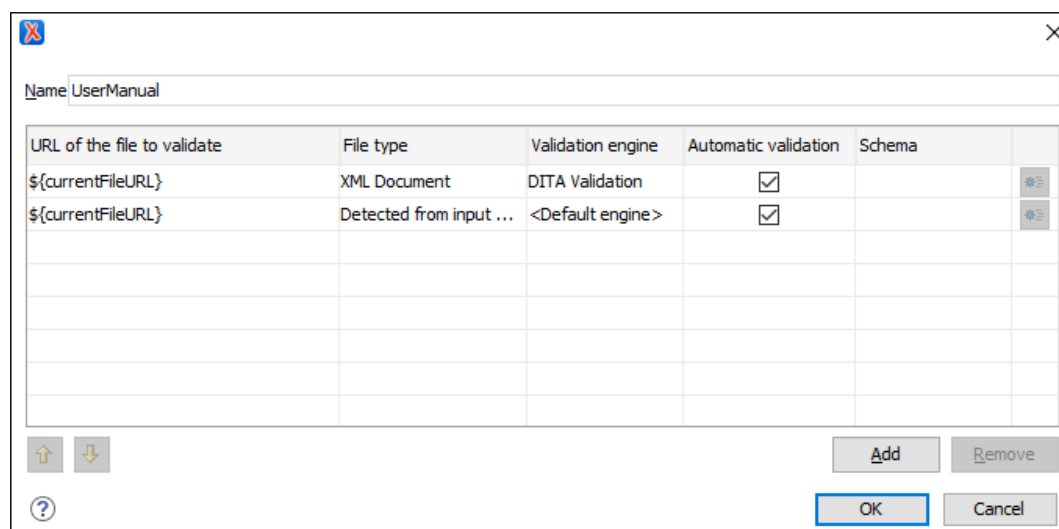

Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Developer creates a **scenarios** file that contains the exported scenarios. This is useful if you want to share scenarios with others or export them to another computer.

2. To add a scenario, click the **New** button.

A validation scenario configuration dialog box is displayed and it lists all the validation units for the scenario.

Figure 128. Validation Scenario Configuration Dialog Box

URL of the file to validate	File type	Validation engine	Automatic validation	Schema
\${currentFileURL}	XML Document	DITA Validation	<input checked="" type="checkbox"/>	
\${currentFileURL}	Detected from input ...	<Default engine >	<input checked="" type="checkbox"/>	

This scenario configuration dialog box allows you to configure the following information and options:

Name

The name of the validation scenario.

Storage

You can choose between storing the scenario in the **Project Options** (on page 2272) or **Global Options** (on page 2269).

URL of the file to validate

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, double-click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the  **Browse** drop-down button to browse for a local, remote, or archived file.
- Use the  **Insert Editor Variable** button to insert an [editor variable \(on page 289\)](#) or a [custom editor variable \(on page 297\)](#).

Figure 129. Insert an Editor Variable

<code>\${_Desktop}</code>	- My Desktop
<code>\${start-dir}</code>	- Start directory of custom validator
<code>\${standard-params}</code>	- List of standard params for command line
<code>\${cfn}</code>	- The current file name without extension
<code>\${currentFileURL}</code>	- The path of the currently edited file (URL)
<code>\${cfdu}</code>	- The path of current file directory (URL)
<code>\${frameworks}</code>	- Oxygen frameworks directory (URL)
<code>\${pdu}</code>	- Project directory (URL)
<code>\${oxygenHome}</code>	- Oxygen installation directory (URL)
<code>\${home}</code>	- The path to user home directory (URL)
<code>\${pn}</code>	- Project name
<code>\${env(VAR_NAME)}</code>	- Value of environment variable VAR_NAME
<code>\${system(var.name)}</code>	- Value of system variable var.name

File type

The type of the document that is validated in the current validation unit. Oxygen XML Developer automatically selects the file type depending on the value of the **URL of the file to validate** field.

Validation engine

You can select one of the engines available in Oxygen XML Developer for validation of the particular document type:

- **Default engine** - The default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, [XSLT preferences page \(on page 214\)](#), [XQuery preferences page \(on page 222\)](#), [XML Schema preferences page \(on page 207\)](#)).
- **DITA Validation** engine - Performs DITA-specific checks in the context of the specifications.
- **DITA Map Validation and Completeness Check** engine - Performs a validation process that checks the DITA map document and all referenced topics and maps.
- **DITA-OT Project Validation and Completeness Check** engine - Performs a validation process that checks each context from the provided DITA-OT project file.
- **Table Layout Validation** engine - Looks for table layout problems.

Automatic validation

If this option is selected, the validation operation defined by this row is also applied by [the automatic validation feature \(on page 546\)](#). If the **Automatic validation** feature is disabled in the [Document Checking preferences page \(on page 194\)](#), then this option is ignored, as the preference setting has a higher priority.

Schema

This option becomes active when you set the **File type** to **XML Document** and allows you to specify the schema used for the validation unit.

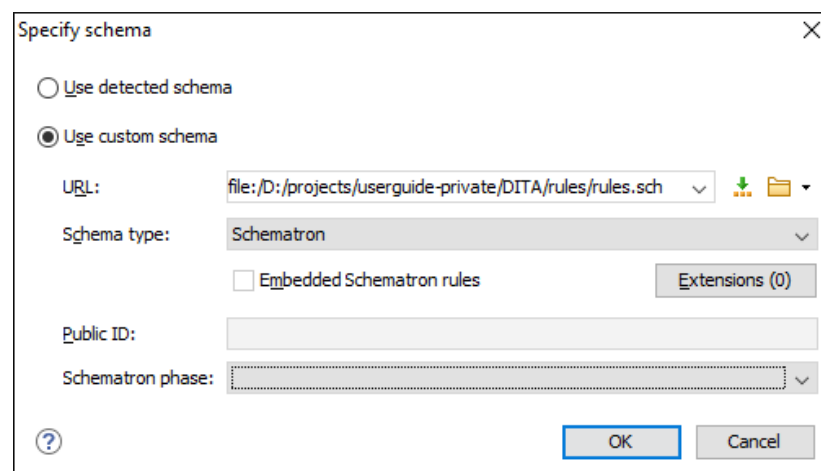

Settings

Depending on the selected validation engine, clicking the  **Settings** button either opens the **Specify Schema** dialog box or the **Configure validation engine** dialog box.

- **Specify Schema Dialog Box**

This dialog box allows you to specify a custom schema to be used for the validation process.

Figure 130. Specify Schema Dialog Box

The **Specify Schema** dialog box contains the following options:

Use detected schema

Uses the [schema detected for the particular document \(on page 583\)](#).

Use custom schema

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S) or SFTP (or a [custom protocol \(on page 1896\)](#)). You can specify the URL by using the text field, the history drop-down, the  **Insert Editor Variables (on page 289)** button, or the browsing actions in the  **Browse** drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
- **Extensions**- Opens a dialog box that allows you to specify [Java extension JARs \(on page 2270\)](#) to be used during the validation.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

◦ **Configure Validation Engine Dialog Box**

This dialog box allows you to configure options for checking the DITA map document and all referenced topics and maps.

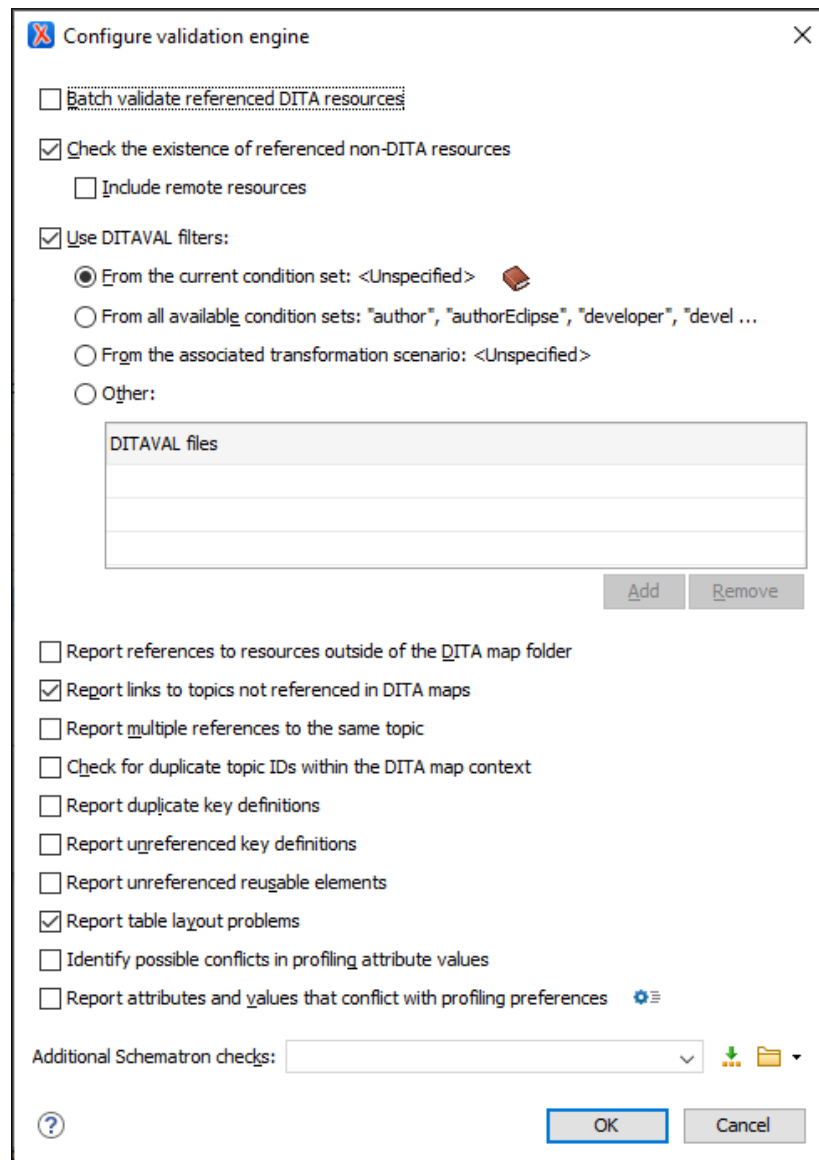

**Note:**

The options presented in the **Configure validation engine** dialog box depends on type of validation engine. For example, when configuring the **DITA-OT Project Validation and Completeness Check** validation engine,

the dialog box has slightly fewer options (omitting those that are not applicable).

Figure 131. Example of the Configure Validation Engine Dialog Box

The **Configure Validation Engine** dialog box contains the following options:

Batch validate referenced DITA resources

This option specifies the level of validation that applies to referenced DITA files:

- If the checkbox is left unchecked (default setting), the DITA files will be validated using the rules defined in the DTD or XML Schema declared in the document.
- If the checkbox is selected, the DITA files will be validated using rules defined in their associated [validation scenario](#) ([on page 554](#)).

Check the existence of non-DITA references resources

Extends the validation of referenced resources to non-DITA files.

Include remote resources

Select this option if you want to check that remote referenced binary resources (such as images, movie clips, ZIP archives) exist at the specified location.

Use DITAVAL filters

The content of the map is filtered by applying a profiling condition set before validation. You can choose between the following options:

- **From the current condition set** - The map is filtered using the condition set currently applied. Clicking the  **Details** icon opens a topic in the Oxygen XML Developer User Guide that explains how to create a profiling condition set.
- **From all available condition sets** - For each available condition set, the map content is filtered using that set before validation.
- **From the associated transformation scenario** - The filtering condition set is specified explicitly as a DITAVAL file in the current transformation scenario associated with the *DITA map*.
- **Other DITAVAL files** - For each DITAVAL file from this list, the map content is filtered using the DITAVAL file before validation. Use the **Add** or **Remove** buttons to configure the list. The **Add** button opens a dialog box that allows you to select a local or remote path to a DITAVAL file. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** (on page 289) button, or the browsing actions in the  **Browse** drop-down list.

Report references to resources outside of the DITA map folder

If selected, it will report any references to DITA resources that are located outside the *main DITA map* (on page 2273) folder.

Report links to topics not referenced in DITA maps

Checks that all the topics referenced by other topics are also linked in the *DITA map*. Also reports related links defined in relationship tables whose target topics are not referenced in the DITA Map.

Report multiple references to the same topic

If selected, it will report warnings when a topic is referenced multiple times in the *DITA map*, unless a unique `@copy-to` attribute is used on the `<topicref>` element for any topic that is referenced multiple times.

For example, it will **not** report a warning if there is a topic referenced twice, but the second `<topicref>` has a `@copy-to` attribute set:

```
<topicref href="topic.dita"/>
.....
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

On the other hand, it **will** report a warning if there is a topic referenced twice and none of the reference-type elements has a `@copy-to` attribute set or both of them have the `@copy-to` attribute set to the same value:

```
<topicref href="topic.dita" copy-to="topic2.dita"/>
.....
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

Check for duplicate topic IDs within the DITA map context

Checks for multiple topics with the same ID in the context of the entire map.

Report duplicate key definitions

Checks the *DITA map* for multiple key references with the same key defined for them. This is helpful because if you have two different resources with the same value for the `@keys` attribute, all references will point to the first one encountered and the other will be ignored.

Report unreferenced key definitions

Checks the entire *DITA map* and reports any key definitions that are not referenced anywhere. Note that if the **Use DITaval filters** option is selected, this check will search for unreferenced key definitions based upon your selected filter.

Report unreferenced reusable elements

Checks the entire *DITA map* and reports any detected reusable elements that are not referenced anywhere. It looks for elements that have an *ID* specified in the following types of topic references:

- Any `<topicref>` that contains a `@processing-role` attribute set to **resource-only**.
- Any other referenced topic that contains elements that are reused elsewhere through a `@conref` or `@conkeyref`.

Report table layout problems

Looks for table layout problems. The types of errors that may be reported include:

- If a row has fewer cells than the number of columns detected.
- For a *CALS* table, if a cell has a vertical span greater than the available rows count.
- For a *CALS* table, if the number of `<colspecs>` is different than the number of columns detected from the table `@cols` attribute.
- For a *CALS* table, if the number of columns detected from the table `@cols` attribute is different than the number of columns detected in the table structure.
- For a *CALS* table, if the value of the `@cols`, `@rowsep`, or `@colsep` attributes are not numeric.
- For a *CALS* table, if the `@namest`, `@nameend`, or `@colname` attributes point to an incorrect column name.

Identify possible conflicts in profile attribute values

When the profiling attributes of a topic contain values that are not found in parent topic profiling attributes, the content of the topic is overshadowed when generating profiled output. This option reports these possible conflicts.

Report attributes and values that conflict with profiling preferences

Looks for profiling attributes and values that are not defined. It also checks if profiling attributes defined as *single-value* have multiple values set in the searched topics.

Additional Schematron checks

Allows you to select a Schematron file that Oxygen XML Developer will use for the validation of DITA resources. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** (on page 289) button, or the browsing actions in the  **Browse** drop-down list.

Advanced Tip:

Some APIs are available that retrieve information about DITA keys that are referenced within a topic. The APIs can be called from XSLT Stylesheets (including XML Refactoring operations) or Schematron schemas. For details, see [API Documentation: DITAXSLTExtensionFunctionUtil](#).

Move Up

Moves the selected validation unit up one spot in the list.

Move Down

Moves the selected validation unit down one spot in the list.

Add

Adds a new validation unit to the list.

Remove

Removes an existing validation unit from the list.

- Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the **validation phase**.
- Click **OK**.

The newly created validation scenario will now be included in the list of scenarios in the **Configure Validation Scenario(s)** dialog box. You can select the scenario in this dialog box to associate it with the current document and click the **Apply associated** button to run the validation scenario.

Editing a Validation Scenario

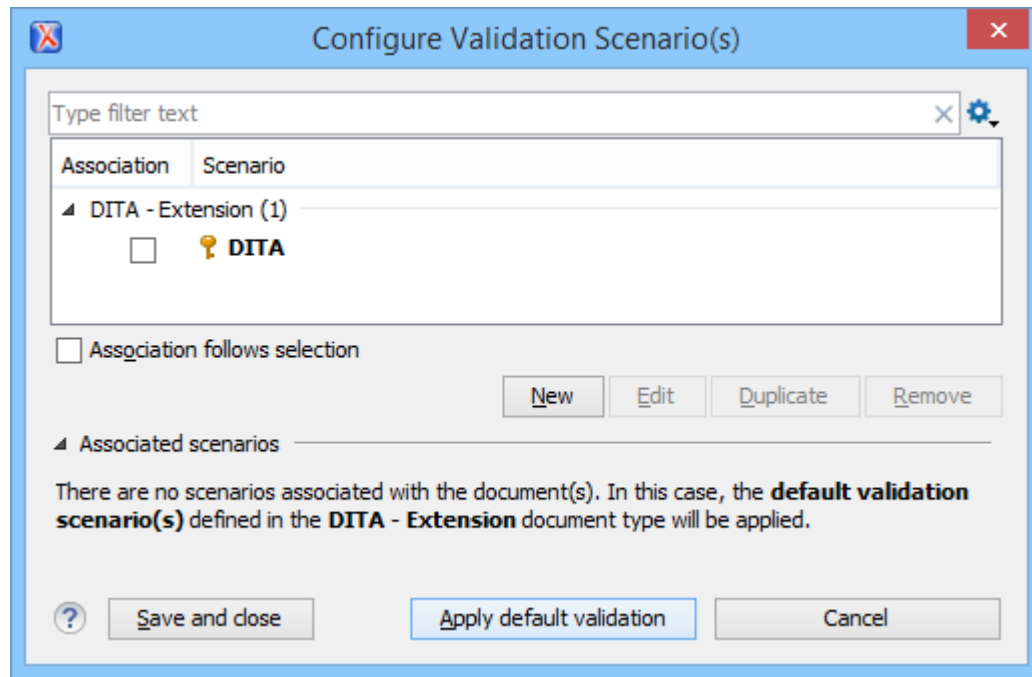

To edit an existing validation scenario, follow these steps:

- Select the  **Configure Validation Scenario(s)** from the  **Validation** toolbar drop-down menu, or from the **Document > Validate** menu (or the **Validate** submenu when invoking the contextual menu on a file in the **Project view** (on page 365)).

The **Configure Validation Scenario(s)** dialog box is displayed. It contains built-in and user-defined scenarios. The built-in scenarios are organized in categories depending on the type of file they apply to and you can identify them by a yellow key icon that marks them as *read-only*. The user-defined scenarios are organized under a single category. The default scenarios for the particular *framework* (on page 2269) are rendered in bold.

**Note:**

If a *main file* is associated with the current file, the validation scenarios defined in the *main file*, along with any Schematron schema defined in the default scenarios for that particular *framework*, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular *framework*. For more information on *main files*, see [Contextual Project Operations Using 'Main Files' Support \(on page 381\)](#) or [Modular Contextual XML Editing Using 'Main Files' Support \(on page 596\)](#).

Figure 132. Configure Validation Scenario Dialog Box

The top section of the dialog box contains a filter that allows you to search through the scenarios list and the  **Settings** button allows you to configure the following options:

Show all scenarios

Select this option to display all the available scenarios, regardless of the document they are associated with.

Show only the scenarios available for the editor

Select this option to only display the scenarios that Oxygen XML Developer can apply for the current document type.

Show associated scenarios

Select this option to only display the scenarios associated with the document you are editing.

Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the **scenarios** file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Developer ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

**Note:**

When you keep both scenarios, Oxygen XML Developer adds *imported* to the name of the imported scenario.

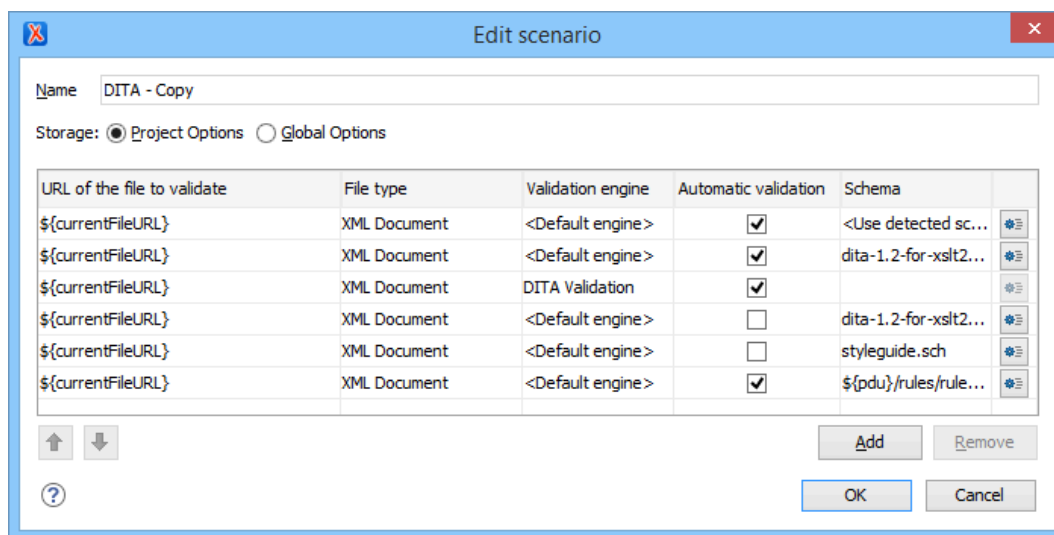

**Export selected scenarios**

Use this option to export selected scenarios individually. Oxygen XML Developer creates a *scenarios* file that contains the exported scenarios. This is useful if you want to share scenarios with others or export them to another computer.

2. Select the scenario and click the **Edit** button. If you try to edit one of the *read-only* built-in scenarios, you will receive a warning message that Oxygen XML Developer needs to create a customizable duplicate (you can also use the **Duplicate** button).

The **Edit scenario** dialog box is displayed and it lists all the validation units for the scenario.

Figure 133. Edit Validation Scenario

This scenario configuration dialog box allows you to configure the following information and options:

Name

The name of the validation scenario.

Storage

You can choose between storing the scenario in the **Project Options** (on page 2272) or **Global Options** (on page 2269).

URL of the file to validate

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, double-click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the  **Browse** drop-down button to browse for a local, remote, or archived file.
- Use the  **Insert Editor Variable** button to insert an [editor variable \(on page 289\)](#) or a [custom editor variable \(on page 297\)](#).

Figure 134. Insert an Editor Variable

<code>\${Desktop}</code>	- My Desktop
<code>\${start-dir}</code>	- <u>S</u> tart directory of custom validator
<code>\${standard-params}</code>	- <u>L</u> ist of standard params for command line
<code>\${cfn}</code>	- <u>T</u> he current file name without extension
<code>\${currentFileURL}</code>	- The path of the currently edited file (URL)
<code>\${cfdu}</code>	- The path of current file directory (<u>U</u> RL)
<code>\${frameworks}</code>	- <u>O</u> xxygen frameworks directory (URL)
<code>\${pdu}</code>	- <u>P</u> roject directory (URL)
<code>\${oxygenHome}</code>	- Oxygen installation directory (URL)
<code>\${home}</code>	- The path to user home directory (<u>U</u> RL)
<code>\${pn}</code>	- Project name
<code>\${env(VAR_NAME)}</code>	- Value of environment variable VAR_NAME
<code>\${system(var.name)}</code>	- Value of system variable var.name

File type

The type of the document that is validated in the current validation unit. Oxygen XML Developer automatically selects the file type depending on the value of the **URL of the file to validate** field.

Validation engine

You can select one of the engines available in Oxygen XML Developer for validation of the particular document type:

- **Default engine** - The default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, [XSLT preferences page \(on page 214\)](#), [XQuery preferences page \(on page 222\)](#), [XML Schema preferences page \(on page 207\)](#)).
- **DITA Validation engine** - Performs DITA-specific checks in the context of the specifications.
- **DITA Map Validation and Completeness Check engine** - Performs a validation process that checks the DITA map document and all referenced topics and maps.
- **DITA-OT Project Validation and Completeness Check engine** - Performs a validation process that checks each context from the provided DITA-OT project file.
- **Table Layout Validation engine** - Looks for table layout problems.

Automatic validation

If this option is selected, the validation operation defined by this row is also applied by the automatic validation feature (on page 546). If the **Automatic validation** feature is disabled in the [Document Checking preferences page](#) (on page 194), then this option is ignored, as the preference setting has a higher priority.

Schema

This option becomes active when you set the **File type** to **XML Document** and allows you to specify the schema used for the validation unit.

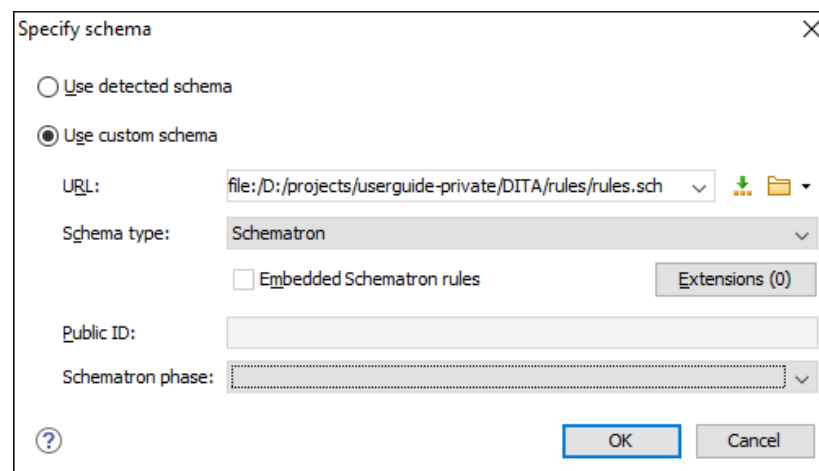

⚙️ Settings

Depending on the selected validation engine, clicking the ⚙️ **Settings** button either opens the **Specify Schema** dialog box or the **Configure validation engine** dialog box.

◦ **Specify Schema Dialog Box**

This dialog box allows you to specify a custom schema to be used for the validation process.

Figure 135. Specify Schema Dialog Box

The **Specify Schema** dialog box contains the following options:

Use detected schema

Uses the [schema detected](#) for the particular document (on page 583).

Use custom schema

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S) or SFTP (or a [custom protocol](#) (on page 1896)). You can specify the URL by using the text field, the history drop-down, the 📁 **Insert Editor**

Variables (on page 289) button, or the browsing actions in the  **Browse** drop-down list.

- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
 - **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
 - **Extensions**- Opens a dialog box that allows you to specify *Java extension JARs (on page 2270)* to be used during the validation.
 - **Public ID** - Allows you to specify a public ID if you have selected a DTD.
 - **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.
- **Configure Validation Engine Dialog Box**

This dialog box allows you to configure options for checking the DITA map document and all referenced topics and maps.

Note:

The options presented in the **Configure validation engine** dialog box depends on type of validation engine. For example, when configuring the **DITA-OT Project Validation and Completeness Check** validation engine, the dialog box has slightly fewer options (omitting those that are not applicable).

Figure 136. Example of the Configure Validation Engine Dialog Box

The **Configure Validation Engine** dialog box contains the following options:

Batch validate referenced DITA resources

This option specifies the level of validation that applies to referenced DITA files:

- If the checkbox is left unchecked (default setting), the DITA files will be validated using the rules defined in the DTD or XML Schema declared in the document.
- If the checkbox is selected, the DITA files will be validated using rules defined in their associated [validation scenario \(on page 554\)](#).

Check the existence of non-DITA references resources

Extends the validation of referenced resources to non-DITA files.

Include remote resources

Select this option if you want to check that remote referenced binary resources (such as images, movie clips, ZIP archives) exist at the specified location.

Use DITAVAL filters

The content of the map is filtered by applying a profiling condition set before validation. You can choose between the following options:

- **From the current condition set** - The map is filtered using the condition set currently applied. Clicking the  **Details** icon opens a topic in the Oxygen XML Developer User Guide that explains how to create a profiling condition set.
- **From all available condition sets** - For each available condition set, the map content is filtered using that set before validation.
- **From the associated transformation scenario** - The filtering condition set is specified explicitly as a DITAVAL file in the current transformation scenario associated with the *DITA map*.
- **Other DITAVAL files** - For each DITAVAL file from this list, the map content is filtered using the DITAVAL file before validation. Use the **Add** or **Remove** buttons to configure the list. The **Add** button opens a dialog box that allows you to select a local or remote path to a DITAVAL file. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** (on page 289) button, or the browsing actions in the  **Browse** drop-down list.

Report references to resources outside of the DITA map folder

If selected, it will report any references to DITA resources that are located outside the *main DITA map* (on page 2273) folder.

Report links to topics not referenced in DITA maps

Checks that all the topics referenced by other topics are also linked in the *DITA map*. Also reports related links defined in relationship tables whose target topics are not referenced in the DITA Map.

Report multiple references to the same topic

If selected, it will report warnings when a topic is referenced multiple times in the *DITA map*, unless a unique `@copy-to` attribute is used on the `<topicref>` element for any topic that is referenced multiple times.

For example, it will **not** report a warning if there is a topic referenced twice, but the second `<topicref>` has a `@copy-to` attribute set:

```
<topicref href="topic.dita"/>
.....
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

On the other hand, it **will** report a warning if there is a topic referenced twice and none of the reference-type elements has a `@copy-to` attribute set or both of them have the `@copy-to` attribute set to the same value:

```
<topicref href="topic.dita" copy-to="topic2.dita"/>
.....
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

Check for duplicate topic IDs within the DITA map context

Checks for multiple topics with the same ID in the context of the entire map.

Report duplicate key definitions

Checks the *DITA map* for multiple key references with the same key defined for them. This is helpful because if you have two different resources with the same value for the `@keys` attribute, all references will point to the first one encountered and the other will be ignored.

Report unreferenced key definitions

Checks the entire *DITA map* and reports any key definitions that are not referenced anywhere. Note that if the **Use DITaval filters** option is selected, this check will search for unreferenced key definitions based upon your selected filter.

Report unreferenced reusable elements

Checks the entire *DITA map* and reports any detected reusable elements that are not referenced anywhere. It looks for elements that have an *ID* specified in the following types of topic references:

- Any `<topicref>` that contains a `@processing-role` attribute set to **resource-only**.
- Any other referenced topic that contains elements that are reused elsewhere through a `@conref` or `@conkeyref`.

Report table layout problems

Looks for table layout problems. The types of errors that may be reported include:

- If a row has fewer cells than the number of columns detected.
- For a *CALS* table, if a cell has a vertical span greater than the available rows count.

- For a *CALS* table, if the number of `<colspecs>` is different than the number of columns detected from the table `@cols` attribute.
- For a *CALS* table, if the number of columns detected from the table `@cols` attribute is different than the number of columns detected in the table structure.
- For a *CALS* table, if the value of the `@cols`, `@rowsep`, or `@colsep` attributes are not numeric.
- For a *CALS* table, if the `@namest`, `@nameend`, or `@colname` attributes point to an incorrect column name.

Identify possible conflicts in profile attribute values

When the profiling attributes of a topic contain values that are not found in parent topic profiling attributes, the content of the topic is overshadowed when generating profiled output. This option reports these possible conflicts.

Report attributes and values that conflict with profiling preferences

Looks for profiling attributes and values that are not defined. It also checks if profiling attributes defined as *single-value* have multiple values set in the searched topics.

Additional Schematron checks

Allows you to select a Schematron file that Oxygen XML Developer will use for the validation of DITA resources. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** (on page 289) button, or the browsing actions in the  **Browse** drop-down list.

Advanced Tip:

Some APIs are available that retrieve information about DITA keys that are referenced within a topic. The APIs can be called from XSLT Stylesheets (including XML Refactoring operations) or Schematron schemas. For details, see [API Documentation: DITAXSLTExtensionFunctionUtil](#).

Move Up

Moves the selected validation unit up one spot in the list.

Move Down

Moves the selected validation unit down one spot in the list.

Add

Adds a new validation unit to the list.

Remove

Removes an existing validation unit from the list.

- Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the **validation phase**.
- When you are done configuring the scenario, click **OK**.

The modified validation scenario will now be included in the list of scenarios in the **Configure Validation Scenario(s)** dialog box. If you chose to duplicate an existing one, the modified scenario will be listed with the word *copy* at the end of its name.

Sharing Validation Scenarios

The validation scenarios and their settings can be shared with other users by saving them at [project level \(on page 2272\)](#) or by [exporting them to a specialized scenarios file \(on page 288\)](#) that can then be imported.

When you create a new validation scenario or edit an existing one, there is a **Storage** option to control whether the scenarios are stored in **Project Options (on page 2272)** or **Global Options (on page 2269)**.

Storage: Project Options Global Options

Selecting **Project Options (on page 2272)** stores the scenario in the project file and can be shared with other users that have access to the project. If your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) then your team will have access to the scenarios that you define. When you create a scenario at the project level, the URLs from the scenario become relative to the project URL.

Selecting **Global Options (on page 2269)** stores the scenario in the global options that are stored in the user home directory.

You can also change the storage options on existing validation scenarios by using the **Change storage** action from the contextual menu of the list of scenarios.

Related Information:

[Sharing Application Settings \(on page 278\)](#)

Resolving References to Remote Schemas with an XML Catalog

When a reference to a remote schema must be used in the validated XML document for interoperability purposes, but a local copy of the schema should actually be used for performance reasons, the reference can be resolved to the local copy of the schema with an [XML Catalog \(on page 2273\)](#).

For example, if the XML document contains a reference to a remote schema `docbook.rng` like this:

```
<?xml-model href="http://www.oasis-open.org/docbook/xml/5.0/rng/docbook.rng"
  type="application/xml" schematypens="http://relaxng.org/ns/structure/1.0"?>
```

it can be resolved to a local copy with a catalog entry like this:

```
<uri name="http://www.oasis-open.org/docbook/xml/5.0/rng/docbook.rng"
      uri="rng/docbook.rng" />
```

An *XML Catalog* can also be used to map an XML Schema specified with a URN in the `@xsi:schemaLocation` attribute of an XML document to a local copy of the schema. For example, if the XML document specifies the schema with:

```
<topic xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
       xsi:noNamespaceSchemaLocation="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1">
```

the URN can be resolved to a local schema file with a catalog entry like this:

```
<uri name="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1"
      uri="topic.xsd" />
```

Related Information:

[Working with XML Catalogs \(on page 593\)](#)

Validation Example - A DocBook Validation Error

In the following DocBook 4 document, the content of the `<listitem>` element does not match the rules of the DocBook 4 schema (`docbookx.dtd`).

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE article PUBLIC "-//OASIS//DTD DocBook XML V4.4//EN"
      "http://www.docbook.org/xml/4.4/docbookx.dtd">
<article>
  <title>Article Title</title>
  <sect1>
    <title>Section1 Title</title>
    <itemizedlist>
      <listitem>
        <link>a link here</link>
      </listitem>
    </itemizedlist>
  </sect1>
</article>
```

The  **Validate Document** action will return the following error:

```
Unexpected element "link". The content of the parent element type must match
"(calloutlist|glosslist|bibliolist|itemizedlist|orderedlist|segmentedlist|simplelist
|variablelist|caution|important|note|tip|warning|literallayout|programlisting
|programlistingco|screen|screenco|screenshot|synopsis|cmdsynopsis|functsynopsis
|classsynopsis|fieldsynopsis|constructorsynopsis|destructorsynopsis|methodsynopsis
```

```
|formalpara|para|simpara|address|blockquote|graphic|graphicco|mediaobject|mediaobjectco
|informalequation|informalexample|informalfigure|informaltable|equation|example|figure
|table|msgset|procedure|sidebar|qandaset|task|anchor|bridgehead|remark|highlights
|abstract|authorblurb|epigraph|indexterm|beginpage)+".
```

This error message is a little more difficult to understand, so understanding of the syntax or processing rules for the DocBook XML DTD `<listitem>` element is recommended. However, the error message does offer a clue as to the source of the problem, indicating that *"The content of element type must match"*.

Fortunately, most standards-based DTDs, XML Schemas, and Relax NG schemas are supplied with reference documentation. This enables you to read about the element. In this case, you should learn about the child elements of `<listitem>` and their nesting rules. Once you have correctly inserted the required child element and nested it in accordance with the XML rules, the document will become valid.

Embedding Schematron Rules in XML Schema or RELAX NG

Schematron rules can be embedded into an XML Schema through annotations (using the `<appinfo>` element), or in any element on any level of a RELAX NG Schema (taking into account that the RELAX NG validator ignores all elements that are not in the RELAX NG namespace).

Oxygen XML Developer supports Schematron validation schemas and it is able to extract and use the embedded rules.

Validating XML Documents with XML Schema and Embedded Schematron

To validate an XML document with XML Schema and its embedded Schematron, you can associate the document like this:

```
<?xml-model href="percent.xsd" type="application/xml"
    schematypens="http://purl.oclc.org/dsdl/schematron"?>
```

Validating XML Documents with Relax NG and Embedded Schematron

To validate an XML document with RELAX NG schema and its embedded Schematron rules, you need to associate the document with both schemas like this:

```
<?xml-model href="percent.rng" type="application/xml"
    schematypens="http://relaxng.org/ns/structure/1.0"?>
<?xml-model href="percent.rng" type="application/xml"
    schematypens="http://purl.oclc.org/dsdl/schematron"?>
```

The second association validates your document with Schematron rules extracted from the RELAX NG Schema.

Note:

When you work with XML Schema or Relax NG documents that have embedded Schematron rules Oxygen XML Developer provides two built-in validation scenarios: **Validate XML Schema with**

embedded Schematron for XML schema, and **Validate Relax NG with embedded Schematron** for Relax NG. You can use one of these scenarios to validate the embedded Schematron rules.

Example: Embedded Schematron in XML Schema

```
<xsd:appinfo>
  <sch:pattern>
    <sch:rule context="...">
      <sch:assert test="...">Message.</sch:assert>
    </sch:rule>
  </sch:pattern>
</xsd:appinfo>
```

Example: Embedded Schematron in Relax NG Schema

```
<grammar
  xmlns="http://relaxng.org/ns/structure/1.0"
  xmlns:sch="http://purl.oclc.org/dsdl/schematron" >
  <sch:pattern>
    <sch:rule context="...">
      <sch:assert test="...">Message.</sch:assert>
    </sch:rule>
  </sch:pattern>
  <start>
    .....
  </start>
</grammar>
```

Related Information:

[Embedding Schematron Quick Fixes in Relax NG or XML Schema \(on page 1033\)](#)

Ignoring/Unignoring Validation Problems

If the **Enable support for ignoring validation problems** option (on page 198) is selected in the **Ignored Validation Problems** preferences page (on page 197), validation problems can be ignored using quick fix actions that are automatically added to the list of proposals for fixing the problem. These quick fix actions are available for validation problems that have an ID in the following places in the interface:

- When the cursor is placed at the location of the problem in the main editor pane, a *Quick Fix* icon (💡) is displayed in the stripe on the left side of the editor. Clicking that icon opens a pop-up window where the quick fix proposals are presented.
- When you hover over the problem in the editor, the proposals are presented in a tooltip.
- When you right-click a problem in the **Results view** (on page 503), the proposals are available in the contextual menu.

**Note:**

For Schematron-based validation, these quick fix actions for ignoring problems are available for validation problems that have an ID set on the Schematron `<assert>` or `<report>` elements. That ID, prefixed with the name of the Schematron, is used as the error code (e.g. `flowers.sch:xrefFormatID`).

The quick fix actions for ignoring problems are:

Ignore this problem in this document

When validating this document, this problem will be ignored based on the message, error code, and file location.

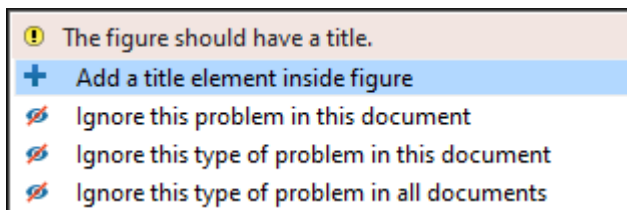

Ignore this type of problem in this document

When validating this document, this type of problem will be ignored based on the error code and file location.

Ignore this type of problem in all documents

When validating any document, this type of problem will be ignored based on the error code.

Figure 137. Schematron Ignored Problems Quick Fix Proposals

When a validation problem is ignored:

- It is added to the *Ignored Problems Table* (on page 198) in the **Ignored Validation Problems preferences page** (on page 197). The table displays all the problems that you have specified to be ignored and you can remove items from the table by selecting them and clicking the **Delete** button located under the table.
- It will no longer be highlighted in the editor pane.
- In the vertical range ruler on the right side of the editor, the problem will be marked with a gray color.
- In the **Results view** (on page 503), the problem will be marked with a disabled (grayed out) action.
- The ignored problem will also be marked when a batch validation operation is executed.

How to Ignore Validation Problems

Validation problems that have previously been ignored (hence, they are added to the *Ignored Problems Table* (on page 198)) can be unignored (removed from the table) using the **Remove from ignored problems list** action from the problem's contextual menu in the **Results view** (on page 503).

Another way to unignore a problem that has been ignored is to hover over its gray marker in the vertical ruler on the right side of the editor until a tooltip is displayed, then use **F2** to change the focus to the tooltip, then click the **Remove from ignored problems list** quick fix link. This results in that problem being removed from the list and the problem is no longer ignored.

XML Quick Fixes

The Oxygen XML Developer *Quick Fix support* (on page 2272) helps you resolve errors that appear in an XML document by offering *Quick Fixes* to problems such as missing required attributes or invalid elements. *Quick Fixes* are available in **Text mode**

To activate this feature, hover over or place the cursor in the highlighted area of text where a validation error or warning occurs. If a *Quick Fix* is available for that particular error or warning, you can access the *Quick Fix* proposals with any of the following methods:

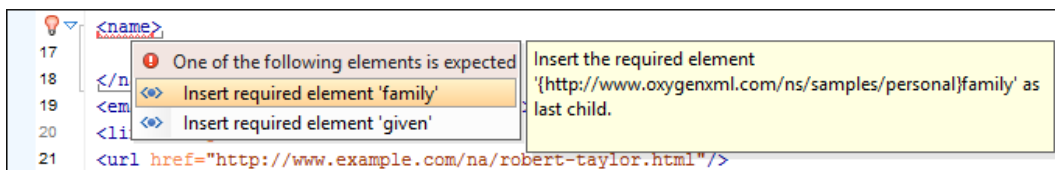

- When hovering over the error or warning, the proposals may be presented in a tooltip pop-up window and the available quick *Quick Fixes* include a link that can be used to perform the fix.

Figure 138. Quick Fix Presented in a Tooltip in Text Mode

- If you place the cursor in the highlighted area where a validation error or warning occurs, a *Quick Fix* icon (💡) is displayed in the stripe on the left side of the editor. If you click this icon, Oxygen XML Developer displays the list of available fixes.

Figure 139. Quick Fix Menu Invoked by Clicking on the 💡 Icon

- With the cursor placed in the highlighted area of the error or warning, you can also invoke the *Quick Fix* menu by pressing **Alt + 1** (**Command + Option + 1 on macOS**) on your keyboard.

Whenever you make a modification in the XML document or you apply a fix, the list of *Quick Fixes* is recomputed to ensure that you always have valid proposals.

Note:

A *Quick Fix* that adds an element inserts it along with required and optional elements, and required and fixed attributes, depending on how the **Content Completion preferences** (*on page 179*) are configured.

Quick Fixes for DTD, XSD, and Relax NG Errors

Oxygen XML Developer offers *Quick Fixes* (*on page 2272*) for common errors that appear in XML documents that are validated against DTD, XSD, or Relax NG schemas.

Note:

For XML documents validated against XSD schemas, the *Quick Fixes* are only available if you use the default Xerces validation engine.

Quick Fixes are available in **Text** mode .

Oxygen XML Developer provides *Quick Fixes* for numerous types of problems, including the following:

Problem Type	Available Quick Fixes
A specific element is required in the current context	Insert the required element
An element is invalid in the current context	Remove the invalid element
The content of the element should be empty	Remove the element content
An element is not allowed to have child elements	Remove all child elements
Text is not allowed in the current element	Remove the text content
A required attribute is missing	Insert the required attribute
An attribute is not allowed to be set for the current element	Remove the attribute
The attribute value is invalid	Propose the correct attribute values
ID value is already defined	Generate a unique ID value
References to an invalid ID	Change the reference to an already defined ID

[Schematron Quick Fixes \(SQF\) \(on page 582\)](#)

[Ignoring/Unignoring Validation Problems \(on page 578\)](#)

Schematron Quick Fixes (SQF)

Oxygen XML Developer provides support for Schematron *Quick Fixes (on page 2272)* (SQF). They help you resolve issues that appear in XML documents that are validated against Schematron schemas by offering you solution proposals. The Schematron *Quick Fixes* are an extension of the Schematron language and they allow you to define fixes for Schematron validation messages. Specifically, they are associated with *assert* or *report* messages.

A typical use case is using Schematron *Quick Fixes* to assist content authors with common editing tasks. For example, you can use Schematron rules to automatically report certain validation warnings (or errors) when performing regular editing tasks, such as inserting specific elements or changing IDs to match specific naming conventions. For more details and examples, see the following blog post: <https://blog.oxygenxml.com/topics/SchematronBCs.html>.

Displaying the Schematron Quick Fix Proposals

The defined Schematron *Quick Fixes* are displayed on validation errors in **Text** mode.

Figure 140. Example of a Schematron Quick Fix

[Ignoring/Unignoring Validation Problems \(on page 578\)](#)

Associating a Schema to XML Documents

To provide as-you-type validation and to compute valid proposals for the *Content Completion Assistant (on page 2267)*, Oxygen XML Developer requires a schema to be associated with the XML document. The schema specifies how the internal structure of the XML is defined.

Supported Types of Schema

The following schema types are supported:

- **W3C XML Schema 1.0 and 1.1** (with and without embedded Schematron rules) - The association with an XML Schema is added as an attribute of the root element with one of the following:
 - `@xsi:schemaLocation` attribute, if the root element of the document is in the namespace.
 - `@xsi:noNamespaceSchemaLocation` attribute, if the root element is not in the namespace.
- **DTD** - The association with a DTD is added as a `DOCTYPE` declaration.
- **Relax NG - XML Syntax** (with and without embedded Schematron rules) - The association is added as an *xml-model processing instruction*.
- **Relax NG - Compact Syntax** - The association is added as an *xml-model processing instruction*.
- **NVDL** - The association is added as an *xml-model processing instruction*.
- **Schematron** (both ISO Schematron and Schematron 1.5) - The association is added as an *xml-model processing instruction*.

Detecting the Schema(s) for Validation

For validation, Oxygen XML Developer tries to detect one or more schemas by searching multiple locations, in the following order:

1. The schema or multiple schemas [referenced in validation stages from the validation scenario\(s\)](#) (*on page 584*) associated with the current XML document.
2. If no validation scenario is selected to be used with the current XML document, then it falls back to the schema or multiple schemas [defined in validation stages from the validation scenarios specified as default in the particular document type configuration](#) (*on page 588*).
3. If a schema is still not detected, then it falls back to the [schema or multiple schemas associated directly in the XML document](#) (*on page 590*).

Tip:

To quickly open the schema used for validating the current document, select the  **Open Associated Schema** action from the toolbar (or **Document > Schema** menu).

4. If a schema is still not detected, then it falls back to the [schema defined in the **Schema** tab of a framework \(document type\) configuration](#) (*on page 592*).

Detecting a Schema for Content Completion

For content completion, Oxygen XML Developer uses just one schema and tries to detect that schema by searching multiple locations, in the following order:

1. If no schema is detected in the document, then it falls back to the highest ranking [schema defined in validation stages from the validation scenario\(s\)](#) associated with the current document (*on page 584*).
2. If a schema is still not detecting, then it falls back to the highest ranking [schema defined in validation stages from validation scenarios specified as default in the particular document type configuration](#) (*on page 588*).

3. Oxygen XML Developer determines the most appropriate or highest ranking [schema that is associated directly in the XML document \(on page 590\)](#) and uses it for content completion.
4. If a schema is still not detecting, then it falls back to the [schema defined in the **Schema** tab of a framework \(document type\) configuration \(on page 592\)](#).

Related Information:

[Modular Contextual XML Editing Using 'Main Files' Support \(on page 596\)](#)

[W3C: Associating Schemas with XML Documents](#)

Associating a Schema Through a Validation Scenario

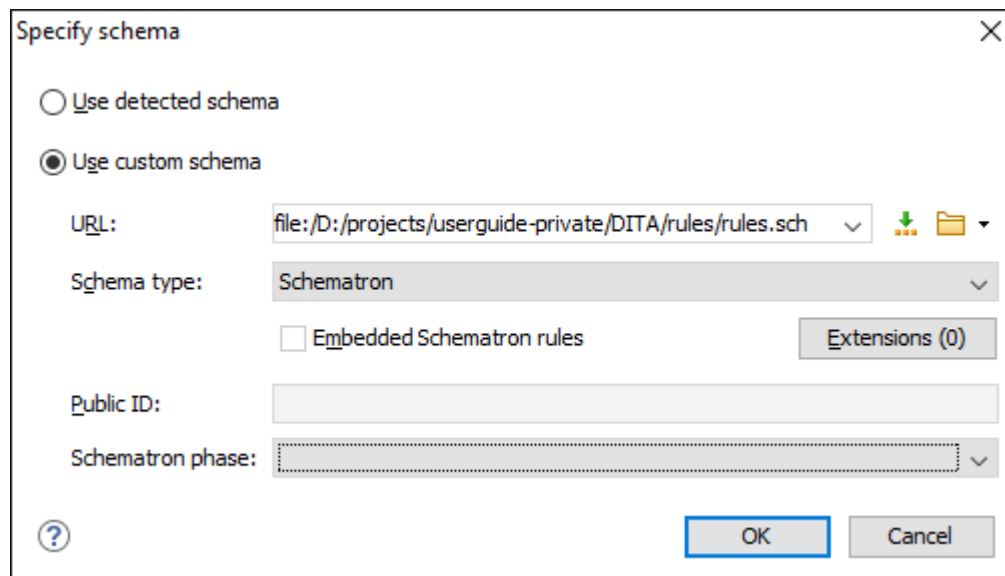

Oxygen XML Developer uses the rules defined in the detected schema to report errors and warnings during automatic and manual validations that help maintain the structural integrity of your XML documents. You can specify the schema to be used for validation directly in [validation scenarios \(on page 554\)](#) and there are several methods that can be used to do so.

Configure a Validation Scenario and Specify the Schema

To associate a schema to a validation scenario to be used whenever the scenario is invoked, follow these steps:

1. Select the  **Configure Validation Scenario(s)** from the  **Validation** toolbar drop-down menu, or from the **Document > Validate** menu (or the **Validate** submenu when invoking the contextual menu on a file in the **Project view (on page 365)**).
2. Click the **New** button to create a new validation scenario or the **Edit** button to modify an existing one.
3. [Add or configure validation units \(on page 567\)](#) according to your needs and click the  **Specify Schema** button.

Step Result: The **Specify Schema** dialog box is displayed:

Figure 141. Specify Schema Dialog Box

The **Specify Schema** dialog box contains the following options:

Use detected schema

Uses the [schema detected for the particular document \(on page 583\)](#).

Use custom schema

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S) or SFTPS (or a [custom protocol \(on page 1896\)](#)). You can specify the URL by using the text field, the history drop-down, the  **Insert Editor Variables (on page 289)** button, or the browsing actions in the  **Browse** drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Extensions**- Opens a dialog box that allows you to specify [Java extension JARs \(on page 2270\)](#) to be used during the validation.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

4. Select the schema to be associated with the validation unit and configure the rest of the options according to your preferences.
5. Click **OK** on both dialog boxes.

Result: The schema is now associated with that validation scenario whenever it is invoked.

Use the Validate with Action to Specify a Schema for Validating the Current Document

To validate the current document using a specified schema, follow these steps:

1. Select the **Validation with** action from the  **Validation** drop-down menu on the toolbar (or **Document > Validate** menu).

Step Result: The **Validate with** dialog box is displayed:

Figure 142. Validate with Dialog Box

This dialog box contains the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S) or SFTPS (or a [custom protocol \(on page 1896\)](#)). You can specify the URL by using the text field, the history drop-down, the  **Insert Editor Variables (on page 289)** button, or the browsing actions in the  **Browse** drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Extensions**- Opens a dialog box that allows you to specify [Java extension JARs \(on page 2270\)](#) to be used during the validation.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

2. Select the schema to be associated with the manual validation and configure the rest of the options according to your preferences.
3. Click **OK**.

Result: The current document is validated using the schema you specified.

Tip:

To quickly open the schema used for validating the current document, select the **Open Associated Schema** action from the toolbar (or **Document > Schema** menu).

Use the Validate with Schema Action to Specify a Schema for Validating all Selected Documents

To validate multiple documents using a specified schema, follow these steps:

1. Select all the documents you want to validate in the **Project** view .
2. Invoke the contextual menu (right-click) and select the **Validate with Schema** action from the **Validate** submenu.

Step Result: The **Validate with** dialog box is displayed:

Figure 143. Validate with Dialog Box

This dialog box contains the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S) or SFTPS (or a [custom protocol \(on page 1896\)](#)). You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables (on page 289)** button, or the browsing actions in the **Browse** drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.

- **Extensions**- Opens a dialog box that allows you to specify *Java extension JARs (on page 2270)* to be used during the validation.
 - **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.
3. Select the schema that you want to use to validate all selected documents and configure the rest of the options according to your preferences.
 4. Click **OK**.

Result: The selected documents are validated using the schema you specified.

Associating a Schema in Validation Scenarios Defined in the Document Type

To report errors and warnings during automatic and manual validations that help maintain the structural integrity of particular XML document types, Oxygen XML Developer uses rules defined in the schema that is detected in the validation scenarios that are associated to each particular document type.

To associate a schema in validation scenarios defined in the *framework (on page 2269)* (document type) configuration, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (*on page 114*) and go to **Document Type Association**.
2. Select your particular document type and click the **Edit** or **Duplicate** button to modify an existing *framework* (or use the **New** button to create a new one).

Step Result: This opens a **Document type** configuration dialog box (*on page 130*).

3. Go to the **Validation** tab (*on page 156*).
4. Create or edit a validation scenario:
 - a. To create a new validation scenario (*on page 555*), click the **+** **New** button.
 - b. To edit the properties of an existing validation scenario (*on page 565*), select it and click the  **Edit** button (you can also use the  **Duplicate** button to copy an existing scenario and edit its properties).
5. Add or configure validation units (*on page 567*) according to your needs and click the  **Specify Schema** button.

Step Result: The **Specify Schema** dialog box is displayed:

Figure 144. Specify Schema Dialog Box

The **Specify Schema** dialog box contains the following options:

Use detected schema

Uses the [schema detected for the particular document \(on page 583\)](#).

Use custom schema

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S) or SFTPS (or a [custom protocol \(on page 1896\)](#)). You can specify the URL by using the text field, the history drop-down, the  **Insert Editor Variables (on page 289)** button, or the browsing actions in the  **Browse** drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Extensions**- Opens a dialog box that allows you to specify [Java extension JARs \(on page 2270\)](#) to be used during the validation.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

6. Select the schema to be associated with the validation unit and configure the rest of the options according to your preferences.
7. Click **OK** on both dialog boxes.

Result: The schema is now associated with the validation scenario you just configured for that particular document type.

Associating a Schema Directly in XML Documents

The schema used by the *Content Completion Assistant (on page 2267)* and document validation engine can be directly associated with the current document by using the  **Associate Schema** action. For most of the schema types, it uses the *xml-model processing instruction*, with the exceptions of:

- **W3C XML Schema** - The `@xsi:schemaLocation` attribute or `@xsi:noNamespaceSchemaLocation` attribute is used.
- **DTD** - The `DOCTYPE` declaration is used.

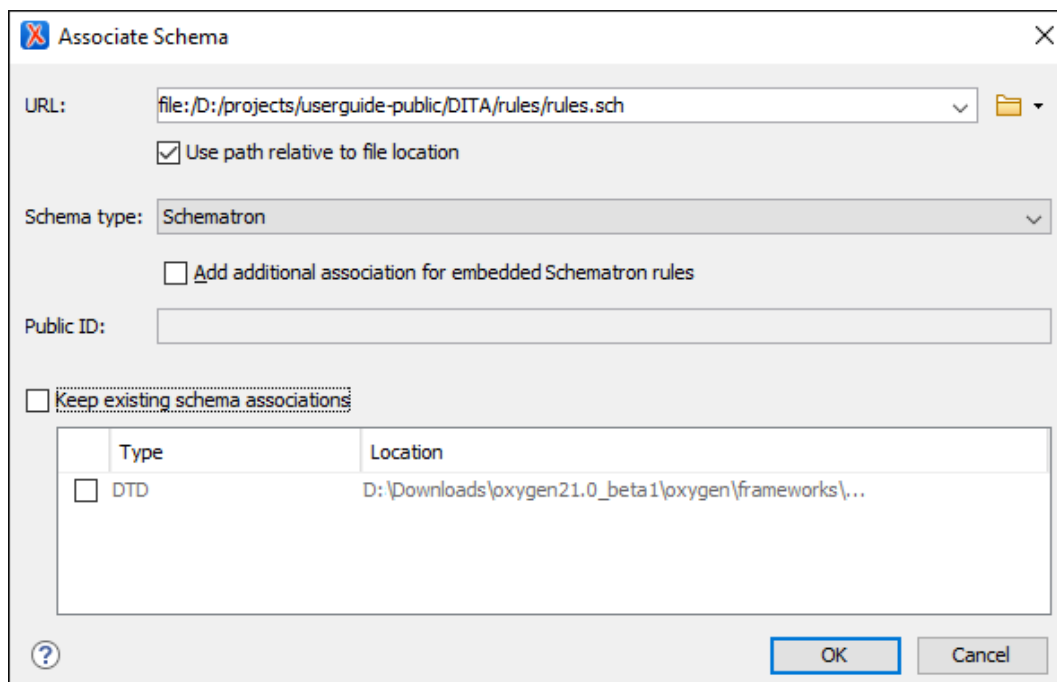

The association can specify a relative file path or a URL of the schema. The advantage of relative file path is that you can configure the schema at file level instead of *framework (on page 2269)* level.

To associate a schema to the current document, follow these steps:

1. Select the  **Associate Schema** action from the toolbar (or **Document > Schema** menu).

Step Result: The **Associate Schema** dialog box is displayed:

Figure 145. Associate Schema Dialog Box

This dialog box contains the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S) or SFTP (or a [custom protocol \(on page 1896\)](#)).
 - **Use path relative to file location** - Select this option if the XML instance document and the associated schema contain relative paths. The location of the schema file is inserted in the XML instance document as a relative file path. This practice allows you, for example, to share these documents with other users without running into problems caused by multiple project locations on physical disk.
 - **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
 - **Add additional association for embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
 - **Public ID** - Allows you to specify a public ID if you have selected a DTD.
 - **Keep existing schema associations** - Select this option to use the existing schema associations of the currently edited document.
2. Select the schema that will be associated with the XML document and configure the rest of the options according to your preferences.
 3. Click **OK**.

Result: The schema association is created based upon the specified type.

- **XML Schema** - The association with an XML Schema is added as an attribute of the root element with one of the following:
 - `@xsi:schemaLocation` attribute, if the root element of the document is in the namespace.
 - `@xsi:noNamespaceSchemaLocation` attribute, if the root element is not in the namespace.
- **DTD** - The association with a DTD is added as a `DOCTYPE` declaration.
- **Other** - The association with a Relax NG, Schematron, or NVDL schema is added as an `xml-model` processing instruction.

Tip:

To quickly open the schema used for validating the current document, select the **Open Associated Schema** action from the toolbar (or **Document > Schema** menu).

Related Information:

[Validating XML Documents \(on page 543\)](#)

[Content Completion Assistant in Text Mode \(on page 486\)](#)

Associating a Schema in a Framework (Document Type) Configuration

The schema used to compute valid proposals in the *Content Completion Assistant* (on page 2267) and by the document validation engine to report errors and warnings can be defined in each particular *framework* (on page 2269) (document type). This schema will be used only if one is not detected in the current XML file (on page 590).

To associate a schema in a particular *framework* (document type), follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Document Type Association**.
2. Select your particular document type and click the **Edit** (on page 128), **Extend** (on page 129), or **Duplicate** (on page 129) button to modify an existing *framework* (or use the **New** button to create a new one).

Step Result: This opens a **Document type** configuration dialog box (on page 130).

3. Go to the **Schema** tab (on page 134).
4. Select the schema type and its URI.
5. Click **OK**.

Result: The schema is now associated with the particular document type and will be used by the *Content Completion Assistant* and validation engine if a schema is not detected in the current XML document.

Learn Document Structure When Schema is not Detected

When working with documents that do not specify a schema, or the schema is not known or does not exist, Oxygen XML Developer can learn the document structure by parsing the document internally to provide an initialization source for *content completion* (on page 486) and *document validation* (on page 543).

This feature is controlled by the **Learn on open document** option (on page 179) that is available in the **Editor > Content Completion** preferences page. This feature enabled by default. If you want to disable it, deselect the **Learn on open document** option.

You can choose to create a DTD from the learned structure and save it as a file using the **Learn Structure** and **Save Structure** actions.

Creating a DTD from Learned Document Structure

To create a DTD from the learned structure of an XML document, follow these steps:

1. Open the XML document that will be used to create the DTD.
2. Go to **Document > XML Document > Learn Structure** (**Ctrl + Shift + L** (**Command + Shift + L** on macOS)). The **Learn Structure** action reads the mark-up structure of the current document. A **Learn completed** message is displayed in the application status bar when the action is finished.

3. Go to **Document > XML Document > Save Structure** (**Ctrl + Shift + S** (**Command + Shift + S** on macOS)) and enter the file path for the DTD.
4. Click the **Save** button.

Related Information:

[Detecting a Schema \(on page 582\)](#)

Working with XML Catalogs

Oxygen XML Developer uses [XML Catalogs \(on page 2273\)](#) to resolve references for validations and transformations and they are especially helpful for resolving external resources when internet access is not available or your connection is slow.

Oxygen XML Developer supports any *XML Catalog* file that conforms to one of the following:

1. [OASIS XML Catalogs Committee Specification v1.1](#).
2. [OASIS Technical Resolution 9401:1997](#), including the plain-text flavor described in that resolution.

The version 1.1 of the OASIS *XML Catalog* specification introduces the possibility to map a system ID, public ID, or a URI to a local copy using only a suffix of the ID or URI used in the actual document. This is done using the catalog elements [systemSuffix](#) and [uriSuffix](#).

Depending on the resource type, Oxygen XML Developer uses different catalog mappings.

Table 5. Catalog Mappings

Doc Type	Referenced Resource	Mappings
XML	DTD	<i>system</i> or <i>public</i> The Prefer option (on page 203) controls which one of the mappings should be used.
	XML Schema	The following strategy is used (if one step fails to provide a resource, the next is applied): <ol style="list-style-type: none"> 1. Resolve the schema using <i>URI</i> catalog mappings. 2. Resolve the schema using <i>system</i> catalog mappings. This happens only if the Resolve schema locations also through system mappings option (on page 204) is selected (it is by default). 3. Resolve the root <i>namespace</i> using <i>URI</i> catalog mappings.
	Relax NG	
	Schematron	
	NVDL	
XSL	XSL/ANY	<i>URI</i>
CSS	CSS	<i>URI</i>

Table 5. Catalog Mappings (continued)

Doc Type	Referenced Resource	Mappings
JSON	JSON	<i>URI</i>
XPROC	XPROC	<i>URI</i>
XML Schema	XML Schema	<p>The following strategy is used (if one step fails to provide a resource, the next is applied):</p> <ol style="list-style-type: none"> 1. Resolve schema reference using <i>URI</i> catalog mappings. 2. Resolve schema reference using <i>system</i> catalog mappings. This happens only if the Resolve schema locations also through system mappings option (on page 204) is selected (it is by default). 3. Resolve schema <i>namespace</i> using <i>URI</i> catalog mappings. This happens only if the Process namespaces through URI mappings for XML Schema option (on page 204) is selected (it is not by default).
Relax NG	Relax NG	

Creating an XML Catalog with a Template

An *XML Catalog* ([on page 2273](#)) file can be easily created in Oxygen XML Developer starting from the document template called *OASIS XML Catalog*. It is available when [creating new document templates](#) ([on page 330](#)).

How Oxygen XML Developer Determines which Catalog to Use

Oxygen XML Developer uses *XML Catalogs* ([on page 2273](#)) to resolve references for validations and transformations and it maps such references to the built-in local copies of the schemas associated with the various *frameworks* ([on page 2269](#)) (DocBook, DITA, TEI, XHTML, SVG, etc.)

Oxygen XML Developer includes default global catalogs and default catalogs for each of the built-in *frameworks*, and you can also create your own.

Oxygen XML Developer looks for catalogs in the following order:

- Global user-defined catalogs that are set in the **XML Catalog** preferences page ([on page 203](#)).
- User-defined catalogs that are set for each *framework* ([on page 2269](#)) in the **Catalog** tab ([on page 154](#)) of the **Document Type** configuration dialog box ([on page 130](#)).
- Default built-in catalogs.

Example: Using an XML Catalog to map an Absolute XML Schema Reference to an XML Schema Located Relative to the XML Catalog

An *XML Catalog* can be used to map an XML Schema specified with a URN in the `@xsi:noNamespaceSchemaLocation` attribute of an XML document to a local copy of the schema.

Considering the following XML document code snippet:

```
<topic xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
      xsi:noNamespaceSchemaLocation="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1">
```

The URN can be resolved to a local schema file with an XML catalog entry like this:

```
<uri name="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1"
     uri="topic.xsd"/>
```

Example: Using an XML Catalog to map an Imported XML Schema Reference to an XML Schema Located Relative to the XML Catalog

An *XML Catalog* can be used to map an `xs:import` or `xs:include` XML Schema reference to a local copy of the schema.

Considering the following `xs:include` inside an XML Schema:

```
<xs:include schemaLocation="someFolder/common.xsd" />
```

The reference can be resolved to a local schema file with an XML catalog entry like this:

```
<uriSuffix uriSuffix="someFolder/common.xsd" uri="relative/path/to/common.xsd"/>
```

[XML Catalog Preferences \(on page 203\)](#)

Resolving Schema Locations Through XML Catalogs

Schema locations can be mapped using an *XML Catalog (on page 2273)*. Oxygen XML Developer resolves the location of a schema in the following order:

- First, it attempts to resolve the schema location as a URI (`uri`, `uriSuffix`, `rewriteUri`, `delegateUri` mappings from the *XML Catalog*). If this succeeds, the process ends here.
- If the **Resolve schema locations also through system mappings option (on page 204)** is selected in the **XML Catalog** preferences page, it attempts to resolve the schema location as a system ID (`system`, `systemSuffix`, `rewriteSuffix`, `rewriteSystem` from the *XML Catalog*). If this succeeds, the process ends here.
- If the **Process "schemaLocation" namespaces through URI mappings for XML Schema option (on page 204)** is selected in the **XML Catalog** preferences page, the target namespace of the imported XML Schema is resolved through URI mappings. If the schema specified in the `schemaLocation` attribute is not resolved successfully, the namespace of the root element is taken into account. If this succeeds, the process ends here.
- If none of these succeeds, the actual *schema location (on page 583)* is used.

[Working with XML Catalogs \(on page 593\)](#)

Modular Contextual XML Editing Using 'Main Files' Support

Smaller interrelated modules that define a complex XML modular structure cannot be correctly edited or validated individually, due to their interdependency with other modules. Oxygen XML Developer provides the support for defining the main module (or modules), allowing you to edit any file from the hierarchy in the context of the *main files* (on page 2270).

You can set a main XML document either using the *main files* support from the **Project** view (on page 381), or using a validation scenario.

To set a *main file* using a validation scenario, add validation units that point to the main modules. Oxygen XML Developer warns you if the current module is not part of the dependencies graph computed for the main XML document. In this case, it considers the current module as the main XML document.

The advantages of working with modular XML files in the context of a *main file* (on page 2270) include:

- Correct validation of a module in the context of a larger XML structure.
- *Content Completion Assistant* (on page 2267) displays all collected entities and IDs starting from the *main files*.
- Oxygen XML Developer uses the schema defined in the *main file* when you edit a module that is included in the hierarchy through the *External Entity* mechanism.
- The *main files* defined for the current module determines the [scope of the search and refactoring actions](#) (on page 598) for ID/IDREFS values and for updating references when renaming/moving a resource. Oxygen XML Developer performs the search and refactoring actions in the context that the *main files* determine, improving the speed of execution.

[Contextual Project Operations Using 'Main Files' Support](#) (on page 381)

[XML Referenced/Dependent Resources View](#) (on page 599)

Search and Refactoring Actions for IDs and IDREFS

Oxygen XML Developer allows you to search for ID declarations and references (IDREFS) and to [define the scope of the search and refactor operations](#) (on page 598). These operations are available for XML documents that have an associated DTD, XML Schema, or Relax NG schema. These operations are available through the search and refactor actions in the contextual menu. In **Text** mode, these actions are also available in the **Quick Assist** (on page 520) menu.

The search and refactor actions from the contextual menu are grouped in the **Manage IDs** section:

 **Rename in**

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and [choose the scope of the rename operation \(on page 598\)](#). For a preview of the changes you are about to make, click **Preview**.

This opens the **Preview** dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

Rename in File

Renames the ID you are editing and all its occurrences from the current file.

**Note:**

Available in the **Text** mode only.

**Search References**

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the [Select the scope for the Search and Refactor operations \(on page 598\)](#) dialog box, this scope will be used instead.

Search References in

Searches for the references of the ID. Selecting this action opens the [Select the scope for the Search and Refactor operations \(on page 598\)](#).

**Search Declarations**

Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the [Select the scope for the Search and Refactor operations \(on page 598\)](#) dialog box, this scope will be used instead.

**Note:**

Available in the **Text** mode only.

Search Declarations in

Searches for the declaration of the ID reference. Selecting this action opens the [Select the scope for the Search and Refactor operations \(on page 598\)](#).

**Note:**

Available in the **Text** mode only.

**Search Occurrences in file**

Searches for the declaration and references of the ID in the current document.

**Tip:**

A quick way to go to the declaration of an ID in **Text** mode is to move the cursor over an ID reference and use the **Ctrl + Single-Click (Command + Single-Click on macOS)** navigation.

Selecting an ID that you use for search or refactor operations differs between the **Text** and **Author** modes. In the **Text** mode, you position the cursor inside the declaration or reference of an ID. In the **Author** mode, Oxygen XML Developer collects all the IDs by analyzing each element from the path to the root. If more IDs are available, you are prompted to choose one of them.

Figure 146. Selecting an ID in the Author Mode

**Related Information:**

[Modular Contextual XML Editing Using 'Main Files' Support \(on page 596\)](#)

Search and Refactor Operations Scope

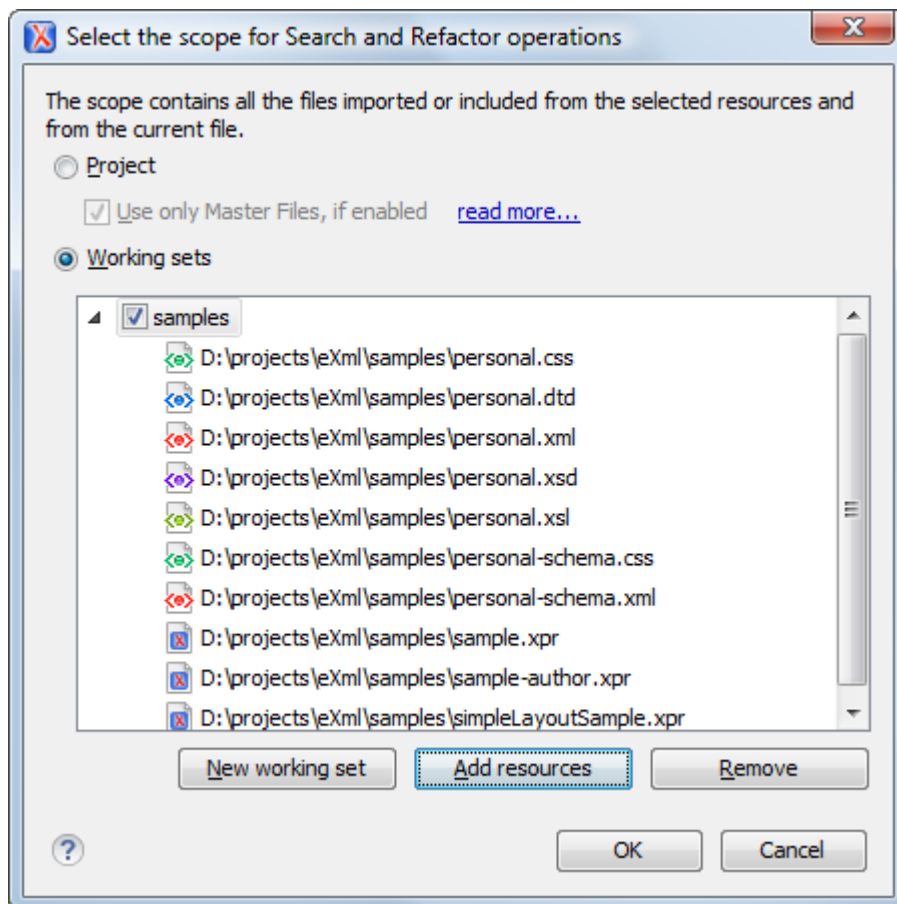

The *scope* is a collection of documents that define the context of a search and refactor operation. To control it you can use the  **Change scope** operation, available in the *Quick Assist* action set or on the **Referenced/Dependent Resources** view's toolbar. You can restrict the scope to the current project or to one or multiple *working sets* (on page 2273). The **Use only Main Files, if enabled** checkbox allows you to restrict the scope of the search and refactor operations to the resources from the **Main Files** directory. Click **read more** for details about the *Main Files* support (on page 381).

Figure 147. Change Scope Dialog Box

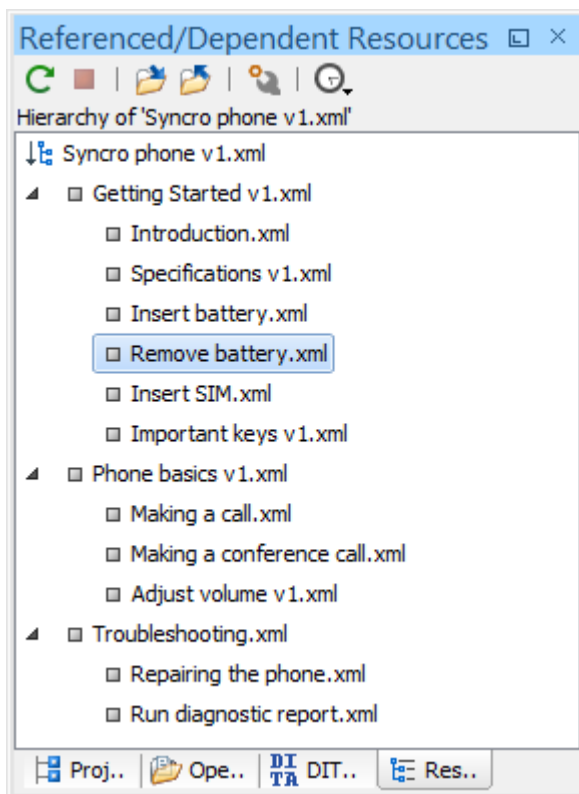

The scope you define is applied to all future search and refactor operations until you modify it. Contextual menu actions allow you to add or delete files, folders, and other resources to the *working set* (on page 2273) structure.

XML Referenced/Dependent Resources View

The **Referenced/Dependent Resources** view displays the hierarchy or dependencies for resources included in an XML document. The tree structure presented in this view is built based on the *Xinclude* and *External Entity* mechanisms. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

If you want to see the hierarchy or dependencies of an XML document, select the document in the **Project view** (on page 365) and choose **Show referenced resources** or **Show dependent resources** from the contextual menu.

Figure 148. Referenced/Dependent Resources View

The following actions are available on the toolbar of the **Referenced/Dependent Resources** view:

 **Refresh**

Refreshes the resource structure.

 **Stop**

Stops the computing.

 **Show hierarchy for**

Computes the hierarchical structure of the references for a resource.

 **Show dependencies for**

Computes the structure of the dependencies for a resource.

 **Configure dependencies search scope**

Allows you to configure a scope to compute the dependencies. There is also an option for automatically using the defined scope for future operations.

 **History**

Provides access to the list of previously computed dependencies. Use the  **Clear history** button to remove all items from this list.

The contextual menu for a resource listed in the **Referenced/Dependent Resources** view contains the following actions:

Open

Opens the resource. You can also double-click a resource within the hierarchical structure to open it.

Go to reference

Opens the source document where the resource is referenced.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show references resources

Shows the references for the selected resource.

Show dependent resources

Shows the dependencies for the selected resource.

**Add to Main Files**

Adds the currently selected resource in the **Main Files** directory.

Expand More

Expands more of the children of the selected resource from the hierarchical structure.

Collapse All

Collapses all children of the selected resource from the hierarchical structure.

**Tip:**

When a recursive reference is encountered in the view, the reference is marked with a special icon .

**Note:**

The **Move resource** or **Rename resource** actions give you the option to [update the references to the resource \(on page 602\)](#). Only the references made through the *XInclude* and *External Entity* mechanisms are handled.

[Modular Contextual XML Editing Using 'Main Files' Support \(on page 596\)](#)

[Search and Refactor Operations Scope \(on page 598\)](#)

Moving/Renaming XML Resources

When you select the **Rename** action in the contextual menu of the **Referenced/Dependent Resources** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource(s)** - Select this option to update the references to the resource you are renaming. A **Preview** option is available that allows you to see what will be updated before selecting **Rename** to process the operation.

When you select the **Move** action from the contextual menu of the **Referenced/Dependent Resources** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, in accordance with the new location and name. A **Preview** option is available that allows you to see what will be updated before selecting **Move** to process the operation.

Combining XML Content Using DTD Entities and XInclude

When documenting large projects, it is likely that there are multiple people involved. In this case, it is usually more efficient to use a modular approach so that everyone involved in the project can work in parallel. Other advantages of modular documentation include: reusable content possibilities, smaller file units are easier to edit, and better version control.

Two possible solutions for this are to use **DTD Entities** or **XInclude** to combine XML content in a *main file* (on page 2270). A main document can be created with references to various document parts, users can edit those documents individually, and then apply an XSLT stylesheet over the main document to obtain the output files in various formats (for example, PDF or HTML).

Combining XML Document Content Using DTD Entities

There are two conditions for including a document fragment using DTD entities:

- The main document should declare the DTD to be used, while the external entities should declare the XML fragments to be referenced.
- The referenced documents that contain the fragments cannot also define the DTD because the main document will not be valid. If you want to validate the parts separately you have to [use XInclude](#) (on page 604) for assembling the parts together with the *main file*.

The main document looks like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE book SYSTEM "../xml/docbookx.dtd" [
```

```
<!ENTITY testing SYSTEM "testing.xml" > ]
>
<book>
<chapter> ...
```

The referenced document (*testing.xml*) looks like this:

```
<section> ... here is the section content ... </section>
```

Note:

The indicated DTD and the element names (*section*, *chapter*) are used here only for illustrating the inclusion mechanism. You can use any DTD and element names you need.

The content from the referenced file (in the example above, it is a `<section>` in the *test.xml* file) can be inserted somewhere in the main document:

```
... &testing; ...
```

To obtain output in various formats (for example, PDF or HTML), you simply need to apply an XSLT stylesheet over the main document using a transformation scenario.

Viewing the Expanded Content in Oxygen XML Developer

When a transformation scenario is applied on the *main file*, an intermediary file combines all the referenced content and it will be expanded in the final output. If you want to see how the referenced content will be expanded before applying the transformation, create a minimal XSLT stylesheet that simply copies the XML content, then create a transformation scenario that applies the stylesheet over the XML. The XSLT stylesheet would look like this:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  xmlns:math="http://www.w3.org/2005/xpath-functions/math"
  exclude-result-prefixes="xs math"
  version="3.0">
  <xsl:template match="node() | @*">
    <xsl:copy>
      <xsl:apply-templates select="node() | @*" />
    </xsl:copy>
  </xsl:template>
</xsl:stylesheet>
```

Combining XML Documents and Fragments Using XInclude

XInclude is a standard for assembling XML instances into another XML document through inclusion. A *main file* (on page 2270) can be dynamically created from smaller XML documents without having to physically duplicate the content of the smaller files. The advantage of using XInclude instead of the [DTD Entities method](#) (on page 602) is that each of the assembled documents is permitted to contain a Document Type Declaration (DOCTYPE). This means that each file is a valid XML instance and can be independently validated. It also means that the main document, which includes smaller instances, can be validated without having to remove or comment out the DOCTYPE (as is the case with External Entities).

Enabling XInclude Support in Oxygen XML Developer

The XInclude support in Oxygen XML Developer is enabled by default. It is controlled by the **Enable XInclude processing** option (on page 206) in the **XML > XML Parser preferences page** (on page 205). When enabled, Oxygen XML Developer will be able to validate and transform documents comprised of parts added using XInclude.

Example: Using XInclude to Combine Files

A chapter file (`introduction.xml`) looks like this:

```
<?xml version="1.0"?>
<!DOCTYPE chapter PUBLIC "-//OASIS//DTD DocBook XML V4.3//EN"
"http://www.oasis-open.org/docbook/xml/4.3/docbookx.dtd">
<chapter>
  <title>Getting started</title>
  <section>
    <title>Section title</title>
    <para>Para text</para>
  </section>
</chapter>
```

The main article (*main file*) looks like this:

```
<?xml version="1.0"?>
<!DOCTYPE article PUBLIC "-//OASIS//DTD DocBook XML V4.3//EN"
"http://www.docbook.org/xml/4.3/docbookx.dtd"
[ <!ENTITY % xinclude SYSTEM "../frameworks/docbook/dtd/xinclude.mod">
%xinclude;
]>
<article>
  <title>Install guide</title>
  <para>This is the install guide.</para>
  <xi:include xmlns:xi="http://www.w3.org/2001/XInclude"
    href="introduction.xml">
  <xi:fallback>
```

```

<para>
  <emphasis>FIXME: MISSING XINCLUDE CONTENT</emphasis>
</para>
</xi:fallback>
</xi:include>
</article>

```

In this example, note the following:

- The DOCTYPE declaration defines an entity that references a file containing the information to add the *xi* namespace to certain elements defined by the DocBook DTD.
- The href attribute of the *xi:include* element specifies that the `introduction.xml` file will replace the *xi:include* element when the document is parsed.
- If the `introduction.xml` file cannot be found, the parser will use the value of the *xi:fallback* element - a *FIXME* message.

Example: Using XInclude to Combine Fragments of Files

If you want to include only a fragment of a file in the *main file (on page 2270)*, the fragment must be contained in a tag having an `@xml:id` attribute and you must use an XPointer expression pointing to the `@xml:id` value.

Notice:

Oxygen XML Developer supports the *XPointer Framework* and the *XPointer element() Scheme*, but it does NOT support the *XPointer xpointer() Scheme*.

For example, if the *main file* is:

```

<?xml version="1.0" encoding="UTF-8"?>
<?xml-model href="test.rng" type="application/xml"
  schematypens="http://relaxng.org/ns/structure/1.0"?>
<test>
  <xi:include href="a.xml" xpointer="a1"
    xmlns:xi="http://www.w3.org/2001/XInclude"/>
</test>

```

and the file (`a.xml`) is:

```

<?xml version="1.0" encoding="UTF-8"?>
<test>
  <a xml:id="a1">test</a>
</test>

```

after resolving the XPointer reference, the document is:

```

<?xml version="1.0" encoding="UTF-8"?>

<?xml-model href="test.rng" type="application/xml"
  schematypens="http://relaxng.org/ns/structure/1.0"?>

<test>
  <a xml:id="a1" xml:base="a.xml">test</a>
</test>

```

Viewing the Expanded Content in Oxygen XML Developer

When a transformation scenario is applied on the *main file*, an intermediary file combines all the referenced content and it will be expanded in the final output. If you want to see how the referenced content will be expanded before applying the transformation create a minimal XSLT stylesheet that simply copies the XML content, then create a transformation scenario that applies the stylesheet over the XML. The XSLT stylesheet would look like this:

```

<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  xmlns:math="http://www.w3.org/2005/xpath-functions/math"
  exclude-result-prefixes="xs math"
  version="3.0">
  <xsl:template match="node() | @"*>
    <xsl:copy>
      <xsl:apply-templates select="node() | @"*/>
    </xsl:copy>
  </xsl:template>
</xsl:stylesheet>

```

XInclude 1.1 Features

Oxygen XML Developer offers partial support for XInclude 1.1 features. This includes support for fragment identifiers and attribute copying.

- **Fragment Identifiers**

You can use `<xi:include>` to reference a text file and specify the `@fragid` value so that you only get part of that text file in the main document. For some examples and to see how the `<xi:include>` gets expanded when the `@fragid` specifies a line range or character range, see [Textual Inclusion Examples with RFC5147 Fragment Identifiers](#).

- **Attribute Copying**

Any *namespaced* attribute defined on the `<xi:include>` element will be passed to the root element of the included content.

For example, if you have this:

```
<xi:include href="section2.xml" xmlns:xi="http://www.w3.org/2001/XInclude"
  set-xml-id="sectInner1" />
```

and `section2.xml` looks like this:

```
<sect2 xmlns="http://docbook.org/ns/docbook" version="5.0"
  xmlns:xlink="http://www.w3.org/1999/xlink" xml:id="section2">
  <title>FS2</title>
  <para>P2</para>
</sect2>
```

then the final processed result will have the original `xml:id="section2"` replaced with the value specified in the `xi:included` section.

For more information, see [Attribute Copying when Processing XML](#). Also, to see more examples, see [Attribute Copying Examples](#).

[W3C Specifications: XML Inclusions \(XInclude\) Version 1.1](#)

Refactoring XML Documents

In the life cycle of XML documents there are instances when the XML structure needs to be changed to accommodate various needs. For example, when an associated schema is updated, an attribute may have been removed, or a new element added to the structure.

These types of situations cannot be resolved with a traditional *Find/Replace* tool, even if the tool accepts regular expressions. The problem becomes even more complicated if an XML document is computed or referenced from multiple modules, since multiple resources need to be changed.

To assist you with these types of refactoring tasks, Oxygen XML Developer includes a specialized **XML Refactoring** tool that helps you manage the structure of your XML documents.

XML Refactoring Tool

The **XML Refactoring** tool is presented in the form of an easy to use wizard that is designed to reduce the time and effort required to perform various structure management tasks. For example, you can insert, delete, or rename an attribute in all instances of a particular element that is found in all documents within your project.

To access the tool, select the  **XML Refactoring** action from one of the following locations:

- The **Tools** menu.
- The **Refactoring** submenu from the contextual menu in the [Project view \(on page 365\)](#).

Note: The built-in refactoring operations are also available from the **Refactoring** submenu in the contextual menu of **Text** mode. This is useful because by selecting the operations from the contextual menu, Oxygen XML Developer considers the editing context to skip directly to the wizard page of the appropriate operation and to help you by preconfiguring some of the parameter values. For your convenience, the last 5 operations that were *finished (on page 610)* or *previewed (on page 610)* also appear in the **Refactoring** submenu of the contextual menu in the **Project** view.

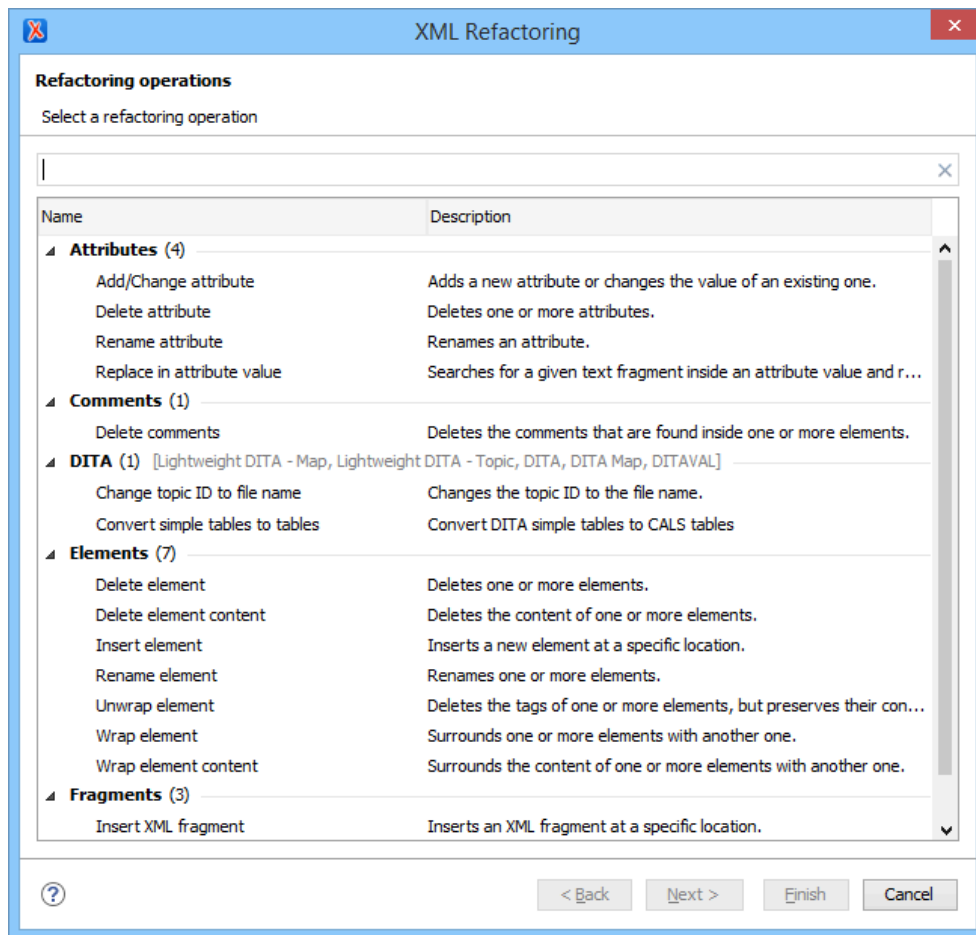

XML Refactoring Wizard

The XML Refactoring tool includes the following wizard pages:

Refactoring operations

The first wizard page presents the available operations, grouped by category. To search for an operation, you can use the filter text box at the top of the page.

Figure 149. XML Refactoring Wizard

Configure Operation Parameters

The next wizard page allows you to specify the parameters for the refactoring operation. The parameters are specific to the type of refactoring operation that is being performed. For

example, to delete an attribute you need to specify the parent element and the qualified name of the attribute to be removed.

Figure 150. XML Refactoring 2nd Wizard Page (Delete Attribute Operation)

Scope and Filters

The last wizard page allows you to select the set of files that represent the input of the operation.

Figure 151. XML Refactoring - Scope and Filters Wizard Page

Scope section

You can specify the scope for the operation by selecting from predefined resource sets or you can define your own set of resources by creating a *working set* (on

[page 2273](#)) (select **Working sets** and click the **Choose** button to the right). If you select **Project**, all files attached to the current project will be used for the scope of the operation. If you select **Current DITA Map hierarchy**, the current DITA map that is open in the DITA Maps Manager along with all of its referenced topics and submaps (and topics referenced in those submaps) are used for the scope.

Filters

The **Filters** section includes the following options:

- **Include files** - Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use `build*.xml` for the file pattern.
- **Restrict only to known XML file types** - When selected, only resources with a known XML file type will be affected by the operation.
- **Look inside archives** - When selected, the resources inside archives will also be affected.

Preview

You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

Finish

After clicking the **Finish** button, the operation will be processed and Oxygen XML Developer provides no automatic means for reverting the operations. Any **Undo** action will only revert changes on the current document.

Troubleshooting:

If an operation fails, a notification will be displayed in the **Results** panel with some information about the error. For example, if the operation was invoked on a read-only resource, the error will indicate that a read-only file cannot be converted.

Tip:

If an operation takes longer than expected you can use the  **Stop** button in the progress bar to cancel the operation.

Restriction:

XML refactoring operations cannot preserve CDATA sections. If your document contains XML CDATA sections, the refactoring operations will convert them to plain text nodes.

Built-in Refactoring Operations

The XML Refactoring tool includes a variety of built-in operations that can be used for common refactoring tasks. They are grouped by category in the **Refactoring operations** wizard page. You can also access the operations from the **Refactoring** submenu in the contextual menu of **Text** mode. The operations are also grouped by category in this submenu. When selecting the operations from the contextual menu, Oxygen XML Developer considers the editing context to get the names and namespaces of the current element or attribute, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.

Tip:

Each operation includes a link in the lower part of the wizard that opens the **XML / XSLT-XQuery / XPath** preferences page where you can configure XPath options and declare namespace prefixes.

The following built-in operations are available:

Refactoring Operations for *Attributes*

Add/Change attribute

Use this operation to change the value of an attribute or insert a new one. This operation allows you to specify the following parameters:

Parent element section

Element

The parent element of the attribute to be changed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute section

Local name

The local name of the affected attribute.

Namespace

The namespace of the affected attribute.

Value

The value for the affected attribute.

Options section

You can choose between one of the following options for the **Operation mode**:

Add the attribute in the parent elements where it is missing

Adds the attribute to all instances of the specified parent element.

Change the value in the parent elements where the attribute already exists

Replaces the value of the already existing attribute in all instance of the specified parent element.

Both

Adds the attributes to the instances where it is missing and replaces the value in instances where the attribute already exists.

Convert attribute to element

Use this operation to convert a specified attribute to an element. This operation allows you to specify the following parameters:

Parent element section

Element

The parent element of the attribute to be converted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute section

Local name

The local name of the affected attribute.

Namespace

The namespace of the affected attribute.

New element section

Local name

The local name of the new element.

Namespace

The namespace of the new element.

Delete attribute

Use this operation to remove one or more attributes. This operation requires you to specify the following parameters:

Element

The parent element of the attribute to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute

The name of the attribute to be deleted.

Rename attribute

Use this operation to rename an attribute. This operation requires you to specify the following parameters:

Element

The parent element of the attribute to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute

The name of the attribute to be renamed.

New local name

The new local name of the attribute.

Replace in attribute value

Use this operation to search for a text fragment inside an attribute value and change the fragment to a new value. This operation allows you to specify the following parameters:

Target attribute section**Element**

The parent element of the attribute to be modified, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute

The name of the attribute to be modified.

Find / Replace section**Find**

The text fragments to find. You can use Perl-like regular expressions.

Replace with

The text fragment to replace the target with. This parameter can bind regular expression capturing groups (\$1, \$2, etc.) from the find pattern.

Refactoring Operations for *Comments***Delete comments**

Use this operation to delete comments from one or more elements. This operation requires you specify the following parameter:

Element

The target element (or elements) that will have comments deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Note:

Comments that are outside the root element will not be deleted because the *serializer* preserves the content before and after the root.

Refactoring Operations for *DITA* Topics

Change topic ID to file name

Use this operation to change the ID of a topic to be the same as its file name.

Convert CALS tables to simple tables

Use this operation to convert DITA CALS tables to simple tables.

Convert DITA 1.3 Maps and Topics to DITA 2.0

Use this operation to convert topics and maps that adhere to the DITA 1.3 standard to the DITA 2.0 standard.

- Changes DOCTYPE declarations and XML Schema/Relax NG schema references.
- DITA Map changes:
 - Removes the `@lockmeta` attribute.
 - Removes the `<topicset>` and `<topicsetref>` elements.
 - Removes the `<anchor>` and `<anchorref>` elements and the `@anchorref` attribute.
 - Migrates the `@navtitle` attribute as a `<navtitle>` element.
 - Migrates the `@title` attribute as a `<title>` element.
 - Converts the `@copy-to` attribute to a `<resourceid>` element.
 - Replaces the `@print` attribute with an `@deliveryTarget` attribute.
 - Convert topicmeta `<linktext>` to `<linktitle>`.
 - Removed `<hasInstance>`, `<hasKind>`, `<hasNarrower>`, `<hasPart>`, `<hasRelated>`, and `<relatedSubjects>` from subject scheme relationship tables in subject scheme, including `<subjectRelTable>`, `<subjectRelHeader>`, `<subjectRel>`, and `<subjectRole>`.
- DITA task changes:
 - Converts the `<substep>` element to a `<step>` element.
 - Converts the `<substeps>` element to a `<steps>` element.
- DITA topic changes:
 - Removes the `@type` attribute with the value `fastpath`.
 - Converts the `@alt` attribute to an `<alt>` element.
 - Replaces the `<index-sort-as>` element with a `<sort-as>` element.
 - Removes the `<itemgroup>` element.
 - Moves the contents of the `<titlealts>` element inside the `<prolog>`.
 - Removes the `@domains` attribute.

- Renames `<sectiondiv>` to `<div>`.
- Remove `@query` attribute from `<link>` element.
- Remove `@specentry` attribute from `<stentry>` element.

Remove the `@spectitle` attribute.

Convert conrefs to conkeyrefs

Use this operation to convert `@conref` attributes to `@conkeyref` attributes.

Convert Nested Topics to New Topics

Use this operation on topics that contain nested `<topic>` elements to convert each nested topic to a new topic.

Convert Sections to New Topics

Use this operation on topics that contain multiple sections to convert each section to a new topic.

Convert simple tables to CALS tables

Use this operation to convert DITA simple tables to CALS tables.

Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task).

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Rename Key

Use this operation to rename a key. It also updates all references to it.

**Note:**

It does not work on DITA 1.3 key scopes.

Generate IDs

Use this operation to automatically generate unique IDs for elements.

Scope and Filters:

All of the DITA refactoring actions allow you to choose a scope for the operation and some filters:

Scope

Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the **Project, All opened files, Current DITA map hierarchy**, or just the **Current file**.

Filters section**Include files**

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).

Restrict to known XML file types only

Excludes non-XML file types from the operation.

Look inside archives

If this option is selected, the scope of the operation will include files inside archives.

Refactoring Operations for *DITA* Maps**Convert DITA Bookmap to Map**

Convert a DITA bookmap to a DITA map.

Convert DITA Map to Bookmap

Convert a DITA map to a DITA bookmap.

Change or remove profiling attribute value

Change or remove a value from a DITA profiling attribute. A profiling attribute can have multiple values, separated by spaces (e.g. for `platform="windows redhat"`, you can change the current `redhat` value to `linux`). Select the name of the profiling attribute, the current value to replace, and the new value. If the new value is left empty, the current value is removed from the profiling attribute. The new value is modified and reflected in DITA maps, DITA topics, and DITAVAL files.

Define keys for all topic references

This refactoring action is useful for converting links inside a DITA project from direct to indirect key-based addressing. When applied on DITA resources from your project (DITA maps and topics), this refactoring action defines keys for all of a DITA map's topic references based on the referenced file name and converts each direct reference to a key reference in each DITA topic. If a topic references already has keys defined, the action does not define new ones. Inside the DITA topics, whenever there is a link element (`<xref>` or `<link>`) with a direct reference to another DITA topic or an element with a `@conref`, the action attempts to convert them to indirect key-based addressing. The refactoring action may introduce linking errors or create duplicate keys so it is advised to run the **Validate and check for completeness** action from the **DITA Maps Manager** toolbar to manually fix those problems. You can enable the **Report duplicate keys** checkbox to also report any keys that are defined more than once.

Scope and Filters:

All of the DITA refactoring actions allow you to choose a scope for the operation and some filters:

Scope

Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the **Project, All opened files, Current DITA map hierarchy**, or just the **Current file**.

Filters section

Include files

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as `*` or `?`).

Restrict to known XML file types only

Excludes non-XML file types from the operation.

Look inside archives

If this option is selected, the scope of the operation will include files inside archives.

Refactoring Operations for *Elements*

Delete element

Use this operation to delete elements. This operation requires you to specify the following parameter:

Element

The target element to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Delete element content

Use this operation to delete the content of elements. This operation requires you to specify the following parameter:

Element

The target element whose content is to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Insert element

Use this operation to insert new elements. This operation allows you to specify the following parameters:

Element section

Local name

The local name of the element to be inserted.

Namespace

The namespace of the element to be inserted.

Location section

XPath

An XPath expression that identifies an existing element to which the new element is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Position

The position where the new element will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.

Rename element

Use this operation to rename elements. This operation requires you to specify the following parameters:

Target elements (XPath)

The target elements to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

New local name

The new local name of the element.

Unwrap element

Use this operation to remove the surrounding tags of elements, while keeping the content unchanged. This operation requires you to specify the following parameter:

Target elements (XPath)

The target elements whose surrounding tags will be removed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Wrap element

Use this operation to surround elements with element tags. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements to be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Wrapper element section**Local name**

The local name of the *Wrapper element*.

Namespace

The namespace of the *Wrapper element*.

Wrap element content

Use this operation to surround the content of elements with element tags. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements whose content will be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Wrapper element section**Local name**

The local name of the *Wrapper element* that will surround the content of the target.

Namespace

The namespace of the *Wrapper element* that will surround the content of the target.

Refactoring Operations for *Fragments*

Insert XML fragment

Use this operation to insert an XML fragment. This operation allows you to specify the following:

XML Fragment

The XML fragment to be inserted.

Location section

XPath

An XPath expression that identifies an existing element to which the inserted fragment is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Position

The position where the fragment will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.

Replace element content with XML fragment

Use this operation to replace the content of elements with an XML fragment. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements whose content will be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

XML Fragment

The XML fragment with which to replace the content of the target element.

Replace element with XML fragment

Use this operation to replace elements with an XML fragment. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements to be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

XML Fragment

The XML fragment with which to replace the target element.

Refactoring Operations for *JATSKit*

Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0

Use this operation to add an NLM 'BITS' 2.0 DOCTYPE declaration.

Add Blue DOCTYPE - NISO JATS Publishing 1.1

Use this operation to add a JATS 'Blue' 1.1 DOCTYPE declaration.

Normalize IDs

Use this operation to normalize assigned IDs and assigned IDs to elements that are missing them.

All of these *JATSKit* refactoring actions allow you to choose a scope for the operation and some filters:

Scope

Select from a variety of options to define the scope for the resources that will be affected by the operation. For example, you can choose to affect all resources in the **Project, All opened files**, or just the **Current file**.

Filters section

Include files

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).

Restrict to known XML file types only

Excludes non-XML file types from the operation.

Look inside archives

If this option is selected, the scope of the operation will include files inside archives.

Refactoring Operations for *Processing Instructions*

Accept all tracked changes, remove all Oxygen-specific comments and highlights

Use this operation to accept all application-specific tracked changes (from elements and attributes) or remove all application-specific comments or highlights. There are several options to choose from:

Accept all tracked changes

Accepts all application-specific tracked changes (from elements and attributes).

Remove comments

Removes all application-specific comments.

Remove highlights

Removes all application-specific highlights.

Delete processing instructions

Use this operation to delete all processing instructions that have a certain target name from the processed documents. This operation requires you to specify the following parameter:

Processing instruction target

The target name of the processing instructions to delete.

Note:

Processing instructions that are outside the root element are not deleted because the *serializer* preserves the content before and after the root.

Refactoring Operations for *Publishing Template*

These operations are for those who use *Oxygen Publishing Templates* for WebHelp Responsive output customization.

Migrate HTML Page Layout Files to v21

Use this operation to convert custom [HTML page layout files \(on page 1316\)](#) that are included in a custom Publishing Template that was created in Oxygen XML Developer version 20.0 or 20.1 so that they will be compatible with Oxygen XML Developer version 21.0.

Migrate HTML Page Layout Files to v22

Use this operation to convert custom [HTML page layout files \(on page 1316\)](#) that are included in a custom Publishing Template that was created in Oxygen XML Developer versions 20.0 - 21.1 so that they will be compatible with Oxygen XML Developer version 22.0.

Update HTML Pages

Attention:

This operation is only used by Oxygen XML Developer and should not be used manually.

Additional Notes:

- There are some operations that allow `<ANY>` for the **local name** and **namespace** parameters. This value can be used to select an element or attribute regardless of its local name or namespace. Also, the `<NO_NAMESPACE>` value can be used to select nodes that do not belong to a namespace.
- Some operations have parameters that accept XPath expressions to match elements or attributes. In these XPath expressions you can only use the prefixes declared in the [Options > Preferences > XML > XSLT-XQUERY > XPath \(on page 227\)](#) page. This preferences page can be

easily opened by clicking the link in the note (**Each prefix used in an XPath expression must be declared in the Default prefix-namespace mappings section**) at the bottom of the **Configure Operation Parameters** wizard page.

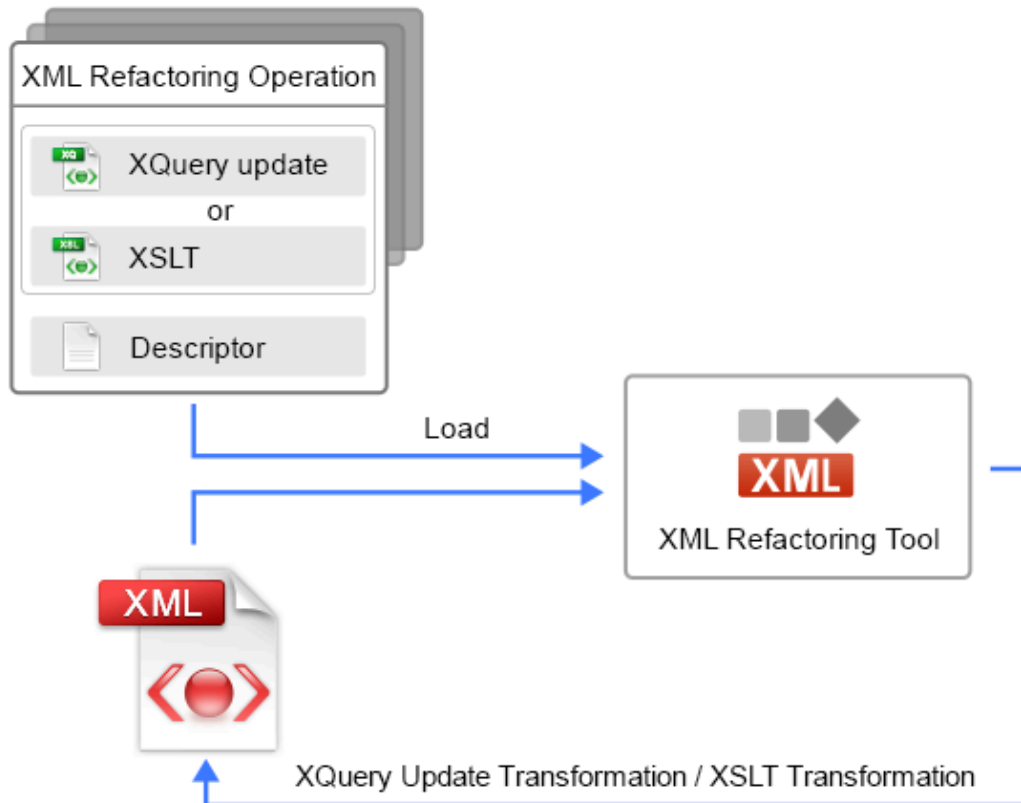

Custom Refactoring Operations

While Oxygen XML Developer includes a variety of built-in XML refactoring operations to help you accomplish particular tasks, you can also create custom operations according to your specific needs. For example, you could create a custom refactoring operation to convert an attribute to an element and insert the element as the first child of the parent element.

An XML Refactoring operation is defined as a pair of resources:

- An *XQuery Update script* or *XSLT stylesheet* that Oxygen XML Developer will run to refactor the XML files.
- An *XML Operation Descriptor* file that contains information about the operation (such as the name, description, and parameters).

Figure 152. Diagram of an XML Refactoring Operation

All the defined custom operations are loaded by the **XML Refactoring Tool** and presented in the **Refactoring Operations** wizard page ([on page 608](#)), along with the built-in operations.

After the user chooses an operation and specifies its parameters, Oxygen XML Developer processes an XQuery Update or XSLT transformation over the input file. This transformation is executed in a **safe mode**, which implies the following:

- When loading the document:
 - The **XInclude** mechanism is disabled. This means that the resources included by using XInclude will not be visible in the transformation.
 - The DTD entities will be processed without being expanded.
 - The associated DTD will be not loaded, so the default attributes declared in the DTD will not be visible in the transformation.
- When saving the updated XML document:
 - The `DOCTYPE` will be preserved.

**Note:**

This can be changed using [Saxon extension functions in XSLT \(on page 640\)](#).

- The DTD entities will be preserved as they are in the original document when the document is saved.
- The attribute values will be kept in their original form without being normalized.
- The spaces between attributes are preserved. Basically, the spaces are lost by a regular XML serialization since they are not considered important.

The result of this transformation overrides the initial input file.

**Note:**

To achieve some of the previous goals, the XML Refactoring mechanism adds several attributes that are interpreted internally. The attributes belong to the http://www.oxygenxml.com/ns/xmlRefactoring/additional_attributes namespace. These attributes should not be taken into account when processing the input XML document since they are discarded when the transformed document is serialized.

**Restriction:**

Comments or *processing instructions* that are in any node before or after the root element cannot be modified by an XML Refactoring operation. In other words, XML Refactoring operations can only be applied on the root element and the nodes inside it. However, as a work around to this limitation, you can use [Saxon extension functions and the XSLT stylesheet method \(on page 640\)](#) to implement the new custom XML refactoring operation.

Creating a Custom Refactoring Operation

To create a custom refactoring operation, follow these steps:

1. Create an [XQuery Update script \(on page 630\)](#) or [XSLT stylesheet file \(on page 635\)](#).
2. Create an XML refactoring operation descriptor file, that references the above script, as explained in these sections: [Example descriptor file for an XQuery Update script \(on page 633\)](#) or [Example descriptor file for an XSLT stylesheet \(on page 638\)](#).
3. Store both files in [one of the locations that Oxygen XML Developer \(on page 642\)](#) scans when loading the custom operations.

Result: Once you run the **XML Refactoring** tool again, the custom operation appears in the **Refactoring Operations** wizard page [\(on page 608\)](#).

Related information

[Storing and Sharing Refactoring Operations \(on page 642\)](#)

Custom Refactoring Script

The first step in creating a custom refactoring operation is to create an [XQuery Update script \(on page 630\)](#) or [XSLT stylesheet \(on page 635\)](#) that is needed to process the refactoring operations. The easiest way to create this script file is to use the **New** document wizard to create a new **XQuery** or **XSLT** file and you can use the [XQuery method example \(on page 630\)](#) or [XSLT method example \(on page 635\)](#) to help you with the content.

There are cases when it is necessary to add parameters in the [XQuery script \(on page 630\)](#) or [XSLT stylesheet \(on page 635\)](#). For instance, if you want to rename an element, you may want to declare an external parameter associated with the name of the element to be renamed. To allow you to specify the value for these parameters, they need to be declared in the *refactoring operation descriptor file* that is associated with this operation.

Note:

The XQuery Update processing is disabled by default in Oxygen XML Developer. Thus, if you want to create or edit an XQuery Update script you have to enable this mechanism by creating an [XQuery transformation scenario \(on page 1220\)](#) and choose **Saxon EE** as the transformation engine. Also, you need to make sure the **Enable XQuery update** option is selected in the Saxon processor advanced options [\(on page 1151\)](#).

Note:

If you are using an XSLT file, XPath expressions that are passed as parameters will automatically be rewritten to conform with the mapping of the namespace prefixes declared in the [XML /XSLT-XQuery / XPath preferences page \(on page 227\)](#).

The next step in creating a custom refactoring operation is to create an **XML Refactoring Operation Descriptor** file contains the path to the [XQuery Update script \(on page 633\)](#) or [XSLT stylesheet \(on page 638\)](#).

Related Information:

[XQuery Update Script for Creating a Custom Operation \(on page 630\)](#)

[XSLT Stylesheet for Creating a Custom Operation \(on page 635\)](#)

Custom Refactoring Operation Descriptor File

The second step in creating a custom refactoring operation is to create an operation descriptor file. The easiest way to do this is to use the **New** document wizard and choose the **XML Refactoring Operation Descriptor** template.

Introduction to the Descriptor File

This descriptor file root element specifies required attributes to define the operation `@name`, `@description`, and `@id` which are necessarily when loading an XML Refactoring operation. It also contains the path to the [XQuery Update script \(on page 630\)](#) or [XSLT stylesheet \(on page 635\)](#) that is associated with the particular operation through the `<script>` element.

The optional `@filesFilter` attribute can be specified to filter the resources by using a file pattern or list of file patterns separated by a comma (for example: `filesFilter="*.dita, *.xml"`). When set, its value is automatically populated in the **Include files** field within the **Scope and Filters** wizard page (on page 610) as a default value.

You can specify a *category* for your custom operations to logically group certain operations. The `<category>` element is optional and if it is not included in the descriptor file, the default name of the category for the custom operations is *Other operations*.

The descriptor file is edited and validated against the following schema: `frameworks/xml_refactoring/operation_descriptor.xsd`.

Declaring Parameters in the Descriptor File

If the XQuery Update script or XSLT stylesheet includes parameters, they should be declared in the **parameters** section of the descriptor file. All the parameters specified in this section of the descriptor file will be displayed in the **XML Refactoring** tool within the **Configure Operation Parameters** wizard page (on page 608) for that particular operation.

The value of the first `<description>` element in the `<parameters>` section will be displayed at the top of the **Configure Operation Parameters** wizard page (on page 608).

To declare a parameter, specify the following information:

- **label** - This value is displayed in the user interface for the parameter.
- **name** - The parameter name used in the XQuery Update script or XSLT stylesheet and it should be the same as the one declared in the script.
- **type** - Defines the type of the parameter and how it will be rendered. There are several types available:

- **TEXT** - Generic type used to specify a simple text fragment.
- **XPATH** - Type of parameter whose value is an XPATH expression. For this type of parameter, Oxygen XML Developer will use a text input with corresponding content completion and syntax highlighting.

**Note:**

The value of this parameter is transferred as plain text to the XQuery Update or XSLT transformation without being evaluated. You should evaluate the XPath expression inside the XQuery Update script or XSLT stylesheet. For example, you could use the `saxon:evaluate` Saxon extension function.

**Note:**

A relative XPath expression is converted to an absolute XPath expression by adding `//` before it (`//XPathExp`). This conversion is done before transferring the XPath expression to the XML refactoring engine.

**Note:**

When writing XPath expressions, you can only use prefixes declared in the [Options > Preferences > XML > XSLT-XQuery > XPath](#) (on page 227) options page.

- **NAMESPACE** - Used for editing namespace values.
- **REG_EXP_FIND** - Used when you want to match a certain text by using Perl-like regular expressions.
- **REG_EXP_REPLACE** - Used along with `REG_EXP_FIND` to specify the replacement string.
- **XML_FRAGMENT** - This type is used when you want to specify an XML fragment. For this type, Oxygen XML Developer will display a text area specialized for inserting XML documents.
- **NC_NAME** - The parameter for `NC_NAME` values. It is useful when you want to specify the local part of a *QName* (on page 2272) for an element or attribute.
- **BOOLEAN** - Used to edit boolean parameters.
- **TEXT_CHOICE** - It is useful for parameters whose value should be from a list of possible values. Oxygen XML Developer renders each possible value as a radio button option.
- **optional** - Specifies whether the parameter is optional or required. For optional parameters, the end user is not required to fill in a value in the XML refactoring wizard.
- **description** - The description of the parameter. It is used by the application to display a tooltip when you hover over the parameter.
- **possibleValues** - Contains the list with possible values for the parameter and you can specify the default value, as in the following example:

```
<possibleValues onlyPossibleValuesAllowed="true">
  <value name="before">Before</value>
  <value name="after" default="true">After</value>
  <value name="firstChild">First child</value>
```

```
<value name="lastChild">Last child</value>
</possibleValues>
```

On a `<value>`, you can specify the `@default` attribute with the value `true` to mark it as the default presented value in the XML refactoring wizard. The text specified inside the `<value>` element is displayed as placeholder default text in the text entry box. If the dialog box is accepted with the placeholder text in place, the `@name` attribute value is passed to the refactoring script. Example:

```
<value name="my-actual-default-value" default="true">[default displayed]</value>
```

Specialized Parameters to Match Elements or Attributes

If you want to match elements or attributes, you can use some specialized parameters, in which case Oxygen XML Developer will propose all declared elements or attributes based on the schema associated with the currently edited file. The following specialized parameters are supported:

elementLocation

This parameter is used to match elements. For this type of parameter, the application displays a text field where you can enter the element name or an XPath expression. The text from the `@label` attribute is displayed in the application as the label of the text field. The `@name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If the value of the `@useCurrentContext` attribute is set to `true`, the element name from the cursor position is used as proposed values for this parameter.

Example of an `<elementLocation>`:

```
<elementLocation name="elem_loc" useCurrentContext="false">
  <element label="Element location">
    <description>Element location description.</description>
  </element>
</elementLocation>
```

attributeLocation

This parameter is used to match attributes. For this type of parameter, the application displays two text fields where you can enter the parent element name and the attribute name (both text fields accept XPath expressions for a finer match). The text from the `@label` attributes is displayed in the application as the label of the associated text fields. The `@name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. The value of this parameter is an XPath expression that is computed by using the values of the expression from the *element* and *attribute* text fields. For example, if `section` is entered for the element and a `title` is entered for the attribute, the XPath expression would be computed as `//section/@title`. If the value of the `useCurrentContext` attribute is set to `true`, the element and attribute name from the cursor position is used as proposed values for the operation parameters.

Example of an `<attributeLocation>`:

```

<attributeLocation name="attr_xpath" useCurrentContext="true">
    <element label="Element path">
        <description>Element path description.</description>
    </element>
    <attribute label="Attribute" >
        <description>Attribute path description.</description>
    </attribute>
</attributeLocation>

```

elementParameter

This parameter is used to specify elements by local name and namespace. For this type of parameter, the application displays two combo boxes with elements and namespaces collected from the associated schema of the currently edited file. The text from the `@label` attribute is displayed in the application as label of the associated combo. The `@name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If you specify the `@allowsAny` attribute, the application will propose `<ANY>` as a possible value for the **Name** and **Namespace** combo boxes. You can also use the `@useCurrentContext` attribute and if its value is set to `true`, the element name and namespace from the cursor position is used as proposed values for the operation parameters.

Example of an `<elementParameter>`:

```

<elementParameter id="elemID" useCurrentContext="true">
    <localName label="Name" name="element_localName" allowsAny="true">
        <description>Local name of the parent element.</description>
    </localName>
    <namespace label="Namespace" name="element_namespace" allowsAny="true">
        <description>Local name of the parent element</description>
    </namespace>
</elementParameter>

```

attributeParameter

This parameter is used to specify attributes by local name and namespace. For this type of parameter, the application displays two combo boxes with attributes and their namespaces collected from the associated schema of the currently edited file. The text from the `@label` attribute is displayed in the application as the label of the associated combo box. You can also use the `@useCurrentContext` attribute and if its value is set to `true`, the attribute name and namespace from the cursor position is used as proposed values for the operation parameters.

Note:

An `<attributeParameter>` is dependant upon an `<elementParameter>`. The list of attributes and namespaces are computed based on the selection in the `elementParameter` combo boxes.

Example of an `<attributeParameter>`:

```
<attributeParameter dependsOn="elemID" useCurrentContext="true">
  <localName label="Name" name="attribute_localName">
    <description>The name of the attribute to be converted.</description>
  </localName>
  <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
    <description>Namespace of the attribute to be converted.</description>
  </namespace>
</attributeParameter>
```

Grouping Parameters in the Descriptor File

You can use `<section>` elements to group related parameters in the descriptor file:

```
<section label="Parent element">
  <elementParameter id="elemID">
    <localName label="Name" name="element_localName" allowsAny="true">
      <description>Local name of the parent element.</description>
    </localName>
    <namespace label="Namespace" name="element_namespace" allowsAny="true">
      <description>Local name of the parent element</description>
    </namespace>
  </elementParameter>
</section>
```

Note:

All built-in operations are loaded from the `[OXYGEN_INSTALL_DIR]/refactoring` folder.

[Example of an Operation Descriptor File with an XQuery Update script \(on page 633\)](#)

XQuery Update Script for Creating a Custom Operation

To demonstrate creating a custom operation, suppose that you have a task where you need to convert an attribute into an element and insert it inside another element. A specific example would be if you have a project with a variety of `<image>` elements where a deprecated `@alt` attribute was used for the description and you want to convert all instances of that attribute into an element with the same name and insert it as the first child of the `<image>` element.

Thus, the task is to convert this attribute into an element with the same name and insert it as the first child of the image element.

Figure 153. Example: Custom XML Refactoring Operation

An XQuery Update script can be used to implement the new custom XML refactoring operation. The second requirement is an [XML Refactoring operation descriptor file](#) ([on page 633](#)) that contains the path to the XQuery Update script.

Restriction:

There is a limitation to using an XQuery script in that *comments* or *processing instructions* that are in any node before or after the root element cannot be modified by an XML Refactoring operation. In other words, XML Refactoring operations can only be performed on *comments* or *processing instructions* that are inside the root element. However, as a work around to this limitation, you can use [Saxon extension functions](#) and the [XSLT stylesheet method](#) ([on page 640](#)) to implement the new custom XML refactoring operation.

Example of an XQuery Update Script for Creating a Custom Operation to *Convert an Attribute to an Element*

The XQuery Update script does the following:

- Iterates over all elements from the document that have the specified local name and namespace.
- Finds the attribute that will be converted to an element.
- Computes the *QName* ([on page 2272](#)) of the new element to be inserted and inserts it as the first child of the parent element.

```
(:
XQuery document used to implement 'Convert attribute to element'
operation from XML Refactoring tool.
:)
```

```

declare namespace output = "http://www.w3.org/2010/xslt-xquery-serialization";

declare option output:method    "xml";

declare option output:indent    "no";

(: Local name of the attribute's parent element. :)
declare variable $element_localName as xs:string external;

(: Namespace of the attribute's parent element. :)
declare variable $element_namespace as xs:string external;

(: The local name of the attribute to be converted :)
declare variable $attribute_localName as xs:string external;

(: The namespace of the attribute to be converted :)
declare variable $attribute_namespace as xs:string external;

(: Local name of the new element. :)
declare variable $new_element_localName as xs:string external;

(: Namespace of the new element. :)
declare variable $new_element_namespace as xs:string external;

(: Convert attribute to element:)
for $node in /**
(: Find the attribute to convert :)
let $attribute :=
    $node/@*[local-name() = $attribute_localName and
    ($attribute_namespace = '<ANY>' or $attribute_namespace = namespace-uri())]

(: Compute the prefix for the new element to insert :)
let $prefix :=
    for $p in in-scope-prefixes($node)
    where $new_element_namespace = namespace-uri-for-prefix($p, $node)
return $p

(: Compute the qname for the new element to insert :)
let $new_element_qName :=
    if (empty($prefix) or $prefix[1] = '') then $new_element_localName
    else $prefix[1] || ':' || $new_element_localName

where ('<ANY>' = $element_localName or local-name($node) = $element_localName)
and

```

```

($element_namespace = '<ANY>' or $element_namespace = namespace-uri($node))

return

if (exists($attribute)) then

    (insert node element {QName($new_element_namespace, $new_element_qName)}
    {string($attribute)} as first into $node,

    delete node $attribute)

else ()

```

Example of an Operation Descriptor File That References the XQuery Script for Creating a Custom Operation to *Convert an Attribute to an Element*

After you have developed the XQuery script (for example, named `convert-attribute-to-element.xq`), you have to create an XML Refactoring operation descriptor (for example, named `convert-attribute-to-element.xml`) that references the stylesheet and provides descriptions and possible values for its parameters. This descriptor is used by the application to load the operation details such as name, description, or parameters.

```

<?xml version="1.0" encoding="UTF-8"?>

<refactoringOperationDescriptor

  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"

  xmlns="http://www.oxygenxml.com/ns/xmlRefactoring"

  id="convert-attribute-to-element"

  name="Convert attribute to element">

  <description>Converts the specified attribute to an element.

    The new element will be inserted as first child of the attribute's
    parent element.</description>

  <script type="XQUERY_UPDATE" href="convert-attribute-to-element.xq"/>

  <parameters>

  <description>Specify the attribute to be converted to element.</description>

  <section label="Parent element">

  <elementParameter id="elemID">

  <localName label="Name" name="element_localName" allowsAny="true">

  <description>Local name of the parent element.</description>

  </localName>

  <namespace label="Namespace" name="element_namespace" allowsAny="true">

  <description>Local name of the parent element</description>

  </namespace>

  </elementParameter>

  </section>

  <section label="Attribute">

  <attributeParameter dependsOn="elemID">

  <localName label="Name" name="attribute_localName">

```

```

    <description>Name of the attribute to be converted.</description>

  </localName>

  <namespace label="Namespace" name="attribute_namespace" allowsAny="true">

    <description>Namespace of the attribute to be converted.</description>

  </namespace>

</attributeParameter>

</section>

<section label="New element">

  <elementParameter>

    <localName label="Name" name="new_element_localName">

      <description>The name of the new element.</description>

    </localName>

    <namespace label="Namespace" name="new_element_namespace">

      <description>The namespace of the new element.</description>

    </namespace>

  </elementParameter>

</section>

</parameters>

</refactoringOperationDescriptor>

```

Results

After you have created these files, copy them into a folder scanned by Oxygen XML Developer when it loads the custom operation (*on page 642*). When the XML Refactoring tool is started again, you will see the created operation.

Since various parameters can be specified, this custom operation can also be used for other similar tasks. The following image shows the parameters that can be specified in the example of the custom operation to convert an attribute to an element:

Figure 154. Example: XML Refactoring Wizard for a Custom Operation

Debugging XQuery Refactoring Operations

You can use the XQuery `trace()` function to generate debugging information messages in the application's **Results** view (on page 503).

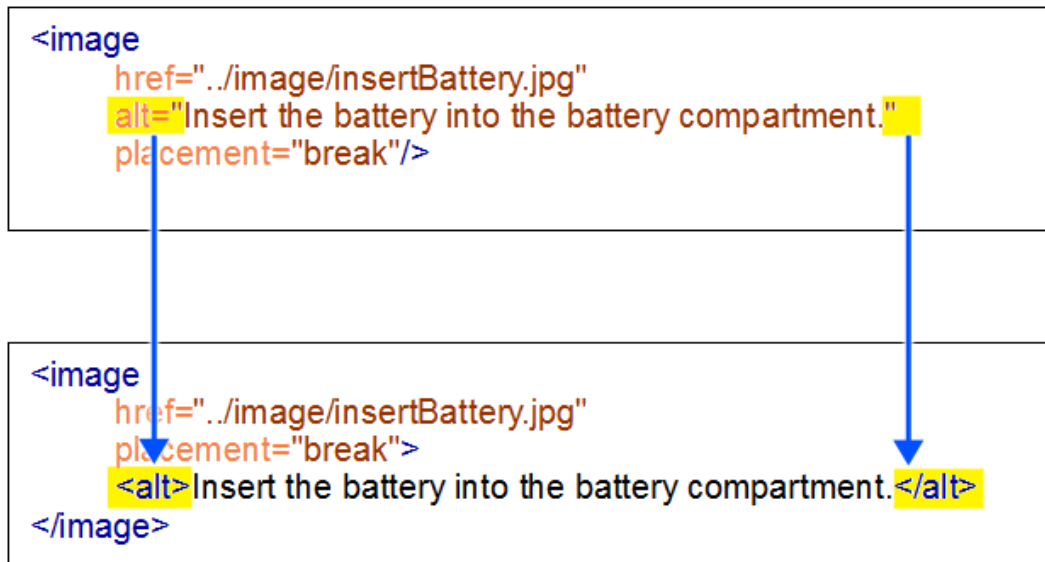

The Saxon processor used for XQuery update processing also supports the `EXPath` extensions, which also allow you to write debugging information to an output file.

XSLT Stylesheet for Creating a Custom Operation

To demonstrate creating a custom operation, suppose that you have a task where you need to convert an attribute into an element and insert it inside another element. A specific example would be if you have a project with a variety of `<image>` elements where a deprecated `@alt` attribute was used for the description and you want to convert all instances of that attribute into an element with the same name and insert it as the first child of the `<image>` element.

Thus, the task is to convert this attribute into an element with the same name and insert it as the first child of the image element.

Figure 155. Example: Custom XML Refactoring Operation

An XSLT stylesheet can be used to implement the new custom XML refactoring operation. The second requirement is an [XML Refactoring operation descriptor file \(on page 638\)](#) that contains the path to the XSLT stylesheet.

Example of an XSLT Script for Creating a Custom Operation to *Convert an Attribute to an Element*

The XSLT stylesheet does the following:

- Iterates over all elements from the document that have the specified local name and namespace.
- Finds the attribute that will be converted to an element.
- Adds the new element as the first child of the parent element.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  xmlns:xr="http://www.oxygenxml.com/ns/xmlRefactoring"
  version="2.0">
  <xsl:import
    href="http://www.oxygenxml.com/ns/xmlRefactoring/resources/commons.xsl"/>
  <xsl:param name="element_localName" as="xs:string" required="yes"/>
  <xsl:param name="element_namespace" as="xs:string" required="yes"/>
  <xsl:param name="attribute_localName" as="xs:string" required="yes"/>
  <xsl:param name="attribute_namespace" as="xs:string" required="yes"/>
  <xsl:param name="new_element_localName" as="xs:string" required="yes"/>
```

```

<xsl:param name="new_element_namespace" as="xs:string" required="yes"/>

<xsl:template match="node() | @">

  <xsl:copy>

    <xsl:apply-templates select="node() | @"/>

  </xsl:copy>

</xsl:template>

<xsl:template match="//*[xr:check-local-name($element_localName, .., true())
and
xr:check-namespace-uri($element_namespace, .)]">

  <xsl:variable name="attributeToConvert"

    select="*[xr:check-local-name($attribute_localName, .., true())
and
xr:check-namespace-uri($attribute_namespace, .)]"/>

  <xsl:choose>

    <xsl:when test="empty($attributeToConvert)">

      <xsl:copy>

        <xsl:apply-templates select="node() | @"/>

      </xsl:copy>

    </xsl:when>

    <xsl:otherwise>

      <xsl:copy>

        <xsl:for-each select="*[empty(. intersect $attributeToConvert)]">

          <xsl:copy-of select="."/>

        </xsl:for-each>

        <!-- The new element namespace -->

        <xsl:variable name="nsURI" as="xs:string">

          <xsl:choose>

            <xsl:when test="$new_element_namespace eq $xr:NO-NAMESPACE">

              <xsl:value-of select=""/>

            </xsl:when>

            <xsl:otherwise>

              <xsl:value-of select="$new_element_namespace"/>

            </xsl:otherwise>

          </xsl:choose>

        </xsl:variable>

        <xsl:element name="{ $new_element_localName }" namespace="{ $nsURI }">

          <xsl:value-of select="$attributeToConvert"/>

        </xsl:element>

      </xsl:copy>

    </xsl:otherwise>

  </xsl:choose>

</xsl:template>

```

```

</xsl:copy>

</xsl:otherwise>

</xsl:choose>

</xsl:template>

</xsl:stylesheet>

```

**Note:**

The XSLT stylesheet imports a module library that contains utility functions and variables. The location of this module is resolved via an *XML Catalog (on page 2273)* set in the XML Refactoring framework (on page 2269).

Example of an Operation Descriptor File That References the XSLT Stylesheet for Creating a Custom Operation to *Convert an Attribute to an Element*

After you have developed the XSLT stylesheet (for example, named `convert-attribute-to-element.xsl`), you have to create an XML Refactoring operation descriptor (for example, named `convert-attribute-to-element.xml`) that references the stylesheet and provides descriptions and possible values for its parameters. This descriptor is used by the application to load the operation details such as name, description, or parameters.

```

<?xml version="1.0" encoding="UTF-8"?>

<refactoringOperationDescriptor
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns="http://www.oxygenxml.com/ns/xmlRefactoring"
  id="convert-attribute-to-element"
  name="Convert attribute to element">
  <description>Converts the specified attribute to an element.
    The new element will be inserted as first child of the attribute's
    parent element.</description>
  <script type="XSLT" href="convert-attribute-to-element.xsl"/>
  <parameters>
    <description>Specify the attribute to be converted to element.</description>
    <section label="Parent element">
      <elementParameter id="elemID">
        <localName label="Name" name="element_localName" allowsAny="true">
          <description>Local name of the parent element.</description>
        </localName>
        <namespace label="Namespace" name="element_namespace" allowsAny="true">
          <description>Local name of the parent element</description>
        </namespace>
      </elementParameter>
    </section>
  </parameters>
</refactoringOperationDescriptor>

```

```

<section label="Attribute">
  <attributeParameter dependsOn="elemID">
    <localName label="Name" name="attribute_localName">
      <description>Name of the attribute to be converted.</description>
    </localName>
    <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
      <description>Namespace of the attribute to be converted.</description>
    </namespace>
  </attributeParameter>
</section>
<section label="New element">
  <elementParameter>
    <localName label="Name" name="new_element_localName">
      <description>The name of the new element.</description>
    </localName>
    <namespace label="Namespace" name="new_element_namespace">
      <description>The namespace of the new element.</description>
    </namespace>
  </elementParameter>
</section>
</parameters>
</refactoringOperationDescriptor>

```

**Note:**

If you are using an XSLT file, the line with the `<script>` element would look like this:

```
<script type="XSLT" href="convert-attribute-to-element.xsl"/>
```

The code exemplified above and other refactoring examples can be found on the [DITA Refactoring GitHub sample project](#).

Results

After you have created these files, copy them into a folder scanned by Oxygen XML Developer when it loads the custom operation (on page 642). When the XML Refactoring tool is started again, you will see the created operation.

Since various parameters can be specified, this custom operation can also be used for other similar tasks. The following image shows the parameters that can be specified in the example of the custom operation to convert an attribute to an element:

Figure 156. Example: XML Refactoring Wizard for a Custom Operation

Using Saxon Extension Functions to Allow Custom Refactoring Operations to Read and Modify Content Outside the Root Node

One advantage to using an XSLT stylesheet is that there is limitation when using an [XQuery Update script \(on page 630\)](#) in that refactoring operations can only be performed on *comments* or *processing instructions* that are inside the root element. Thus, using the XQuery method, *comments* or *processing instructions* that are in any node before or after the root element cannot be modified by an XML Refactoring operation.

The XSLT stylesheet method offers a work-around to this limitation through the use of some Saxon extension functions.

To illustrate the use of these functions, consider the following sample XML file:

```
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment before root -->
<?pi before root ?>
<root>
  <child></child>
</root>
<!-- comment after root -->
<?pi after root ?>
```

The following Saxon extension functions can be used to read and modify content outside the root node:

Note:

They belong to the <http://www.oxygenxml.com/ns/xmlRefactoring/functions> namespace.

- **get-content-after-root()** - Returns the content after root as `xs:string`.

For the XML above, the call of this function will return the following string value:

```
<!-- comment after root -->
<?pi after root ?>
```

- **set-content-after-root(xs:string)** - Updates the content that will be serialized in the refactored document after the root node.

The function call `set-content-after-root('<!-- Inserted comment -->')` will result in replacing the nodes after the root element with the comment passed as string argument. The XML document will be modified as follows:

```
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment before root -->
<?pi before root ?>
<root>
  <child></child>
</root><!-- Inserted comment -->
```

- **get-content-before-root()** - Returns the content before root as `xs:string`.

For the XML above, the call of this function will return the following string value:

```
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment before root -->
<?pi before root ?>
```

- **set-content-before-root(xs:string)** - Updates the content that will be serialized in the refactored document after the root node.

The function call `set-content-before-root('<!-- Inserted comment -->')` will result in replacing the nodes before the root element with the comment passed as string argument. The XML document will be modified as follows:

```
<!-- Inserted comment --><root>
  <child></child>
</root>
<!-- comment after root -->
<?pi after root ?>
```

XSLT Example:

To process content after the root node, the XSLT would look like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema" exclude-result-prefixes="xs"
```

```

xmlns:xrf="http://www.oxygenxml.com/ns/xmlRefactoring/functions" version="3.0">

<xsl:template match="/">

  <!-- The comment content that will be inserted after the root element -->

  <xsl:variable name="commentAsText"><!-- COMMENT ADDED FROM XR OPERATION-->

</xsl:variable>

  <!-- Retrieve the content after the root element as is -->

  <xsl:variable name="after-root-content" as="xs:string"

    select="xrf:get-content-after-root()"/>

  <xsl:variable name="processedContent"

    select="concat($after-root-content, $commentAsText)"/>

  <!-- Update the content after the root element -->

  <xsl:value-of select="xrf:set-content-after-root($processedContent)"/>

  <xsl:apply-templates/>
</xsl:template>

<xsl:template match="node() | @">

  <xsl:copy>

    <xsl:apply-templates select="node() | @"/>

  </xsl:copy>
</xsl:template>
</xsl:stylesheet>

```

**Note:**

The above XSLT retrieves the nodes after the root element as string, appends a new comment, and then sets back the updated content into the XML document.

Storing and Sharing Refactoring Operations

Oxygen XML Developer scans the following locations when looking for XML Refactoring operations to provide flexibility:

- A folder named **refactoring**, created inside the folder of the *framework* you are customizing. In the **Classpath** tab of the **Document type** configuration dialog box (*on page 134*), you need to add a reference to the **refactoring** folder specific for the framework.
- A folder that you specify in the **Load additional refactoring operations from** text box (*on page 237*) in the **XML Refactoring** preferences page (*on page 237*).

**Note:**

If you share a project with your team, you can also share the custom operation by doing the following:

1. Save the custom operation in a folder that is part of your project.
2. Switch the **XML Refactoring** option page to *project level* (on page 2272):
 - a. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **XML > XML Refactoring** (on page 237).
 - b. Select **Project Options** (on page 2272) at the bottom of the dialog box.
3. In the **Load additional refactoring operations from text box** (on page 237), use the `${pd}` editor variable (on page 296) so that the folder path is declared relative to the project.

- A folder specified by the **XML Refactoring Operations Plugin Extension** (on page 1885).
- The `refactoring` folder from the Oxygen XML Developer installation directory (`[OXYGEN_INSTALL_DIR]/refactoring/`).

Sharing Custom Refactoring Operations

The purpose of Oxygen XML Developer scanning multiple locations for the XML Refactoring operations is to provide more flexibility for developers who want to share the refactoring operations with the other team members. Depending on your particular use case, you can attach the custom refactoring operations to other resources, such as *framework* (on page 2269) or projects.

After storing custom operations, you can share them with other users by sharing the resources.

Localizing XML Refactoring Operations

Oxygen XML Developer includes localization support for the XML refactoring operations.

The translation keys for the built-in refactoring operations are located in

`[OXYGEN_INSTALL_DIR]/refactoring/i18n/translation.xml`.

The localization support is also available for custom refactoring operations. The following information can be translated:

- The operation `name`, `description`, and `category`.
- The `<description>` of the `<parameters>` element.
- The `label`, `description`, and `possibleValues` for each `parameter`.

Translated refactoring information uses the following form:

```
${i18n(translation_key)}
```

Oxygen XML Developer scans the following locations to find the `translation.xml` files that are used to load the translation keys:

- A `refactoring/i18n` folder, created inside a directory that is associated to a customized *framework*.
- A `i18n` folder, created inside a directory that is associated to a customized *framework*.
- An `i18n` folder inside any specified folder. In this case, you need to [open the Preferences dialog box \(Options > Preferences\)](#) (on page 114), go to **XML > XML Refactoring**, and specify the folder in the **Load additional refactoring operations from** text box.
- An `i18n` folder located in directories specified through the [XML Refactoring Operations Plugin Extension](#) (on page 1885).
- The `refactoring/i18n` folder from the Oxygen XML Developer installation directory (`[OXYGEN_INSTALL_DIR]/refactoring/i18n`).

Example: Refactoring Operation Descriptor File with *i18n* Support

```
<?xml version="1.0" encoding="UTF-8"?>

<refactoringOperationDescriptor

  xmlns="http://www.oxygenxml.com/ns/xmlRefactoring" id="remove_text_content"

  name="{i18n(Remove_text_content)}">

  <description>{i18n(Remove_text_content_description)}</description>

  <script type="XQUERY_UPDATE" href="remove_text_content.xq"/>

  <parameters>

    <description>{i18n(parameters_description)}</description>

    <parameter label="{i18n(Element_name)}" name="element_localName"

      type="NC_NAME">

      <description>{i18n(Element_name_descriptor)}</description>

      <possibleValues>

        <value default="true" name="value1">{i18n(value_1)}</value>

        <value name="value2">{i18n(value_2)}</value>

      </possibleValues>

    </parameter>

  </parameters>

</refactoringOperationDescriptor>
```

Applying All Default Quick Fix Proposals

The **Apply all default quick fix proposals** tool can be used to apply quick fix proposals for all reported validation errors in one or more documents when one or more quick fix proposals have been detected for reported validation errors. If multiple quick fixes are available for the same validation error, the default quick fix defined in the Schematron validation schema using the `sqf:default-fix` attribute is automatically selected to be applied. If no default quick fix is explicitly specified, the first quick fix proposal in the list is considered. All quick fix proposals are then automatically executed in bulk, one after the other.

**Important Notes to Consider:**

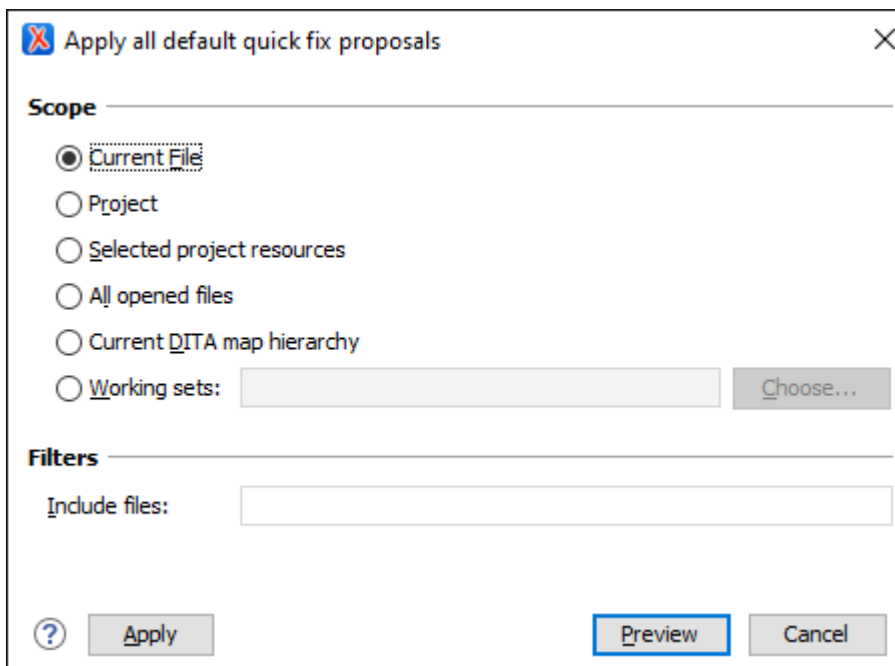

- To maintain the accuracy of the initially calculated error validation ranges, the quick fix proposals are applied in the reverse order of their selection.
- If two or more quick fixes act on the same "area" within the document, only one is applied (no changes can be made to changes already made).
- Quick fixes that involve "user-entered values" that normally present a dialog box to facilitate data entry will not be executed (the automatic process of applying all selected quick fixes cannot be interrupted by the presence of the respective dialog boxes).

The **Apply all default quick fix proposals** tool can be accessed from the following interface locations:

- **[Single Document]** The contextual menu when you right-click anywhere in **Text mode** (*on page 521*) when there is a detected quick fix proposal in the current document.
- **[One or More Documents]** The **Tools** menu.
- **[One or More Documents]** The **Refactoring** submenu when you right-click one or more files in the **Project view** (*on page 365*).

Invoking the tool opens the **Apply all default quick fix proposals** dialog box where you can choose the scope for the operation and optionally specify a filter to narrow the scope.

Figure 157. Apply All Default Quick Fix Proposals Dialog Box

The **Scope** section allows you to choose from the following scopes:

- **Current File** - The quick fix proposals are applied on the current file only.
- **Project** - The quick fix proposals are applied on the current project.

- **Selected project resources** - The quick fix proposals are applied on the selected files from the current project.
- **All opened files** - The quick fix proposals are applied on all opened files.
- **Current DITA map hierarchy** (for DITA documents) - The quick fix proposals are applied on current DITA map along with all of its referenced topics and submaps (and topics referenced in those submaps).
- **Working sets** - The quick fix proposals are applied on a user-defined set of resources, referred to as a *working set* (on page 2273).

The **Include files** option in the **Filters** section can be used to narrow the scope of the operation by filtering the selected resources using a file pattern. For example, to restrict the operation to only parse and update XML documents from the selected files, you could use `{*}.xml` for the file pattern.

You can click the **Preview** button to see a comparison preview that provides an overview of the content changes that will be made, according to the quick fixes that will be applied. The comparison panel also informs you of any problems encountered. While previewing the changes, you can also choose to exclude certain files from having the quick fixes be applied if you do not agree with the changes for the particular files. If you agree with the changes presented, click **Apply** to trigger the quick fixes and update the content.

Troubleshooting:

If a quick fix did not apply, a notification with some information about the error will be displayed in the **Results** view at the bottom of the application.

Tip:

If the operation takes longer than expected, you can use the **Stop** button in the progress bar to cancel the operation.

For more information about the **Apply all default quick fix proposals** tool, see our video: [Introducing the Apply All Default Quick Fix Proposals Tool](#).

XML Digital Signatures

This chapter explains how to apply and verify digital signatures on XML documents.

Digital Signatures Overview

Digital signatures are widely used as security tokens, not just in XML. A *digital signature* provides a mechanism for assuring integrity of data, the authentication of its signer, and the non-repudiation of the entire signature to an external party:

- A *digital signature* must provide a way to verify that the data has not been modified or replaced to ensure integrity.
- The *signature* must provide a way to establish the identity of the data's signer for authentication.
- The *signature* must provide the ability for the data's integrity and authentication to be provable to a third party for non-repudiation.

A *public key system* is used to create the digital signature and it is also used for verification. The signature binds the signer to the document because digitally signing a document requires the originator to create a hash of the message and then encrypt that hash value with their own private key. Only the originator has that private key and that person is the only one who can encrypt the hash so that it can be unencrypted using their public key. The recipient, upon receiving both the message and the encrypted hash value, can decrypt the hash value, knowing the originator's public key. The recipient must also try to generate the hash value of the message and compare the newly generated hash value with the unencrypted hash value received from the originator. If the hash values are identical, it proves that the originator created the message, because only the actual originator could encrypt the hash value correctly.

XML Signatures can be applied to any digital content (data object), including XML (see W3C Recommendation, [XML-Signature Syntax and Processing](#)). An XML Signature may be applied to the content of one or more resources:

- Enveloped or enveloping signatures are applied over data within the same XML document as the signature
- Detached signatures are applied over data external to the signature element; the signature is "detached" from the content it signs. This definition typically applies to separate data objects, but it also includes the instance where the signature and data object reside within the same XML document but are sibling elements.

The *XML Signature* is a method of associating a key with referenced data. It does not normatively specify how keys are associated with persons or institutions, nor the meaning of the data being referenced and signed.

The original data is not actually signed. Instead, the signature is applied to the output of a chain of [canonicalization \(on page 2267\)](#) and transformation algorithms, which are applied to the data in a designated sequence. This system provides the flexibility to accommodate whatever "normalization" or desired preprocessing of the data that might be required or desired before subjecting it to being signed.

Since the signature is dependent on the content it is signing, a signature produced from a *non-canonicalized* document could possibly be different from one produced from a [canonicalized \(on page 2267\)](#) document. The [canonical \(on page 2267\)](#) form of an XML document is physical representation of the document produced by the method described in this specification. The [XML canonicalization \(on page 2267\)](#) method is the algorithm defined by this specification that generates the canonical form of a given XML document or document subset. *XML canonicalization* is designed to be useful for applications that require the ability to test whether or not the information content of a document or document subset has been changed. This is done by comparing the *canonical* form of the original document before application processing with the *canonical* form of the document result of the application processing.

A digital signature over the *canonical* (on page 2267) form of an XML document or document subset allows the signature digest calculations to be oblivious to changes in the original document's physical representation. During signature generation, the digest is computed over the *canonical* form of the document. The document is then transferred to the relying party, which validates the signature by reading the document and computing a digest of the *canonical* form of the received document. The equivalence of the digests computed by the signing and relying parties (hence, the equivalence of the *canonical* forms that they were computed for) ensures that the information content of the document has not been altered since it was signed.

The following *canonicalization algorithms* are used in Oxygen XML Developer:

- **Canonical XML (or Inclusive XML Canonicalization) (XMLC14N)** - Used for XML where the context doesn't change.

Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. *Inclusive Canonicalization* is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the *Inclusive Canonicalization* will copy them and the signature will be invalid.

- **Exclusive XML Canonicalization (EXCC14N)** - Designed for *canonicalization* where the context might change.

Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

The *canonicalization* (on page 2267) method can specify whether or not comments should be included in the *canonical* form output by the *XML canonicalization* method. If a *canonical* form contains comments corresponding to the comment nodes in the input node-set, the result is called *canonical XML with comments*. In an uncommented *canonical* form, comments are removed, including the delimiter for comments outside the document element.

The three operations. **Canonicalize** (on page 649), **Sign** (on page 651), and **Verify Signature** (on page 654), are available from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu.

Related Information:

[Certificates \(on page 649\)](#)

[Canonicalizing Files \(on page 649\)](#)

[Signing Files \(on page 651\)](#)

[Verifying Signature \(on page 654\)](#)

[Example of How to Digitally Sign XML Files or Content \(on page 654\)](#)

Certificates

A certificate is a digitally signed statement from the issuer (an individual, an organization, a website or a firm), saying that the public key (and some other information) of some other entity has a particular value. When data is digitally signed, the signature can be verified to check the data integrity and authenticity. Integrity means that the data has not been modified. Authenticity means the data comes indeed from the entity that claims to have created and signed it. Certificates are kept in special repositories called *keystores* ([on page 2270](#)).

All *keystore* entries (key and trusted certificate entries) are accessed via unique aliases. An alias must be assigned for every new entry of either a key or certificate as a reference for that entity. No *keystore* can store an entity if its alias already exists in that *keystore* and cannot store trusted certificates generated with keys in its *keystore*.

Oxygen XML Developer provides two types of *keystores*: Java Key Store (JKS) and Public-Key Cryptography Standards version 12 (PKCS-12). A *keystore* file is protected by a password. In a PKCS 12 *keystore* you should not store a certificate without alias together with other certificates, with or without alias, as in such a case the certificate without alias cannot be extracted from the *keystore*.

To configure the options for a certificate or to validate it, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **XML > XML Signing Certificates**. This opens [the certificates preferences page \(on page 236\)](#).

Related Information:

[Digital Signatures Overview \(on page 646\)](#)

Canonicalizing Files

You can select the *canonicalization* ([on page 2267](#)) algorithm to be used for a document from the dialog box that is displayed by using the **Canonicalize** action that is available from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu.

Figure 158. Canonicalization Settings Dialog Box

The **Canonicalize** dialog box allows you to set the following options:

- **Input URL** - Available if the **Canonicalize** action was selected from the **Tools** menu. It allows you to specify the location of the input file.
- **Exclusive** - If selected, the exclusive (uncommented) *canonicalization (on page 2267)* method is used.

**Note:**

Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments *canonicalization (on page 2267)* method is used.
- **Inclusive** - If selected, the inclusive (uncommented) *canonicalization (on page 2267)* method is used.

**Note:**

Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. *Inclusive Canonicalization* is useful when it is less likely that the signed data will be inserted

in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive *Canonicalization* will copy them and the signature will be invalid.

- **Inclusive with comments** - If selected, the inclusive with comments *canonicalization* (on page 2267) method is used.
- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **Output** - Available if the **Canonicalize** action was selected from the **Tools** menu. It allows you to specify the output file path where the signed XML document will be saved.
- **Open in editor** - If selected, the output file will be opened in the editor.

Related Information:

[Digital Signatures Overview \(on page 646\)](#)

Signing Files

You can select the type of signature to be used for documents from a signature settings dialog box. To open this dialog box, select the **Sign** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu.

Figure 159. Signature Settings Dialog Box

The following options are available:

**Note:**

If Oxygen XML Developer could not find a valid certificate, a link is provided at the top of the dialog box that opens the [XML Signing Certificates preferences page \(on page 236\)](#) where you can configure a valid certificate.

Could not obtain a valid certificate. [You must configure a valid certificate.](#)

- **Input** - Available if the **Sign** action was selected from the **Tools** menu. Specifies the location of the input URL.
- **Transformation Options** - See the [Digital Signature Overview \(on page 646\)](#) section for more information about these options.

- **None** - If selected, no *canonicalization* (on page 2267) algorithm is used.
- **Exclusive** - If selected, the exclusive (uncommented) *canonicalization* (on page 2267) method is used.

**Note:**

Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments *canonicalization* (on page 2267) method is used.
- **Inclusive** - If selected, the inclusive (uncommented) *canonicalization* (on page 2267) method is used.

**Note:**

Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. *Inclusive Canonicalization* is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the *Inclusive Canonicalization* will copy them and the signature will be invalid.

- **Inclusive with comments** - If selected, the inclusive with comments *canonicalization* (on page 2267) method is used.
- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **ID** - Provides ID of the XML element to be signed.
- **Envelope** - If selected, the *enveloped* signature is used. See the [Digital Signature Overview](#) (on page 646) for more information.
- **Detached** - If selected, the *detached* signature is used. See the [Digital Signature Overview](#) (on page 646) for more information.
- **Append KeyInfo** - If this option is selected, the `<ds:KeyInfo>` element will be added in the signed document.
- **Signature algorithm** - The algorithm used for signing the document. The following options are available: **RSA with SHA1**, **RSA with SHA256**, **RSA with SHA384**, **RSA with SHA512**, **ECDSA with SHA1**, **ECDSA with SHA256**, **ECDSA with SHA384**, and **ECDSA with SHA512**.

- **Output** - Available if the **Sign** action was selected from the **Tools** menu. Specifies the path of the output file where the signed XML document will be saved.
- **Open in editor** - If selected, the output file will be opened in Oxygen XML Developer.

Related Information:[Digital Signatures Overview \(on page 646\)](#)[Verifying Signature \(on page 654\)](#)[Example of How to Digitally Sign XML Files or Content \(on page 654\)](#)

Verifying Signature

You can verify the signature of a file by selecting the **Verify Signature** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu. The **Verify Signature** dialog box then allows you to specify the location of the file whose signature is verified.

If the signature is valid, a dialog box displays the name of the signer. Otherwise, an error shows details about the problem.

Related Information:[Digital Signatures Overview \(on page 646\)](#)[Signing Files \(on page 651\)](#)[Example of How to Digitally Sign XML Files or Content \(on page 654\)](#)

Example of How to Digitally Sign XML Files or Content

Suppose you want to digitally sign an XML document, but more specifically, suppose you have multiple instances of the same element in the document and you just want to sign a specific ID. Oxygen XML Developer includes a signature tool that allows you to digitally sign XML documents or specific content.

The Oxygen XML Developer installation directory includes a `samples` folder that contains a file called `personal.xml`. For the purposes of this example, this file will be used to demonstrate how to digitally sign specific content. Notice that this file has multiple `<person>` elements inside the `<personnel>` element. Suppose you want to digitally sign the specific `<person>` element that contains the `id=robert.taylor`. To do this, follow this procedure:

1. Open the `personal.xml` file in Oxygen XML Developer in **Text** editing mode.
2. Right-click anywhere in the editor and select the **Sign** action from the **Source** submenu.
The **Sign** dialog box is displayed.

**Tip:**

If you want to sign a file but create a new output file so that the original file remains unchanged, use the **Sign** action from the **Tools** menu. Selecting the action from this menu will allow you to choose an input file and output file in the **Sign** dialog box.

3. If Oxygen XML Developer cannot find a valid certificate, click the link at the top of the dialog box to **configure a valid certificate**. This opens the **XML Signing Certificates preferences page** (*on page 236*) that allows you to configure and validate a certificate.
4. Once a valid certificate is recognized, continue to configure the **Sign** dialog box.
 - a. Select one of **the Transformation Options** (*on page 652*). For the purposes of this example, select the **Inclusive with comments** option.
 - b. Specify the appropriate **XPath** expression for the specific element that needs to be signed. For this example, type `/personnel/person` in the **XPath** text box.
 - c. Enter the specific **ID** that needs to be signed. For this example, type `robert.taylor` in the **ID** field.
 - d. Select **the Envelope option** (*on page 653*) and leave the other options as their default values.The digital signature is added at the end of the XML document, just before the end tag. It is always added at the end of the document, even if you only sign specific content within the document.
5. You can verify the signature by choosing the **Verify Signature** action from the **Source** submenu of the contextual menu.

Editing XSLT Stylesheets

Oxygen XML Developer includes a built-in editor for XSLT stylesheets. This section presents the features of the XSLT editor and how these features can be used. The features of the XSLT editor include:

- **Create new XSLT files and templates** - You can use the built-in new file wizards to [create new XSLT documents or templates](#) (*on page 330*).
- **Open and Edit XSLT files** - XSLT files can be opened and edited in the source editor (**Text mode** (*on page 471*)).
- **Validation** - Presents validation errors in XSLT files.
- **Content completion** - Offers proposals for properties and the values that are available for each property.
- **Syntax highlighting** - The syntax highlighting in Oxygen XML Developer makes XSLT files more readable.

Resources

For more information about working with XSLT in Oxygen XML Developer, see the following resources:

- Webinar: [Introduction to XSLT Using Oxygen](#).
- Webinar: [XSLT Quick Fixes](#).

Modular Contextual XSLT Editing Using 'Main Files' Support

Smaller interrelated modules that define a complex stylesheet cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, a function defined in a main stylesheet is not visible when you edit an included or imported module. Oxygen XML Developer provides the support for defining the main module (or modules), allowing you to edit any of the imported/included files in the context of the larger stylesheet structure.

You can set a main XSLT stylesheet either using the *main files* support from the **Project** view (on page 381), or using a validation scenario.

To set a *main file* using a validation scenario, add validation units that point to the main modules. Oxygen XML Developer warns you if the current module is not part of the dependencies graph computed for the main stylesheet. In this case, it considers the current module as the main stylesheet.

The advantages of editing in the context of *main file* (on page 2270) include:

- Correct validation of a module in the context of a larger stylesheet structure.
- *Content Completion Assistant* (on page 2267) displays all components valid in the current context.
- The **Outline** view (on page 668) displays the components collected from the entire stylesheet structure.

Resources

For more information about editing XSLT stylesheets in the *main files* context, watch our video demonstration:

<https://www.youtube.com/embed/UZwg385RKNw>

[XSLT Component Dependencies View \(on page 678\)](#)

Validating XSLT Stylesheets

Numerous XSLT code quality assurance checks are done during automatic validation to help you keep your stylesheets valid and well-formed. Oxygen XML Developer performs the validation of XSLT documents with the help of an XSLT processor that you can configure in the preferences pages (on page 214) according to the XSLT version.

For XSLT 1.0, the options are: Xalan (Deprecated), Saxon 6.5.5 and Saxon 12.5. For XSLT 2.0, the option is: Saxon 12.5. For XSLT 3.0, the option is Saxon 12.5.

To access the *XSLT preferences* (on page 214) quickly, use the  **Validation options** action from the **Document > Validate** menu.

Creating a Validation Scenario for XSLT Stylesheets

You can validate an XSLT document using the engine defined in the transformation scenario, or a custom validation scenario. If you choose to validate using the engine from transformation scenario, and a transformation scenario is not associated with the current document or the engine has no validation support, the default engine is used. To set the default engine, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **XML > XSLT/FO/XQuery > XSLT**.

You can also create new validation scenarios or edit existing ones, and you can add [JARS \(on page 2270\)](#) and classes that contain extension functions. To create or edit a validation scenario for an XSLT stylesheet, follow these steps:

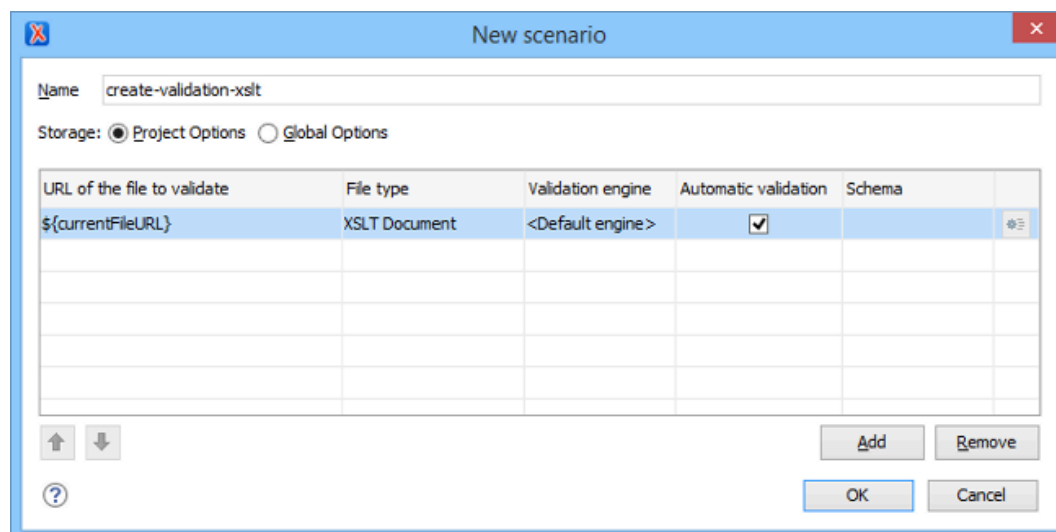

1. With the XSLT file open in Oxygen XML Developer, select the  **Configure Validation Scenario(s)** from the **Document > Validate** menu, or the  **Validation** toolbar drop-down menu, or from the **Validate** submenu when invoking the contextual menu on the XSLT file in the **Project view (on page 365)**. The **Configure Validation Scenario(s)** dialog box is displayed. It contains the existing scenarios, organized in categories depending on the type of file they apply to. You can use the options in the  **Settings** drop-down menu to filter which scenarios are shown.
2. To edit an existing scenario, select the scenario and click the **Edit** button. If you try to edit one of the *read-only* built-in scenarios, Oxygen XML Developer creates a customizable duplicate (you can also use the **Duplicate** button).
3. To add a new scenario, click the  **New** button. The **New scenarios** dialog box is displayed. It lists all validation units of the scenario.

Figure 160. Add / Edit a Validation Unit

4. Configure the following information in this dialog box:
 - a. **Name** - The name of the validation scenario.
 - b. **Storage** - You can choose between storing the scenario in the **Project Options (on page 2272)** or **Global Options (on page 2269)**.

- c. **URL of the file to validate** - In most cases, leave this field as the default selection (the URL of the current file). If you want to specify a different URL, double-click its cell and enter the URL in the text field, select it from the drop-down list, or use the  **Browse** drop-down menu or  **Insert Editor Variable** (on page 289) button.
 - d. **File type** - The file type should be **XSLT Document**.
 - e. **Validation engine** - Click the cell to select a validation engine. You must select an engine to be able to add or edit extensions.
 - f. **Automatic validation** - If this option is selected, the validation operation defined by this row is also used by the automatic validation feature.
5. To add or edit extensions, click the  **Edit extensions** button. This button is only available if the **File type** is set as **XSLT Document** and a **Validation engine** is chosen.
- The **Libraries** dialog box is opened. It is used to specify the *JARS* and classes that contain extension functions called from the XSLT file of the current validation scenario. They will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item and click the  **Move up** or  **Move down** buttons.
6. Click **OK** to close the **New scenario** dialog box.
- The newly created validation scenario is now included in the list of scenarios in the **Configure Validation Scenario(s)** dialog box. You can select the scenario in this dialog box to associate it with the current XSLT document and click the **Apply associated** button to run the validation scenario.

Validating XSLT Stylesheets with Custom Engines

If you need to validate an XSLT stylesheet with a validation engine that is different from the built-in engine, you can configure external engines as custom XSLT validation engines in the Oxygen XML Developer preferences. After a custom validation engine is [properly configured \(on page 195\)](#), it can be applied on the current document by selecting it from the list of custom validation engines in the  **Validation** toolbar drop-down menu. The document is validated against the schema declared in the document.

By default, there are two validators that are configured for XSLT stylesheets:

- **MSXML 4.0 (Deprecated)** - included in Oxygen XML Developer (Windows edition). It is associated to the XSL Editor type in [Preferences page. \(on page 195\)](#)
- **MSXML.NET (Deprecated)** - included in Oxygen XML Developer (Windows edition). It is associated to the XSL Editor type in [Preferences page. \(on page 195\)](#)

Validating XSLT Stylesheets that Call Java Extensions

It is possible to validate an XSLT that calls Java extensions. This is achieved through a transformation scenario where the Java extensions are specified, and the default validation will be processed using the parameters defined in the transformation scenario.

To validate XSLT with Java extensions, follow this procedure:

1. Create an [XSLT transformation on XML scenario \(on page 1188\)](#) for your XSLT document (select  **Configure Transformation Scenario(s)** action from the toolbar, then click **New**, and select **XSLT transformation on XML**).
2. In the **New scenario** dialog box, click the **Extensions** button (in the **XSLT** tab), specify the Java extensions (JAR libraries) that are needed, and click **OK**.
3. Once you are finished configuring the transformation scenario, click **OK**, then select **Save and close**.
4. Use the  **Validate** button on the toolbar and the default validation will detect and use the transformation scenario profile you just configured and saved.

Related Information:

[Debugging XSLT that Call Java Extensions \(on page 1861\)](#)

XSLT Quick Fix Support

The Oxygen XML Developer [Quick Fix support \(on page 2272\)](#) helps you resolve various errors that appear in a stylesheet by proposing *Quick Fixes* to problems such as missing templates, misspelled template names, missing functions, or references to an undeclared variable or parameter.

To activate this feature, hover over or place the cursor in the highlighted area of text where a validation error or warning occurs. If a *Quick Fix* is available for that particular error or warning, you can access the *Quick Fix* proposals with any of the following methods:

- When hovering over the error or warning, the proposals are presented in a tooltip pop-up window.
- If you place the cursor in the highlighted area where a validation error or warning occurs, a *Quick Fix* icon (💡) is displayed in the stripe on the left side of the editor. If you click this icon, Oxygen XML Developer displays the list of available fixes.
- With the cursor placed in the highlighted area of the error or warning, you can also invoke the *Quick Fix* menu by pressing **Alt + 1 (Command + Option + 1 on macOS)** on your keyboard.

**Note:**

The *Quick Fixes* are available only when validating an XSLT file with Saxon HE/PE/EE.

Figure 161. Example of an Undefined XSLT Functions Quick Fix

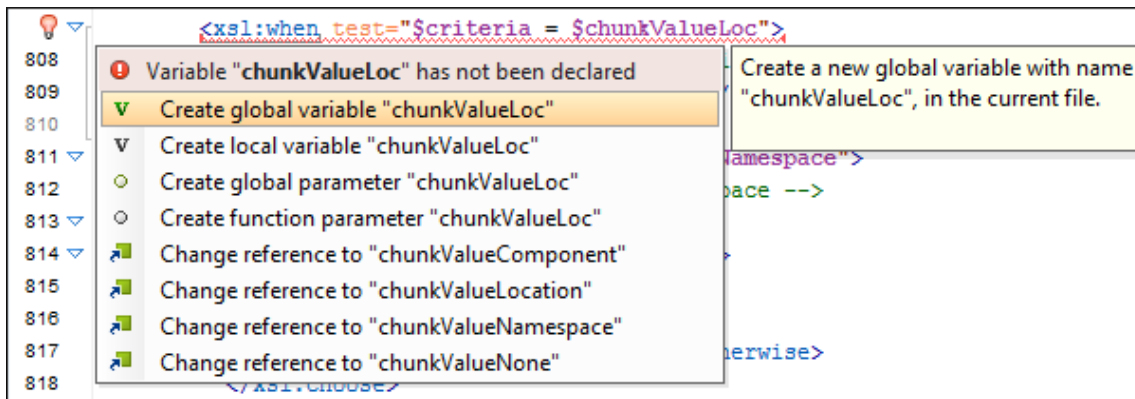

Figure 162. Example of an Undeclared XSLT Variables/Parameters Quick Fix

Oxygen XML Developer provides XSLT *Quick Fixes* for the following types of instances:

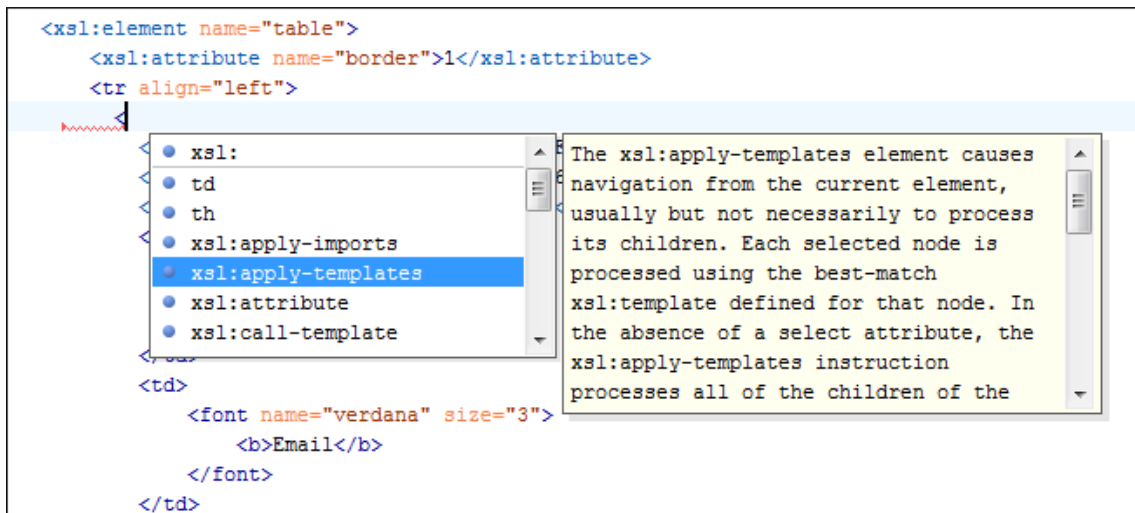

- **Template does not exist**, when the template name referenced in a `<call-template>` element does not exist. The following fixes are available:
 - **Create template "templateName"** - creates a template and generates its corresponding parameters. The template name and parameter names and types are collected from the `<call-template>` element.
 - **Change reference to "newTemplateName"** - changes the name of the missing template referenced in the `<call-template>` element. The proposed new names are the existing templates with names similar with the missing one.
- **Variable/Parameter not declared**, when a parameter or variable reference cannot be found. The following fixes are available:
 - **Create global variable "varName"** - creates a global variable with the specified name in the current stylesheet. The new variable is added at the beginning of the stylesheet after the last global variable or parameter declaration.
 - **Create global parameter "paramName"** - creates a global parameter with the specified name in the current stylesheet. The new parameter is added at the beginning of the stylesheet after the last global parameter or variable declaration.
 - **Create local variable "varName"** - creates a local variable with the specified name before the current element.
 - **Create template parameter "paramName"** - creates a new parameter with the specified name in the current template. This fix is available if the error is located inside a template.
 - **Create function parameter "paramName"** - creates a new parameter with the specified name in the current function. This fix is available if the error is located inside a function.
 - **Change reference to "varName"** - changes the name of the referenced variable/parameter to an existing local or global variable/parameter, that has a similar name with the current one.
- **Parameter from a called template is not declared**, when a parameter referenced from a `<call-template>` element is not declared. The following fixes are available:

- **Create parameter "paramName" in the template "templateName"** - creates a new parameter with the specified name in the referenced template.
- **Change "paramName" parameter reference to "newParamName"** - changes the parameter reference from the `<call-template>` element to a parameter that is declared in the called template.
- **Remove parameter "paramName" from call-template** - removes the parameter with the specified name from the `<call-template>` element.
- **No value supplied for required parameter**, when a required parameter from a template is not referenced in a `<call-template>` element. The **Add parameter "paramName" in call-template** quick-fix is available. It creates a new parameter with the specified name in call-template element.
- **Function "prefix:functionName()" has not been defined**, when a function declaration is not found. The following *Quick Fixes* are available:
 - **Create function "prefix:functionName(param1, param2)"** - creates a new function with the specified signature, after the current top-level element from stylesheet.
 - **Change function to "newFunctionName(..)"** - changes the referenced function name to an already defined function. The proposed names are collected from functions with similar names and the same number of parameters.
- **Attribute-set "attrSetName" does not exist**, when the referenced attribute set does not exist. The following *Quick Fixes* are available:
 - **Create attribute-set "attrSetName"** - creates a new attribute set with the specified name, after the current top-level element from stylesheet.
 - **Change reference to "attrSetName"** - changes the referenced attribute set to an already defined one.
- **Character-map "chacterMap" has not been defined**, when the referenced character map declaration is not found. The following *Quick Fixes* are available:
 - **Create character-map "characterMapName"** - creates a new character map with the specified name, after the current top-level element from stylesheet.
 - **Change reference to "characterMapName"** - changes the referenced character map to an already defined one.

Content Completion in XSLT Stylesheets

The list of proposals offered by the *Content Completion Assistant (on page 2267)* in XSLT are context-sensitive and includes proposals that are valid at the current cursor position. It can be manually activated with the **Ctrl + Space** shortcut.

You can enhance the list of proposals by specifying an additional schema. This schema is defined in the **Content Completion / XSLT preferences (on page 181)** page and can be any of the following: XML Schema, DTD, RELAX NG schema, or NVDL schema.

Figure 163. XSLT Content Completion Assistant

The feature is activated in **Text** mode in the following situations:

- After you enter the `<` character when inserting an element, it is automatically activated after a short delay. You can adjust the activation delay with the **Activation delay of the proposals window (ms) option (on page 181)** from the **Content Completion** preferences page.
- After typing a partial element or attribute name, you can manually activate it by pressing **Ctrl + Space** or **Alt + ForwardSlash (Command + Option + ForwardSlash on macOS)**. If there is only one valid proposal at the current location, it is inserted without displaying the list of proposals.

The *Content Completion Assistant* proposes numerous item types (such as templates, variables, parameters, keys, etc.) that are defined in the current stylesheet, and in the imported and included XSLT stylesheets. The *Content Completion Assistant* also includes **code templates that can be used to quickly insert code fragments (on page 491)** into stylesheets.

**Note:**

For XSL and XSD resources, the *Content Completion Assistant* collects its components starting from the *main files (on page 2270)*. The *main files* can be defined in the project or in the associated validation scenario. For further details about the *Main Files* support go to [Defining Main Files at Project Level \(on page 381\)](#).

The extension functions included in the Saxon 6.5.5 and 12.5 transformation engines are presented in the content completion list only if the Saxon namespace (`http://saxon.sf.net` for XSLT version 2.0 / 3.0 or `http://icl.com/saxon` for XSLT version 1.0) is declared and one of the following conditions is true:

- The edited file has a transformation scenario that uses as transformation engine Saxon 6.5.5 (for XSLT version 1.0), Saxon 12.5 PE or Saxon 12.5 EE (for XSLT version 2.0 / 3.0).
- The edited file has a validation scenario that uses as validation engine Saxon 6.5.5 (for version 1.0), Saxon 12.5 PE or Saxon 12.5 EE (for version 2.0 / 3.0).
- The validation engine specified in [Options \(on page 214\)](#) page is Saxon 6.5.5 (for version 1.0), Saxon 12.5 PE or Saxon 12.5 EE (for version 2.0 / 3.0).

- On XPath operators detected in one of the `@match`, `@select`, and `@test` attributes of XSLT elements: `"`, `'`, `/`, `//`, `(`, `[`, `|`, `:`, `::`, `$`
- For attribute value templates of non-XSLT elements, that is the `{` character when detected as the first character of the attribute value.
- On request, if the combination **Ctrl + Space** is pressed inside an edited XPath expression.

The proposals presented in the *Content Completion Assistant* are dependent on:

- The context of the current XSLT element.
- The XML document associated with the edited stylesheet in the stylesheet transformation scenario.
- The XSLT version of the stylesheet (1.0, 2.0, or 3.0).

Note:

The XSLT 3.0 content completion list of proposals includes specific elements and attributes for the 3.0 version.

For example, if the document associated with the edited stylesheet is:

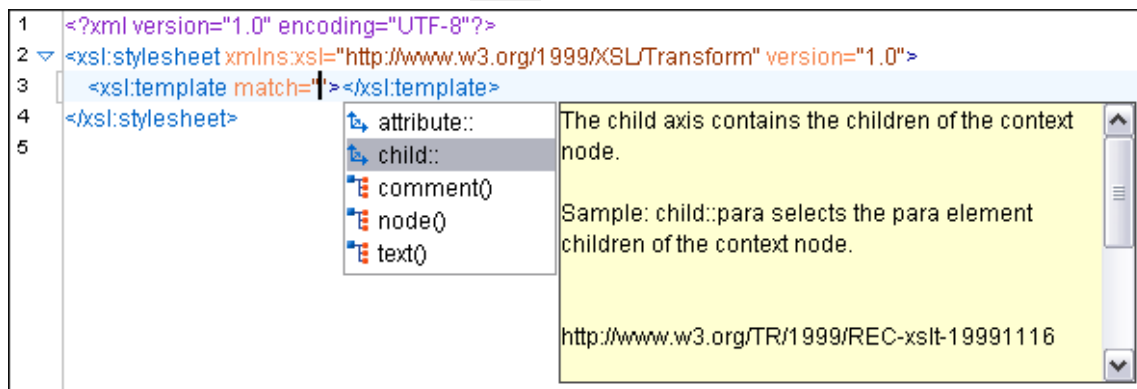

```
<personnel>
  <person id="Big.Boss">
    <name>
      <family>Boss</family>
      <given>Big</given>
    </name>
    <email>chief@oxygenxml.com</email>
    <link subordinates="one.worker"/>
  </person>
  <person id="one.worker">
    <name>
      <family>Worker</family>
      <given>One</given>
    </name>
    <email>one@oxygenxml.com</email>
    <link manager="Big.Boss"/>
  </person>
</personnel>
```

If you enter an `<xsl:template>` element using the *Content Completion Assistant*, the following actions are triggered:

- The `@match` attribute is inserted automatically.
- The cursor is placed between the quotes.
- The *XPath Content Completion Assistant* automatically displays a pop-up window with all the XSLT axes, XPath functions and elements and attributes from the XML input document that can be inserted in the current context.

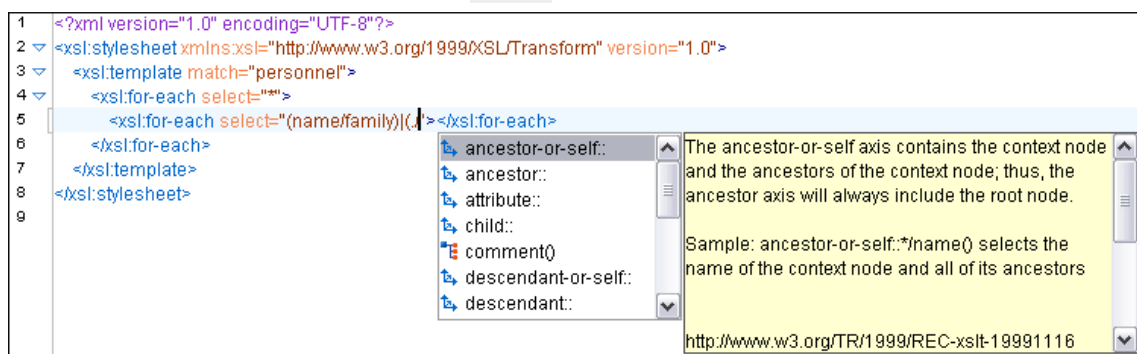

The set of XPath functions depends on the XSLT version declared in the root element `xsl:stylesheet`: 1.0, 2.0, or 3.0. Functions from other namespaces, such as `maps`, `arrays`, and `math`, are presented only if the namespaces are declared.

Figure 165. Content Completion in the `@match` Attribute

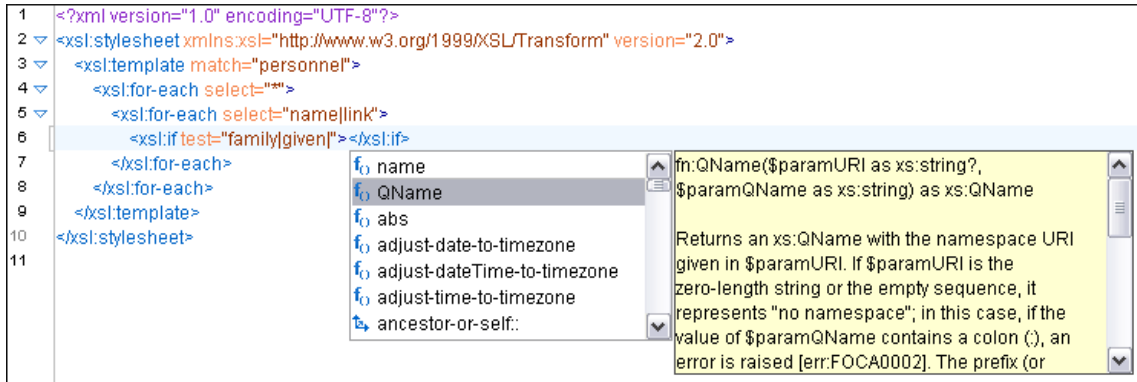

If the cursor is inside the `@select` attribute of an `<xsl:for-each>`, `<xsl:apply-templates>`, `<xsl:value-of>` or `<xsl:copy-of>` element the content completion proposals depend on the path obtained by concatenating the XPath expressions of the parent XSLT elements `<xsl:template>` and `<xsl:for-each>` as shown in the following figure:

Figure 166. Content Completion in the `@select` Attribute

Also XPath expressions typed in the `@test` attribute of an `<xsl:if>` or `<xsl:when>` element benefit of the assistance of the content completion.

Figure 167. Content Completion in the @test Attribute

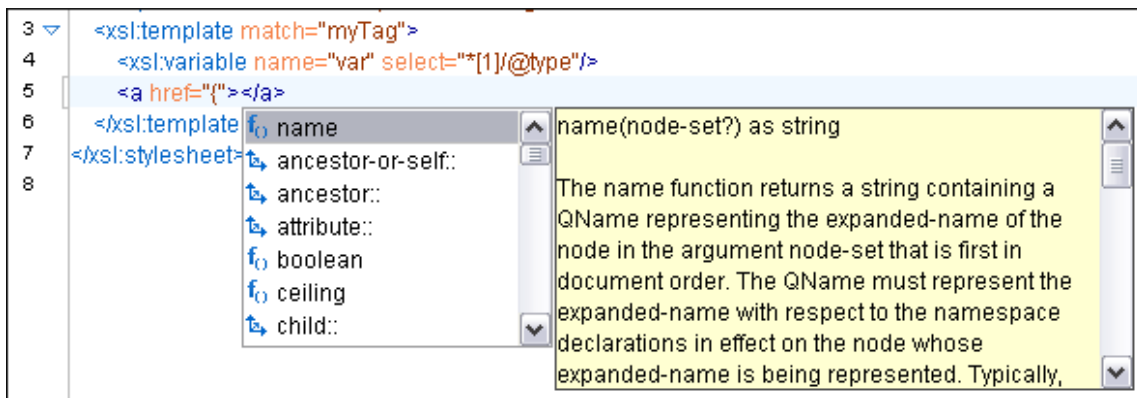

XSLT variable references are easier to insert in XPath expressions with the help of the content completion pop-up triggered by the `$` character, which signals the start of such a reference in an XPath expression.

Figure 168. Content Completion in the @test Attribute

If the `{` character is the first one in the value of the attribute, the same *Content Completion Assistant* is available also in attribute value templates of non-XSLT elements.

Figure 169. Content Completion in Attribute Value Templates

The time delay (configured in the **Content Completion** preferences page (on page 181)) is also applied for the content completion in XPath expressions.

Related Information:[Working with XPath Expressions \(on page 1732\)](#)

Tooltip Helper for the XPath Functions Arguments

When editing the arguments of an XPath/XSLT function, Oxygen XML Developer tracks the current entered argument by displaying a tooltip containing the function signature. The currently edited argument is highlighted with a bolder font.

When moving the cursor through the expression, the tooltip is updated to reflect the argument found at the cursor position.

Examples:

If you want to concatenate the absolute values of two variables, named *v1* and *v2*:

```
<xsl:template match="/">
  <xsl:value-of select="concat(abs($v1), abs($v2))"></xsl:value-of>
</xsl:template>
```

When moving the cursor before the first `abs` function, Oxygen XML Developer identifies it as the first argument of the `concat` function. The tooltip shows in bold font the following information about the first argument:

- Its name is `$arg1`.
- Its type is `xdt:anyAtomicType`.
- It is optional (note the `?` sign after the argument type).

The function also takes other arguments that have the same type and returns a `xs:string`.

Figure 170. XPath Tooltip Helper - Identify the `concat` Function's First Argument

Moving the cursor on the first variable `$v1`, the editor identifies the `abs` as context function and shows its signature:

Figure 171. XPath Tooltip Helper - Identify the `abs` Function's Argument

Further, clicking the second `abs` function name, the editor detects that it represents the second argument of the `concat` function. The tooltip is repainted to display the second argument in bold font.

Figure 172. XPath Tooltip Helper - Identify the `concat` Function's Second Argument

The screenshot shows a tooltip for the XPath function `concat`. The tooltip text is: `concat($arg1 as xdt:anyAtomicType?, $arg2 as xdt:anyAtomicType?, ...) as xs:string`. The second argument, `$arg2 as xdt:anyAtomicType?`, is highlighted in a light blue box. Below the tooltip, the following XSLT code is visible: `select="concat(abs($v1), abs($v2))"></xsl:value-of>` and `</xsl:template>`. The `abs($v2)` part of the code is also highlighted in light blue.

**Note:**

The tooltip helper is also available in the **XPath Builder** view ([on page 1735](#)) and XPath toolbar ([on page 1733](#)).

Related Information:

[Working with XPath Expressions \(on page 1732\)](#)

Syntax Highlighting in XSLT

Oxygen XML Developer supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for XSLT files, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) ([on page 114](#)).
2. Go to **Editor > Syntax Highlight** ([on page 193](#)).
3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XSL** tab in the **Preview** pane to see the effects of your changes.

**Tip:**

Oxygen XML Developer also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the **Editor > Syntax Highlight > Elements/Attributes by Prefix** preferences page ([on page 193](#)).

Related Information:

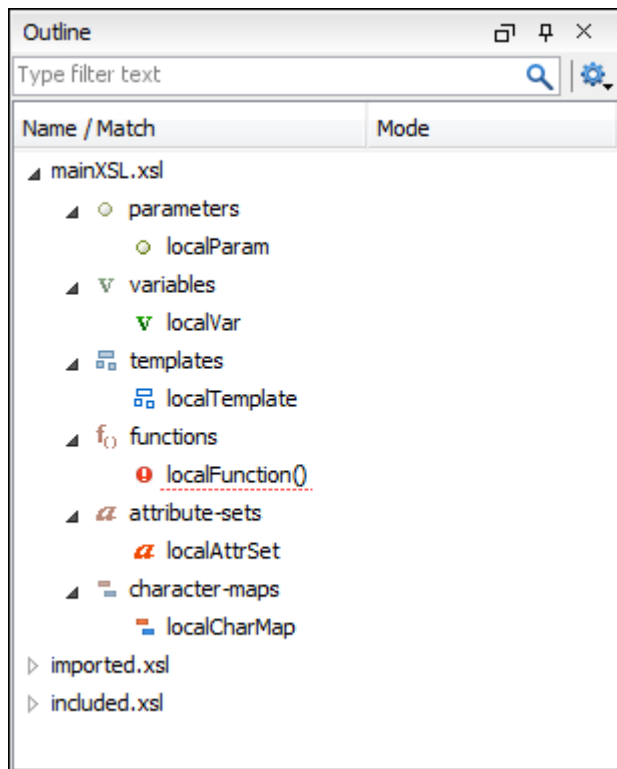

[Customize Syntax Highlight colors \(on page 193\)](#)

XSLT Outline View

The **Outline** view for XSLT stylesheets displays the list of all the components (templates, attribute-sets, character-maps, variables, functions, keys, outputs) from both the edited stylesheet and its imports or includes. For XSL and XSD resources, the **Outline** view collects its components starting from the *main files* ([on page 2270](#)). The main files can be defined in the project or in the associated validation scenario. For further details about the *Main Files* support go to [Defining Main Files at Project Level \(on page 381\)](#).

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 173. XSLT Outline View

The following actions are available in the  **Settings** menu on the **Outline** view toolbar:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches;

Selection update on cursor move

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the XSLT editor.

Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

When the  **Show components** option is selected, the following actions are available:

Show XML structure

Displays the XML document structure in a tree-like structure.

Show all components

Displays all components that were collected starting from the *main file (on page 2270)*. This option is set by default.

Show only local components

Displays the components defined in the current file only.

Group by location/type

The stylesheet components can be grouped by location and type.

When the  **Show XML structure** option is selected, the following actions are available:

Show components

Switches the **Outline** view to the components display mode.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

Show element name

Show/hide element name.

Show text

Show/hide additional text content for the displayed elements.

Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the [Outline preferences panel \(on page 272\)](#).

Configure displayed attributes

Displays the [XML Structured Outline preferences page \(on page 272\)](#).

The following contextual menu actions are also available when the  **Show components** option is selected in the  **Settings** menu:

Edit Attributes

Opens a small in-place editor that allows you to edit the attributes of the selected node.

Cut

Cuts the currently selected node.

Copy

Copies the currently selected node.

Delete

Deletes the currently selected node.

Search References Ctrl + Shift + R (Command + Shift + R on macOS)

Searches all references of the item found at current cursor position in the defined scope, if any. See [Finding XSLT References and Declarations \(on page 680\)](#) for more details.

Search References in

Searches all references of the item found at current cursor position in the specified scope. See [Finding XSLT References and Declarations \(on page 680\)](#) for more details.

Component Dependencies

Opens the **Component Dependencies** view ([on page 678](#)) that allows you to see the dependencies for the currently selected component.

Show referenced resources

Opens the **Referenced/Dependent Resources** view ([on page 675](#)) that displays the references for the currently selected resource.

Show dependent resources

Opens the **Referenced/Dependent Resources** view ([on page 675](#)) that displays the dependencies of the currently selected resource.

 **Rename Component in**

Renames the selected component. See [XSLT Refactoring Actions \(on page 684\)](#) for more details.

The following contextual menu actions are available in the **Outline** view when the  **Show XML structure** option is selected in the  **Settings** menu:

Append Child

Displays a list of elements that you can insert as children of the current element.

Insert Before

Displays a list of elements that you can insert as siblings of the current element, before the current element.

Insert After

Displays a list of elements that you can insert as siblings of the current element, after the current element.

 **Edit Attributes**

Opens a small in-place editor that allows you to edit the attributes of the selected node.

 **Toggle Comment**

Comments/uncomments the currently selected element.

 **Search references**

Searches for the references of the currently selected component.

Search references in

Searches for the references of the currently selected component in the context of a scope that you define.

Component dependencies

Opens the **Component Dependencies** view (*on page 678*) that displays the dependencies of the currently selected component.

Rename Component in

Renames the currently selected component in the context of a scope that you define.

Cut

Cuts the currently selected component.

Copy

Copies the currently selected component.

Delete

Deletes the currently selected component.

Expand More

Expands the structure of a component in the **Outline** view.

Collapse All

Collapses the structure of all the component in the **Outline** view.

The stylesheet components information is presented on two columns: the first column presents the `@name` and `@match` attributes, the second column the `@mode` attribute. If you know the component name, match or mode, you can search it in the **Outline** view by typing one of these pieces of information in the filter text field from the top of the view or directly on the tree structure. When you type the component name, match or mode in the text field, you can switch to the tree structure using:

- Keyboard arrow keys
- **Enter** key
- **Tab** key
- **Shift-Tab** key combination

To switch from tree structure to the filter text field, you can use **Tab** and **Shift-Tab**.

Tip:

The search filter is case insensitive. The following wildcards are accepted:

- * - any string
- ? - any character
- , - patterns separator

If no wildcards are specified, the string to search is used as a partial match.

The content of the **Outline** view and the editing area are synchronized. When you select a component in the **Outline** view, its definition is highlighted in the editing area.

Oxygen XML Developer allows you to sort the components of the tree in the **Outline** view.

Note:

Sorting groups in the **Outline** view is not supported.

Oxygen XML Developer has a predefined order of the groups in the **Outline** view:

- For location, the names of the files are sorted alphabetically. The file you are editing is located at the top of the list.
- For type, the order is: parameters, variables, templates, functions, set attributes, character-map.

Note:

When no grouping is available and the table is not sorted, Oxygen XML Developer sorts the components depending on their order in the document. Oxygen XML Developer also takes into account the name of the file that the components are part of.

XSLT Input View

The structure of the XML document associated to the edited XSLT stylesheet is displayed in a tree form in a view called the **XSLT Input** view. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu. The tree nodes represent the elements of the documents.

If you click a node in the **XSLT Input** view, the corresponding template from the stylesheet is highlighted.

A node can be dragged from this view and dropped in the editor area for quickly inserting `<xsl:template>`, `<xsl:for-each>`, or other XSLT elements that have the `@match`, `@select`, or `@test` attribute already completed. The value of the attribute is the correct XPath expression that refers to the dragged tree node. This value is based on the current editing context of the drop spot.

Figure 174. XSLT Input View

Example:

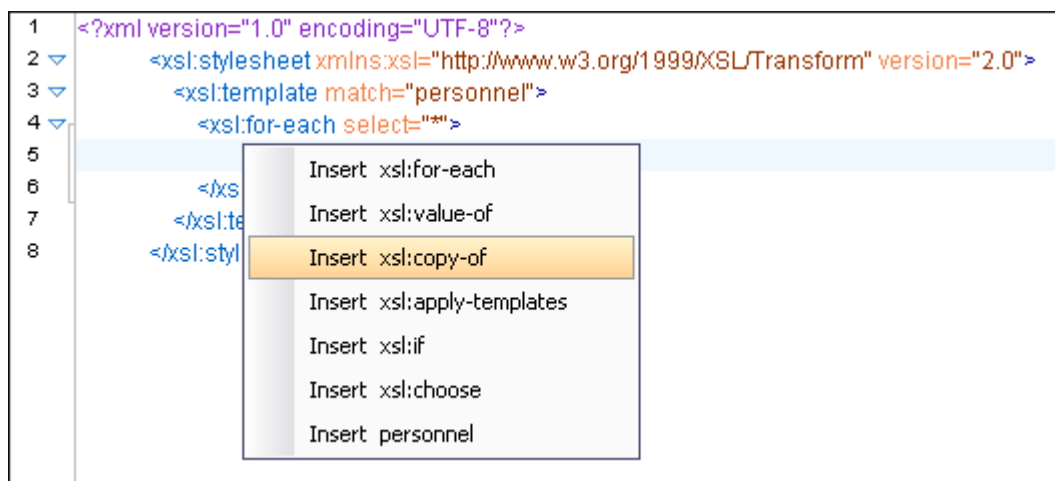

For the following XML document:

```
<personnel>
  <person id="Big.Boss">
    <name>
      <family>Boss</family>
      <given>Big</given>
    </name>
    <email>chief@oxygenxml.com</email>
    <link subordinates="one.worker" />
  </person>
  <person id="One.worker">
    <name>
      <family>Worker</family>
      <given>One</given>
    </name>
    <email>one@oxygenxml.com</email>
    <link manager="Big.Boss" />
  </person>
</personnel>
```

and the following XSLT stylesheet:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  version="2.0">
  <xsl:template match="personnel">
    <xsl:for-each select="*">
      </xsl:for-each>
    </xsl:template>
  </xsl:stylesheet>
```

if you drag the `<given>` element and drop it inside the `<xsl:for-each>` element, the following pop-up menu is displayed:

if you select **Insert xsl:copy-of** (for example), the resulting document will look like this:

```

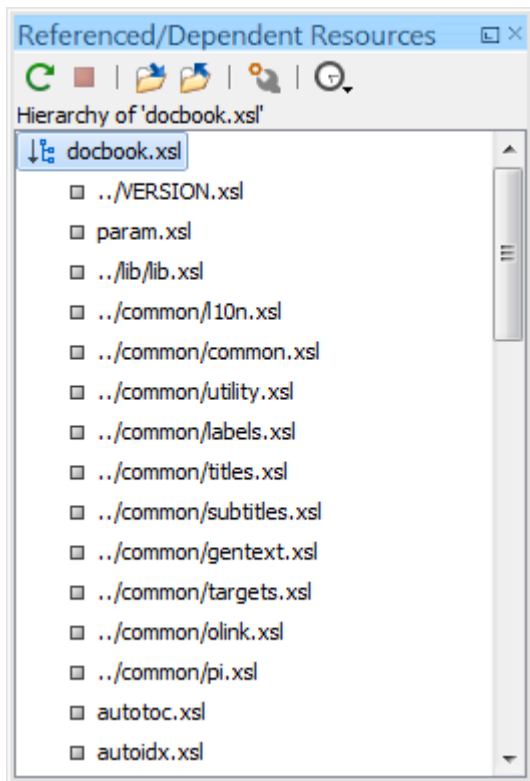

<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform" version="2.0">
  <xsl:template match="personnel">
    <xsl:for-each select="*">
      <xsl:copy-of select="name/given"/>
    </xsl:for-each>
  </xsl:template>
</xsl:stylesheet>

```

XSLT Referenced/Dependent Resources View

The **Referenced/Dependent Resources** view displays the hierarchy or dependencies for resources included in a stylesheet. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

If you want to see the references or dependencies of a stylesheet, select the desired stylesheet in the **Project view** (on page 365) and choose **Show referenced resources** or **Show dependent resources** from the contextual menu.

Figure 175. Referenced/Dependent Resources View

The following actions are available on the toolbar of the **Referenced/Dependent Resources** view:

 **Refresh**

Refreshes the resource structure.

 **Stop**

Stops the computing.

 **Show hierarchy for**

Computes the hierarchical structure of the references for a resource.

 **Show dependencies for**

Computes the structure of the dependencies for a resource.

 **Configure dependencies search scope**

Allows you to configure a scope to compute the dependencies. There is also an option for automatically using the defined scope for future operations.

 **History**

Provides access to the list of previously computed dependencies. Use the  **Clear history** button to remove all items from this list.

The contextual menu for a resource listed in the **Referenced/Dependent Resources** view contains the following actions:

Open

Opens the resource. You can also double-click a resource within the hierarchical structure to open it.

Go to reference

Opens the source document where the resource is referenced.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show references resources

Shows the references for the selected resource.

Show dependent resources

Shows the dependencies for the selected resource.

 **Add to Main Files**

Adds the currently selected resource in the **Main Files** directory.

Expand More

Expands more of the children of the selected resource from the hierarchical structure.

Collapse All

Collapses all children of the selected resource from the hierarchical structure.

**Tip:**

When a recursive reference is encountered in the view, the reference is marked with a special icon .

Related Information:

[Modular Contextual XML Editing Using 'Main Files' Support \(on page 596\)](#)

[Search and Refactor Operations Scope \(on page 598\)](#)

Moving/Renaming XSLT Resources

You can move and rename a resource presented in the **Referenced/Dependent Resources** view, using the **Rename resource** and **Move resource** refactoring actions from the contextual menu.

When you select the **Rename** action in the contextual menu of the **Referenced/Dependent Resources** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource(s)** - Select this option to update the references to the resource you are renaming. A **Preview** option is available that allows you to see what will be updated before selecting **Rename** to process the operation.

When you select the **Move** action from the contextual menu of the **Referenced/Dependent Resources** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, in accordance with the new location and name. A **Preview** option is available that allows you to see what will be updated before selecting **Move** to process the operation.

XSLT Component Dependencies View

The **Component Dependencies** view allows you to see the dependencies for a selected component. This is helpful if you want to see where components are used in the entire hierarchy. For example, if you want to find all the references where a given component is used.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

To see the dependencies of an XSLT component:

1. Right-click the desired component in the editor or **Outline** view.
2. Select the **Component Dependencies** action from the contextual menu.

The action is available for all named components (templates, variables, parameters, attribute sets, keys, functions, outputs).

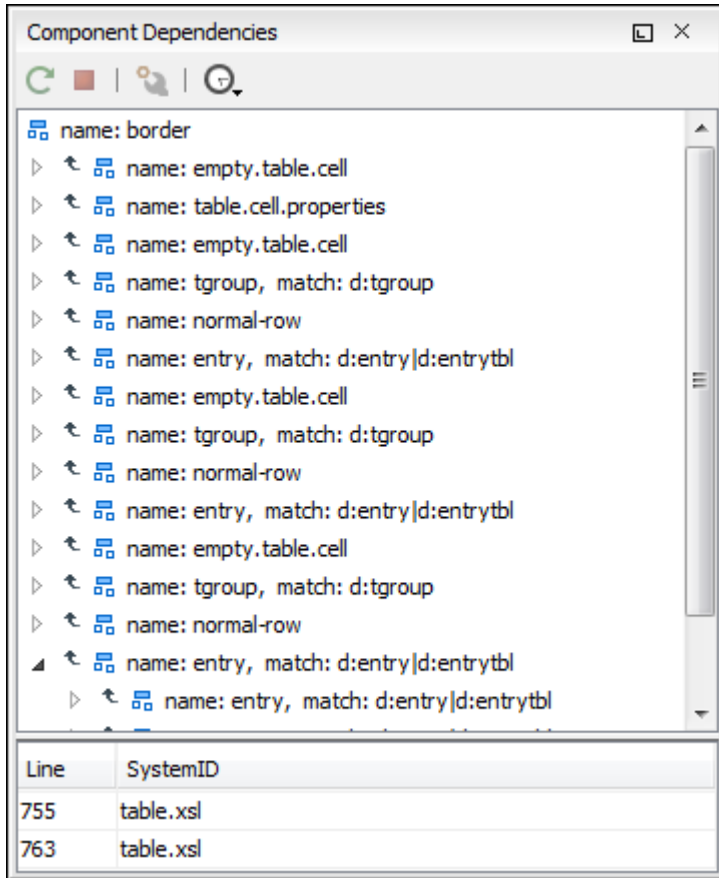

If a component contains multiple references, a small table is displayed at the bottom of the view that contains all the references. When a recursive reference is encountered, it is marked with a special icon .

Figure 176. Component Dependencies View

The **Component Dependencies** view includes the following toolbar actions:

 **Refresh**

Refreshes the dependencies structure.

 **Stop**

Stops the dependency computation.

 **Configure**

Allows you to choose the search scope for computing the dependencies structure. This is helpful for making sure all imported/included resources are computed.

 **History**

Allows you to select from a list of the most recently used dependency computations.

In addition, the following actions are available in the contextual menu:

Go to First Reference

Selects the first reference of the currently selected component in the dependencies tree.

Go to Component

Shows the definition of the currently selected component in the dependencies tree.

Related Information:[Search and Refactor Operations Scope \(on page 598\)](#)

Highlight Component Occurrences

When a component (for example variable or named template) is found at current cursor position, Oxygen XML Developer performs a search over the entire document to find the component declaration and all its references. When found, they are highlighted both in the document and in the stripe bar, at the right side of the document.

**Note:**

Oxygen XML Developer also supports occurrences highlight for template modes.

Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected and a new search is performed. All occurrences are removed when you start to edit the document.

This feature is enabled by default. To configure it, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **Editor > Mark Occurrences**. A search can also be triggered with the **Search > Search Occurrences in File (Ctrl + Shift + U (Command + Shift + U on macOS))** contextual menu action. Matches are displayed in separate tabs of the [Results view \(on page 503\)](#).

Finding XSLT References and Declarations

The following search actions related with XSLT references and declarations are available from the **Search** submenu of the contextual menu and from the **Document > References** menu:

**Search References**

Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined but the currently edited resource is not part of the range of determined resources, a warning dialog box is displayed that allows you to define another search scope.

Search References in

Searches all references of the item found at current cursor position in the file or files that you specify when a scope is defined.

**Search Declarations**

Searches all declarations of the item found at current cursor position in the defined scope, if any. If a scope is defined but the currently edited resource is not part of the range of resources determined by this scope, a warning dialog box is displayed that allows you to define another search scope.

Search Declarations in

Searches all declarations of the item found at current cursor position in the file or files that you specify when a scope is defined.

Search Occurrences in File

Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the contextual menu and the **Document > Schema** menu:

Go to Definition

Moves the cursor to the location of the definition of the current item.

Note:

You can also use the **Ctrl + Single-Click (Command + Single-Click on macOS)** shortcut on a reference to display its definition.

Related Information:

[Search and Refactor Operations Scope \(on page 598\)](#)

XSLT Stylesheet Component Documentation Support

Oxygen XML Developer offers built-in support for documenting XSLT stylesheets. If the expanded *QName* (on page 2272) of the element has a non-null namespace URI, the `<xsl:stylesheet>` element may contain any element not from the XSLT namespace. Such elements are referenced as user-defined data elements. Such elements can contain the documentation for the stylesheet and its elements (top-level elements whose names are in the XSLT namespace). Oxygen XML Developer offers its own XML schema that defines such documentation elements. The schema is named `stylesheet_documentation.xsd` and can be found in `[OXYGEN_INSTALL_DIR]/frameworks/stylesheet_documentation`. The user can also specify a custom schema in [XSL Content Completion options \(on page 181\)](#).

Content Completion

When content completion is invoked inside an XSLT editor by pressing **Ctrl + Space**, it offers elements from the XSLT documentation schema (either the built-in one or one specified by user).

Adding Documentation Blocks

In **Text** mode, to add documentation blocks, press **Ctrl + Alt + D (Command + Option + D on macOS)** or select **Add component documentation** from the contextual menu.

If the cursor is positioned inside the `<xsl:stylesheet>` element context, documentation blocks are generated for all XSLT elements. If the cursor is positioned inside a specific XSLT element (such as a template or function), a documentation block is generated for that element only.

Example: Documentation Block Using Oxygen XML Developer Built-in Schema

```

<xd:doc>

  <xd:desc>

    <xd:p>Search inside parameter <xd:i>string</xd:i>

      for the last occurrence of parameter

    <xd:i>searched</xd:i>. The substring starting from the 0 position

      to the identified last occurrence will be returned.

    <xd:ref name="f:substring-after-last" type="function"

      xmlns:f="http://www.oxygenxml.com/doc/xsl/functions">See also

    </xd:ref>

  </xd:p>

</xd:desc>

<xd:param name="string">

  <xd:p>String to be analyzed</xd:p>

</xd:param>

<xd:param name="searched">

  <xd:p>Marker string. Its last occurrence will be identified</xd:p>

</xd:param>

<xd:return>

  <xd:p>A substring starting from the beginning of <xd:i>string</xd:i>

    to the last occurrence of <xd:i>searched</xd:i>.

    If no occurrence is found an empty string will be returned.

  </xd:p>

</xd:return>

</xd:doc>

```

XSLT Documentation Links

Oxygen XML Developer includes support for links inside XSLT documentation blocks. Using a construct like `<xd:a docid="user-defined-id">TEXT</xd:a>` will cause the browser to scroll to the particular anchor (the defined ID) in the current document. Using a construct like `<xd:a href="http://www.my-web-site">TEXT</xd:a>` or `<xd:a href="local-file-path/filename">TEXT</xd:a>` will open the referenced link in a new tab.

Example: Documentation Links

```

<xd:doc xmlns:xd="http://www.oxygenxml.com/ns/doc/xsl" id="thisDoc">

  <xd:desc>

    <xd:p>

      <xd:ref name="test" type="variable">My test variable</xd:ref>

      <xd:a docid="thisDoc">Link to this documentation, see

the the id="thisDoc" above</xd:a>

      <xd:a docid="otherDocID" href="included.xsl">Link to

otherDocID defined in included.xsl</xd:a>

    </xd:p>

```

```
</xd:desc>
</xd:doc>
```

Related Information:

[Generating Documentation for an XSLT Stylesheet \(on page 694\)](#)

XSLT 3.0 Text Value Templates

Oxygen XML Developer offers built-in support for *XSLT 3.0 Text Value Templates*, including content completion to present the variables, functions, and parameters from the current context and syntax highlighting.

A text node in the stylesheet is treated as a *text value template* if the following things are true:

- It is part of a [sequence constructor](#) or a child of an `<xsl:text>` instruction.
- There is an ancestor element with an `@[xsl:]expand-text` attribute and on the innermost ancestor element that has such an attribute, the value of the attribute is `yes`.

Example:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
xmlns:xs="http://www.w3.org/2001/XMLSchema"
expand-text="yes"
version="3.0">

  <xsl:param name="seq" as="xs:string*" select="'c', 'a', 'b', 'z'"/>

  <xsl:template name="main">

    {sort($seq)}

  </xsl:template>

</xsl:stylesheet>
```

For more information, see: [W3C XSLT Specifications: Text Value Templates](#).

Related Information:

[Content Completion in XPath Expressions \(on page 663\)](#)

XSLT 3.0 Packages (xsl:package Element)

Oxygen XML Developer offers built-in support for *XSLT 3.0 Packages* (`<xsl:package>` element). This element defines a set of stylesheet modules that can be compiled as a unit, independently of other packages.

Oxygen XML Developer includes a new document template called **XSLT Package** to help you easily create an XSLT 3.0 file with the `<xsl:package>` element set as the document's root element. It is available when creating [new documents from templates \(on page 330\)](#) and can be found in the **New Document** folder or by typing `xslt package` in the search field.

Also, when editing XSLT 3.0 documents, the `<xsl:package>` element is offered as one of the proposals for the document's root element in the content completion window.

XSLT Refactoring Actions

Oxygen XML Developer offers a set of actions that allow you to change the structure of an XSLT stylesheet without changing the results of running it in an XSLT transformation. Depending on the selected text, the following XSLT refactoring actions are available from the **Refactoring** submenu of the contextual menu (or from the **Document > Refactoring** menu):

Extract template (Active only when the selection contains well-formed elements)

Extracts the selected XSLT instructions sequence into a new template. It opens a dialog box that allows you to specify the name of the new template to be created. The possible changes to perform on the document can be previewed before altering the document. After pressing OK, the template is created and the selection is replaced with the `<xsl:call-template>` instruction referencing the newly created template.

Note:

The newly created template is indented and its name is highlighted in the `<xsl:call-template>` element.

Extract function

Extracts the selected XSLT instructions sequence into a new function. It opens a dialog box that allows you to specify the name of the new function. It then moves the selected lines to a newly created XSLT function and inserts a function call in the place of the selected lines. XPath expressions are rebuilt based on the current context and the context is passed as parameters in the new functions. You can also use parts of an XPath expression to create the new functions.

Create local variable

Creates an XSLT variable, wrapped around the selection. It opens a dialog box that allows you to specify the name of the new variable. It then wraps the selection in the variable and you can reference it at anytime in the code.

Move to another stylesheet (Active only when entire components are selected)

Allows you to move one or more XSLT global components (templates, functions, or parameters) to another stylesheet. It opens a dialog box that allows you to specify where the selected components will be moved to. Follow these steps when using the dialog box:

1. Choose whether you want to move the selected components to a new stylesheet or an existing one.
2. If you choose to move the components to an existing one, select the destination stylesheet. Click the **Choose** button to select the destination stylesheet file. Oxygen XML Developer will automatically check if the destination stylesheet is already contained

by the hierarchy of the current stylesheet. If it is not contained, choose whether or not the destination stylesheet will be referenced (imported or included) from the current stylesheet. The following options are available:

- **Include** - The current stylesheet will use an `<xsl:include>` instruction to reference the destination stylesheet.
 - **Import** - The current stylesheet will use an `<xsl:import>` instruction to reference the destination stylesheet.
 - **None** - There will be created no relation between the current and destination stylesheets.
3. Click the **Move** button to move the components to the destination. The moved components are highlighted in the destination stylesheet.

Convert attributes to xsl:attributes

Converts the attributes from the selected element and represents each of them with an `<xsl:attribute>` instruction. For example, the following element:

```
<person id="Big{test}Boss"/>
```

is converted to:

```
<person>
  <xsl:attribute name="id">
    <xsl:text>Big</xsl:text>
    <xsl:value-of select="test"/>
    <xsl:text>Boss</xsl:text>
  </xsl:attribute>
</person>
```

Convert xsl:attributes to attributes

Converts `<xsl:attribute>` elements to inline attributes for elements outside the XSL namespace. For example, the following element: It is the reverse of the **Convert attributes to xsl:attributes** action with the following limitations:

- The `<xsl:attribute>` element is "text only".
- The `<xsl:attribute>` element has a single `<xsl:text>` child element.
- The `<xsl:attribute>` element has a single `<xsl:value-of>` child element. In this case, the value of the attribute will be the XPath expression from the `@select` attribute surrounded by curly brackets (*text value template*).

```
<person>
  <xsl:attribute name="id">john.doe</xsl:attribute>
  <xsl:attribute name="email"><xsl:text>john.doe@example.com</xsl:text>
</xsl:attribute>
  <xsl:attribute name="manager"><xsl:value-of select="person[@id='boss']/name"/>
</person>
```

```
</xsl:attribute>

</person>
```

is converted to:

```
<person id="john.doe" email="john.doe@example.com" manager="{person[@id='boss']/name}"/>
```

Convert xsl:if into xsl:choose/xsl:when

Converts one or more `<xsl:if>` element blocks into one or more `<xsl:when>` blocks surrounded by an `<xsl:choose>` element. If it is invoked on a selection, the selection must contain a well-formed fragment. If there is no selection, the `<xsl:if>` element that surrounds the content at the current cursor position is converted.

For example, the following block:

```
<xsl:if test="a">
  <!-- XSLT code -->
</xsl:if>
```

is converted to:

```
<xsl:choose>
  <xsl:when test="a">
    <!-- XSLT code -->
  </xsl:when>
  <xsl:otherwise>
    |
  </xsl:otherwise>
</xsl:choose>
```

where the `|` character is the current cursor position.

Convert xsl:choose/xsl:when into xsl:if

Converts each `<xsl:when>` block into an `<xsl:if>` block. For the `<xsl:otherwise>` branch, it also adds an *and* statement to each negated form of the conditions. For example, the following block:

```
<xsl:choose>
  <xsl:when test="c1">
    <!-- XSLT statement 1 -->
  </xsl:when>
  <xsl:when test="c2">
    <!-- XSLT statement 2 -->
  </xsl:when>
  <xsl:when test="c3">
    <!-- XSLT statement 3 -->
  </xsl:when>
  <xsl:otherwise>
```

```

        <!-- XSLT "otherwise" statement-->
    </xsl:otherwise>
</xsl:choose>

```

is converted to:

```

<xsl:if test="c1">
    <!-- XSLT statement 1 -->
</xsl:if>
<xsl:if test="c2">
    <!-- XSLT statement 2 -->
</xsl:if>
<xsl:if test="c3">
    <!-- XSLT statement 3 -->
</xsl:if>
<xsl:if test="not(c1) and not(c2) and not(c3)">
    <!-- XSLT "otherwise" statement-->
</xsl:if>

```

▼ Extract local variable (Active on a selection made inside an attribute that contains an XPath expression)

Allows you to create a new local variable by extracting the selected XPath expression. After creating the new local variable before the current element, Oxygen XML Developer allows you to edit the name of the variable.

▼ Extract global variable (Active on a selection made inside an attribute that contains an XPath expression)

Allows you to create a new global variable by extracting the selected XPath expression. After creating the new global variable, Oxygen XML Developer allows you to edit the name of the variable.

Note:

Oxygen XML Developer checks if the selected expression depends on local variables or parameters that are not available in the global context where the new variable is created.

○ Extract template parameter (Active on a selection made inside an attribute that contains an XPath expression)

Allows you to create a new template parameter by extracting the selected XPath expression. After creating the new parameter, Oxygen XML Developer allows you to edit the name of the parameter.

● Extract global parameter (Active on a selection made inside an attribute that contains an XPath expression)

Allows you to create a new global parameter by extracting the selected XPath expression. After creating the new parameter, Oxygen XML Developer allows you to edit the name of the parameter.

Note:

Oxygen XML Developer checks if the selected expression depends on local variables or parameters that are not available in the global context where the new parameter is created.

Rename Component

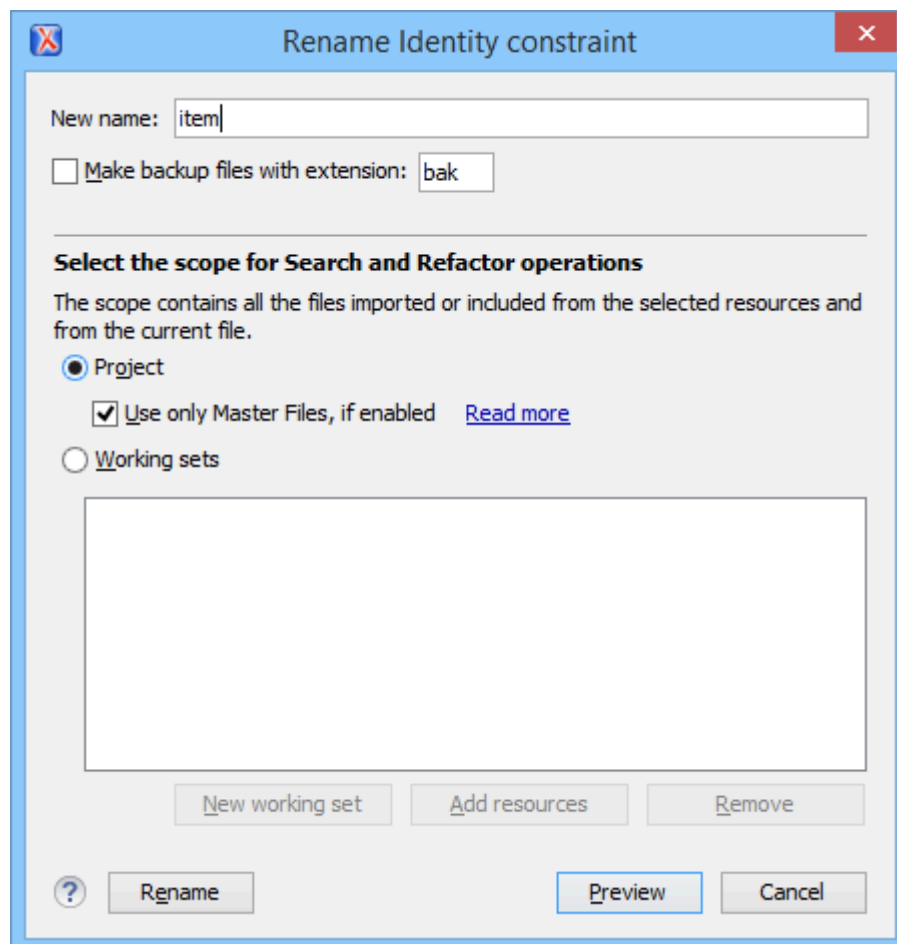

Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.

Rename Component in

Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

Figure 177. Rename Identity Constraint Dialog Box

**Note:**

Many of these refactoring actions are also proposed by the *Quick Assist* support (on page 689).

Resources

For more information about XSLT refactoring, watch our video demonstration:

<https://www.youtube.com/embed/4ir5XWyp8Zo>

XSLT Quick Assist Support

The *Quick Assist* support (on page 2272) helps you to rapidly access search and refactoring actions. If one or more actions are available in the current context, they are accessible via a yellow bulb help (💡) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the *Quick Assist* menu by using the **Alt + 1 (Meta + Option + 1** on macOS) keyboard shortcuts.

Two categories of actions are available in the *Quick Assist* menu:

- Actions available on a selection made inside an attribute that contains an XPath expression:

**Extract template**

Extracts the selected XSLT instructions sequence into a new template.

**Move to another stylesheet**

Allows you to move one or more XSLT global components (templates, functions, or parameters) to another stylesheet.

**Extract local variable**

Allows you to create a new local variable by extracting the selected XPath expression.

**Extract global variable**

Allows you to create a new global variable by extracting the selected XPath expression.

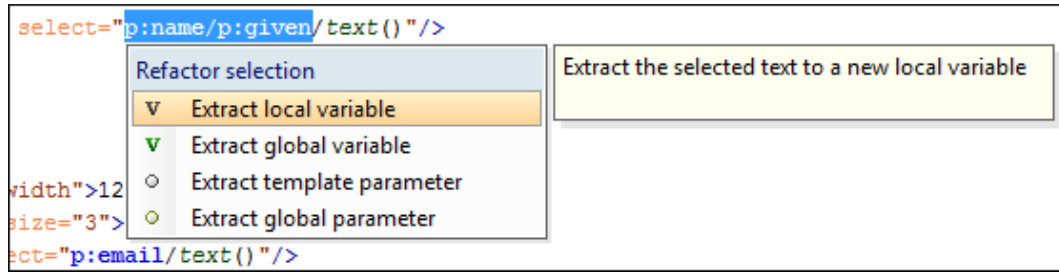

**Extract template parameter**

Allows you to create a new template parameter by extracting the selected XPath expression.

**Extract global parameter**

Allows you to create a new global parameter by extracting the selected XPath expression.

Figure 178. XSLT Quick Assist Support - Refactoring Actions

- Actions available when the cursor is positioned over the name of a component:

 **Rename Component in**

Renames the component and all its dependencies.

 **Search Declarations**

Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

 **Search References**

Searches all references of the component in a predefined scope.

 **Component Dependencies**

Searches the component dependencies in a predefined scope.

 **Change Scope**

Configures the scope that will be used for future search or refactor operations.

 **Rename Component**

Allows you to rename the current component in-place.

 **Search Occurrences**

Searches all occurrences of the component within the current file.

Figure 179. XSLT Quick Assist Support - Component Actions

[Search and Refactor Operations Scope \(on page 598\)](#)

XSLT Unit Test (XSpec)

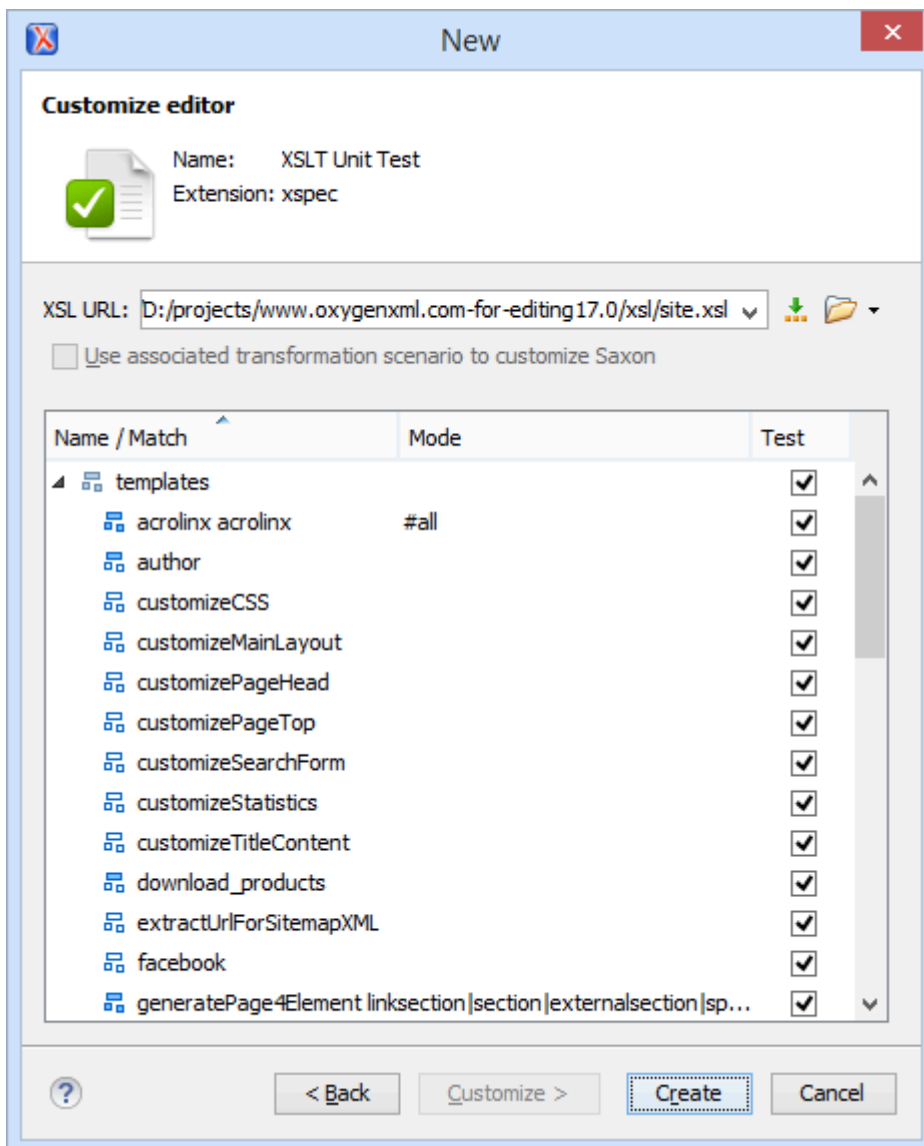

XSpec is a behavior driven development (BDD) *framework* for XSLT, XQuery, and Schematron. XSpec consists of syntax for describing the behavior of your XSLT, XQuery, or Schematron code, and some code that enables you to test your code against those descriptions.

Creating an XSLT Unit Test

To create an XSLT Unit Test, go to **File > New > XSLT Unit Test**. You can also create an XSLT Unit Test from the contextual menu of an XSL file in the **Project view (on page 365)**. Oxygen XML Developer allows you to customize the XSpec document when you create it. In the customization dialog box, you can enter the path to an XSL document or to a main XSL document.

When you create an XSpec document based on an XSL document, Oxygen XML Developer uses information from the validation and transformation scenarios associated with the XSL file. From the transformation scenario Oxygen XML Developer uses extensions and properties of Saxon 12.5, improving the Ant scenario associated with the XSpec document.

Figure 180. New XSLT Unit Test Wizard

Running an XSLT Unit Test

To run a Unit Test, open the XSpec file in an editor and click  **Apply Transformation Scenario(s)** on the main toolbar. This will run the built-in **Run XSpec Test** transformation scenario that is defined in the XSpec *framework (on page 2269)*.

Testing a Stylesheet

An XSpec file contains one or more test scenarios. You can test a stylesheet in one of the following ways:

- **Test an entire stylesheet** - Testing is performed in a certain context. You can define a context as follows:
 - Inline context, building the test based on a string.

```
<x:scenario label="when processing a para element">
  <x:context>
```

```

    <para>...</para>

  </x:context>

  ...

</x:scenario>

```

- Based on an external file, or on a part of an external file extracted with an XPath expression.

```

<x:scenario label="when processing a para element">

  <x:context href="source/test.xml" select="/doc/body/p[1]" />

  ...

</x:scenario>

```

• Test a function:

```

<x:scenario label="when capitalising a string">

  <x:call function="eg:capital-case">

    <x:param select="'an example string'" />

    <x:param select="true()" />

  </x:call>

  ...

</x:scenario>

```

• Test a template with a name:

```

<x:scenario label="when creating a table">

  <x:call template="createTable">

    <x:param name="nodes">

      <value>A</value>

      <value>B</value>

    </x:param>

    <x:param name="cols" select="2" />

  </x:call>

</x:scenario>

```

You can reference test files between each other, which allows you to define a suite of tests. For further details about test scenarios, go to <https://github.com/xspec/xspec/wiki/Writing-Scenarios>.

Adding a Catalog to an XSpec Transformation

If your XSLT needs a catalog, you can add one to the XSpec transformation by doing one of the following:

- If you are using a [project \(on page 361\)](#) in Oxygen XML Developer, create a `catalog.xml` file in the project directory. This catalog will then be loaded automatically.
- [Edit \(on page 1237\)](#) the **Run XSpec Test** transformation scenario, go to the **Parameters** tab [\(on page 1172\)](#), and set the value of the `catalog` parameter to the location of your catalog file.

Generating Documentation for an XSLT Stylesheet

You can use Oxygen XML Developer to generate detailed documentation in HTML format for the elements (top-level elements whose names are in the XSLT namespace) of an XSLT stylesheet. You can select what XSLT elements to include in the generated documentation and also the level of details to present for each of them. The elements are hyperlinked. To generate documentation in a [custom output format \(on page 700\)](#), you can edit the XSLT stylesheet used to generate the documentation, or create your own stylesheet.

To open the **XSLT Stylesheet Documentation** dialog box, select **XSLT Stylesheet Documentation** from the **Tools > Generate Documentation** menu or from the **Generate Documentation** submenu in the contextual menu of the **Project view (on page 365)**. You can also open the tool by using the  **Generate Documentation** toolbar button.

Figure 181. XSLT Stylesheet Documentation Dialog Box

The **XSL URL** field of the dialog box must contain the full path to the XSL Stylesheet file you want to generate documentation for. The stylesheet may be a local or a remote file. You can specify the path to the stylesheet by entering it in the text field, or by using the  **Insert Editor Variables** button or the options in the  **Browse** drop-down menu.

Output Tab

The following options are available in the **Output** tab:

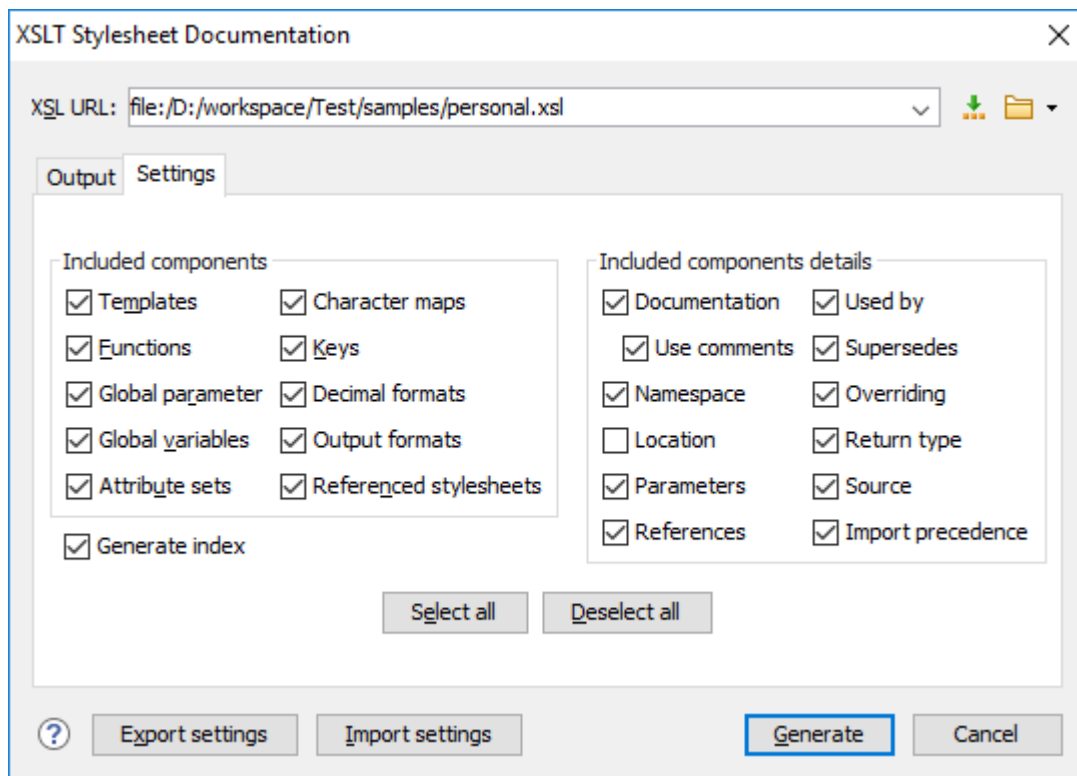

- **Format** - Allows you to choose between the following formats:
 - **HTML** - The documentation is generated in [HTML output format \(on page 697\)](#).
 - **Custom** - The documentation is generated in a [custom output format \(on page 700\)](#), allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box [\(on page 701\)](#) where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.
- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the  **Insert Editor Variables** button or the options in the  **Browse** drop-down menu.
- **Split output into multiple files** - Instructs the application to split the output into multiple files. For large XSLT stylesheets, choosing another split criterion may generate smaller output files, providing faster documentation browsing. You can choose to split them by namespace, location, or component name.
- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

**Note:**

To set the browser or system application that will be used, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#), go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

Settings Tab

When you generate documentation for an XSLT stylesheet you can choose what XSLT elements to include in the output (templates, functions, global parameters, global variables, attribute sets, character maps, keys, decimal formats, output formats, XSLT elements from referenced stylesheets) and the details to include in the documentation.

Figure 182. Settings Tab of the XSLT Stylesheet Documentation Dialog Box

The **Settings** tab allows you to choose whether or not to include the following components: **Templates**, **Functions**, **Global parameters**, **Global variables**, **Attribute sets**, **Character maps**, **Keys**, **Decimal formats**, **Output formats**, **Referenced stylesheets**.

You can choose whether or not to include the following other details:

- **Documentation** - Shows the documentation for each XSLT element. For HTML format, the user-defined data elements that are recognized and transformed in documentation blocks of the XSLT elements they precede, are the ones from the following schemas:
 - Oxygen XML Developer built-in XSLT documentation schema.
 - A subset of DocBook 5 elements. The recognized elements are: *section*, *sect1* to *sect5*, *emphasis*, *title*, *ulink*, *programlisting*, *para*, *orderedlist*, *itemizedlist*.
 - A subset of DITA elements. The recognized elements are: *concept*, *topic*, *task*, *codeblock*, *p*, *b*, *i*, *ul*, *ol*, *pre*, *sl*, *sli*, *step*, *steps*, *li*, *title*, *xref*.
 - Full XHTML 1.0 support.
 - XSLStyle documentation environment. XSLStyle uses DocBook or DITA languages inside its own user-defined data elements. The supported DocBook and DITA elements are the ones mentioned above.

- DOXSL documentation *framework* ([on page 2269](#)). Supported elements are: *codefrag*, *description*, *para*, *docContent*, *documentation*, *parameter*, *function*, *docSchema*, *link*, *list*, *listitem*, *module*, *parameter*, *template*, *attribute-set*.

Other XSLT documentation blocks that are not recognized will just be serialized inside an HTML *pre* element. You can change this behavior by using a [custom format](#) ([on page 700](#)) instead of the built-in [HTML format](#) ([on page 697](#)) and providing your own XSLT stylesheets.

- **Use comments** - Controls whether or not the comments that precede an XSLT element is treated as documentation for the element they precede. Comments that precede or succeed the *xsl:stylesheet* element, are treated as documentation for the whole stylesheet. Note that comments that precede an import or include directive are not collected as documentation for the imported/included module. Also, comments from within the body of the XSLT elements are not collected at all.
- **Namespace** - Shows the namespace for named XSLT elements.
- **Location** - Shows the stylesheet location for each XSLT element.
- **Parameters** - Shows parameters of templates and functions.
- **References** - Shows the named XSLT elements that are referenced from within an element.
- **Used by** - Shows the list of all the XSLT elements that reference the current named element.
- **Supersedes** - Shows the list of all the XSLT elements that are superseded the current element.
- **Overriding** - Shows the list of all the XSLT elements that override the current element.
- **Return type** - Shows the return type of the function.
- **Source** - Shows the text stylesheet source for each XSLT element.
- **Import precedence** - Shows the computed import precedence as declared in the XSL transformation specifications.
- **Generate index** - Creates an index with all the XSLT elements included in the documentation.

Export settings - Save the current settings in a settings file for further use (for example, if you need the exported settings file for [generating the documentation from the command-line interface](#)).

Import settings - Reloads the settings from the exported file.

Generate - Use this button to generate the XSLT documentation.

Tip:

This function can be executed from an automated command-line script, for more details, see [Scripting Oxygen](#) ([on page 2233](#)).

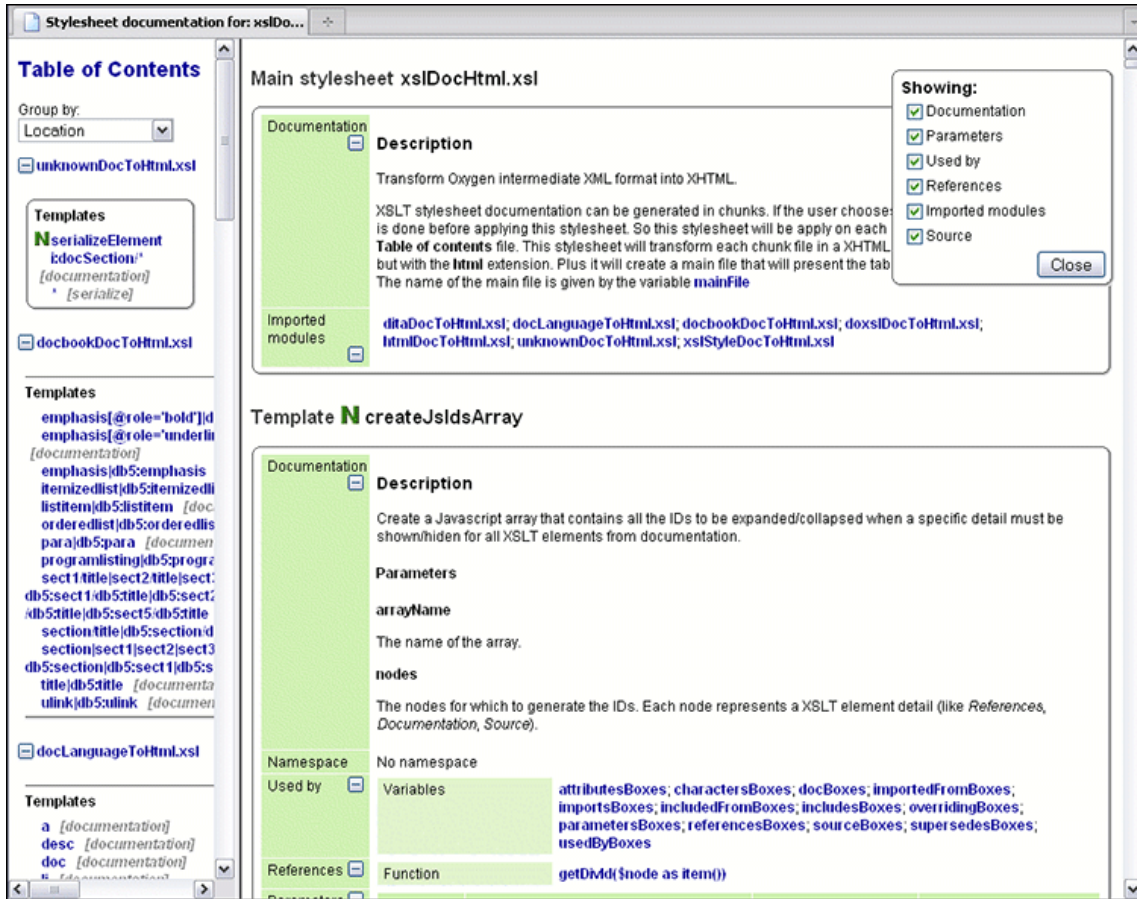

Related Information:

[XSLT Stylesheet Component Documentation Support](#) ([on page 681](#))

Generate XSLT Documentation in HTML Format

When using the [XSLT Stylesheet Documentation dialog box](#) ([on page 694](#)) to generate XSLT documentation in HTML format, it is presented in a visual diagram style with various sections, hyperlinks, and options.

Figure 183. XSLT Stylesheet Documentation Example

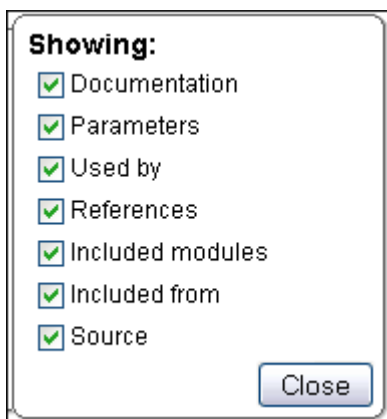

The generated documentation includes the following:

- Table of Contents - You can group the contents by namespace, location, or component type. The XSLT elements from each group are sorted alphabetically (named templates are presented first and the `<match>` elements second).
- Information about main, imported, and included stylesheets. This information consists of:
 - XSLT modules included or imported by the current stylesheet.
 - The XSLT stylesheets where the current stylesheet is imported or included.
 - The stylesheet location.

Figure 184. Information About an XSLT Stylesheet

If you choose to split the output into multiple files, the table of contents is displayed in the left frame. The contents are grouped using the same criteria as the split.

After the documentation is generated, you can collapse or expand details for some stylesheet XSLT elements by using the **Showing** options or the **Collapse** or **Expand** buttons.

Figure 185. Showing Options

For each element included in the documentation, the section presents the element type followed by the element name (value of the `@name` or `@match` attribute for match templates).

Figure 186. Documentation for an XSLT Element

Function func:substring-before-last

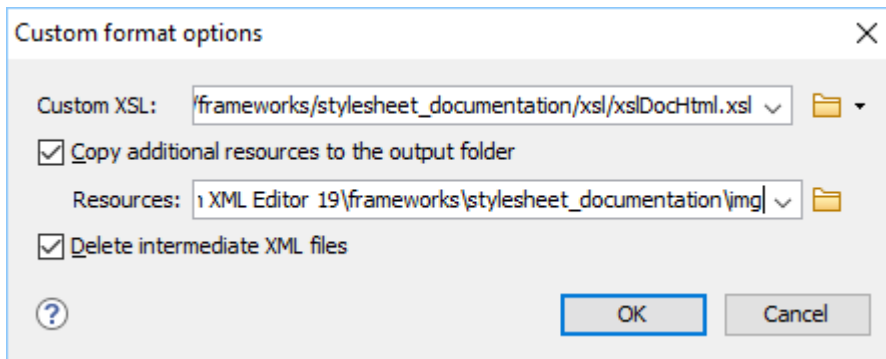

Documentation	<p>Description</p> <p>Get the substring before the last occurrence of the given substring</p> <p>Parameters</p> <p>string The string in which to search</p> <p>searched The string to search</p> <p>Return</p> <p>The substring starting from the start of the string to the index of the last occurrence of searched</p>

Generate XSLT Documentation in a Custom Format

XSLT stylesheet documentation can be also generated in a custom format. You must write your custom stylesheet based on the schema `xslDocSchema.xsd` from `[OXYGEN_INSTALL_DIR]/frameworks/stylesheet_documentation`. You can create a custom format starting from one of the stylesheets used in the built-in HTML, PDF, and DocBook formats. These stylesheets are available in `[OXYGEN_INSTALL_DIR]/frameworks/stylesheet_documentation/xsl`.

To generate XSLT documentation in a custom format:

1. Select **Tools > Generate Documentation > XSLT Stylesheet Documentation** to open the [XSLT Stylesheet Documentation dialog box \(on page 694\)](#).
2. Select **Custom** for the **Format** and click the **Options** button.
3. In this next dialog box, specify your own stylesheet to transform the intermediary XML generated in the documentation process.
4. You can also choose to copy additional resources into the output folder or choose whether or not to keep the intermediate XML files created during the documentation process.
5. Click **OK** to close this dialog box and then click **Generate**.

Figure 187. Custom Format Options Dialog Box

Compiling an XSL Stylesheet for Saxon

As of Saxon 12.5, it is possible to export a compiled form of a stylesheet as a JSON or XML file (called a *stylesheet export file* or SEF). Oxygen XML Developer includes a simple tool called **Compile XSL Stylesheet for Saxon** (found in the **Tools** menu) that does this for you.

Use-Cases for a Stylesheet Export File (SEF)

- **Use Saxon-JS to run transformations in a browser** - A *stylesheet export file* (SEF) is needed if you want to use the [Saxon-JS product](#) to run transformations in a browser, as in the following example:

```
<script type="text/javascript" src="SaxonJS/SaxonJS.min.js"></script>
<script>
  window.onload = function() {
    SaxonJS.transform({
      stylesheetLocation: "books.sef",
      sourceLocation: "books.xml"
    });
  }
</script>
```

- **Use SEF to run transformations in Oxygen XML Developer** - You can also use a *stylesheet export file* (SEF) in Oxygen XML Developer to apply an XSLT transformation over an XML file. This requires **Saxon-EE** or **Saxon-PE** versions of the Saxon product and you must select one of those two versions for the **Target** when you configure the SEF file ([on page 702](#)). When configuring the XSLT transformation, you will specify the SEF file in the **XSL URL** field ([on page 1131](#)).

Compiling an SEF File

The **Compile XSL Stylesheet for Saxon** tool can be found in the **Tools** menu and it compiles a specified stylesheet as a JSON or an XML file (*stylesheet export file*).

If you choose **Saxon-JS** as the **Target** (the type of Saxon product that the export file will be used with), then the compiled stylesheet will be a JSON file with a file extension of `.sef` by default.

If you choose **Saxon-EE**, **Saxon-PE**, or **Saxon-HE** for the **Target**, then the compiled stylesheet will be an XML file with a file extension of **.xsef** by default.

Selecting this tool opens the **Compile XSL Stylesheet for Saxon** dialog box that allows you to configure some options for conversion.

Figure 188. Compile XSLT Stylesheet for Saxon Dialog Box

This dialog box includes the following options:

XSL URL

Allows you to select URL of the source XSL stylesheet. You can specify the URL by using the text field, the history drop-down, or the browsing actions in the **Browse** drop-down list.

Output file

You can specify the path where the output file will be saved by entering it in the text field, using the **Insert Editor Variables** button, or using the browsing actions in the **Browse** drop-down list.

Open in Editor

Select this option to open the resulting *stylesheet export file* in the main Oxygen XML Developer editing pane.

Target

Allows you to select the type of Saxon product that the export file will be used with. You can choose **Saxon-JS**, **Saxon-EE**, **Saxon-PE**, or **Saxon-HE**.

Relocatable

Can be used to control the Saxon `-relocate` parameter. You can select this option to produce a *relocatable* export package (SEF) that can be deployed to a different location, with a different base URI.

Set the default namespace for unprefix element names ("-ns")

Can be used to control the `-ns:(uri|##any|##html5)` Saxon parameter that defines the handling of unprefix element names that appear as name tests in path expressions and match patterns in the stylesheet:

- The **##any** value declares that unprefix names are treated as a test on the local name of the element only. They will match regardless of namespace.
- The **##html5** value declares that an unprefix element name will match either a name in the XHTML namespace or a name in no namespace. This option is primarily intended for use when generating stylesheets to run under Saxon-JS in the browser since the resulting behavior is close to that defined by the special rules in the HTML5 specification for XSLT and XPath running against an HTML5 DOM.
- You can also specify a valid URI by editing the value in the combo box. Specifying a URI sets the default namespace for elements and types (effectively a default value for `xpath-default-namespace`). Note that an explicit value for this attribute takes precedence.

Use a configuration file ("-config")

Select this option if you want to use a Saxon 12.5 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration file by entering it in the **URL** field, or by using the  **Insert Editor Variables** button, or using the browsing actions in the  **Browse** drop-down list.

Attention:

Oxygen XML Developer does not support the `ALLOWED_PROTOCOLS` Saxon property (<http://saxon.sf.net/feature/allowedProtocols>). This feature is specific to Saxon and controls access by Saxon (but not by underlying software, such as the XML parser). For more information, see <https://www.saxonica.com/documentation12/index.html#configuration/config-features>.

Compile

Use this button to generate the *stylesheet export file* according the options selected in this dialog box.

Editing Ant Build Files

Oxygen XML Developer includes an Ant editor that provides a variety of specialized features to assist you with creating and editing Ant build files. The editor includes some specialized views, content completion

assistance, automatic validation, syntax highlighting, [Quick Assist \(on page 2272\)](#) and [Quick Fix \(on page 2272\)](#) support, as well as numerous common editing and search features.

Related Information:

[Editing XML Documents in Text Mode \(on page 471\)](#)

Modular Contextual Ant Build File Editing Using 'Main Files' Support

Smaller interrelated modules that define a complex Ant build file cannot be correctly edited or validated individually due to their interdependency with other modules. For example, a *target* defined in a main build file is not visible when you edit an included or imported module. Oxygen XML Developer provides support for defining the main module (or modules), allowing you to edit any of the imported/included files in the context of the larger Ant build structure.

You can set a main Ant build file either by using the *main files* support from the **Project** view ([on page 381](#)), or a *validation scenario* ([on page 705](#)).

To set a *main file* using a validation scenario, add validation units that point to the main modules. Oxygen XML Developer warns you if the current module is not part of the dependencies graph computed for the main build file. In this case, it considers the current module as the main build file.

The advantages of editing in the context of *main file* ([on page 2270](#)) include:

- Correct validation of a module in the context of a larger build structure.
- *Content Completion Assistant* ([on page 2267](#)) displays all components valid in the current context.
- The **Outline** view ([on page 708](#)) displays the components collected from the entire build file structure.

Validating Ant Build Files

Oxygen XML Developer performs the validation of Ant build files with the help of a built-in processor, which is largely based on the *Apache Ant* ([on page 2267](#)) libraries. The path to these libraries can be configured in the **Ant preferences** page ([on page 234](#)). The validation processor accesses the **parameters set in the associated Ant transformation scenario** ([on page 1172](#)) and uses them as Ant properties when validating the current build script.

Oxygen XML Developer automatically validates Ant build files as you type. You can also validate the currently edited file by selecting the  **Validate** action from the  ▾ **Validation** toolbar drop-down menu or the **Document > Validate** menu.

**Tip:**

To make a custom task available in the Ant validation engine, add a *JAR* ([on page 2270](#)) file that contains the task implementation to the library directory of the built-in Ant distribution that comes bundled with Oxygen XML Developer (for example, `[OXYGEN_INSTALL_DIR]/tools/ant/lib` folder).

Create a Validation Scenario for Ant Build Files

If you want to customize the validation process for Ant build files, you can create a new validation scenario (or configure an existing one). For example, if you want to validate interrelated modules that define a complex Ant build file, you can specify the main Ant file by configuring a validation scenario. To create or configure a validation scenario, select  **Configure Validation Scenario(s)** from the  **Validation** toolbar drop-down menu or the **Document > Validate** menu.

Passing parameters to the Ant validation engine

Ant validation scenarios cannot be configured to accept custom Ant parameters. However, you can specify values for the parameters in your Ant document using an Ant transformation scenario:

1. Create a new [Ant transformation scenario \(on page 1169\)](#).
2. Edit the transformation scenario and [set all parameters \(on page 1172\)](#) you need to pass to your Ant document.
3. Associate the new scenario with your Ant document (in the **Configure Transformation Scenarios(s) dialog box (on page 1240)**). You do not need to run the transformation scenario. Every time a validation operation is triggered, the built-in validation engine uses the parameters set in the transformation scenario.

Note:

This behavior is available only for the validation scenarios that use the built-in validation engine. The custom defined validation engines do not benefit from this functionality.

Transforming Ant Build Files

Oxygen XML Developer includes a few built-in transformation scenarios that allow you to transform Ant build files. They are listed in the **Ant** section in the **Configure Transformation Scenario(s) dialog box (on page 1240)**:

- **Ant** - This transformation scenario runs as an external process that executes the Ant build script with the built-in Ant distribution ([Apache Ant \(on page 2267\)](#) version 1.9.8) that is included with Oxygen XML Developer, or optionally with a custom Ant distribution configured in the scenario.
- **Ant (with Saxon-HE XSLT support)** - This transformation scenario allows Ant XSLT tasks to be performed using Saxon 9 Home Edition libraries that come bundled with Oxygen XML Developer and all defined XML catalogs are also taken into account during the transformation.

Tip:

Certain Ant tasks require additional JAR libraries (for example, Ant *mail* tasks). The additional libraries can be added by editing the Ant transformation scenario, and in the **Output** tab, click the **Libraries** button (on page 1170) in the bottom right corner. This opens a dialog box where

you can add JAR libraries. For a list of library dependencies, see <https://ant.apache.org/manual/install.html#librarydependencies>.

[Ant Transformation \(on page 1169\)](#)

Ant Quick Fix Support

The Oxygen XML Developer [Quick Fix support \(on page 2272\)](#) helps you resolve missing target reference errors that may occur when developing Ant build documents.

To activate this feature, hover over or place the cursor in the highlighted area of text where a validation error or warning occurs. If a *Quick Fix* is available for that particular error or warning, you can access the *Quick Fix* proposals with any of the following methods:

- When hovering over the error or warning, the proposals are presented in a tooltip pop-up window.
- If you place the cursor in the highlighted area where a validation error or warning occurs, a *Quick Fix* icon (💡) is displayed in the stripe on the left side of the editor. If you click this icon, Oxygen XML Developer displays the list of available fixes.
- With the cursor placed in the highlighted area of the error or warning, you can also invoke the *Quick Fix* menu by pressing **Alt + 1 (Command + Option + 1 on macOS)** on your keyboard.

Oxygen XML Developer provides the following types of *Quick Fixes* for Ant build files:

- **Create new target** - Creates a new target with the specified name.
- **Change reference to "targetName"** - Corrects the reference to point to an already defined target.
- **Remove target reference** - Removes the erroneous reference.

Content Completion in Ant Build Files

The list of proposals offered by the [Content Completion Assistant \(on page 2267\)](#) in Ant build files are context-sensitive and includes proposals that are valid at the current cursor position. It can be manually activated with the **Ctrl + Space** shortcut.

The *Content Completion Assistant* proposes various item types that are defined in the current Ant build and in the imported and included builds. The proposals include:

- Element names
- Attribute names
- Property names

**Note:**

In addition to the user-defined properties, the *Content Completion Assistant* offers the following values:

- The system properties set in the Java Virtual Machine.
- The built-in properties that Ant provides.

- Target names
- Task and type reference IDs

**Tip:**

To make a custom task available in the *Content Completion Assistant*, add a *JAR* (on [page 2270](#)) file that contains the task implementation to the library directory of the built-in Ant distribution that comes bundled with Oxygen XML Developer (for example, `[OXYGEN_INSTALL_DIR]/tools/ant/lib` folder).

**Note:**

For Ant resources, the proposals are collected starting from the *main files* (on [page 2270](#)). The *main files* can be defined in the project or in the associated validation scenario. For further details about the *Main Files* support go to [Defining Main Files at Project Level](#) (on [page 381](#)).

Related Information:

<http://ant.apache.org/manual/properties.html>

Syntax Highlighting in Ant Files

Oxygen XML Developer supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for Ant build files, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on [page 114](#)).
2. Go to **Editor > Syntax Highlight** (on [page 193](#)).
3. Select and expand the **Ant Property** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

Related Information:

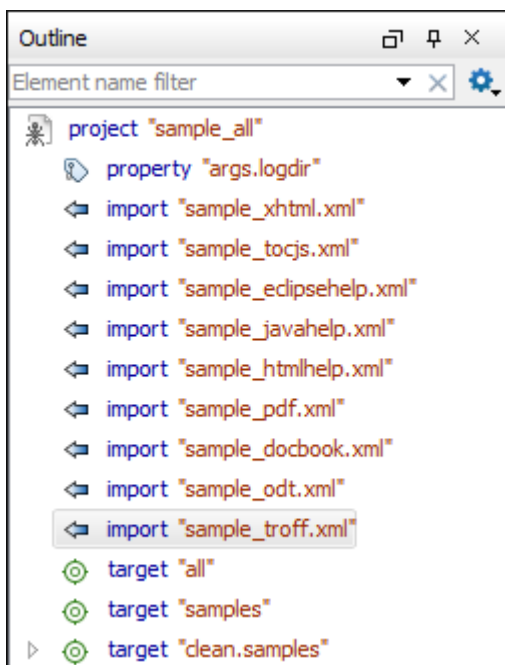

[Syntax Highlight Preferences](#) (on [page 193](#))

Ant Outline View

The **Outline** view for Ant files displays the list of all the components (properties, targets, extension points, task/type definitions and references) from both the edited Ant build file and its imported and included modules. For Ant resources, the **Outline** view collects its components starting from the *main files* (on page 2270). The *main files* can be defined in the project and the main build file can be specified in a validation scenario. For more details, see [Defining Main Files at Project Level](#) (on page 381).

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 189. Ant Outline View

The following actions are available in the  **Settings** menu on the Outline view toolbar:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches. By default, this filter is not selected.

Selection update on cursor move

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the Ant editor. Selecting one of the components from the outline view also selects the corresponding item in the source document.

When the  **Show components** option is selected, the following actions are available:

Show XML structure

Displays the XML document structure in a tree-like manner.

Sort

Sorts the components in the **Outline** view alphabetically.

Show all components

Displays all components that were collected starting from the *main file (on page 2270)*. This option is set by default.

Show only local components

Displays the components defined in the current file only.

Group by location/type

The build file components can be grouped by location and type.

When the  **Show XML structure** option is selected, the following actions are available:

Show components

Switches the **Outline** view to the components display mode.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

Show element name

Show/hide element name.

Show text

Show/hide additional text content for the displayed elements.

Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the *Outline preferences panel (on page 272)*.

Configure displayed attributes

Displays the **XML Structured Outline** preferences page (*on page 272*).

The following actions are available in the contextual menu of the **Outline** view (when the  **Show XML structure** option is selected in the  **Settings** menu:

Append Child

Displays a list of elements that can be inserted as children of the current element.

Insert Before

Displays a list of elements that can be inserted as siblings of the current element, before the current element.

Insert After

Displays a list of elements that can be inserted as siblings of the current element, after the current element.

Edit Attributes

Displays an in-place attribute editing window.

Toggle Comment

Comments/uncomments the currently selected element.

Search References Ctrl + Shift + R (Command + Shift + R on macOS)

Searches all references of the item found at current cursor position in the defined scope. See [Find References and Declarations of Ant Components \(on page 714\)](#) for more details.

Search References in

Searches all references of the item found at current cursor position in the specified scope. See [Find References and Declarations of Ant Components \(on page 714\)](#) for more details.

Component Dependencies

Opens the [Ant Component Dependencies view \(on page 713\)](#) that allows you to see the dependencies for the currently selected component.

Rename Component in

Renames the selected component. See [Ant Refactoring Actions \(on page 715\)](#) for more details.

Cut, **Copy**, **Delete**

Executes the typical editing actions on the currently selected component.

Expand More

Expands recursively all sub-components of the selected component.

Collapse All

Collapses recursively all sub-components of the selected component.

You can search a component in the **Outline** view by typing its name in the filter text field at the top of the view or directly on the tree structure. When you type the component name in the text field, you can switch to the tree structure using the following:

- **Down** arrow key
- **Tab** key
- **Shift-Tab** key combination

To switch from tree structure to the filter text field, you can use **Tab** and **Shift-Tab**.

Tip:

The search filter is case insensitive. The following wildcards are accepted:

- * - any string
- ? - any character
- , - patterns separator

If no wildcards are specified, the string to search is used as a partial match (such as ***textToFind***).

The content of the **Outline** view and the editing area are synchronized. When you select a component in the **Outline** view, its definition is highlighted in the editing area.

Oxygen XML Developer has a predefined order for the groups in the **Outline** view:

- For location, the names of the files are sorted alphabetically. The file you are editing is located at the top of the list.
- For type, the order is: properties, targets, references.

**Note:**

When no grouping is available Oxygen XML Developer sorts the components depending on their order in the document. Oxygen XML Developer also takes into account the name of the file that the components are part of.

Ant Referenced/Dependent Resources View

The **Referenced/Dependent Resources** view displays the hierarchy or dependencies for an Ant build file by analyzing imported or included build files. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

If you want to see the references or dependencies of a build file, select it in the **Project view** (*on page 365*) and choose **Show referenced resources** or **Show dependent resources** from the contextual menu.

The following actions are available on the toolbar of the **Referenced/Dependent Resources** view:

**Refresh**

Refreshes the resource structure.

**Stop**

Stops the computing.

**Show hierarchy for**

Computes the hierarchical structure of the references for a resource.

**Show dependencies for**

Computes the structure of the dependencies for a resource.

**Configure dependencies search scope**

Allows you to configure a scope to compute the dependencies. There is also an option for automatically using the defined scope for future operations.

History

Provides access to the list of previously computed dependencies. Use the  **Clear history** button to remove all items from this list.

The contextual menu for a resource listed in the **Referenced/Dependent Resources** view contains the following actions:

Open

Opens the resource. You can also double-click a resource within the hierarchical structure to open it.

Go to reference

Opens the source document where the resource is referenced.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show references resources

Shows the references for the selected resource.

Show dependent resources

Shows the dependencies for the selected resource.

Add to Main Files

Adds the currently selected resource in the **Main Files** directory.

Expand More

Expands more of the children of the selected resource from the hierarchical structure.

Collapse All

Collapses all children of the selected resource from the hierarchical structure.

Tip:

When a recursive reference is encountered in the view, the reference is marked with a special icon .

Ant Component Dependencies View

The **Component Dependencies** view allows you to see the dependencies for a selected component. This is helpful if you want to see where components are used in the entire hierarchy. For example, if you want to find all the references where a given component is used.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

To see the dependencies of an Ant component:

1. Right-click the desired component in the editor or **Outline** view.
2. Select the **Component Dependencies** action from the contextual menu.

The action is available for the following components: *properties*, *targets*, *extension-points*, and *references* (those that have an ID set).

If a component contains multiple references, a small table is displayed at the bottom of the view that contains all the references. When a recursive reference is encountered, it is marked with a special icon .

The **Component Dependencies** view includes the following toolbar actions:

Refresh

Refreshes the dependencies structure.

Stop

Stops the dependency computation.

Configure

Allows you to choose the search scope for computing the dependencies structure. This is helpful for making sure all imported/included resources are computed.

History

Allows you to select from a list of the most recently used dependency computations.

In addition, the following actions are available in the contextual menu:

Go to First Reference

Selects the first reference of the currently selected component in the dependencies tree.

Go to Component

Shows the definition of the currently selected component in the dependencies tree.

Related Information:

[Search and Refactor Operations Scope \(on page 598\)](#)

Highlight Component Occurrences

When a component (for example *property* or *target*) is found at the current cursor position, they are highlighted in both the document and in the stripe bar at the right side of the document. Oxygen XML Developer also supports occurrences highlight for type and task references.

Customizable colors are used (one for the component definition and another one for component references). Occurrences are displayed until another component is selected and a new search is performed. All highlights are removed when you start to edit the document.

This feature is enabled by default. To configured it, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **Editor > Mark Occurrences**. If your particular type of file is not selected, you can perform this search by going to **Search > Search Occurrences in File Ctrl + Shift + U (Command + Shift + U on macOS)** in the contextual menu. Matches are displayed in separate tabs of the **Results view (on page 503)**.

Related Information:

[Mark Occurrences Preferences \(on page 194\)](#)

Find References and Declarations of Ant Components

The following search actions related to references and declarations of Ant components are available from the **Search** submenu of the contextual menu and from the **Document > References** menu::

Search References

Searches all references of the item found at the current cursor position in the defined scope.

Search References in

Searches all references of the item found at the current cursor position in the file or files that you specify after selecting a scope for the search operation.

Search Declarations

Searches all declarations of the item found at the current cursor position in the defined scope.

Search Declarations in

Searches all declarations of the item found at the current cursor position in the file or files that you specify when defining a new scope.

Search Occurrences in File

Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the contextual menu and the **Document > Schema** menu:

Go to Definition

Moves the cursor to the location of the definition of the current item.

**Note:**

You can also use the **Ctrl + Single-Click (Command + Single-Click on macOS)** shortcut on a reference to display its definition.

Related Information:

[Search and Refactor Operations Scope \(on page 598\)](#)

Ant Refactoring Actions

The following refactoring actions can be applied on *targets*, *extension-points*, *properties*, and *references* and allow you to consistently rename a component in the entire Ant build file structure. They are available from the **Refactoring** submenu in the contextual menu of the current editor or from the **Document > Refactoring** menu:

Rename Component

Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.

Rename Component in

Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

Figure 190. Rename Identity Constraint Dialog Box

Ant Quick Assist Support

The *Quick Assist* support (on page 2272) helps you to rapidly access search and refactoring actions. If one or more actions are available in the current context, they are accessible via a yellow bulb icon (💡) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the *Quick Assist* menu by using the **Alt + 1 (Meta + Option + 1** on macOS) keyboard shortcuts.

The *Quick Assist* support offers direct access to the following actions:

Rename Component in

Renames the component and all its dependencies.

Search Declarations

Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

Search References

Searches all references of the component in a predefined scope.

Component Dependencies

Searches the component dependencies in a predefined scope.

 **Change Scope**

Configures the scope that will be used for future search or refactor operations.

 **Rename Component**

Allows you to rename the current component in-place.

 **Search Occurrences**

Searches all occurrences of the component within the current file.

Editing XML Schemas (XSD)

An XML Schema (XSD) describes the structure of an XML document and is used to validate XML document instances against it, to check that the XML instances conform to the specified requirements. If an XML instance conforms to the schema then it is said to be valid. Otherwise, it is invalid.

Oxygen XML Developer offers support for both XML Schema 1.0 and 1.1 and you can edit XML Schema files in the following editing modes:

- **Text editing mode (on page 759)** - Allows you to edit XML Schema files in a source editing mode.
- **Grid editing mode (on page 316)** - Displays XML Schema files in a structured spreadsheet-like grid.
- **Design editing mode (on page 317)** - Visual schema designer that helps you understand the structure and develop complex schemas.

For information about applying and detecting schemas, see [Associating a Schema to XML Documents \(on page 582\)](#).

Resources

For more information about editing XML Schemas, see our video demonstration:

<https://www.youtube.com/embed/vz1eIZELQgc>

Related Information:

[Associating a Schema to XML Documents \(on page 582\)](#)

XML Schema Design Mode (XML Schema Diagram Editor)

This section includes topics that describe how to work with XML Schema documents in **Design** mode, including various features, actions that are available, and much more.

The **Design** mode in Oxygen XML Developer provides a simple and expressive XML Schema diagram editor for working with XML Schema documents. The schema diagram helps both the content authors who want to understand a schema and schema designers who develop complex schemas.

To switch to this mode, select **Design** at the bottom of the editing area.

The diagram font can be increased using the usual Oxygen XML Developer shortcuts: **(Ctrl + "+" (Meta + "+" on macOS))**, **(Ctrl + "-" (Meta + "-" on macOS))**, **(Ctrl + 0 (Meta + 0 on macOS))** or **(Ctrl + mouse wheel (Meta + mouse wheel on macOS))**. The whole diagram can also be zoomed with one of the predefined factors available in the [Schema preferences panel \(on page 166\)](#). The same zoom factor is applied for the print and save actions.

Resources

For more information about designing XML Schemas, watch our video demonstration:

<https://www.youtube.com/embed/vz1eIZELQgc>

Navigation in the XML Schema Design Mode

The following editing and navigation features work for all types of schema components in the XML Schema **Design** mode:

- Move/reference components in the diagram using drag-and-drop actions.
- Select consecutive components on the diagram (components from the same level) using the *Shift* key. You can also make discontinuous selections in the schema diagram using the **Ctrl (Meta on macOS)** key. To deselect one of the components, use **Ctrl + Single-Click (Command + Single-Click on macOS)**.
- Use the arrow keys to navigate the diagram vertically and horizontally.
- Use *Home/End* keys to jump to the first/last component from the same level. Use **Ctrl + Home (Command + Home on macOS)** key combination to go to the diagram root and **Ctrl + End (Command + End on macOS)** to go to the last child of the selected component.
- You can easily go back to a previously visited component while moving from left to right. The path will be preserved only if you use the left arrow key or right arrow key. For example, if the current selection is on the second attribute from an attribute group and you press the left arrow key to jump to the attribute group, when you press the right arrow key, then the selection will be moved to the second attribute.
- Go back and forward between components viewed or edited in the diagram by selecting them in the **Outline view (on page 763)**:
 -  **Back** (go to previous schema component).
 -  **Forward** (go to next schema component).
 -  **Go to Last Modification** (go to last modified schema component).
- Copy, reference, or move global components, attributes, and identity constraints to another position and from one schema to another using the **Cut/Copy** and **Paste/Paste as Reference** actions.
- Go to the definition of an element or attribute with the **Go to Definition** action.

- Search in the diagram using the [Find/Replace dialog box \(on page 394\)](#) or the [Quick find toolbar \(on page 408\)](#). You can find/replace components only in the current file scope.
- You can expand and see the contents of the imports/includes/redefines in the diagram. To edit components from other schemas, the schema for each component will be opened as a separate file in Oxygen XML Developer.

**Tip:**

If an XML Schema referenced by the currently open schema was modified on disk, the change will be detected and you will be asked to refresh the current schema contents.

- Recursive references are marked with a *recurse symbol* () . Click this symbol to navigate between the element declaration and its reference.

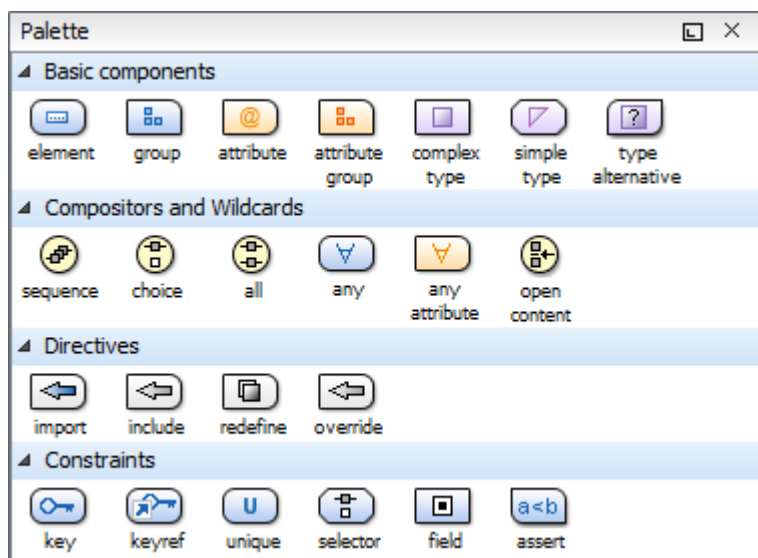

Figure 191. Recursive Reference

XML Schema Palette View (Available in Design Mode)

The **Palette** view is designed to offer quick access to XML Schema components and to improve the usability of the XML Schema diagram builder. You can use the **Palette** to drag and drop components in the **Design** mode. The components offered in the **Palette** view depend on the XML schema version set in the [XML Schema preferences page \(on page 207\)](#). If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 192. Palette View

Components are organized functionally into 4 collapsible categories:

- Basic components: *elements, group, attribute, attribute group, complex type, simple type, type alternative*.
- Compositors and Wildcards: *sequence, choice, all, any, any attribute, open content*.
- Directives: *import, include, redefine, override*.
- Identity constraints: *key, keyref, unique, selector, field, assert*.

Note:

The *type alternative, open content, override, and assert* components are available for XML Schema 1.1.

To add a component to the edited schema:

- Click and hold a graphic symbol from the **Palette** view, then drag the component into the **Design** view.
- A line dynamically connects the component with the XML schema structure.
- Release the component into a valid position.

Note:

You cannot drop a component into an invalid position. When you hover the component into an invalid position, the mouse cursor changes its shape into . Also, the connector line changes its color from the usual dark gray to the color defined in the **Validation error highlight color** option (*on page 194*) (default color is red).

Resources

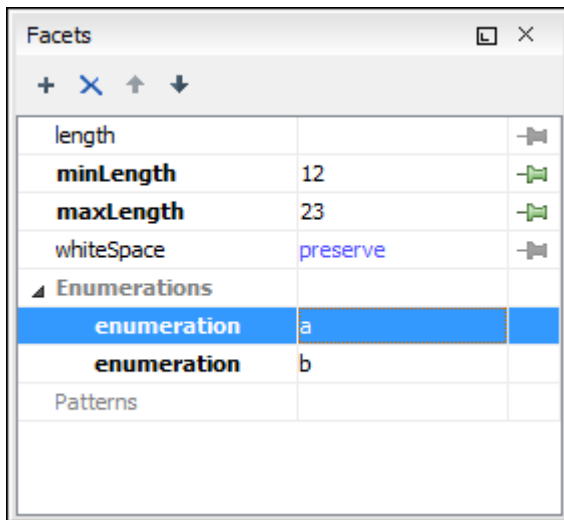

For more information about the Schema palette, watch our video demonstration:

<https://www.youtube.com/embed/KalHUXmpuAA>

XML Schema Facets View (Available in Design Mode)

The **Facets** view for XML Schemas presents the facets for the selected component, if available. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 193. Facets View

The default value of a facet is rendered in the **Facets** view with a blue color. The facets that can not be edited are rendered with a gray color. The grouping categories (for example: **Enumerations** and **Patterns**) are not editable. If these categories contain at least one child they are rendered with bold. Bold facets are facets with values set explicitly to them.

Important:

Usually inherited facets are presented as default in the **Facets** view but if patterns are inherited from a base type and also specified in the current simple type only the current specified patterns will be presented. You can see the effective pattern value obtained by combining the inherited and the specified patterns as a tooltip on the **Patterns** category.

Facets for components that do not belong to the currently edited schema are read-only but if you double-click them you can choose to open the corresponding schema and edit them.

You can edit a facet by double-clicking it or by pressing Enter, when that facet is selected. For some facets you can choose valid values from a list or you can specify another value. If a facet has an invalid value or a warning, it will be highlighted in the table with the corresponding foreground color. By default, facets with errors are presented with red and the facets with warnings with yellow. You can customize the error colors from the [Document Checking user preferences \(on page 194\)](#).

The **Facets** view provides the following actions in its toolbar and contextual menu:

+ Add

Allows you to add a new enumeration or a new pattern.

× Remove

Allows you to remove the value of a facet.

Edit Annotations

Allows you to edit an annotation for the selected facet.

↑ Move Up

Allows you to move up the current enumeration/pattern in **Enumerations/Patterns** category.

↓ Move Down

Allows you to move down the current enumeration/pattern in **Enumerations/Patterns** category.

 **Copy**

Copy the attribute value.

Open in Regular Expressions Builder

Rather than editing regular expressions manually, this action allows you to open the pattern in the [XML Schema Regular Expressions Builder \(on page 797\)](#) that guides you through the process of testing and constructing the pattern..

Facets can be fixed to prevent a derivation from modifying its value. To fix a facet value just click the  **Pin** button.

Schema Editing Actions

You can edit an XML schema using drag and drop operations or contextual menu actions.

Drag and drop is the easiest way to move the existing components to other locations in an XML schema. For example, you can quickly insert an element reference in the diagram with a drag and drop from the **Outline view (on page 763)** to a compositor in the diagram. Also, the components order in an `<xs:sequence>` can be easily changed using drag and drop.

If this property has not been set, you can easily set the attribute/element type by dragging over it a simple type or complex type from the diagram. If the type property for a simple type or complex type is not already set, you can set it by dragging over it a simple or complex type.

Depending on the drop area, various actions are available:

- **Move** - Context dependent, the selected component is moved to the destination.
- **Reference** - Context dependent, the selected component is referenced from the parent.
- **Copy** - If the **Ctrl (Meta on macOS)** key is pressed, a copy of the selected component is inserted to the destination.

Visual clues about the operation type are indicated by the mouse pointer shape:

-  - When moving a component.
-  - When referencing a component.
-  - When copying a component.

You can edit some schema components directly in the diagram. For these components, you can edit the name and the additional properties presented in the diagram by double-clicking the value you want to edit. If you want to edit the name of a selected component, you can also press **Enter**. The list of properties that can be displayed for each component can be customized [in the Preferences \(on page 167\)](#).

When editing references, you can choose from a list of available components. A component from an imported schema whose target namespace does not have an associated prefix is displayed in the list as `componentName#targetNamespace`. If the reference is from a target namespace that was not yet mapped, you are prompted to add prefix mappings for the inserted component namespace in the currently edited schema.

You can also change the compositor by double-clicking it and choose the compositor you want from the proposals list.

There are some components that cannot be edited directly in the diagram: imports, includes, redefines. The editing action can be performed if you double-click or press **Enter** on an import/include/define component. An edit dialog box is displayed, allowing you to customize the directives.

[Generating Sample XML Files \(on page 776\)](#)

[Schema Design Preferences \(on page 166\)](#)

Contextual Menu Actions in the Design Mode

The contextual menu of the **Design** mode includes the following actions:

Go to Definition (Ctrl + Shift + Enter)

Shows the definition for the currently selected component. For references, this action is available by clicking the arrow displayed in its bottom right corner.

Open Schema (Ctrl + Shift + Enter)

Opens the selected schema. This action is available for `<xsd:import>`, `<xsd:include>` and `<xsd:redefine>` elements. If the file you try to open does not exist, a warning message is displayed and you have the possibility to create the file.

Edit Attributes ()

Allows you to edit the attributes of the selected component in a small in-place editor that presents the same attributes as in the **Attributes view (on page 765)** and the **Facets view (on page 720)**. The actions that can be performed on attributes in this dialog box are the same actions presented in the two views.

Append child

Offers a list of valid components, depending on the context, and appends your selection as a child of the currently selected component. You can set a name for a named component after it has been added in the diagram.

Insert before

Offers a list of valid components, depending on the context, and inserts your selection before the selected component, as a sibling. You can set a name for a named component after it has been added in the diagram.

Insert after

Offers a list of valid components, depending on the context, and inserts your selection after the selected component, as a sibling. You can set a name for a named component after it has been added in the diagram.

New global

Inserts a global component in the schema diagram. This action does not depend on the current context. If you choose to insert an import you have to specify the URL of the imported file, the target namespace and the import ID. The same information, excluding the target namespace, is requested for an `<xsd:include>` or `<xsd:redefine>` element.

Note:

If the imported file has declared a target namespace, the field **Namespace** is completed automatically.

Edit Schema Namespaces

When performed on the schema root, it allows you to edit the schema target namespace and namespace mappings. You can also invoke the action by double-clicking the target namespace property from **Attributes view** (*on page 765*) for the schema or by double-clicking the schema component.

Edit Annotations

Allows you to edit the annotation for the selected schema component in the **Edit Annotations** dialog box. You can perform the following operations in the dialog box:

- **Edit all `appinfo/documentation` items for a specific annotation** - All `appinfo/documentation` items for a specific annotation are presented in a table and can be easily edited. Information about an annotation item includes: type (`documentation/appinfo`), content, source (optional, specify the source of the `documentation/appinfo` element) and `xml:lang`. The content of a `documentation/appinfo` item can be edited in the **Content** area below the table.
- **Insert/Insert before/Remove `documentation/appinfo`** - The **+** **Add** button allows you to insert a new annotation item (`documentation/appinfo`). You can add a new item before the

item selected in table by pressing the  **Insert Before** button. Also, you can delete the selected item using the  **Remove** button.

- **Move items up/down** - Do this by using the  **Move up** and  **Move down** buttons.
- **Insert/Insert before/Remove annotation** - Available for components that allow multiple annotations such as schemas or redefines.
- **Specify an ID for the component annotation** - An optional identifier for the annotation.

Annotations are rendered by default under the graphical representation of the component. When you have a reference to a component with annotations, these annotations are also presented in the diagram below the referenced component. To edit the annotations, use the **Edit Annotations** action from the contextual menu. If the reference component does not have annotations, you can edit the annotations of the referenced component by double-clicking the annotations area. Otherwise, you can edit the referenced component annotations only if you go to the definition of the component.

Note:

For imported/included components that do not belong to the currently edited schema, the **Edit Annotations** dialog box presents the annotation as read-only. To edit its annotation, open the schema where the component is defined.

Change XML Schema Version

Use this action to change the XML Schema version of the current document.

Extract Global Element

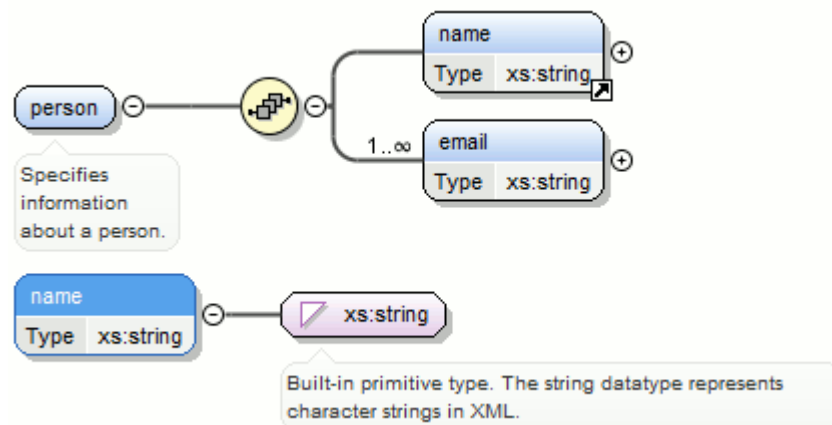

This action is available for local elements. A local element is made global and is replaced with a reference to the global element. The local element properties that are also valid for the global element declaration are kept.

Figure 194. Extracting a Global Element

If you use the **Extract Global Element** action on a `<name>` element, the result is:

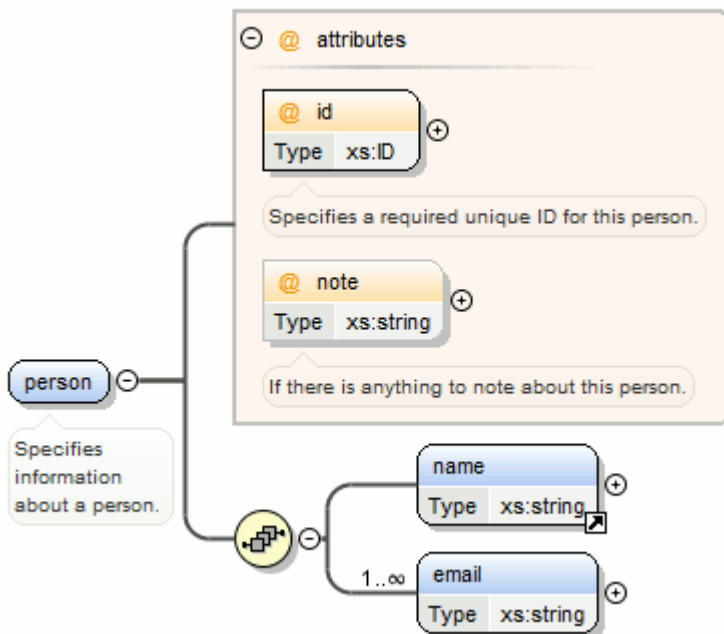

Figure 195. Extracting a Global Element on a <name> Element

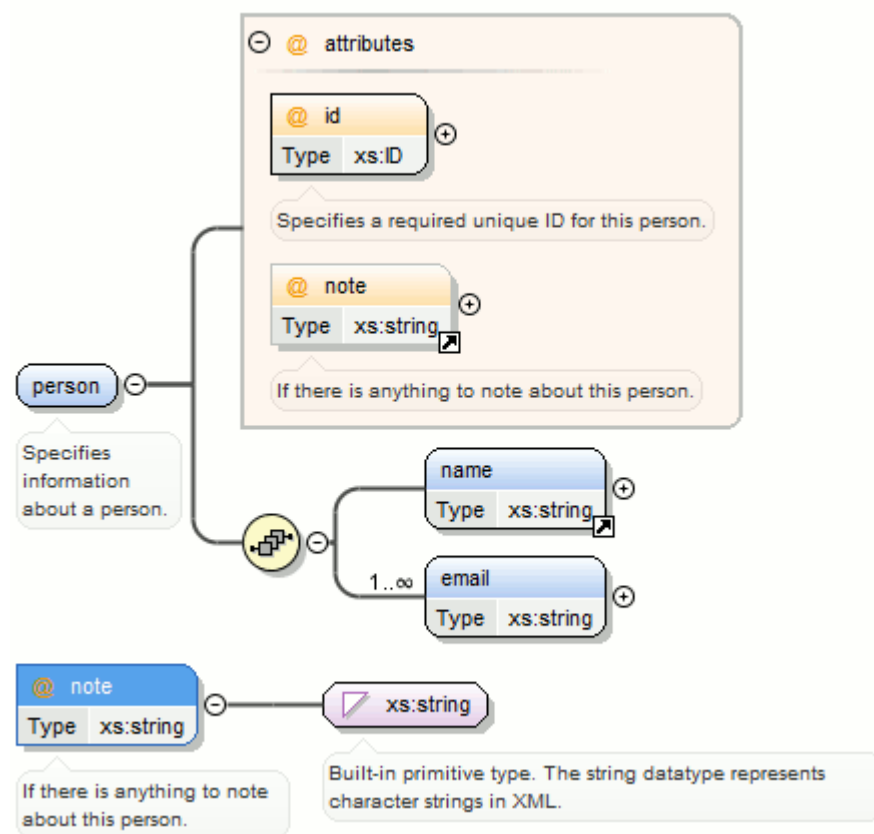

Extract Global Attribute

This action is available for local attributes. A local attribute is made global and replaced with a reference to the global attribute. The properties of local attribute that are also valid in the global attribute declaration are kept.

Figure 196. Extracting a Global Attribute

If you use the **Extract Global Attribute** action on a `@note` attribute, the result is:

Figure 197. Extracting a Global Attribute on a @note Attribute

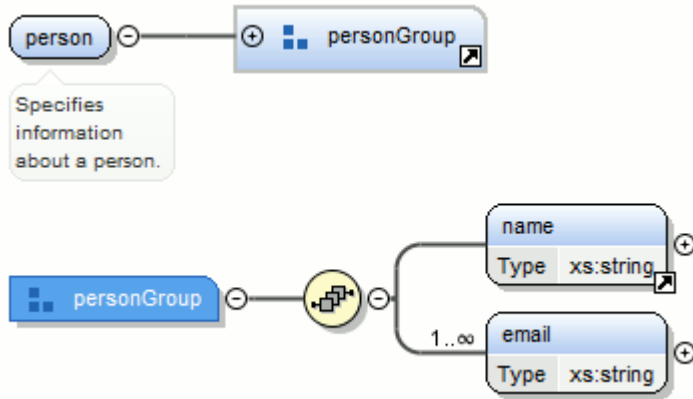

Extract Global Group

This action is available for compositors (sequence, choice, all). This action extracts a global group and makes a reference to it. The action is available only if the parent of the compositor is not a group.

Figure 198. Extracting a Global Group

If you use the **Extract Global Group** action on the `<sequence>` element, the **Extract Global Component** dialog box is displayed and you can choose a name for the group. If you type `personGroup`, the result is:

Figure 199. Extracting a Global Group on a `<sequence>` Element

Extract Global Type

This action is used to extract an anonymous simple type or an anonymous complex type as global. For anonymous complex types, the action is available on the parent element.

Figure 200. Extracting a Global Simple Type

If you use the action on the `union` component and choose `numericST` for the new global simple type name, the result is:

Figure 201. Extracting a Global Simple Type on a `union` Component

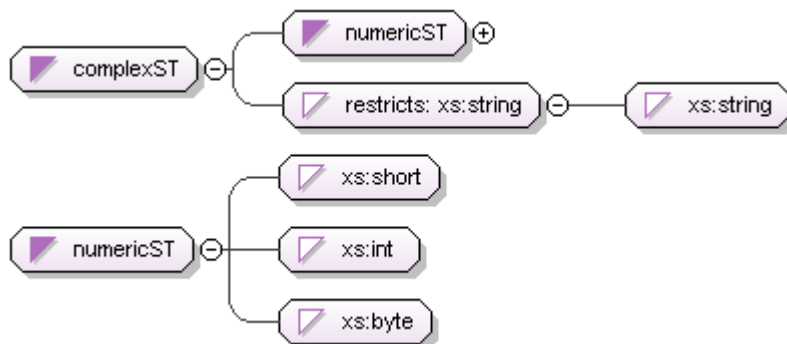

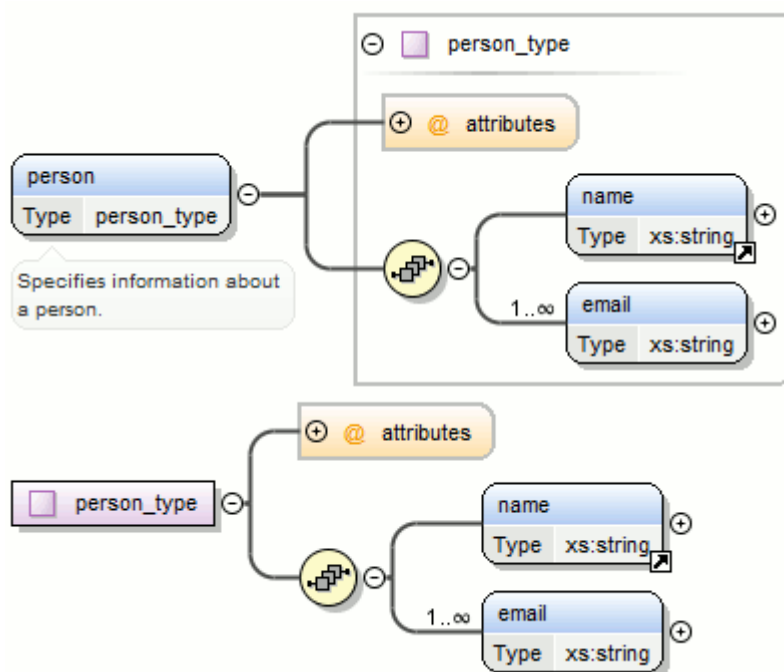

Figure 202. Extracting a Global Complex Type

If you use the action on a `<person>` element and choose `person_type` for the new complex type name, the result is:

Figure 203. Extracting a Global Complex Type on a `<person>` Element

Rename Component in

Renames the selected component.

Cut Ctrl + X (Command + X on macOS)

Cuts the selected component(s).

Copy Ctrl + C (Command + C on macOS)

Copies the selected component(s) to the clipboard.

Copy XPath

This action copies an XPath expression that identifies the selected element or attribute in an instance XML document of the edited schema and places it in the clipboard.

Paste Ctrl + V (Command + V on macOS)

Pastes the component(s) from the clipboard as children of the selected component.

Paste as Reference

Creates references to the copied component(s). If not possible, a warning message is displayed.

Remove Delete

Removes the selected component(s).

Override component

Copies the overridden component in the current XML Schema. This option is available for `xs:override` components.

Redefine component

The referenced component is added in the current XML Schema. This option is available for `xs:redefine` components.

Optional

Can be performed on element/attribute/group references, local attributes, elements, compositors, and element wildcards. The `minOccurs` property is set to 0 and the `use` property for attributes is set to `optional`.

Unbounded

Can be performed on element/attribute/group references, local attributes, elements, compositors, and element wildcards. The `maxOccurs` property is set to `unbounded` and the `use` property for attributes is set to `required`.

Search

Can be performed on local elements or attributes. This action makes a reference to a global element or attribute.

Search References

Searches all references of the item found at current cursor position in the defined scope if any.

Search References in

Searches all references of the item found at current cursor position in the specified scope.

Search Occurrences in File

Searches all occurrences of the item found at current cursor position in the current file.

Component Dependencies

Opens the **Component Dependencies view** (*on page 770*) that allows you to see the dependencies for the currently selected component.

Show referenced resources

Opens the **Referenced/Dependent Resources view** (*on page 767*) that allows you to see the references for the currently selected resource.

Show dependent resources

Allows you to see the dependencies for the currently selected resource.

Expand All

Recursively expands all sub-components of the selected component.

Collapse All

Recursively collapses all sub-components of the selected component.

Save as Image

Saves the diagram as image, in JPEG, BMP, SVG or PNG format.

Generate Sample XML Files

Generates XML files using the current opened schema. The selected component is the XML document root. See more in the [Generate Sample XML Files \(on page 776\)](#) section.

Flatten Schema

Recursively adds the components of included Schema files to the main one. It also flattens every imported XML Schema from the hierarchy.

Options

Opens the [Schema preferences page \(on page 166\)](#).

XML Schema Components

A schema diagram contains a series of interconnected components. To quickly identify the relation between two connected components, the connection is represented as:

- A thick line to identify a connection with a required component (in the following image, `<family>` is a required element).

Figure 204. Example: Required Component

- A thin line to identify a connection with an optional component (in the following image, `<email>` is an optional element).

Figure 205. Example: Optional Component

The topics in this section provide details about all of the available components and their symbols as they appear in an XML schema diagram.

xs:schema

Figure 206. The *xs:schema* Component

Defines the root element of a schema. A schema document contains representations for a collection of schema components, such as type definitions and element declarations, that have a common target namespace. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-schema>.

By default, it displays the *targetNamespace* property when rendered.

Table 6. *xs:schema* Properties

Property Name	Description	Possible Values
Target Namespace	The schema target namespace	Any URI
Element Form Default	Determining whether or not local element declarations will be namespace-qualified by default	qualified, unqualified, [Empty] (default value is unqualified)
Attribute Form Default	Determining whether or not local attribute declarations will be namespace-qualified by default	qualified, unqualified, [Empty] (default value is unqualified)
Block Default	Default value of the <i>block</i> attribute of <i>xs:element</i> and <i>xs:complexType</i>	#all, extension, restriction, substitution, restriction extension, restriction substitution, extension substitution, restriction extension substitution, [Empty]
Final Default	Default value of the <i>final</i> attribute of <i>xs:element</i> and <i>xs:complexType</i>	#all, restriction, extension, restriction extension, [Empty]
Default Attributes	Specifies a set of attributes that apply to every complex Type in a schema document	Any
XPath Default Namespace	The default namespace used when the XPath expression is evaluated	##defaultNamespace, ##targetNamespace, ##local
Version	Schema version	Any token

Table 6. *xs:schema* Properties (continued)

Property Name	Description	Possible Values
ID	The schema ID	Any ID
Component	The edited component name	Not editable property
System-ID	The schema system ID	Not editable property

xs:element

Figure 207. The *xs:element* Component

Defines an element. An element declaration is an association of a name with a type definition, either simple or complex, an (optional) default value and a (possibly empty) set of identity-constraint definitions. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-element>.

An element by default displays the following properties when rendered in the diagram: *default*, *fixed*, *abstract* and *type*. When referenced or declared locally, the element graphical representation also contains the value for the *minOccurs* and *maxOccurs* properties (for 0..1 and 1..1 occurs the values are implied by the connector style) and the connectors to the element are drawn using dotted lines if the element is optional.

Table 7. *xs:element* Properties

Property Name	Description	Possible Values	Mentions
Name	The element name (always required)	Any NCName for global or local elements, any <i>QName</i> (on page 2272) for element references	If missing, will be displayed as '[element]' in diagram
Is Reference	When set, the local element is a reference to a global element	true/false	Appears only for local elements
Type	The element type	All declared or built-in types. In addition, the fol-	For all elements.

Table 7. *xs:element* Properties (continued)

Property Name	Description	Possible Values	Mentions
		lowing anonymous types are available: [ST-restriction], [ST-union], [ST-list], [CT-anonymous], [CT-extension SC], [CT-restriction SC], [CT-restriction CC], [CT-extension CC].	For references, the value is set in the referenced element.
Base Type	The extended/restricted base type	All declared or built-in types	For elements with complex type, with simple or complex content
Mixed	Defines if the complex type content model will be mixed	true/false	For elements with complex type
Content	The content of the complex type	simple/complex	For elements with complex type that extends/restricts a base type. It is automatically detected
Content Mixed	Defines if the complex content model will be mixed	true/false	For elements with complex type that has a complex content

Table 7. *xs:element* Properties (continued)

Property Name	Description	Possible Values	Mentions
Default	Default value of the element. A default value is automatically assigned to the element when no other value is specified	Any string	The fixed and default attributes are mutually exclusive
Fixed	A simple content element may be fixed to a specific value using this attribute. A fixed value is also automatically assigned to the element and you cannot specify another value.	Any string	The fixed and default attributes are mutually exclusive
Min Occurs	Minimum number of occurrences of the element	A numeric positive value. Default value is 1	Only for references/local elements
Max Occurs	Maximum number of occurrences of the element	A numeric positive value (default value is 1)	Only for references/local elements
Substitution Group	Qualified name of the head of the substitution group that this element belongs to	All declared elements. For XML Schema 1.1 this property supports multiple values.	For global and reference elements
Abstract	Controls whether or not the element may be used directly in instance XML documents. When set to true, the element may still be used to define content models, but it must be substituted through a substitution group in the instance document.	true/false	For global elements and element references
Form	Defines if the element is "qualified" (belongs to the target namespace) or "unqualified" (doesn't belong to any namespace)	unqualified/qualified	Only for local elements

Table 7. *xs:element* Properties (continued)

Property Name	Description	Possible Values	Mentions
Nil-able	When this attribute is set to true, the element can be declared as nil using an <i>xsi:nil</i> attribute in the instance documents	true/false	For global elements and element references
Target Namespace	Specifies the target namespace for local element and attribute declarations. The namespace URI may be different from the schema target namespace. This property is available for local elements only.	Not editable property	For all elements
Block	Controls if the element can be subject to a type or substitution group substitution. '#all' blocks any substitution, 'substitution' blocks any substitution through substitution groups and 'extension'/'restriction' block any substitution (both through <i>xsi:type</i> and substitution groups) by elements or types, derived respectively by extension or restriction from the type of the element. Its default value is defined by the <i>blockDefault</i> attribute of the parent <i>xs:schema</i> .	#all, restriction, extension, substitution, extension restriction, extension substitution, restriction substitution, restriction extension substitution	For global elements and element references
Final	Controls whether the element can be used as the head of a substitution group for elements whose types are derived by extension or restriction from the type of the element. Its default value is defined by the <i>finalDefault</i> attribute of the parent <i>xs:schema</i> .	#all, restriction, extension, restriction extension, [Empty]	For global elements and element references
ID	The component ID	Any ID	For all elements
Component	The edited component name	Not editable property	For all elements
Namespace	The component namespace	Not editable property	For all elements
System ID	The component system ID	Not editable property	For all elements

xs:attribute

Figure 208. The *xs:attribute* Component

Defines an attribute. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-attribute>.

An attribute by default displays the following properties when rendered in the diagram: *default*, *fixed*, *use* and *type*. Connectors to the attribute are drawn using dotted lines if the attribute use is optional. The attribute name is stroked out if prohibited.

Table 8. *xs:attribute* Properties

Property Name	Description	Possible Value	Mentions
Name	Attribute name (always required)	Any NCName for global/local attributes, all declared attributes' <i>QName</i> (on page 2272) for references	For all local or global attributes. If missing, will be displayed as '[attribute]' in the diagram.
Is Reference	When set, the local attribute is a reference	true/false	For local attributes
Type	Qualified name of a simple type	All global simple types and built-in simple types. In addition another 3 proposals are present: [anonymous restriction], [anonymous list], [anonymous union] for creating anonymous simple types more easily.	For all attributes. For references, the type is set to the referenced attribute.
Default	Default value. When specified, an attribute is added by the schema processor (if it is missing from the instance XML document) and it is given this value. The default and fixed attributes are mutually exclusive.	Any string	For all local or global attributes. For references the value is from the referenced attribute.

Table 8. *xs:attribute* Properties (continued)

Property Name	Description	Possible Value	Mentions
Fixed	When specified, the value of the attribute is fixed and must be equal to this value. The default and fixed attributes are mutually exclusive.	Any string	For all local or global attributes. For references the value is from the referenced attribute.
Use	Possible usage of the attribute. Marking an attribute "prohibited" is useful to exclude attributes during derivations by restriction.	optional, required, prohibited	For local attributes
Form	Specifies whether or not the attribute is qualified (must have a namespace prefix in the instance XML document). The default value for this attribute is specified by the <i>attributeFormDefault</i> attribute of the <i>xs:schema</i> document element.	unqualified/qualified	For local attributes
In-heri-table	Specifies if the attribute is inheritable. Inheritable attributes can be used by <alternative> element on descendant elements	true/false	For all local or global attributes. The default value is false. This property is available for XML Schema 1.1.
Target Name-space	Specifies the target namespace for local attribute declarations. The namespace URI may be different from the schema target namespace.	Any URI	Setting a target namespace for local attribute is useful only when restricts attributes of a complex type that is declared in other schema with a different target namespace. This property is available for XML Schema 1.1.
ID	The component ID	Any ID	For all attributes
Component	The edited component name	Not editable property	For all attributes
Name-space	The component namespace	Not editable property	For all attributes

Table 8. *xs:attribute* Properties (continued)

Property Name	Description	Possible Value	Mentions
Sys-tem ID	The component system ID	Not editable property	For all attributes

xs:attributeGroup

Figure 209. The *xs:attributeGroup* Component

Defines an attribute group to be used in complex type definitions. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-attributeGroup>.

Table 9. *xs:attributeGroup* Properties

Property Name	Description	Possible Values	Mentions
Name	Attribute group name (always required)	Any NCName for global attribute groups, all declared attribute groups for reference	For all global or referenced attribute groups. If missing, will be displayed as '[attribute-Group]' in diagram.
ID	The component ID	Any ID	For all attribute groups
Component	The edited component name	Not editable property	For all attribute groups
Name-space	The component namespace	Not editable property	For all attribute groups
Sys-tem ID	The component system ID	Not editable property	For all attribute groups

xs:complexType

Figure 210. The *xs:complexType* Component

Defines a top-level complex type. Complex Type Definitions provide for: See more data at <http://www.w3.org/TR/xmlschema11-1/#element-complexType>.

- Constraining element information items by providing Attribute Declarations governing the appearance and content of attributes.
- Constraining element information item children to be empty, or to conform to a specified element-only or mixed content model, or else constraining the character information item children to conform to a specified simple type definition.
- Using the mechanisms of Type Definition Hierarchy to derive a complex type from another simple or complex type.
- Specifying post-schema-validation info set contributions for elements.
- Limiting the ability to derive additional types from a given complex type.
- Controlling the permission to substitute, in an instance, elements of a derived type for elements declared in a content model to be of a given complex type.

Tip:

A complex type that is a base type to another type will be rendered with yellow background.

Table 10. *xs:complexType* Properties

Property Name	Description	Possible Values	Mentions
Name	The name of the complex type (always required)	Any NC-Name	Only for global complex types. If missing, will be displayed as '[complexType]' in diagram.
Base Type Definition	The name of the extended/restricted types	Any from the declared simple or complex types	For complex types with simple or complex content
Derivation Method	The derivation method	restriction/ extension	Only when base type is set. If the base type is a simple type, the derivation method

Table 10. *xs:complexType* Properties (continued)

Property Name	Description	Possible Values	Mentions
			is always extension.
Content	The content of the complex type	simple/ complex	For complex types that extend/restrict a base type. It is automatically detected.
Content Mixed	Specifies if the complex content model will be mixed	true/ false	For complex contents
Mixed	Specifies if the complex type content model will be mixed	true/ false	For global and anonymous complex types
Abstract	When set to <i>true</i> , this complex type cannot be used directly in the instance documents and needs to be substituted using an <i>xsi:type</i> attribute	true/ false	For global and anonymous complex types
Block	Controls if a substitution (either through a <i>xsi:type</i> or substitution groups) can be performed for a complex type, which is an extension or a restriction of the current complex type. This attribute can only block such substitutions (it cannot "unblock" them), which can also be blocked in the element definition. The default value is defined by the <i>blockDefault</i> attribute of <i>xs:schema</i> .	all, extension, restriction, extension restriction, [Empty]	For global complex types
Final	Controls whether the complex type can be further derived by extension or restriction to create new complex types	all, extension, restriction, extension restriction, [Empty]	For global complex types

Table 10. *xs:complexType* Properties (continued)

Property Name	Description	Possible Values	Mentions
Default Attributes Apply	The <i>schema</i> element can carry a <i>defaultAttributes</i> attribute, which identifies an attribute group. Each <i>complexType</i> defined in the schema document then automatically includes that attribute group, unless this is overridden by the <i>defaultAttributesApply</i> attribute on the <i>complexType</i> element.	true/false	This property is available only for XML Schema 1.1
ID	The component ID	Any ID	For all complex types
Component	The edited component name	Not editable property	For all complex types
Namespace	The component namespace	Not editable property	For all complex types
System ID	The component system ID	Not editable property	For all complex types

xs:simpleType

Figure 211. The *xs:simpleType* Component

Defines a simple type. A simple type definition is a set of constraints on strings and information about the values they encode, applicable to the normalized value of an attribute information item or of an element information item with no element children. Informally, it applies to the values of attributes and the text-only content of elements. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-simpleType>.

**Tip:**

A simple type that is a base type to another type will be rendered with yellow background.

Table 11. *xs:simpleType* Properties

Name	Description	Possible Values	Scope
Name	Simple type name. Always required.	Any NCName	Only for global simple types. If missing, will be displayed as '[simpleType]' in diagram.
Derivation	A simple type category	restriction, list, or union	For all simple types
Base Type	A simple type definition component. Required if derivation method is set to restriction.	All global simple types and built-in simple types. In addition another 3 proposals are present: [anonymous restriction], [anonymous list], [anonymous union] for easily create anonymous simple types.	For global and anonymous simple types with the derivation method set to restriction
Item Type	A simple type definition component. Required if derivation method is set to list.	All global simple types and built-in simple types(from schema for schema). In addition another 3 proposals are present: [anonymous restriction], [anonymous list], [anonymous union] for easily create anonymous simple types.	For global and anonymous simple types with the derivation method set to list. Derivation by list is the process of transforming a simple datatype (named the item type) into a whitespace-separated list of values from this datatype. The item type can be defined inline by adding a simpleType definition as a child element of the list element, or by reference, using the itemType attribute (it is an error to use both).
Member Types	Category for grouping union members	Not editable property	For global and anonymous simple types with the derivation method set to union
Member	A simple type definition component. Re-	All global simple types and built-in simple types(from schema for schema). In addition another 3 proposals are present: [anonymous re-	For global and anonymous simple types with the derivation method set to union. Deriving a simple datatype by union merges the lexical spaces of several simple datatypes (called member types) to create a new simple datatype. The member types can be defined either by ref-

Table 11. *xs:simpleType* Properties (continued)

Name	Description	Possible Values	Scope
	quired if derivation method is set to union.	striction], [anonymous list], [anonymous union] for easily create anonymous simple types.	erence (through the memberTypes attribute) or embedded as simple datatype local definitions in the xs:union element. Both styles can be mixed.
Final	Blocks any further derivations of this datatype (by list, union, derivation or all)	#all, list, restriction, union, list restriction, list union, restriction union. In addition, [Empty] proposal is present for set empty string as value.	Only for global simple types
ID	The component ID	Any ID	For all simple types
Component	The name of the edited component	Not editable property	Only for global and local simple types
Namespace	The component namespace	Not editable property	For global simple types
System ID	The component system ID	Not editable property	Not present for built-in simple types

xs:alternative

The *type alternatives* mechanism allows you to specify type substitutions on an element declaration.

Note:

xs:alternative is available for XML Schema 1.1.

Figure 212. The *xs:alternative* ComponentTable 12. *xs:alternative* Properties

Name	Description	Possible Values
Type	Specifies type substitutions for an element, depending on the value of the attributes	All declared or built-in types. In addition, the following anonymous types are available: [ST-restriction], [ST-union], [ST-list], [CT-anonymous], [CT-extension SC], [CT-restriction SC], [CT-restriction CC], [CT-extension CC]
Test	Specifies an XPath expression. If the XPath condition is valid, the specified type is selected as the element type. The expressions allowed are limited to a subset of XPath 2.0. Only the attributes of the current element and inheritable attributes from ancestor elements are accessible in the XPath expression. When you edit this property, the content completion list of proposals offers XPath expressions.	An XPath expression
XPath Default Namespace	The default namespace used when the XPath expression is evaluated	##defaultNamespace, ##targetNamespace, ##local
ID	Specifies the component ID	Any ID
Component	Specifies the type of XML schema component	Not editable property
System ID	Points to the document location of the schema	Not editable property

xs:group

Figure 213. The *xs:group* Component

Defines a group of elements to be used in complex type definitions. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-group>.

When referenced, the graphical representation also contains the value for the *minOccurs* and *maxOccurs* properties (for 0..1 and 1..1 occurs the values are implied by the connector style) and the connectors to the group are drawn using dotted lines if the group is optional.

Table 13. *xs:group* Properties

Property Name	Description	Possible Values	Mentions
Name	The group name (always required)	Any NCName for global groups, all declared groups for reference	If missing, will be displayed as '[group]' in diagram
Min Occurs	Minimum number of occurrences of the group	A numeric positive value. Default value is 1	Appears only for reference groups
Max Occurs	Maximum number of occurrences of the group	A numeric positive value. Default value is 1	Appears only for reference groups
ID	The component ID	Any ID	For all groups
Component	The edited component name	Not editable property	For all groups
Name-space	The component name-space	Not editable property	For all groups
System ID	The component system ID	Not editable property	For all groups

xs:include

Figure 214. The *xs:include* Component

Adds multiple schemas with the same target namespace to a document. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-include>.

Table 14. *xs:include* properties

Property Name	Description	Possible Values
Schema Location	Included schema location	Any URI
ID	Include ID	Any ID
Component	The component name	Not editable property

xs:import

Figure 215. The *xs:import* Component

Adds multiple schemas with a different target namespace to a document. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-import>.

Table 15. *xs:import* Properties

Property Name	Description	Possible Values
Schema Location	Imported schema location	Any URI
Namespace	Imported schema namespace	Any URI
ID	Import ID	Any ID
Component	The component name	Not editable property

xs:redefine

Figure 216. The *xs:redefine* Component

Redefines simple and complex types, groups, and attribute groups from an external schema. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-redefine>.

Table 16. *xs:redefine* Properties

Property Name	Description	Possible Values
Schema Location	Redefine schema location	Any URI
ID	Redefine ID	Any ID
Component	The component name	Not editable property

xs:override

Figure 217. The *xs:override* Component

The override construct allows replacements of old components with new ones without any constraint. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-override>.

Table 17. *xs:override* Properties

Property Name	Description	Possible Values
Schema Location	Redefine schema location	Any URI
ID	Redefine ID	Any ID

xs:notation

Figure 218. The *xs:notation* Component

Describes the format of non-XML data within an XML document. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-notation>.

Table 18. *xs:notation* Properties

Property Name	Description	Possible values	Mentions
Name	The notation name (always required)	Any NCName	If missing, will be displayed as '[notation]' in diagram
System Identifier	The notation system identifier	Any URI	Required if public identifier is absent (otherwise, optional)
Public Identifier	The notation public identifier	A Public ID value	Required if system identifier is absent (otherwise, optional)
ID	The component ID	Any ID	For all notations
Component	The edited component name	Not editable property	For all notations
Namespace	The component namespace	Not editable property	For all notations
System ID	The component system ID	Not editable property	For all notations

xs:sequence / xs:choice / xs:all

Figure 219. *xs:sequence*

xs:sequence specifies that the child elements must appear in a sequence. Each child element occurs once by default. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-sequence>.

Figure 220. *xs:choice*

xs:choice allows only one of the elements contained in the declaration to be present within the containing element. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-choice>.

Figure 221. *xs:all*

xs:all specifies that the child elements can appear in any order. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-all>.

The compositor graphical representation also contains the value for the *minOccurs* and *maxOccurs* properties (for 0..1 and 1..1 occurs the values are implied by the connector style) and the connectors to the compositor are drawn using dotted lines if the compositor is optional.

Table 19. *xs:sequence*, *xs:choice*, *xs:all* Properties

Property Name	Description	Possible Values	Mentions
Compositor	Compositor type	sequence, choice, all	'all' is only available as a child of a group or complex type
Min Occurs	Minimum occurrences of compositor	A numeric positive value. Default is 1	The property is not present if compositor is 'all' and is child of a group
Max Occurs	Maximum occurrences of compositor	A numeric positive value. Default is 1	The property is not present if compositor is 'all' and is child of a group
ID	The component ID	Any ID	For all compositors
Component	The edited component name	Not editable property	For all compositors
System ID	The component system ID	Not editable property	For all compositors

xs:any

Figure 222. The *xs:any* Component

Enables the author to extend the XML document with elements not specified by the schema. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-any>.

The graphical representation also contains the value for the *minOccurs* and *maxOccurs* properties (for 0..1 and 1..1 occurs the values are implied by the connector style) and the connectors to the wildcard are drawn using dotted lines if the wildcard is optional.

Table 20. xs:any Properties

Property Name	Description	Possible Values
Name-space	The list of allowed namespaces. The namespace attribute expects a list of namespace URIs. In this list, two values have a specific meaning: '##targetNamespace' stands for the target namespace, and '##local' stands for local attributes (without namespaces).	##any, ##other, ##targetNamespace, ##local or anyURI
not-Name-space	Specifies the namespace that extension elements or attributes cannot come from	##local, ##targetNamespace
notQ-Name	Specifies an element or attribute that is not allowed	##defined
Process-Contents	Type of validation required on the elements allowed for this wildcard	skip, lax, strict
Min Occurs	Minimum occurrences of any	A numeric positive value. Default is 1
Max Occurs	Maximum occurrences of any	A numeric positive value. Default is 1
ID	The component ID	Any ID
Component	The name of the edited component	Not editable property
System ID	The component system ID	Not editable property

xs:anyAttribute

Figure 223. The *xs:anyAttribute* Component

Enables the author to extend the XML document with attributes not specified by the schema. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-anyAttribute>.

Table 21. *xs:anyAttribute* Properties

Property Name	Description	Possible Value
Name-space	The list of allowed namespaces. The namespace attribute expects a list of namespace URIs. In this list, two values have a specific meaning: '##targetNamespace' stands for the target namespace, and '##local' stands for local attributes (without namespaces).	##any, ##other, ##targetNamespace, ##local or anyURI
Process Contents	Type of validation required on the elements allowed for this wildcard	skip, lax, strict
ID	The component ID	Any ID
Component	The name of the edited component	Not editable property
System ID	The component system ID	Not editable property

xs:unique

Figure 224. The *xs:unique* Component

Defines that an element or an attribute value must be unique within the scope. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-unique>.

Table 22. *xs:unique* Properties

Property Name	Description	Possible Values
Name	The unique name (always required)	Any NCName
ID	The component ID	Any ID
Component	The edited component name	Not editable property
Namespace	The component namespace	Not editable property
System ID	The component system ID	Not editable property

xs:key

Figure 225. The *xs:key* Component

Specifies an attribute or element value as a key (unique, non-nullable and always present) within the containing element in an instance document. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-key>.

Table 23. *xs:key* Properties

Property Name	Description	Possible Value
Name	The key name (always required)	Any NCName
ID	The component ID	Any ID
Component	The edited component name	Not editable property
Namespace	The component namespace	Not editable property
System ID	The component system ID	Not editable property

xs:keyRef

Figure 226. The *xs:keyRef* Component

Specifies that an attribute or element value corresponds to that of the specified key or unique element. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-keyref>.

A keyref by default displays the *Referenced Key* property when rendered.

Table 24. *xs:keyRef* Properties

Property Name	Description	Possible Values
Name	The keyref name (always required)	Any NCName
Referenced Key	The name of referenced key	Any declared element constraints
ID	The component ID	Any ID
Component	The edited component name	Not editable property
Namespace	The component namespace	Not editable property
System ID	The component system ID	Not editable property

xs:selector

Figure 227. The *xs:selector* Component

Specifies an XPath expression that selects a set of elements for an identity constraint. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-selector>.

Table 25. *xs:selector* Properties

Property Name	Description	Possible Values
XPath	Relative XPath expression identifying the element that the constraint applies to	An XPath expression
ID	The component ID	Any ID

Table 25. *xs:selector* Properties (continued)

Property Name	Description	Possible Values
Component	The edited component name	Not editable property
System ID	The component system ID	Not editable property

xs:field

Figure 228. The *xs:field* Component

Specifies an XPath expression that specifies the value used to define an identity constraint. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-field>.

Table 26. *xs:field* Properties

Property Name	Description	Possible Values
XPath	Relative XPath expression identifying the field(s) composing the key, key reference, or unique constraint	An XPath expression
ID	The component ID	Any ID
Component	The edited component name	Not editable property
System ID	The component system ID	Not editable property

xs:assert

Assertions provide a flexible way to control the occurrence and values of elements and attributes available in an XML Schema.

**Note:**

xs:assert is available for XML Schema 1.1.

Figure 229. The *xs:assert* Component

Table 27. *xs:assert* Properties

Property Name	Description	Possible Values
Test	Specifies an XPath expression. If the XPath condition is valid, the specified type is selected as the element type. The expressions allowed are limited to a subset of XPath 2.0. Only the attributes of the current element and inheritable attributes from ancestor elements are accessible in the XPath expression. When you edit this property, the content completion list of proposals offers XPath expressions.	An XPath expression
XPath Default Namespace	The default namespace used when the XPath expression is evaluated	##default-namespace, ##target-namespace, ##local
ID	Specifies the component ID	Any ID
Component	The edited component name	Not editable property
System ID	The component system ID	Not editable property

xs:openContent

Figure 230. The *xs:openContent* Component

The *openContent* element enables instance documents to contain extension elements to be inserted amongst the elements declared by the schema. You can declare open content for your elements at one place (within the *complexType* definition) or at the schema level.

For further details about the *openContent* component, go to <http://www.w3.org/TR/xmlschema11-1/#element-openContent>.

Table 28. *xs:openContent* Properties

Property Name	Description	Possible Value
Mode	Specifies where the extension elements can be inserted	The value can be: "interleave", "suffix" or "none". The default value is "interleave".
ID	The component ID	Any ID
Component	The edited component name	Not editable property
System ID	The component system ID	Not editable property

Note:

This component is available for XML Schema 1.1 only. To change the version of the XML Schema, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **XML > XML Parser > XML Schema**.

Constructs Used to Group Schema Components

This section explains the components that can be used for grouping other schema components.

Attributes

Figure 231. Attributes Construct

Groups all attributes and attribute groups belonging to a complex type.

Table 29. *attributes* Properties

Property Name	Description	Possible Values
Component	The element that has the attributes displayed	Not editable property
System ID	The component system ID	Not editable property

Constraints

Figure 232. Constraints Construct

Groups all constraints (*xs:key* (on page 752), *xs:keyRef* (on page 753), or *xs:unique* (on page 751)) belonging to an element.

Table 30. *constraints* Properties

Property Name	Description	Possible Values
Component	The element that has the constraints displayed	Not editable property
System ID	The component system ID	Not editable property

Substitutions

Figure 233. Substitutions Construct

Groups all elements that can substitute the current element.

Table 31. *substitutions* Properties

Property Name	Description	Possible Values
Component	The element that has the substitutions displayed	Not editable property
System ID	The component system ID	Not editable property

Schema Validation

Validation for the **Design** mode is seamlessly integrated in the Oxygen XML Developer [XML documents validation \(on page 543\)](#) capability.

Figure 234. XML Schema Validation

A schema validation error is presented by highlighting the invalid component:

- In the [Attributes View \(on page 765\)](#).
- In the diagram by surrounding the component that has the error with a red border.
- A marker on the errors stripe at the right of the diagram view.
- A status label with a red icon (❗) below the diagram view.

Invalid facets for a component are highlighted in the [Facets View \(on page 720\)](#).

Components with invalid properties are rendered with a red border. This is a default color, but you can customize it in the [Document checking user preferences \(on page 194\)](#). When hovering an invalid component, the tooltip will present the validation errors associated with that component.

When editing a value that is supposed to be a qualified or unqualified XML name, the application provides automatic validation of the entered value. This proves to be very useful in avoiding setting invalid XML names for the given property.

If you validate the entire schema using the  **Validate** action from the **Document > Validate** menu or from the  **Validation** toolbar drop-down menu, all validation errors will be presented in the **Errors** tab. To resolve an error, just click it (or double-click for errors located in other schemas) and the corresponding schema component will be displayed as the diagram root so that you can easily correct the error.

**Important:**

If the schema imports only the namespace of other schema without specifying the schema location and a [catalog is set up \(on page 593\)](#) that maps the namespace to a certain location both the validation and the diagram will correctly identify the imported schema.

**Tip:**

If the validation action finds that the schema contains unresolved references, the application will suggest the use of validation scenarios, but only if the currently edited schema is an XML Schema module.

Edit Schema Namespaces

You can use the **XML Schema Namespaces** dialog box to easily set a target namespace and define namespace mappings for a newly created XML Schema. In the **Design** mode these namespaces can be modified anytime by choosing **Edit Schema Namespaces** from the contextual menu. You can also do this by double-clicking the schema root in the diagram.

The **XML Schema Namespaces** dialog box allows you to edit the following information:

- **Target namespace** - The target namespace of the schema.
- **Prefixes** - The dialog box displays a table with namespaces and the mapped prefixes. You can add a new prefix mapping or remove an already existing one.

Editing XML Schema in Text Editing Mode

The Oxygen XML Developer **Text** editing mode can be used for editing XML Schema in a source editing mode. It offers powerful content completion support, a synchronized Outline view, and multiple [refactoring actions \(on page 772\)](#). The Outline view has two display modes: the [standard outline \(on page 494\)](#) mode and the [components \(on page 763\)](#) mode.

A diagram of the XML Schema can be presented side by side with the text. To activate the diagram presentation, select the [Show Full Model XML Schema diagram option \(on page 164\)](#) in the **Diagram preferences page (on page 163)**.

Modular Contextual XML Schema Editing Using 'Main Files' Support

Smaller interrelated modules that define a complex XML Schema cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, an element defined in a main schema document is not visible when you edit an included module. Oxygen XML Developer provides the support for defining the main module (or modules), thus allowing you to edit any of the imported/included schema files in the context of the larger schema structure.

You can set a main XML document either using the [main files support from the Project view \(on page 381\)](#), or using a validation scenario.

To set a *main file* using a validation scenario, add validation units that point to the main schemas. Oxygen XML Developer warns you if the current module is not part of the dependencies graph computed for the main schema. In this case, it considers the current module as the main schema.

The advantages of editing in the context of a *main file* (on page 2270) include:

- Correct validation of a module in the context of a larger schema structure.
- *Content Completion Assistant* (on page 2267) displays all the referable components valid in the current context. This include components defined in modules other than the currently edited one.
- The **Outline view** (on page 763) displays the components collected from the entire schema structure.

Validating XML Schema Documents

By default, XML Schema files are validated as you type. To change this, open the **Preferences** dialog box (**Options > Preferences**) (on page 114), go to **Editor > Document Checking**, and deselect the **Enable automatic validation** option (on page 195).

To validate an XML Schema document manually, select the  **Validate** action from the  **Validation** toolbar drop-down menu or the **Document > Validate** menu. When Oxygen XML Developer validates an XML Schema file, it expands all the included modules so the entire schema hierarchy is validated. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

Some validation messages have an icon () in the **Info** column in the *Results view* (on page 503) or at the bottom of the main editor and clicking it opens a dialog box with additional information and a link to the W3C specification exactly at the location where the error is described, thus allowing you to understand the reason for that error.

Validation of an XML Schema containing a type definition with a `@minOccurs` or `@maxOccurs` attribute having a value larger than 256 limits the value to 256 and issues a warning about this restriction in the Message panel at the bottom of the Oxygen XML Developer window. Otherwise, for large values of the `@minOccurs` and `@maxOccurs` attributes, the validator fails with an **OutOfMemory** error that might make Oxygen XML Developer unusable without restarting the entire application.

Important:

If the schema imports only a namespace without specifying the schema location and a *catalog is set up* (on page 593) to map the namespace to a certain location, both validation and the schema components will correctly identify the imported schema.

[Validation Scenario](#) (on page 554)

[Associating a Schema to XML Documents](#) (on page 582)

[Presenting Validation Errors in Text Mode](#) (on page 548)

Quick Fixes for DTD, XSD, and Relax NG Errors

Oxygen XML Developer offers *Quick Fixes* (on page 2272) for common errors that appear in XML documents that are validated against DTD, XSD, or Relax NG schemas.

Note:

For XML documents validated against XSD schemas, the *Quick Fixes* are only available if you use the default Xerces validation engine.

Quick Fixes are available in **Text** mode .

Oxygen XML Developer provides *Quick Fixes* for numerous types of problems, including the following:

Problem Type	Available Quick Fixes
A specific element is required in the current context	Insert the required element
An element is invalid in the current context	Remove the invalid element
The content of the element should be empty	Remove the element content
An element is not allowed to have child elements	Remove all child elements
Text is not allowed in the current element	Remove the text content
A required attribute is missing	Insert the required attribute
An attribute is not allowed to be set for the current element	Remove the attribute
The attribute value is invalid	Propose the correct attribute values
ID value is already defined	Generate a unique ID value
References to an invalid ID	Change the reference to an already defined ID

Related Information:

[Schematron Quick Fixes \(SQF\) \(on page 582\)](#)

[Ignoring/Unignoring Validation Problems \(on page 578\)](#)

Content Completion in XML Schema

The intelligent *Content Completion Assistant* (on page 2267) allows you to quickly identify and insert elements, attributes, and attribute values that are valid in the current editing context. All available proposals are listed in a pop-up menu displayed at the current cursor position.

The *Content Completion Assistant* is enabled by default. To disable it, open the **Preferences** dialog box (**Options > Preferences**) (on page 114), go to **Editor > Content Completion**, and deselect the **Enable content completion** option (on page 179).

When active, the *Content Completion Assistant* displays a list of context-sensitive proposals valid at the current cursor position. It can be manually activated with the **Ctrl + Space** shortcut. You can navigate through the list of proposals by using the **Up** and **Down** keys on your keyboard. For each selected item in the list, the *Content Completion Assistant* displays a documentation window. You can customize the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal in **Text** mode, do one of the following:

- Press **Enter** or **Tab** to insert both the start and end tags and position the cursor inside the start tag in a position suitable for inserting attributes.
- Press **Ctrl + Enter** (**Command + Enter** on macOS) to insert both the start and end tags and positions the cursor between the tags in a position where you can start typing content.

Depending on the [selected schema version \(on page 800\)](#), Oxygen XML Developer populates the proposals list with information taken either from XML Schema 1.0 or 1.1.

Oxygen XML Developer helps you to easily reference a component by providing the list of proposals (complex types, simple types, elements, attributes, groups, attribute groups, or notations) valid in the current context. The components are collected from the current file or from the imported/included schemas.

When editing `<xs:annotation>` or `<xs:appinfo>` elements of an XML Schema, the *Content Completion Assistant* proposes elements and attributes from a custom schema (by default ISO Schematron). This feature can be configured from the [XSD Content Completion \(on page 183\)](#) preferences page.

Syntax Highlighting in XML Schema

Oxygen XML Developer supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for XML Schema files, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) [\(on page 114\)](#).
2. Go to **Editor > Syntax Highlight** [\(on page 193\)](#).
3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XSD** tab in the **Preview** pane to see the effects of your changes.

**Tip:**

Oxygen XML Developer also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the **Editor > Syntax Highlight > Elements/Attributes by Prefix** preferences page [\(on page 193\)](#).

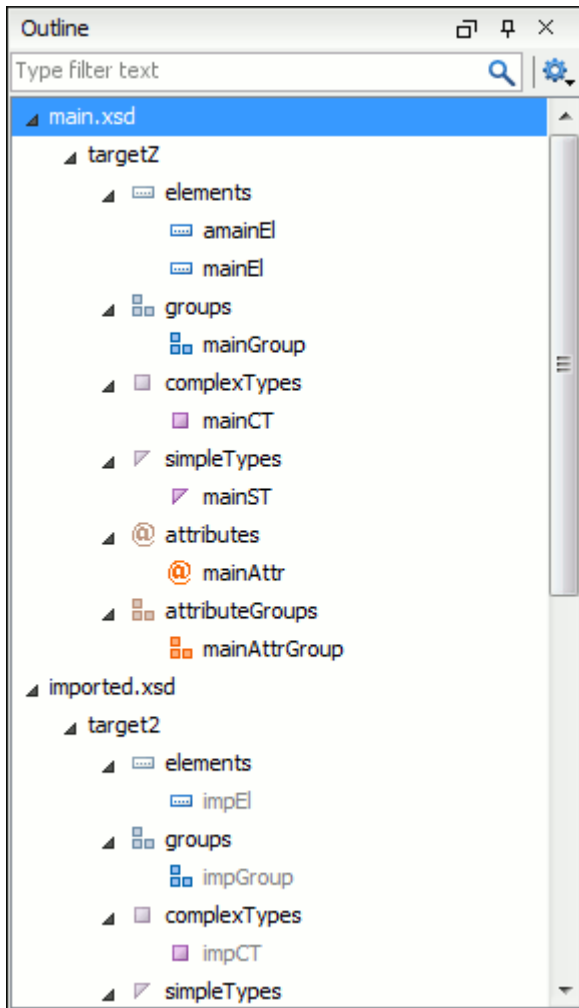

Related Information:

[Customize Syntax Highlight colors \(on page 193\)](#)

XML Schema Outline View

The **Outline** view for XML Schemas presents all the global components grouped by their location, namespace, or type. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 235. Outline View for XML Schema

The **Outline** view provides the following options in the  **Settings** menu on the **Outline** view toolbar:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches;

Selection update on cursor move

Allows a synchronization between **Outline** view and schema diagram. The selected view from the diagram is also selected in the **Outline** view.

Sort

Allows you to sort alphabetically the schema components.

Show all components

Displays all components that were collected starting from the *main files (on page 2270)*. Components that are not referable from the current file are marked with an orange underline. To reference them, add an import directive with the `componentNS` namespace.

Show referable components

Displays all components (collected starting from the *main files (on page 2270)*) that can be referenced from the current file. This option is set by default.

Show only local components

Displays the components defined in the current file only.

Group by location/namespace/type

These three operations allow you to group the components by location, namespace, or type. When grouping by namespace, the main schema target namespace is the first presented in the **Outline** view.

The following contextual menu actions are available in the **Outline** view:

Remove (Delete)

Removes the selected item from the diagram.

Search References (Ctrl + Shift + R (Meta + Shift + R on macOS))

Searches all references of the item found at current cursor position in the defined scope, if any.

Search References in

Searches all references of the item found at current cursor position in the specified scope.

Component Dependencies (Ctrl + Shift + F4 (Meta + Shift + F4 on macOS))

Opens the **Component Dependencies view (on page 770)** that allows you to see the dependencies for the currently selected component.

Show referenced resources (F4)

Opens the **Referenced/Dependent Resources view (on page 599)** that allows you to see the references for the currently selected resource.

Show dependent resources (Shift + F4)

Opens the **Referenced/Dependent Resources view (on page 599)** that allows you to see the dependencies for the currently selected resource.

Rename Component in

Renames the selected component.

Generate Sample XML Files

Generate XML files using the currently open schema. The selected component is the XML document root.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as * or ?) and separate multiple patterns with commas.

**Tip:**

The search filter is case insensitive. The following wildcards are accepted:

- * - any string
- ? - any character
- , - patterns separator

If no wildcards are specified, the string to search will be searched as a partial match.

The content of the **Outline** view and the editing area are synchronized. When you select a component in the **Outline** view, its definition is highlighted in the editing area.

[XML Schema Referenced/Dependent Resources View \(on page 767\)](#)

[Generating Sample XML Files \(on page 776\)](#)

[Modular Contextual Relax NG Schema Editing Using 'Main Files' Support \(on page 852\)](#)

XML Schema Attributes View

The **Attributes** view for XML Schemas presents the properties for the selected component in the schema diagram. By default, it is displayed on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 236. Attributes View

Name	family
Type	[ST - union]
Member Types	
Member	xs:string
Default	
Fixed	
Substitution Group	
Abstract	false
Nilable	false
Block	
Final	
ID	
Component	element
Namespace	
System ID	personal.xsd

The default value of a property is presented in the **Attributes** view with blue foreground. The properties that can not be edited are rendered with gray foreground. A non-editable category that contains at least one child is rendered with bold. Bold properties are properties with values set explicitly to them.

Properties for components that do not belong to the currently edited schema are read-only but if you double-click them you can choose to open the corresponding schema and edit them.

You can edit a property by double-clicking by pressing Enter. For most properties you can choose valid values from a list or you can specify another value. If a property has an invalid value or a warning, it will be highlighted in the table with the corresponding foreground color. By default, properties with errors are highlighted with red and the properties with warnings are highlighted with yellow. You can customize these colors from the [Document checking user preferences \(on page 194\)](#).

For imports, includes and redefines, the properties are not edited directly in the **Attributes** view. A dialog box will open that allows you to specify properties for them.

The schema namespace mappings are not presented in **Attributes** view. You can view/edit these by choosing **Edit Schema Namespaces** from the contextual menu on the schema root. See more in the [Edit Schema Namespaces \(on page 759\)](#) section.

The **Attributes** view has five actions available on the toolbar and also on the contextual menu:

+ Add

Allows you to add a new member type to an union's member types category.

× Remove

Allows you to remove the value of a property.

 **Move Up**

Allows you to move up the current member to an union's member types category.

 **Move Down**

Allows you to move down the current member to an union's member types category.

 **Copy**

Copy the attribute value.

 **Go to Definition**

Shows the definition for the selected type.

Show Facets

Allows you to edit the facets for a simple type.

XML Schema Referenced/Dependent Resources View

The **Referenced/Dependent Resources** view displays the hierarchy or dependencies for resources included in an XML Schema. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The **Referenced/Dependent Resources** is useful when you want to start from an XML Schema (XSD) file and build and review the hierarchy of all the other XSD files that are imported, included or redefined in the given XSD file. The view is also able to build the tree structure, that is the structure of all other XSD files that import, include or redefine the given XSD file. The scope of the search is configurable (the current project, a set of local folders, etc.)

If you want to see the references or dependencies of an XML schema, select the desired schema in the **Project view** ([on page 365](#)) and choose **Show referenced resources** or **Show dependent resources** from the contextual menu.

Figure 237. Referenced/Dependent Resources View

The following actions are available on the toolbar of the **Referenced/Dependent Resources** view:

 **Refresh**

Refreshes the resource structure.

 **Stop**

Stops the computing.

 **Show hierarchy for**

Computes the hierarchical structure of the references for a resource.

 **Show dependencies for**

Computes the structure of the dependencies for a resource.

 **Configure dependencies search scope**

Allows you to configure a scope to compute the dependencies. There is also an option for automatically using the defined scope for future operations.

 **History**

Provides access to the list of previously computed dependencies. Use the  **Clear history** button to remove all items from this list.

The contextual menu for a resource listed in the **Referenced/Dependent Resources** view contains the following actions:

Open

Opens the resource. You can also double-click a resource within the hierarchical structure to open it.

Go to reference

Opens the source document where the resource is referenced.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show references resources

Shows the references for the selected resource.

Show dependent resources

Shows the dependencies for the selected resource.

 **Add to Main Files**

Adds the currently selected resource in the **Main Files** directory.

Expand More

Expands more of the children of the selected resource from the hierarchical structure.

Collapse All

Collapses all children of the selected resource from the hierarchical structure.

**Tip:**

When a recursive reference is encountered in the view, the reference is marked with a special icon .

**Note:**

The **Move resource** or **Rename resource** actions give you the option to [update the references to the resource \(on page 769\)](#).

Related Information:

[Modular Contextual XML Editing Using 'Main Files' Support \(on page 596\)](#)

[Search and Refactor Operations Scope \(on page 598\)](#)

Moving/Renaming XML Schema Resources

You can move and rename a resource presented in the **Referenced/Dependent Resources** view, using the **Rename resource** and **Move resource** refactoring actions from the contextual menu.

When you select the **Rename** action in the contextual menu of the **Referenced/Dependent Resources** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource(s)** - Select this option to update the references to the resource you are renaming. A **Preview** option is available that allows you to see what will be updated before selecting **Rename** to process the operation.

When you select the **Move** action from the contextual menu of the **Referenced/Dependent Resources** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, in accordance with the new location and name. A **Preview** option is available that allows you to see what will be updated before selecting **Move** to process the operation.

XML Schema Component Dependencies View

The **Component Dependencies** view allows you to see the dependencies for a selected component. This is helpful if you want to see where components are used in the entire hierarchy. For example, if you want to find all the references where a given component is used.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

To see the dependencies of an XML Schema component:

1. Right-click the desired component in the editor or **Outline** view.
2. Select the **Component Dependencies** action from the contextual menu.

The action is available for all named components (for example, elements or attributes).

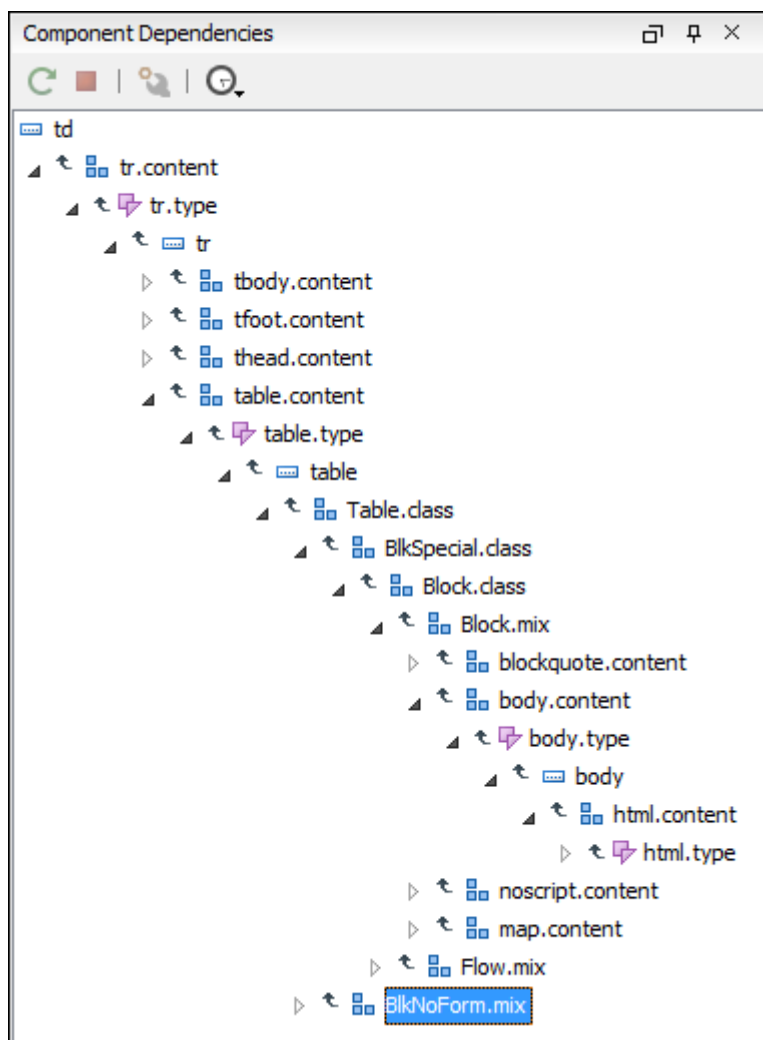

If a component contains multiple references, a small table is displayed at the bottom of the view that contains all the references. When a recursive reference is encountered, it is marked with a special icon .

Figure 238. Component Dependencies View

The **Component Dependencies** view includes the following toolbar actions:

Refresh

Refreshes the dependencies structure.

Stop

Stops the dependency computation.

Configure

Allows you to choose the search scope for computing the dependencies structure. This is helpful for making sure all imported/included resources are computed.

History

Allows you to select from a list of the most recently used dependency computations.

In addition, the following actions are available in the contextual menu:

Go to First Reference

Selects the first reference of the currently selected component in the dependencies tree.

Go to Component

Shows the definition of the currently selected component in the dependencies tree.

[Search and Refactor Operations Scope \(on page 598\)](#)

Highlight Component Occurrences

When a component (for example types, elements, attributes) is found at current cursor position, Oxygen XML Developer performs a search over the entire document to find the component declaration and all its references. When found, they are highlighted both in the document and in the stripe bar, at the right side of the document. Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected and a new search is performed. All occurrences are removed when you start to edit the document.

This feature is on by default. To configured it, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **Editor > Mark Occurrences**. A search can also be triggered with the **Search > Search Occurrences in File ()** contextual menu action. All matches are displayed in a separate tab of the **Results view (on page 503)**.

Searching and Refactoring Actions in XML Schemas

Search Actions

The following search actions can be applied on `attribute`, `attributeGroup`, `element`, `group`, `key`, `unique`, `keyref`, `notation`, `simple`, or `complex` types and are available from the **Search** submenu in the contextual menu of the current editor or from the **Document > References** menu:

Search References

Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the currently edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.

Search References in

Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.

Search Declarations

Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the currently edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.

Search Declarations in

Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.

Search Occurrences in File

Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the contextual menu and the **Document > Schema** menu:

Go to Definition

Moves the cursor to the definition of the referenced XML Schema item.

Note:

You can also use the **Ctrl + Single-Click (Command + Single-Click on macOS)** shortcut on a reference to display its definition.

Refactoring Actions

The following refactoring actions can be applied on `attribute`, `attributeGroup`, `element`, `group`, `key`, `unique`, `keyref`, `notation`, `simple`, or `complex` types and are available from the **Refactoring** submenu in the contextual menu of the current editor or from the **Document > Refactoring** menu:

Rename Component

Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.

Rename Component in

Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

Figure 239. Rename Identity Constraint Dialog Box**Related Information:**

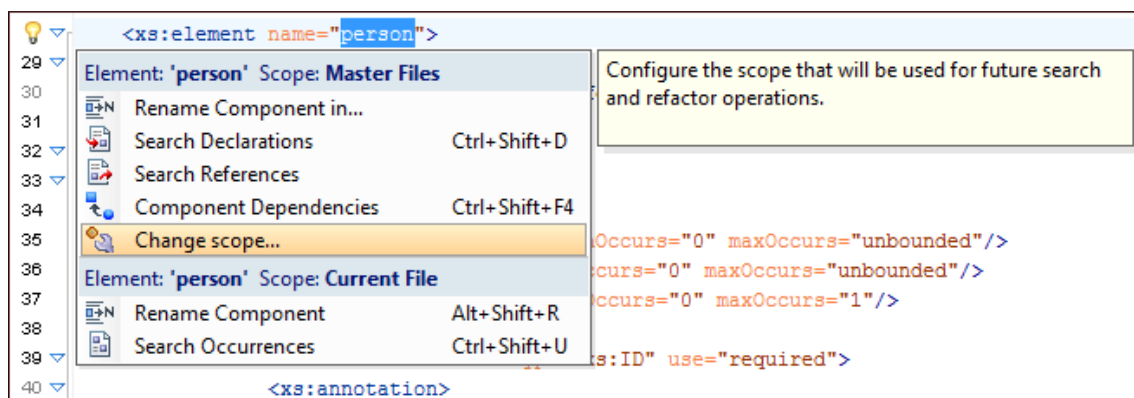

[Search and Refactor Operations Scope \(on page 598\)](#)

XML Schema Quick Assist Support

The *Quick Assist* support (on page 2272) improves the development work flow, offering fast access to the most commonly used actions when you edit schema documents.

The *Quick Assist* feature (on page 2272) is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb icon (💡) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the *quick assist* menu by using the **Alt + 1** (**Meta + Alt + 1** on macOS) keyboard shortcuts.

Figure 240. Quick Assist Support

The *Quick Assist* support offers direct access to the following actions:

Rename Component in

Renames the component and all its dependencies.

Search Declarations

Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

Search References

Searches all references of the component in a predefined scope.

Component Dependencies

Searches the component dependencies in a predefined scope.

Change Scope

Configures the scope that will be used for future search or refactor operations.

Rename Component

Allows you to rename the current component in-place.

Search Occurrences

Searches all occurrences of the component within the current file.

Resources

For more information about improving schema development using the **Quick Assist** action set, watch our video demonstration:

<https://www.youtube.com/embed/X-2-gkrFSGU>

Related Information:[Referenced/Dependent Resources View \(on page 767\)](#)[Component Dependencies View \(on page 770\)](#)[Searching and Refactoring Actions \(on page 772\)](#)

Generating Sample XML Files

Oxygen XML Developer offers support to generate sample XML files both from XML schema 1.0 and XML schema 1.1, depending on the XML schema version set in [XML Schema preferences page \(on page 207\)](#).

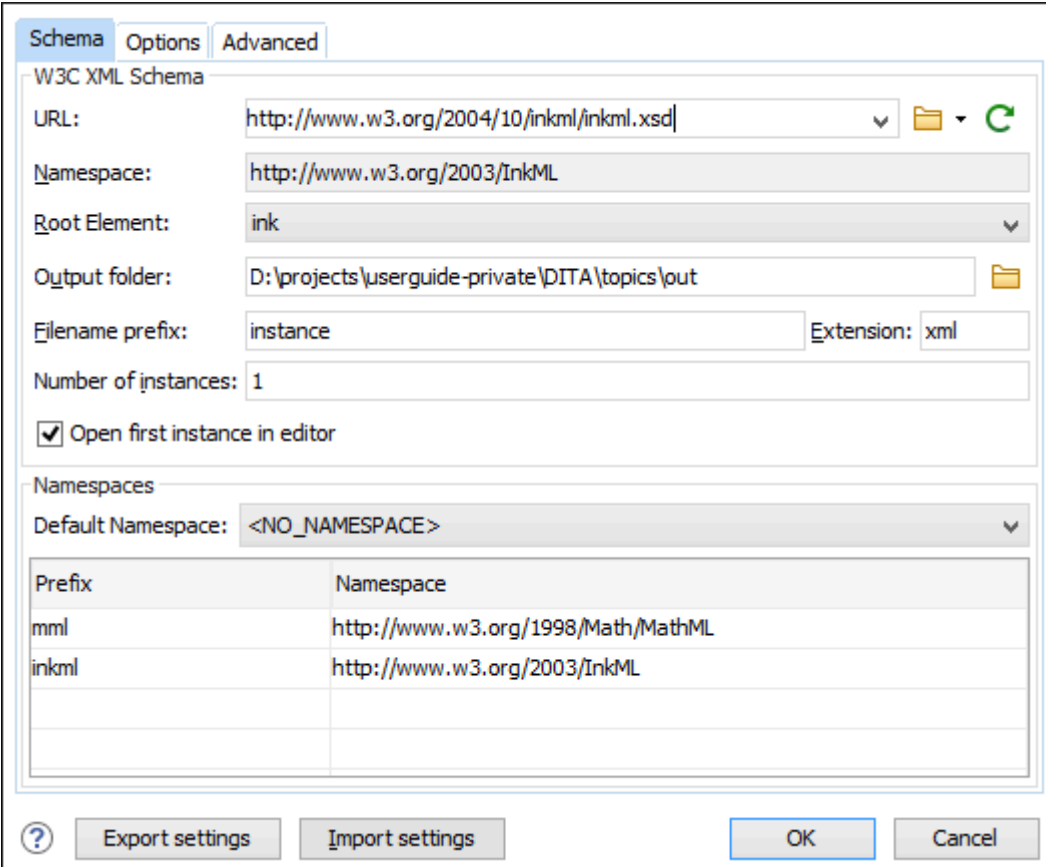

To generate sample XML files from an XML Schema, use the  **Generate Sample XML Files** action from the **Tools** menu. This action is also available in the contextual menu of the schema [Design mode \(on page 722\)](#). The action opens the **Generate Sample XML Files** dialog box that allows you to configure a variety of options for generating the files.

The **Generate Sample XML Files** dialog box contains three tabs with various configurable options. Default values for these options can be set in the [Sample XML Files Generator preferences page \(on page 210\)](#). You can also run the tool from the command line using exported options.

Schema Tab

The first set of options for the  **Generate Sample XML Files** tool are found in the **Schema** tab.

Figure 241. Generate Sample XML Files Dialog Box (Schema Tab)

The dialog box is titled "Generate Sample XML Files" and has three tabs: "Schema", "Options", and "Advanced". The "Schema" tab is selected. The "W3C XML Schema" section contains the following fields:

- URL:** (with folder and refresh icons)
- Namespace:**
- Root Element:** (with dropdown arrow)
- Output folder:** (with folder icon)
- Filename prefix:** **Extension:**
- Number of instances:**
- Open first instance in editor**

The "Namespaces" section contains a **Default Namespace:** (with dropdown arrow) and a table:

Prefix	Namespace
mml	http://www.w3.org/1998/Math/MathML
inkml	http://www.w3.org/2003/InkML

At the bottom of the dialog are buttons for **Export settings**, **Import settings**, **OK**, and **Cancel**.

This tab includes the following options:

URL

Specifies the URL of the Schema location. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the  ▾ **Browse** drop-down list.

Namespace

Displays the namespace of the selected schema.

Root Element

After the schema is selected, this drop-down menu is populated with all root candidates gathered from the schema. Choose the root of the output XML documents.

Output folder

Path to the folder where the generated XML instances will be saved.

Filename prefix and Extension

You can specify the prefix and extension for the file name that will be generated. Generated file names have the following format: `prefixN.extension`, where `N` represents an incremental number from 0 up to the specified **Number of instances**.

Number of instances

The number of XML files to be generated.

Open first instance in editor

When selected, the first generated XML file is opened in the editor.

Namespaces section

You can specify the **Default Namespace**, as well as the prefixes for the namespaces.

Export settings

Use this button to save the current settings for future use.

Import settings

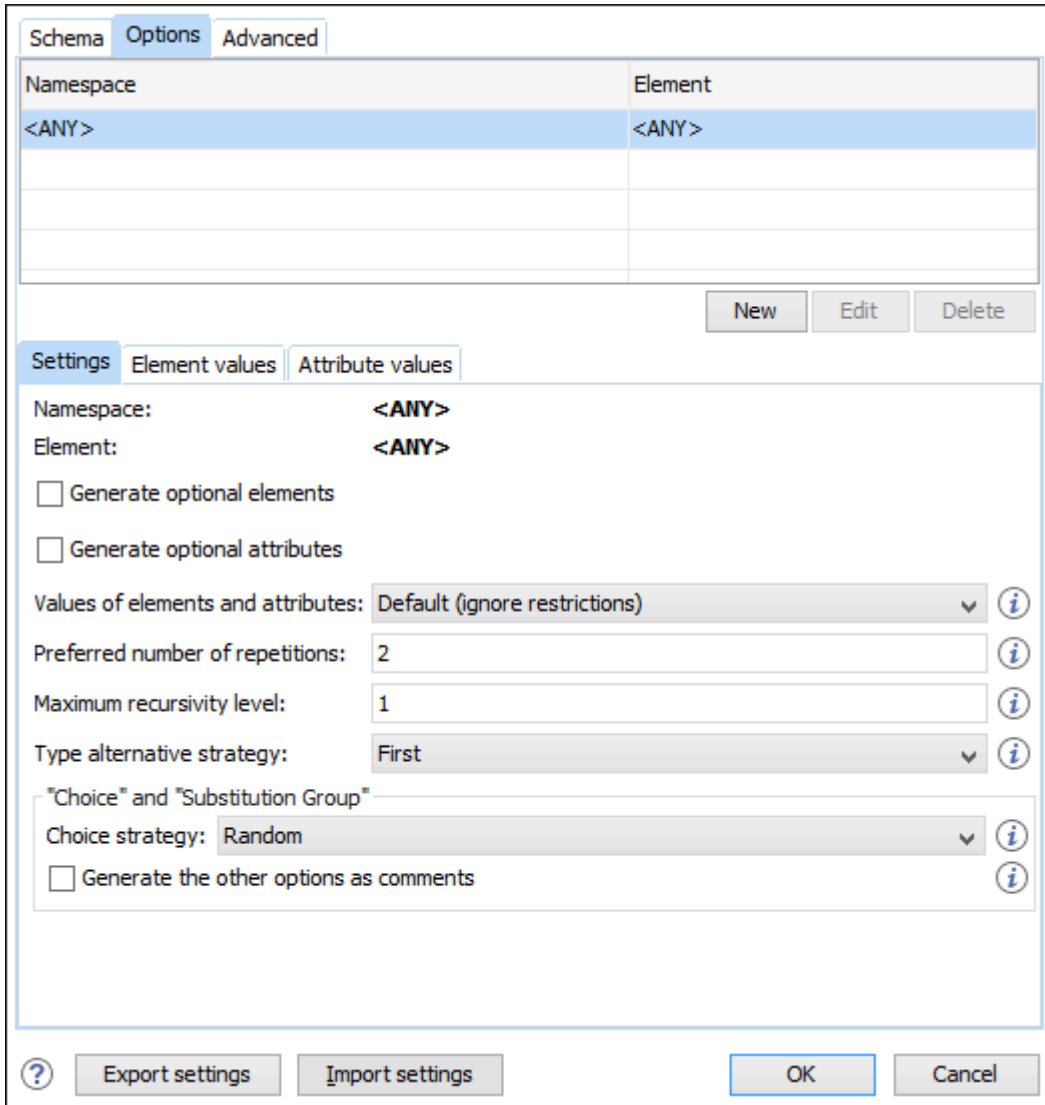

Use this button to load previously exported settings.

You can click **OK** at any point to generate the sample XML files.

Options Tab

The **Options** tab allows you to set specific options for namespaces and elements.

Figure 242. Generate Sample XML Files Dialog Box (Options Tab)

This tab includes the following options:

Namespace / Element table

Allows you to set a namespace for each element name that appears in an XML document instance. The following prefix-to-namespace associations are available:

- All elements from all namespaces (<ANY> - <ANY>). This is the default setting.
- All elements from a specific namespace.
- A specific element from a specific namespace.

Settings subtab

Namespace

Displays the namespace specified in the table at the top of the dialog box.

Element

Displays the element specified in the table at the top of the dialog box.

Generate optional elements

When selected, all elements are generated, including the optional ones (having the `minOccurs` attribute set to 0 in the schema).

Generate optional attributes

When selected, all attributes are generated, including the optional ones (having the `use` attribute set to `optional` in the schema).

Values of elements and attributes

Controls the content of generated attribute and element values. The following choices are available:

- **None** - No content is inserted.
- **Default** - Inserts a default value depending on the data type descriptor of the particular element or attribute. The default value can be either the data type name or an incremental name of the attribute or element (according to the global option from the **Sample XML Files Generator** preferences page). Note that type restrictions are ignored when this option is selected. For example, if an element is of a type that restricts an `xs:string` with the `xs:maxLength` facet to allow strings with a maximum length of 3, the XML instance generator tool may generate string element values longer than 3 characters.
- **Random** - Inserts a random value depending on the data type descriptor of the particular element or attribute.

Important:

If all of the following are true, the **Generate Sample XML Files** tool outputs invalid values:

- At least one of the restrictions is a `regex`.
- The value generated after applying the `regex` does not match the restrictions imposed by one of the facets.

Preferred number of repetitions

Allows you to set the preferred number of repeating elements related to `minOccurs` and `maxOccurs` facets defined in the XML Schema.

- If the value set here is between `minOccurs` and `maxOccurs`, then that value is used.
- If the value set here is less than `minOccurs`, then the `minOccurs` value is used.
- If the value set here is greater than `maxOccurs`, then `maxOccurs` is used.

Maximum recursion level

If a recursion is found, this option controls the maximum allowed depth of the same element.

Type alternative strategy

Used for the `<xsl:alternative>` element from XML Schema 1.1. The possible strategies are:

- **First** - The first valid alternative type is always used.
- **Random** - A random alternative type is used.

Choice strategy

Used for `<xsl:choice>` or `<substitutionGroup>` elements. The possible strategies are:

- **First** - The first branch of `<xsl:choice>` or the head element of `<substitutionGroup>` is always used.
- **Random** - A random branch of `<xsl:choice>` or a substitute element or the head element of a `<substitutionGroup>` is used.

Generate the other options as comments

If selected, generates the other possible choices or substitutions (for `<xsl:choice>` and `<substitutionGroup>`). These alternatives are generated inside comments groups so you can uncomment and use them later. Use this option with care (for example, on a restricted namespace and element) as it may generate large result files.

Element values subtab

Allows you to add values that are used to generate the content of elements. If there are multiple values, then the values are used in a random order.

Attribute values subtab

Allows you to add values that are used to generate the content of attributes. If there are multiple values, then the values are used in a random order.

Export settings

Use this button to save the current settings for future use.

Import settings

Use this button to load previously exported settings.

You can click **OK** at any point to generate the sample XML files.

Advanced Tab

The **Advanced** tab allows you to set some options regarding output values and performance.

Figure 243. Generate Sample XML Files Dialog Box (Advanced Tab)

This tab includes the following options:

Use incremental attribute / element names as default

If selected, the value of an element or attribute starts with the name of that element or attribute. For example, for an `<a>` element the generated values are: `a1`, `a2`, `a3`, and so on. If not selected, the value is the name of the type of that element / attribute (for example: `string`, `decimal`, etc.)

Maximum length

The maximum length of string values generated for elements and attributes.

Discard optional elements after nested level

The optional elements that exceed the specified nested level are discarded. This option is useful for limiting deeply nested element definitions that can quickly result in very large XML documents.

Export settings

Use this button to save the current settings for future use.

Import settings

Use this button to load previously exported settings.

Tip:

This function can be executed from an automated command-line script, for more details, see [Scripting Oxygen \(on page 2233\)](#).

Generating Documentation for an XML Schema

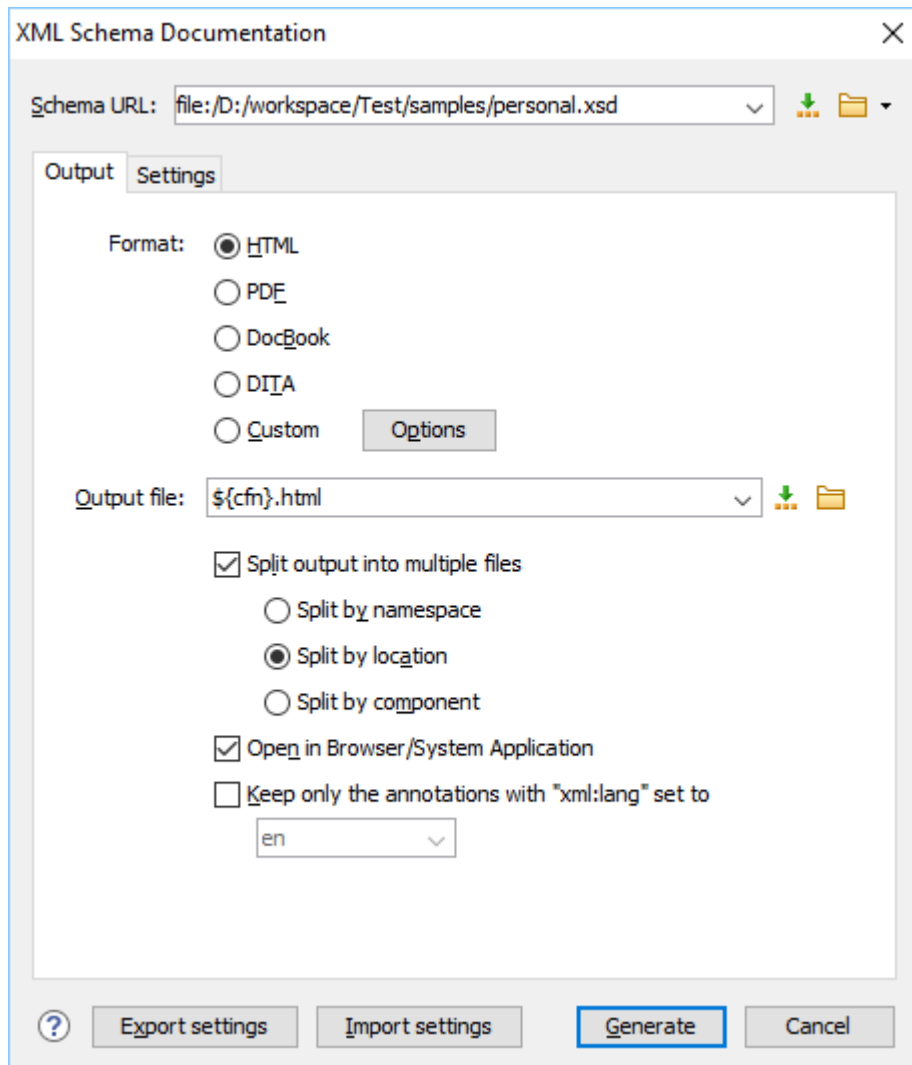

Oxygen XML Developer can generate detailed documentation for the components of an XML Schema in HTML, PDF, DocBook, or other custom formats. You can select the components and the level of detail. The components are hyperlinked in both HTML and DocBook documents.

**Note:**

You can generate documentation for both XML Schema version 1.0 and 1.1.

To generate documentation for an XML Schema document, select **XML Schema Documentation** from the **Tools > Generate Documentation** menu or from the **Generate Documentation** submenu in the contextual menu of the **Project view** (on page 365). You can also open the tool by using the **Generate Documentation** toolbar button.

Figure 244. XML Schema Documentation Dialog Box

The **Schema URL** field of the dialog box must contain the full path to the XML Schema (XSD) file that will have documentation generated. The schema may be a local or a remote file. You can specify the path to the schema by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

Output Tab

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
 - **HTML** - The documentation is generated in [HTML output format \(on page 786\)](#).
 - **PDF** - The documentation is generated in [PDF output format \(on page 789\)](#).
 - **DocBook** - The documentation is generated in [DocBook output format \(on page 789\)](#).
 - **DITA** - The documentation is generated in [DITA output format \(on page 789\)](#).
 - **Custom** - The documentation is generated in a [custom output format \(on page 789\)](#), allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.
- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the  **Insert Editor Variables** button or the options in the  **Browse** drop-down menu.
- **Split output into multiple files** - Instructs the application to split the output into multiple files. You can choose to split them by namespace, location, or component name.
- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type. For DITA and DocBook documents, this option appears as **Open in Editor** and the result will be opened in Oxygen XML Developer (in the current editor).

Note:

To set the browser or system application that will be used, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#), go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

- **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the `@xml:lang` attribute set to the selected language. If you choose a primary language code (for example, **en** for English), this includes all its possible variations (**en-us**, **en-uk**, etc.).

Settings Tab

When you generate documentation for an XML schema you can choose what components to include in the output and the details to be included in the documentation.

Figure 245. Settings Tab of the XML Schema Documentation Dialog Box

The **Settings** tab allows you to choose whether or not to include the following components: **Global elements**, **Global attributes**, **Local elements**, **Local attributes**, **Simple Types**, **Complex Types**, **Groups**, **Attribute Groups**, **Redefines**, **Referenced schemas**, **Include notations**.

You can choose whether or not to include the following other details:

- **Diagram** - Displays the diagram for each component. You can choose the image format (JPEG, PNG, GIF, SVG) to use for the diagram section. The generated diagrams are dependent on the options from the [Schema Design Properties \(on page 167\)](#) page.
- **Diagram annotations** - This option controls whether or not the annotations of the components presented in the diagram sections are included.
- **Namespace** - Displays the namespace for each component.
- **Location** - Displays the schema location for each component.
- **Type** - Displays the component type if it is not an anonymous one.
- **Type hierarchy** - Displays the types hierarchy.
- **Model** - Displays the model (sequence, choice, all) presented in BNF form. The separator characters that are used depend upon the information item used:

- **xs:all** - Its children will be separated by space characters.
- **xs:sequence** - Its children will be separated by comma characters.
- **xs:choice** - Its children will be separated by / characters.
- **Children** - Displays the list of component's children.
- **Instance** - Displays an XML instance generated based on each schema element.
- **Used by** - Displays the list of all the components that reference the current one. The list is sorted by component type and name.
- **Properties** - Displays some of the component's properties.
- **Facets** - Displays the facets for each simple type.
- **Identity constraints** - Displays the identity constraints for each element. For each constraint there are presented the name, type (unique, key, keyref), reference attribute, selector and field(s).
- **Attributes** - Displays the attributes for the component. For each attribute there are presented the name, type, fixed or default value, usage and annotation.
- **Asserts** - Displays the **assert** elements defined in a complex type. The test, XPath default namespace, and annotation are presented for each assert.
- **Annotations** - Displays the annotations for the component. If you choose **Escape XML Content**, the XML tags are present in the annotations.
- **Source** - Displays the text schema source for each component.
- **Generate index** - Displays an index with the components included in the documentation.
 - **Include local elements and attributes** - If selected, local elements and attributes are included in the documentation index.
 - **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is deselected by default.

Export settings - Save the current settings in a settings file for further use (for example, if you need the exported settings file for [generating the documentation from the command-line interface](#)).

Import settings - Reloads the settings from the exported file.

Generate - Use this button to generate the XML Schema documentation.

Tip:

This function can be executed from an automated command-line script, for more details, see [Scripting Oxygen \(on page 2233\)](#).

Related Information:

[Customizing PDF or DocBook Output of Generated XML Schema Documentation \(on page 790\)](#)

Output Formats for Generating XML Schema Documentation

XML Schema documentation can be generated in HTML, PDF, DocBook, or a custom format. You can choose the format from the [Schema Documentation \(on page 781\)](#) dialog box. For the PDF and DocBook formats, the option to split the output in multiple files is not available.

HTML Output Format

The XML Schema documentation generated in HTML format contains images corresponding to the same schema definitions as the ones displayed by [the schema diagram editor](#). (on page 317) These images are divided in clickable areas that are linked to the definitions of the names of types or elements. The documentation of a definition includes a **Used By** section with links to the other definitions that reference it. If the **Escape XML Content** option is unchecked, the HTML or XHTML tags used inside the `<xs:documentation>` elements of the input XML Schema for formatting the documentation text (for example, ``, `<i>`, `<u>`, ``, ``, etc.) are rendered in the generated HTML documentation.

The generated images format is **PNG**. The image of an XML Schema component contains the graphical representation of that component as it is rendered in [the schema diagram panel of the Oxygen XML Developer XSD editor panel](#). (on page 318)

Figure 246. XML Schema Documentation Example

The screenshot displays the Oxygen XML Developer's XML Schema documentation interface. On the left is a 'Table of Contents' panel with a 'Group by:' dropdown set to 'Location' and a list of elements including 'email', 'family', 'given', 'link', 'name', 'person', 'personnel', and 'url'. The main area is titled 'Element name' and shows a diagram of the 'name' element, which is a complex type containing 'family' and 'given' elements. Below the diagram, the 'Properties' section shows 'Content' as 'complex' and 'Used by' as 'person'. The 'Model' is 'ALL(family given)', and the 'Children' are 'family, given'. An 'Instance' section shows the XML representation: `<name><family>{1,1}</family><given>{1,1}</given></name>`. The 'Source' section shows the XSD code for the 'name' element, including annotations for 'Name' and 'Annotation', and a complex type definition for 'name' containing 'family' and 'given' elements. On the right, a 'Showing:' panel lists various features that can be toggled on or off, such as 'Annotations', 'Attributes', 'Diagrams', 'Facets', 'Identity Constraints', 'Instances', 'Model', 'Properties', 'Source', and 'Used by'. A 'Close' button is located at the bottom right of this panel.

The generated documentation includes a table of contents. You can group the contents by namespace, location, or component type. After the table of contents there is some information about the main, imported, included, and redefined schemas. This information contains the schema target namespace, schema properties (attribute form default, element form default, version), and schema location.

Figure 247. Information About a Schema

Namespace	No namespace	
Properties 	Attribute Form Default:	unqualified
	Element Form Default:	unqualified
Schema location	file:/D:/personal.xsd	

If you choose to split the output into multiple files, the table of contents is displayed in the left frame. The contents are grouped in the same mode. If you split the output by location, each file contains a schema description and the components that you have chosen to include. If you split the output by namespace, each file contains information about schemas from that namespace and the list with all included components. If you choose to split the output by component, each file contains information about a schema component.

After the documentation is generated, you can collapse or expand details for some schema components by using the **Showing** options or the  **Collapse** or  **Expand** buttons.

Figure 248. Showing Options

Showing:

- Annotations
- Attributes
- Diagrams
- Facets
- Identity Constraints
- Instances
- Properties
- Source
- Used by

For each component included in the documentation, the section presents the component type followed by the component name. For local elements and attributes, the name of the component is specified as *parent name/component name*. You can easily go to the parent documentation by clicking the parent name.

Figure 249. Documentation for a Schema Component

Namespace	No namespace
Annotations	Specifies the person family and given name.
Diagram	<pre> graph LR name((name)) --- complex(()) complex --- family[family Type xs:string] complex --- given[given Type xs:string] </pre>
Properties	Content: complex
Used by	Element: person
Model	ALL(family given)
Children	family, given
Instance	<pre> <name> <family>{1,1}</family> <given>{1,1}</given> </name> </pre>
Source	<pre> <xs:element name="name"> <xs:annotation> <xs:documentation>Specifies the person family and given name.</xs:documentation> </xs:annotation> <xs:complexType> <xs:all> <xs:element ref="family"/> <xs:element ref="given"/> </xs:all> </xs:complexType> </xs:element> </pre>

If the schema contains imported or included modules, their dependencies tree is generated in the documentation.

Figure 250. Example: Generated Documentation

  [+ ↙] dml-main.xsd
  ↙ opc-contentTypes.xsd
  [+ ↙] opc-coreProperties.xsd
  ↙ opc-relationships.xsd
  [+ ↙] pml.xsd
  [+ ↙] shared-documentPropertiesCustom.xsd
  [+ ↙] shared-documentPropertiesExtended.xsd
  [+ ↙] sml.xsd
  [+ ↙] wml.xsd
            
```

PDF Output Format

For the PDF output format, the documentation is generated in DocBook format and a transformation using the FOP processor is applied to obtain the PDF file. To configure the FOP processor, see the [FO Processors \(on page 229\)](#) preferences page.

For information about customizing the PDF output, see [Customizing PDF or DocBook Output of Generated XML Schema Documentation \(on page 790\)](#).

DocBook Output Format

If you generate the documentation in DocBook output format, the documentation is generated as a DocBook XML file. You can then apply a [built-in DocBook transformation scenario \(on page 1127\)](#) (such as, *DocBook PDF* or *DocBook HTML*) on the output file, or [configure your own transformation scenario \(on page 1129\)](#) to convert it into whatever format you desire.

For information about customizing the DocBook output, see [Customizing PDF or DocBook Output of Generated XML Schema Documentation \(on page 790\)](#).

DITA Output Format

If you generate the documentation in DITA output format, each element of the schema is converted to a DITA *Topic* and all the generated topics are referenced in a [DITA map \(on page 2268\)](#) file. You can then apply a built-in DITA transformation scenario (such as, *DITA Map PDF* or *DITA Map XHTML*), or [configure your own DITA-OT transformation scenario \(on page 1156\)](#) to convert it into whatever format you desire.

For information about customizing the DITA output, see [Customizing DITA Output of Generated XML Schema \(on page 791\)](#).

Custom Output Format

For the custom format, you can specify a stylesheet to transform the intermediary XML file generated in the documentation process. You have to edit your stylesheet based on the schema `xsdDocSchema.xsd` from [\[OXYGEN_INSTALL_DIR\]/frameworks/schema_documentation](#). You can create a custom format starting from one of the stylesheets used in the built-in HTML, PDF, DocBook, and DITA formats. These stylesheets are available in [\[OXYGEN_INSTALL_DIR\]/frameworks/schema_documentation/xsl](#).

When using a custom format you can also copy additional resources into the output folder and choose to keep the intermediate XML files created during the documentation process.

Important:

If you create a custom format for DITA, you must select the **Split output into multiple files** option in the **Output** tab [\(on page 783\)](#) and choose **Split by component**.

Customizing PDF or DocBook Output of Generated XML Schema Documentation

To customize the PDF or DocBook output of the generated XML Schema documentation, use the following procedure:

1. Customize the `[OXYGEN_INSTALL_DIR]/frameworks/schema_documentation/xsl/xsdDocDocbook.xsl` stylesheet to include the content that you want to add in the PDF or DocBook output. Add the content in the XSLT template with the `match="schemaDoc"` attribute between the `<info>` and `<xsl:apply-templates>` elements, as commented in the following example:

```
<info>
  <pubdate><xsl:value-of select="format-date(current-date(),
    '[Mn] [D], [Y]', 'en', (), ())"/></pubdate>
</info>

<!-- Add the XSLT template content with match="schemaDoc" attribute here -->

<xsl:apply-templates select="schemaHierarchy"/>
```

2. Create an intermediary file that holds the content of your XML Schema documentation by following these steps:
 - a. Go to **Tools > Generate Documentation > XML Schema Documentation**.
 - b. Select **Custom** for the output format and click the **Options** button.
 - c. In the **Custom format options** dialog box, do the following:
 - i. Enter the customized stylesheet in the **Custom XSL** field
(`[OXYGEN_INSTALL_DIR]/frameworks/schema_documentation/xsl/xsdDocDocbook.xsl`).
 - ii. Select the **Copy additional resources to the output folder** option and leave the default selection in the **Resources** field.
 - iii. Click **OK**.
 - d. When you return to the **XML Schema Documentation** dialog box, just click the **Generate** button to generate a DocBook XML file with an intermediary form of the Schema documentation.
3. If you want the DocBook file to be transformed into a PDF document, follow these steps:
 - a. Use the  **Configure Transformation Scenario(s)** action from the toolbar or the **Document > Transformation** menu, click **New**, and select **XML transformation with XSLT**.
 - b. In the **New Scenario** dialog box, go to the **XSL URL** field and choose the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/oxygen/xsdDocDocbookCustomizationFO.xsl` file.
 - c. Go to the **FO Processor** tab and select the **Perform FO Processing** and **XSLT result as input** options.
 - d. Go to the **Output** tab and select the directory where you want to store the XML Schema documentation output and click **OK**.
 - e. Click **Apply Associated**.

**Tip:**

If you want your modifications to be permanent so that you can simply select the PDF output format in the **XML Schema Documentation** dialog box, rather than configuring a custom format each time you generate this documentation, follow this procedure:

1. Create a *JAR* (on page 2270) or ZIP file that includes the modified stylesheet (customized in step 1 above), placed in the following directory structure: `builtin/documentation/schema_documentation/xsdDocDocbook.xsl`.
2. Create a new directory named **endorsed** inside the `[OXYGEN_INSTALL_DIR]/lib` directory and place the created *JAR* or ZIP file inside it.
3. Restart Oxygen XML Developer and the PDF output format will now use your customized stylesheet.

Customizing DITA Output of Generated XML Schema

To customize the DITA output of the generated XML Schema documentation, use the following procedure:

1. Customize the `[OXYGEN_INSTALL_DIR]/frameworks/schema_documentation/xsl/xsdDocDita.xsl` stylesheet to incorporate your desired changes.
2. Create an intermediary file that holds the content of your XML Schema documentation by following these steps:
 - a. Go to **Tools > Generate Documentation > XML Schema Documentation**.
 - b. Select **Custom** for the output format and click the **Options** button.
 - c. In the **Custom format options** dialog box, do the following:
 - i. Enter the customized stylesheet in the **Custom XSL** field
(`[OXYGEN_INSTALL_DIR]/frameworks/schema_documentation/xsl/xsdDocDita.xsl`).
 - ii. Select the **Copy additional resources to the output folder** option and leave the default selection in the **Resources** field.
 - iii. Click **OK**.
 - d. Make sure the **Split output into multiple files** option (on page 783) is selected and choose **Split by component**.
 - e. When you return to the **XML Schema Documentation** dialog box, just click the **Generate** button to generate a DITA map file that contains the XML Schema documentation.

Converting Schema to Another Schema Language

The  **Generate/Convert Schema** tool allows you to convert a DTD or Relax NG (full or compact syntax) schema or a set of XML files to an equivalent XML Schema, DTD or Relax NG (full or compact syntax) schema. Where perfect equivalence is not possible due to limitations of the target language, Oxygen XML Developer generates an approximation of the source schema. Oxygen XML Developer uses the *Trang multiple format converter* to perform the actual schema conversions.

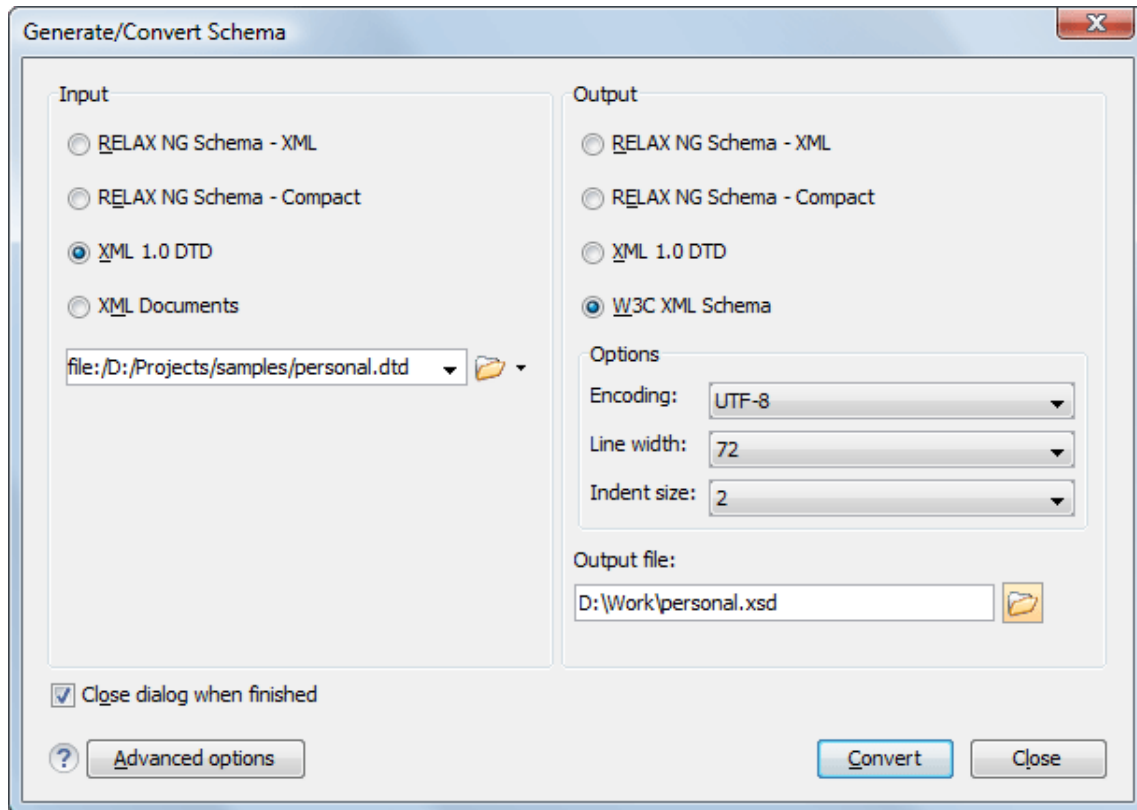

To use this tool, select the  **Generate/Convert Schema (Alt + Shift + C (Command + Option + C on macOS))** action from the **Tools** menu or from the **Open with** submenu when invoking the contextual menu in the **Project view** (on page 365). This action opens the **Generate/Convert Schema** dialog box that allows you to configure various options for conversion.

Figure 251. Generate/Convert Schema Dialog Box

The **Generate/Convert Schema** dialog box includes the following options:

Input section

Allows you to select the language of the source schema. If the conversion is based on a set of XML files, rather than just a single XML file, select the **XML Documents** option and use the file selector to add the XML files involved in the conversion.

Output section

Allows you to select the language of the target schema.

Options

You can choose the **Encoding**, the maximum **Line width**, and the **Indent size** (in number of spaces) for one level of indentation.

Output file

Specifies the path for the output file that will be generated.

Close dialog when finished

If you deselect this option, the dialog box will remain open after the conversion so that you can easily continue to convert more files.

Advanced options

If you select **XML 1.0 DTD** for the input, you can click this button to access more advanced options to further fine-tune the conversion. The following advanced options are available:

XML 1.0 DTD Input section

These options apply to the source DTD:

- **xmlns** - Specifies the default namespace, that is the namespace used for unqualified element names.
- **attlist-define** - Specifies how to construct the name of the definition representing an attribute list declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **colon-replacement** - Replaces colons in element names with the specified chars when constructing the names of definitions used to represent the element declarations and attribute list declarations in the DTD.
- **any-name** - Specifies the name of the definition generated for the content of elements declared in the DTD as having a content model of ANY.
- **element-define** - Specifies how to construct the name of the definition representing an element declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **annotation-prefix** - Default values are represented using a `@prefix:defaultValue` annotation attribute where prefix is the specified value and is bound to `http://relaxng.org/ns/compatibility/annotations/1.0` as defined by the RELAX NG DTD Compatibility Committee Specification. By default, the conversion engine will use a for prefix unless that conflicts with a prefix used in the DTD.
- **inline-attlist** - Instructs the application not to generate definitions for attribute list declarations, but instead move attributes declared in attribute list declarations into the definitions generated for element declarations. This is the default behavior when the output language is XSD.
- **strict-any** - Preserves the exact semantics of ANY content models by using an explicit choice of references to all declared elements. By default, the conversion engine uses a wildcard that allows any element
- **generate-start** - Specifies whether or not the conversion engine should generate a start element. DTD's do not indicate what elements are allowed

as document elements. The conversion engine assumes that all elements that are defined but never referenced are allowed as document elements.

- **xmlns mappings** table - Each row specifies the prefix used for a namespace in the input schema.

W3C XML Schema Output section

This section is available if you select **W3C XML Schema** for the output.

- **disable-abstract-elements** - Disables the use of abstract elements and substitution groups in the generated XML Schema. This can also be controlled using an annotation attribute.
- **any-process-contents** - One of the values: strict, lax, skip. Specifies the value for the `@processContents` attribute of any elements. The default is skip (corresponding to RELAX NG semantics) unless the input format is DTD, in which case the default is strict (corresponding to DTD semantics).
- **any-attribute-process-contents** - Specifies the value for the `@processContents` attribute of `<anyAttribute>` elements. The default is skip (corresponding to RELAX NG semantics).

Converting Database to XML Schema

Oxygen XML Developer includes a tool that allows you to create an XML Schema from the structure of a database.

To convert a database structure to an XML Schema, use the following procedure:

1. Select the **Convert DB Structure to XML Schema** action from the **Tools** menu.

Result: The **Convert DB Structure to XML Schema** dialog box is opened and your current database connections are displayed in the **Connections** section.

2. If the database source is not listed, click the **Configure Database Sources** button to open the [Data Sources preferences page \(on page 242\)](#) where you can configure data sources and connections.
3. In the **Format for generated schema** section, select one of the following formats:
 - **Flat schema** - A flat structure that resembles a tree-like view of the database without references to elements.
 - **Hierarchical schema** - Display the table dependencies visually, in a type of tree view where dependent tables are shown as indented child elements in the content model. Select this option if you want to configure the database columns of the tables to be converted.

4. Click **Connect**.

Result: The database structure is listed in the **Select database tables** section according to the format you chose.

5. Select the database tables that you want to be included in the XML Schema.

6. If you selected **Hierarchical schema** for the format, you can configure the database columns.
 - a. Select the database column you want to configure.
 - b. In the **Criterion** section you can choose to convert the selected database column as an **Element**, **Attribute**, or to be **Skipped** in the resulting XML Schema.
 - c. You can also change the name of the selected database column by changing it in the **Name** text field.
7. Click **Generate XML Schema**.

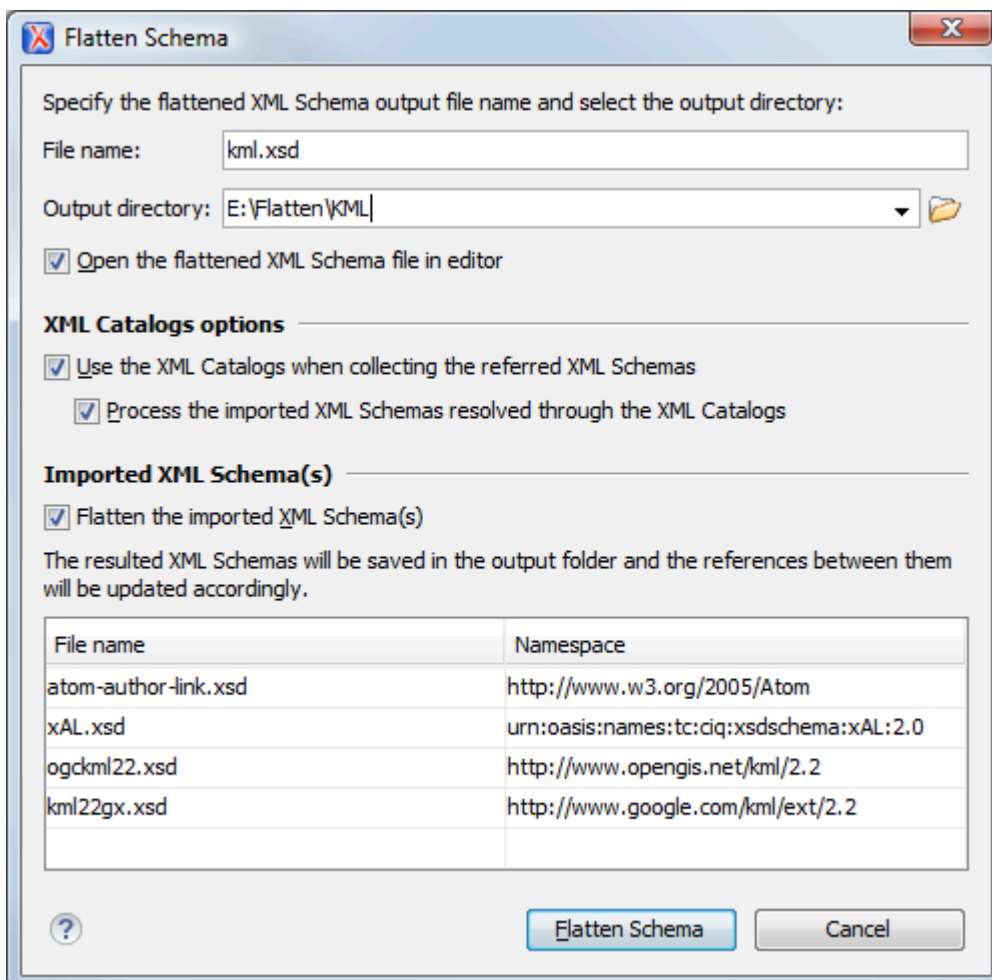

Result: The database structure is converted to an XML Schema and it is opened for viewing and editing.

Flatten an XML Schema

You can organize an XML schema linked by `<xs:include>` and `<xs:import>` statements on several levels. In some cases, working on such a schema as if it were a single file is more convenient than working on multiple files separately. The **Flatten Schema** operation allows you to flatten an entire hierarchy of XML schemas. Starting with the main XML schema, Oxygen XML Developer calculates its hierarchy by processing the `<xs:include>` and `<xs:import>` statements.

The **Flatten Schema** action is available from the **Tools** menu or the contextual menu in **Text** mode. This action opens the **Flatten Schema** dialog box that allows you to configure the operation.

Figure 252. Flatten Schema Dialog Box

For the main schema file and for each imported schema, a new flattened schema is generated in the specified output folder. These schemas have the same name as the original ones.

**Note:**

If necessary, the operation renames the resulted schemas to avoid duplicated file names.

A flattened XML schema is obtained by recursively adding the components of the included schemas into the main one. This means Oxygen XML Developer replaces the `<xs:include>`, `<xs:redefine>`, and `<xs:override>` elements with the ones coming from the included files.

Options in the Flatten Schema Dialog Box

The following options are available in the **Flatten Schema** dialog box:

File name

The name of the output file.

Output directory

The path of the output directory where the flattened schema file will be saved.

Open the flattened XML Schema file in editor

Opens the main flattened schema in the editing area after the operation completes.

Use the XML Catalogs when collecting the referenced XML Schemas

Enables the imported and included schemas to be resolved through the available [XML Catalogs \(on page 2273\)](#).

**Note:**

Changing this option triggers the recalculation of the dependencies graph for the main schema.

Process the imported XML Schemas resolved through the XML Catalogs

Specifies whether or not the imported schemas that were resolved through an [XML Catalog \(on page 2273\)](#) are also processed.

Flatten the imported XML Schema(s)

Specifies whether or not the imported schemas are flattened.

**Note:**

For the schemas skipped by the flatten operation, no files are created in the output folder and the corresponding import statements remain unchanged.

**Tip:**

This function can be executed from an automated command-line script, for more details, see [Scripting Oxygen \(on page 2233\)](#).

Generating Java Classes from XML Schema

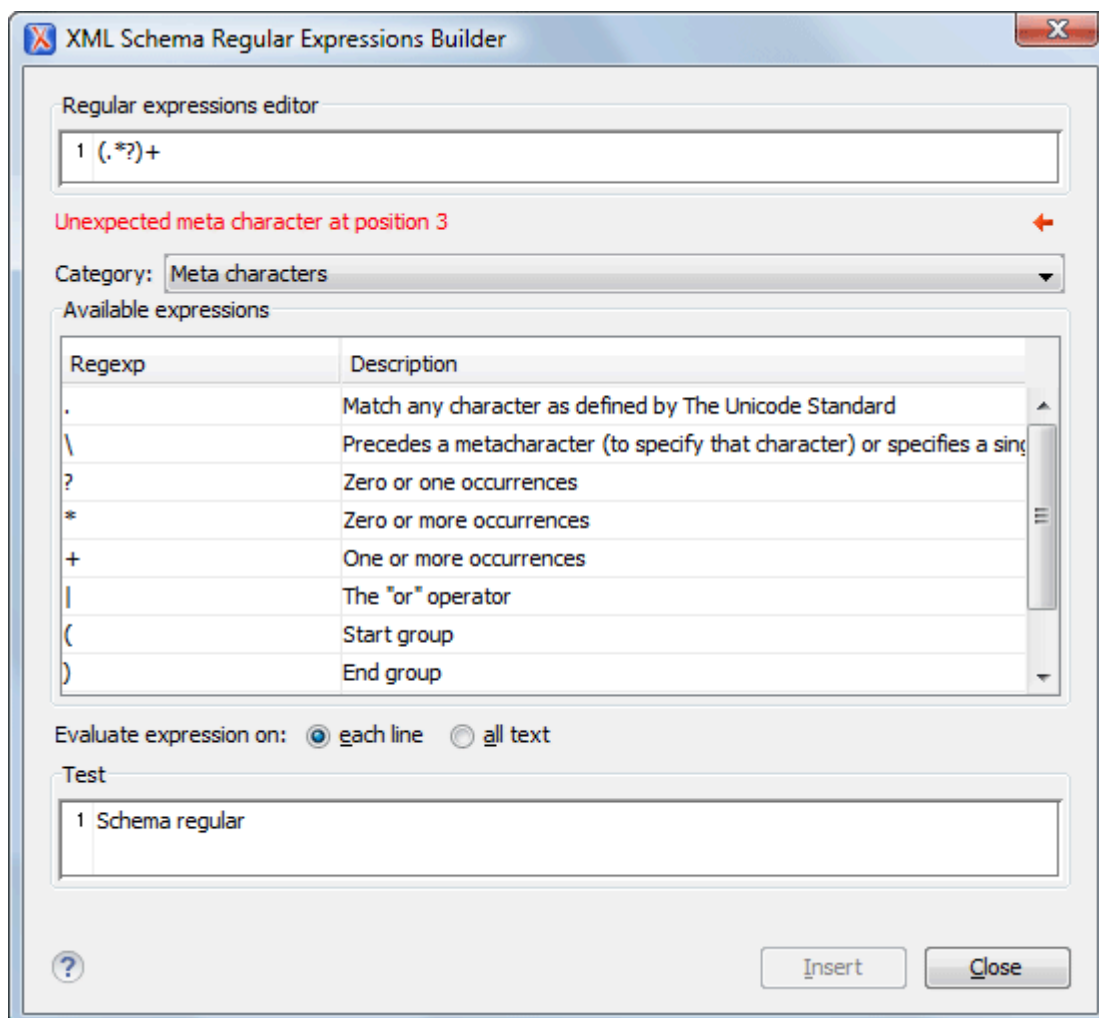

Oxygen XML Developer includes a tool for generating Java classes from an XML Schema (XSD) file. The **Generate Java classes from XML Schema (XSD)** action for invoking the tool can be found in the **Tools** menu. It requires an additional add-on to be installed, so the first time you invoke the action, Oxygen XML Developer will present a dialog box asking if you want to install it. Once installed, you need to restart Oxygen XML Developer and the action will invoke the Java class generator tool.

[Add-on documentation and installation details.](#)

XML Schema Regular Expressions Builder Tool

The XML Schema regular expressions builder allows you to test regular expressions on a fragment of text as they are applied to an XML instance document. Start the tool by selecting **XML Schema Regular Expressions Builder** from the **Tools** menu.

Figure 253. XML Schema Regular Expressions Builder Dialog Box

The dialog box contains the following:

Regular expressions editor

Allows you to edit the regular expression to be tested and used. Content completion is available and presents a list with all the predefined expressions. It is triggered by pressing **Ctrl + Space**.

Error display area

If the edited regular expression is incorrect, an error message will be displayed here. The message contains the description and the exact location of the error. Also, clicking the quick navigation button (↔) highlights the error inside the regular expression.

Category

You can choose from several categories of predefined expressions. The selected category influences the displayed expressions in the **Available expressions** table.

Available expressions

This table includes the available regular expressions and a short description for each of them. The set of expressions depends on the category selected in the previous **Category** combo box. You can add an expression in the **Regular expressions editor** by double-clicking the expression row in the table. You will notice that in the case of **Character categories** and **Block names**, the expressions are also listed in complementary format.

Evaluate expression on

You can choose between two options:

- **Evaluate expression on each line** - The edited expression will be applied on each line in the **Test** area.
- **Evaluate expression on all text** - The edited expression will be applied on the whole text.

Test

A text editor that allows you to enter a text sample that will have the regular expression applied. All matches of the edited regular expression will be highlighted.

After editing and testing your regular expression you can insert it in the current editor. The **Insert** button will become active when an editor is opened in the background and there is an expression in the **Regular expressions editor**.

The regular expression builder cannot be used to insert regular expressions in the **Grid mode** ([on page 316](#)) or **schema Design mode** ([on page 317](#)). Accordingly, the **Insert** button will be not available if the current document is edited in these modes.

Note:

Some regular expressions may indefinitely block the Java Regular Expressions engine. If the execution of the regular expression does not end in about five seconds, the application displays a dialog box that allows you to interrupt the operation.

XML Schema 1.1

Oxygen XML Developer offers full support for XML Schema 1.1, including:

- XML Documents *Validation (on page 543)* and *Content Completion (on page 486)* based on XML Schema 1.1.
- XML Schema 1.1 *Validation (on page 760)* and *Content Completion (on page 761)*.
- Editing XML Schema 1.1 files in the Schema **Design** mode *(on page 317)*.
- The *Flatten Schema (on page 795)* action.
- *Referenced/Dependent Resources (on page 767)* and *Refactoring Actions (on page 772)*.
- *Main files (on page 2270)*.
- *Generating Documentation for XML Schema 1.1 (on page 781)*.
- Support for generating XML instances based on XML Schema.
- Support for validating XML documents with an NVDL schema that contains an XML Schema 1.1 validation step.

Note:

To enable XML Schema 1.1 validation in NVDL, you need to pass the following option to the validation engine to specify the schema version: `http://www.thaiopensource.com/validate/xsd-version` (the possible values are 1.0 or 1.1).

Tip:

To enable the full XPath expression in assertions and type alternatives, you need to set the `http://www.thaiopensource.com/validate/full-xpath` option.

XML Schema 1.1 is a superset of XML Schema 1.0, that offers lots of new powerful capabilities.

Figure 254. XML Schema 1.1

The significant new features in XSD 1.1 are:

- **Assertions** - Support to define assertions against the document content using XPath 2.0 expressions (an idea borrowed from Schematron).
- **Conditional type assignment** - The ability to select the type of schema an element is validated against, based on the values of the attribute of the element.
- **Open content** - Content models can use the `<openContent>` element to specify content models with *open content*. These content models allow elements not explicitly mentioned in the content model to appear in the document instance. It is as if wildcards were automatically inserted at appropriate points within the content model. A default may be set that causes all content models to be open unless specified otherwise.

To see the complete list with changes since version 1.0, go to http://www.w3.org/TR/xmlschema11-1/#ch_specs.

XML Schema 1.1 is intended to be mostly compatible with XML Schema 1.0 and to have approximately the same scope. It also addresses bug fixes and brings improvements that are consistent with the constraints on scope and compatibility.

**Note:**

An XML document conforming to a 1.0 schema can be validated using a 1.1 validator, but an XML document conforming to a 1.1 schema may not validate using a 1.0 validator.

If you are constrained to use XML Schema 1.0 (for example, if you develop schemas for a server that uses an XML Schema 1.0 validator that cannot be updated), change the default XML Schema version to 1.0. If you keep the default XML Schema version set to 1.1, the *Content Completion Assistant* (on page 2267) presents XML Schema 1.1 elements that you can insert accidentally in an 1.0 XML Schema. So even if you make a document invalid conforming with XML Schema 1.0, the validation process does not signal any issues.

To change the default XML Schema version, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **XML > XML Parser > XML Schema**.

Resources

For more information about the XML Schema 1.1 support, watch our video demonstration:

<https://www.youtube.com/embed/DAkrubQNm0w>

Related Information:

[Setting the XML Schema Version](#) (on page 800)

Setting the XML Schema Version

Oxygen XML Developer lets you set the version of the XML Schema you are editing either in the **XML Schema** preferences page, or through the versioning attributes. If you want to use the versioning attributes, set the

minVersion and *maxVersion* attributes, from the <http://www.w3.org/2007/XMLSchema-versioning> namespace, on the *schema* root element.

**Note:**

The versioning attributes take priority over the XML Schema version defined in the preferences page.

Table 32. Using the *minVersion* and *maxVersion* Attributes to Set the XML Schema Version

Versioning Attributes	XML Schema Version
minVersion = "1.0" maxVersion = "1.1"	1.0
minVersion = "1.1"	1.1
minVersion = "1.0" maxVersion = greater than "1.1"	The XML Schema version defined in the XML Schema preferences page (on page 207)
Not set in the XML Schema document	The XML Schema version defined in the XML Schema preferences page (on page 207)

To change the XML Schema version of the current document, use the **Change XML Schema version** action from the contextual menu. This is available both in the **Text** mode, and in the **Design** mode and opens the **Change XML Schema version** dialog box. The following options are available:

- **XML Schema 1.0** - Inserts the *minVersion* and *maxVersion* attributes on the *schema* element and gives them the values "1.0" and "1.1" respectively. Also, the namespace declaration (*xmlns:vc=http://www.w3.org/2007/XMLSchema-versioning*) is inserted automatically if it does not exist.
- **XML Schema 1.1** - Inserts the *minVersion* attribute on the *schema* element and gives it the value "1.1". Also, removes the *maxVersion* attribute if it exists and adds the versioning namespace (*xmlns:vc=http://www.w3.org/2007/XMLSchema-versioning*) if it is not declared.
- **Default XML Schema version** - Removes the *minVersion* and *maxVersion* attributes from the *schema* element. The default schema version, defined in the **XML Schema** preferences page, is used.

**Note:**

The **Change XML Schema version** action is also available in the informative panel presented at the top of the edited XML Schema. If you close this panel, it will no longer appear until you restore Oxygen XML Developer to its default options.

Oxygen XML Developer automatically uses the version set through the versioning attributes, or the default version if the versioning attributes are not declared, when proposing content completion elements and validating an XML Schema. Also, the XML instance validation against an XML Schema is aware of the versioning attributes defined in the XML Schema.

When you generate sample XML files from an XML Schema, Oxygen XML Developer takes into account the *minVersion* and *maxVersion* attributes defined in the XML Schema.

Related Information:[XML Schema 1.1 \(on page 799\)](#)

Editing XQuery Documents

XQuery is the query language for XML and is officially defined by a [W3C Recommendation document](#). Oxygen XML Developer provides support for XQuery 4.0 and 3.1 (which is also backwards compatible with XQuery 3.0 and 1.0).

The many benefits of XQuery include:

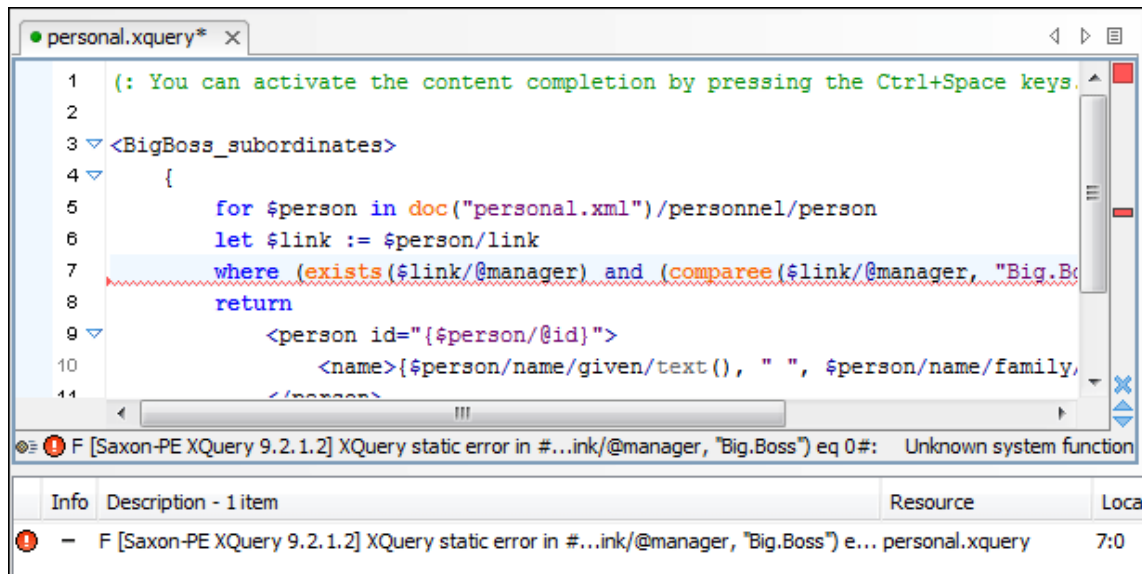

- XQuery allows you to work in one common model no matter what type of data you are working with: relational, XML, or object data.
- XQuery is ideal for queries that must represent results as XML, to query XML stored inside or outside the database, and to span relational and XML sources.
- XQuery allows you to create many different types of XML representations of the same data.
- XQuery allows you to query both relational sources and XML sources, and create one XML result.

Related Information:[XQuery and Databases \(on page 1801\)](#)

XQuery Validation

With Oxygen XML Developer, you can validate your documents before using them in your transformation scenarios. The validation uses the Saxon 12.5 PE, EE, or HE processor, or you can use some database engines (such as MarkLogic or eXist) if you installed them. Any other XQuery processor that offers an [XQJ API implementation \(on page 1790\)](#) can also be used. This is in conformance with [the XQuery Working Draft](#). The processor is used in two cases: validation of the expression and execution. Although the execution implies a validation, it is faster to check the expression syntactically, without executing it. The errors that occurred in the document are presented in the messages view at the bottom of editor window, with a full description message. As with all error messages, if you click an entry, the line where the error appeared is highlighted.

Figure 255. XQuery Validation

**Note:**

If you choose a processor that does not support XQuery validation, Oxygen XML Developer displays a warning when trying to validate.

The **Validation options** button, available in the **Document > Validate** menu, allows quick access to the [XQuery options \(on page 222\)](#) in the Oxygen XML Developer preferences.

When you open an XQuery document from a connection that supports validation (for example, MarkLogic, or eXist), by default Oxygen XML Developer uses this connection for validation. If you open an XQuery file using a MarkLogic connection, the validation resolves imports better.

Content Completion in XQuery

Oxygen XML Developer provides content completion for keywords and all known XQuery functions and operators. The [Content Completion Assistant \(on page 2267\)](#) can be manually activated with the **(Ctrl + Space)** shortcut. The functions and operators are presented together with a description of the parameters and functionality, depending on the validation or transformation engine.

For some supported database engines such as MarkLogic and eXist, the content completion list offers the specific XQuery functions implemented by that engine. This feature is available when the XQuery file has an associated transformation scenario that uses one of these database engines or the XQuery validation engine is set to one of them via a validation scenario or in the [XQuery Preferences \(on page 222\)](#) page. For more information about the support for working with XQuery with regard to databases, see [XQuery and Databases \(on page 1801\)](#).

The extension functions included in the Saxon engine are available on content completion if one of the following conditions are true:

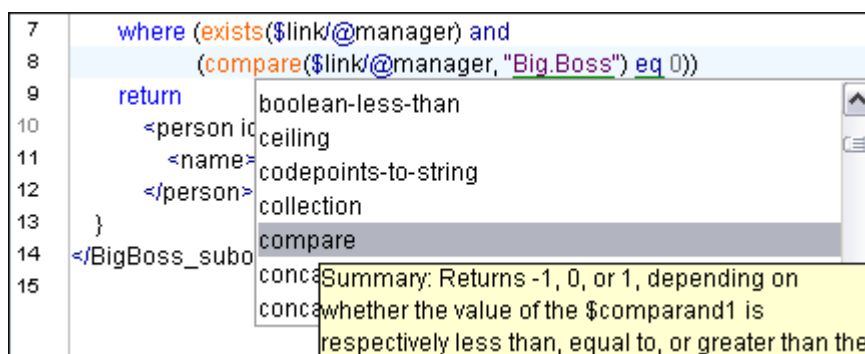

- The edited file has a transformation scenario associated that uses as transformation engine Saxon 12.5 PE or Saxon 12.5 EE.
- The edited file has a validation scenario associated that use as validation engine Saxon 12.5 PE or Saxon 12.5 EE.
- The validation engine specified in [Preferences \(on page 222\)](#) is Saxon 12.5 PE or Saxon 12.5 EE.

If the Saxon namespace (<http://saxon.sf.net>) is mapped to a prefix, the functions are presented using this prefix. Otherwise, the default prefix for the Saxon namespace (`saxon`) is used.

If you want to use a function from a namespace mapped to a prefix, just type that prefix and the content completion displays all the XQuery functions from that namespace. When the default namespace is mapped to a prefix, the XQuery functions from this namespace offered by content completion are also prefixed. Otherwise, only the function name being used.

The content completion pop-up window presents all the variables and functions from both the edited XQuery file and its imports.

Figure 256. XQuery Content Completion

Syntax Highlighting in XQuery

Oxygen XML Developer supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for XQuery files, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114).
2. Go to **Editor > Syntax Highlight** (on page 193).
3. Select and expand the **XQuery/XPath** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

Related Information:

[Customize Syntax Highlight colors \(on page 193\)](#)

Formatting and Indenting XQuery Documents

Editing XQuery documents may lead to large chunks of content that are not easily readable by human audience. Also, each developer may have a particular way of writing XQuery code. Oxygen XML Developer assists you in maintaining a consistent code writing style with the  **Format and Indent** action that is available in the **Document > Source** menu and also on the toolbar..

The  **Format and Indent** action achieves this by performing the following steps:

- Manages whitespaces, by collapsing or inserting space characters where needed.
- Formats complex expressions on multiple, more readable lines by properly indenting each of them. The amount of whitespaces that form an indent unit is controlled through one of the **Indent with tabs** and **Indent size** options from the **Format Preferences** page (*on page 171*).

Note:

These operations can be performed only if your XQuery document conforms with XQuery 1.0, 3.0, 3.1, or XQuery Update Facility 1.0 specifications. If the *Format and Indent* operation fails, the document is left unaltered and an error message is presented in the **Results** view (*on page 503*).

Folding in XQuery Documents

In a large XQuery document, the instructions enclosed in the '{' and '}' characters can be collapsed so that only the needed instructions remain in focus. The same **folding** features available for XML documents (*on page 483*) are also available in XQuery documents.

Figure 257. Folding in XQuery Documents

```

8  let $minRating := min($review/reviews/review[@movie-id = $movie-id]/rating)
9  return
10 <movie id="{ $movie/@id }">
11   { $movie/title }
12   { $movie/year }
13   <avgRating>
14   {
15     if ($avgRating) then $avgRating else "not rated"
16   }
17 </avgRating>
18 <maxRating>
19   <value>
20   { [2 lines]
23   </value>
24   { [5 lines]
30 </maxRating>
31 <minRating>
32   <value>
33   { [2 lines]
36   </value>
37   { [5 lines]
43 </minRating>
44 </movie>

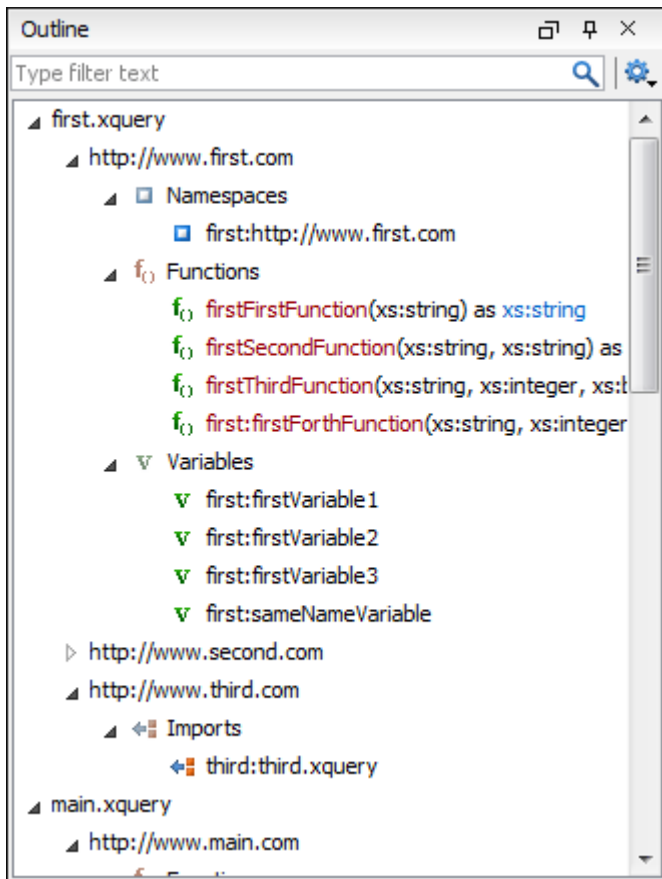

```

There is available the action **Go to Matching Bracket Ctrl + Shift + G (Command + Shift + G on macOS)** on contextual menu of XQuery editor for going to matching character when cursor is located at '{' character or '}' character. It helps for finding quickly matching character of current *folding element* (on page 2269).

XQuery Outline View

The XQuery document structure is presented in the **Outline** view. The outline tree presents the list of all the components (namespaces, imports, variables, and functions) from both the edited XQuery file and its imports and it allows quick access to components. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 258. XQuery Outline View

The following actions are available in the  **Settings** menu on the **Outline** view toolbar:

Selection update on cursor move

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes performed in the XQuery editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

Sort

Allows you to alphabetically sort the XQuery components.

Show all components

Displays all collected components starting from the current file. This option is set by default.

Show only local components

Displays the components defined in the current file only.

Group by location/namespace/type

Allows you to group the components by location, namespace, and type. When grouping by namespace, the main XQuery module namespace is presented first in the **Outline** view.

If you know the component name, you can search it in the **Outline** view by typing its name in the filter text field from the top of the view or directly on the tree structure. When you type the component name in the filter text field you can switch to the tree structure using the arrow keys of the keyboard, **Enter**, **Tab**, **Shift-Tab**. To switch from tree structure to the filter text field, you can use **Tab**, **Shift-Tab**.

**Tip:**

The search filter is case insensitive. The following wildcards are accepted:

- * - any string
- ? - any character
- , - patterns separator

If no wildcards are specified, the string to search is used as a partial match.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as * or ?) and separate multiple patterns with commas.

XQuery Builder View

The **XPath/XQuery Builder** view allows you to compose complex XQuery expressions and execute them over the currently edited XML or JSON document. You can use the `doc()` function to specify the source file that will have the expressions executed. When you connect to a database, the expressions are executed over that database. If you are using the **XPath/XQuery Builder** view and the current file is an XSLT document, Oxygen XML Developer executes the expressions over the XML document in the associated scenario.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the view contains the following actions:

XPath version chooser drop-down menu

A drop-down menu that allows you to select the type of the expression you want to execute. You can choose between:

- XPath 1.0 (Xerces-driven)
- XPath 2.0, XPath 2.0 SA, XPath 3.1, XPath 3.1 SA, Saxon-HE XQuery, Saxon-PE XQuery, or Saxon-EE XQuery (all of them are Saxon-driven)
- Custom connection to XML databases that can execute XQuery expressions

**Note:**

The results returned by XPath 2.0 SA and XPath 3.1 SA have a location limited to the line number of the start element (there are no column information and no end specified).

**Note:**

Oxygen XML Developer uses Saxon to execute XPath 3.1 expressions. Since Saxon implements a part of the 3.1 functions, when using a function that is not implemented, Oxygen XML Developer returns a compilation error.

**Execute XPath button**

Use this button to start the execution of the XPath or XQuery expression you are editing. The result of the execution is displayed in the **Results** view at the bottom of the application.

**Favorites button**

Allows you to save certain expressions that you can later reuse. To add an expression as a favorite, click this button and enter a name for it. The star turns yellow to confirm that the expression was saved. Expand the drop-down menu next to the star button to see all your favorites. Oxygen XML Developer automatically groups favorites in folders named after the method of execution.

**History drop-down menu**

Keeps a list of the last 15 executed XPath or XQuery expressions. Use the  **Clear history** action from the bottom of the list to remove them.

**Settings drop-down menu**

Contains the following three options:

**Update on cursor move**

When selected and you navigate through a document, the XPath expression corresponding to the XML node at the current cursor position is displayed. For JSON documents, it displays the XPath expression for the current property.

**Evaluate as you type**

When you select this option, the XPath expression you are composing is evaluated in real time.

**Note:**

This option and the automatic validation are disabled when you edit [huge documents \(on page 428\)](#) or when the scope is other than **Current file**.

Options

Opens the Preferences page of the currently selected processing engine.

XPath scope menu

Oxygen XML Developer allows you to define a scope for the XPath operation to be executed. You can choose where the XPath expression will be executed:

-  **Current file** - Currently selected file only.
-  **Project** - All the files in the project.
-  **Selected project resources** - The files selected in the project.
-  **All opened files** - All files that are opened in the application.
-  **Opened archive** - Files that are opened in the **Archive Browser view (on page 1741)**.
-  **Working sets** - The selected [working sets \(on page 2273\)](#).

At the bottom of the scope menu the following scope configuration actions are available:

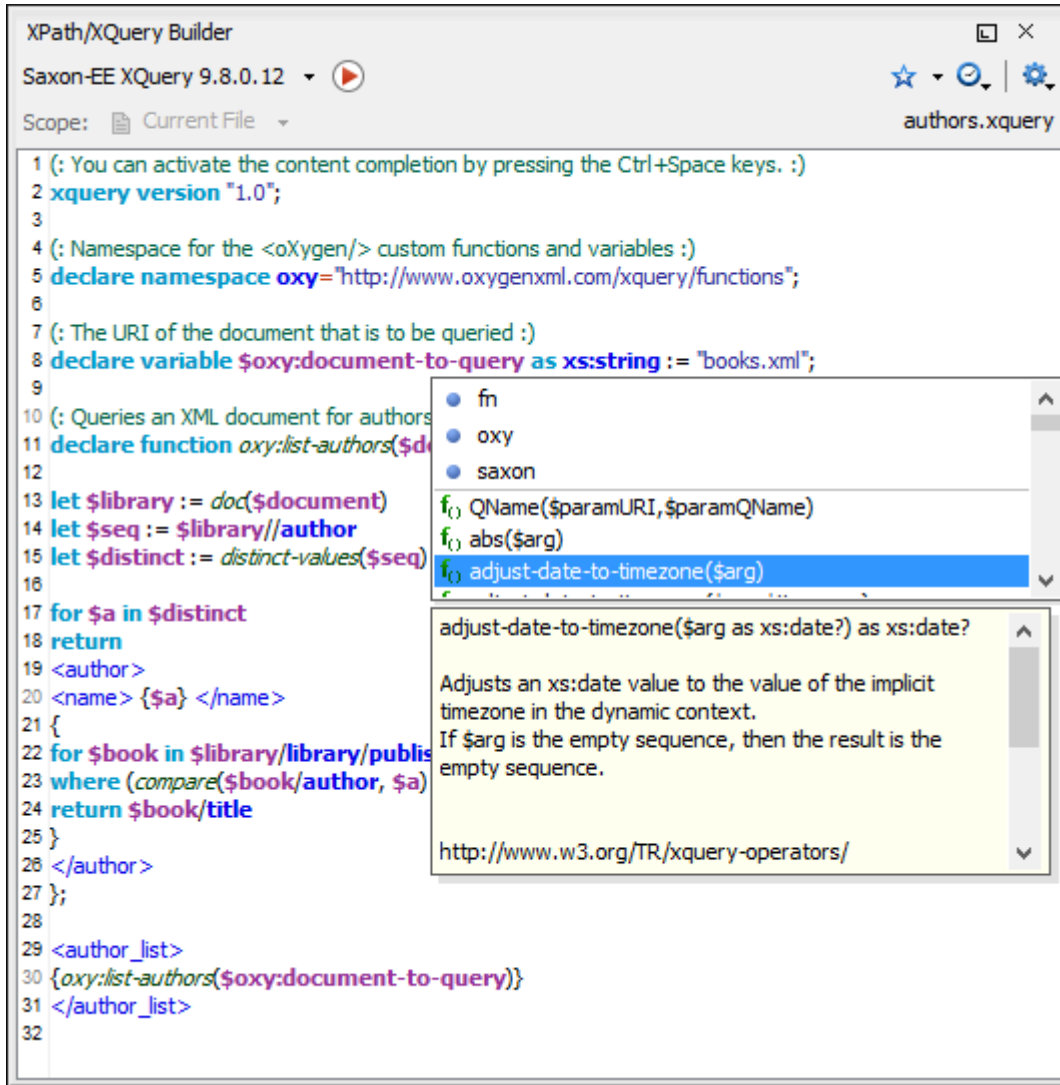

-  **Configure XPath working sets** - Allows you to configure and manage collections of files and folders, encapsulated in logical containers called [working sets \(on page 2273\)](#).
-  **XPath file filter** - You can filter the files from the selected scope that will have the XPath expression executed. By default, the XPath expression will be executed only on XML or JSON files, but you can also define a set of patterns that will filter out files from the current scope. If you select the **Include archive** option, the XPath expression will be also executed on the files in any archive (including EPUB and DocX) found at the current scope.

Figure 259. XPath/XQuery Builder View

While you edit an XPath or XQuery expression, Oxygen XML Developer assists you with the following features:

- *Content Completion Assistant (on page 2267)* - It offers context-dependent proposals and takes into account the cursor position in the document you are editing. The set of functions proposed by the *Content Completion Assistant* also depends on the engine version. Select the engine version from the drop-down menu available in the toolbar.
- Syntax Highlighting - Allows you to identify the components of an expression. To customize the colors of the components of the expression, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Editor > Syntax Highlight** (on page 193).
- Automatic validation of the expression as you type.

Note:

When you type invalid syntax, a red serrated line underlines the invalid fragments.

- Function signature and documentation balloon, when the cursor is located inside a function.

The usual edit actions (**Cut**, **Copy**, **Paste**, **Select All**, **Undo**, **Redo**) are available in the contextual menu of the top editable part of the view.

XQuery Input View

The structure of the source documents of an edited XQuery is displayed in a tree form in a view called the **XQuery Input** view. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu. The tree nodes represent the elements of the documents.

You can use the **XQuery Input** view to drag and drop a node into the editing area to quickly insert XQuery expressions.

Figure 260. XQuery Input View

Example:

For the following XML documents:

```
<movies>
  <movie id="1">
    <title>The Green Mile</title>
    <year>1999</year>
  </movie>
  <movie id="2">
    <title>Taxi Driver</title>
    <year>1976</year>
  </movie>
</movies>
```

```
<reviews>
  <review id="100" movie-id="1">
```

```

<rating>5</rating>

<comment>It is made after a great Stephen King book.
</comment>

<author>Paul</author>

</review>

<review id="101" movie-id="1">

<rating>3</rating>

<comment>Tom Hanks does a really nice acting.</comment>

<author>Beatrice</author>

</review>

<review id="104" movie-id="2">

<rating>4</rating>

<comment>Robert De Niro is my favorite actor.</comment>

<author>Maria</author>

</review>

</reviews>

```

and the following XQuery:

```

let $review := doc("reviews.xml")

for $movie in doc("movies.xml")/movies/movie

let $movie-id := $movie/@id

return

<movie id="{ $movie/@id }">

{ $movie/title }

{ $movie/year }

<maxRating>

{

}

</maxRating>

</movie>

```

If you drag the **review** element and drop it between the braces, the following pop-up menu is displayed:

Select **FLWOR review**, the resulting document will look like this:

```

37 {
38     for $review in doc("reviews.xml")/reviews/review
39     return
40     where ((compare($rev/rating/text(), string($minRating)) eq 0)
41           and ($rev/@movie-id = $movie/@id))
42     return $rev/author
43 }

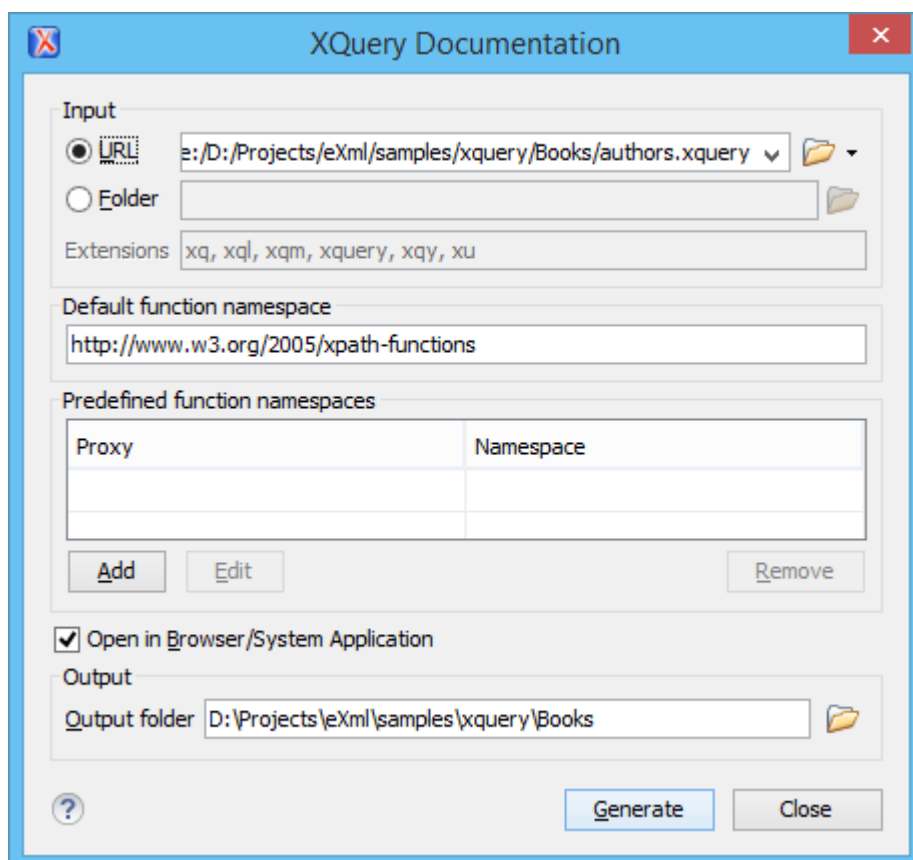

```

Generating HTML Documentation for an XQuery Document

To generate HTML documentation for an XQuery document, use the **XQuery Documentation** dialog box. It is opened with the **XQuery Documentation** action that is available from the **Tools > Generate Documentation** menu or from the **Generate Documentation** submenu in the contextual menu of the **Project view** (on page 365). You can also open the tool by using the  **Generate Documentation** toolbar button.

The dialog box allows you to configure a set of parameters for the process of generating the HTML documentation.

Figure 261. XQuery Documentation Dialog Box

The following options are available:

- **Input** - The full path to the XQuery file must be specified in one of the two fields in this section:
 - **URLFile** - The URL of the file to be used for generating the documentation.
 - **Folder** - The directory that contains the files to be used for generating the documentation. You can also specify the XQuery file extensions to be searched for in the specified directory.

- **Default function namespace** - Optional URI for the default namespace for the submitted XQuery.
- **Predefined function namespaces** - Optional, engine-dependent, predefined namespaces that the submitted XQuery refers to. They allow the conversion to generate annotation information to support the presentation component hypertext linking (only if the predefined modules have been loaded into the local xqDoc XML repository).
- **Open in Browser/System Application** - Select this option if you want the result to be opened in the system application associated with that file type.

**Note:**

To set the browser or system application that will be used, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#), go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

- **Output** - Allows you to specify where the generated documentation is saved on disk.

Transforming XML Documents Using XQuery

XQuery is similar to XSL stylesheets, both being capable of transforming an XML input into another format. You specify the input URL when you [define the transformation scenario \(on page 1129\)](#). The result can be saved and opened in the associated application. You can even run a [FO processor \(on page 1204\)](#) on the output of an XQuery. The transformation scenarios may be shared between many XQuery files, are [exported \(on page 288\)](#) together with the XSLT scenarios and can be managed in the **Configure Transformation Scenario** dialog box [\(on page 1240\)](#), or in the **Scenarios** view [\(on page 1246\)](#). The transformation can be performed on the XML document specified in the **XML URL** field, or, if this field is empty, the documents referenced from the query expression. The parameters of XQuery transforms must be set in [the Parameters dialog box \(on page 1130\)](#). Parameters that are in a namespace must be specified using the qualified name (for example, a `param` parameter in the `http://www.oxygenxml.com/ns` namespace must be set with the name `{http://www.oxygenxml.com/ns}param`).

The transformation uses one of the Saxon 12.5 HE, Saxon 12.5 PE, Saxon 12.5 EE processors, a database connection (details can be found in the [Working with Databases \(on page 1748\)](#) chapter - in the [XQuery transformation \(on page 1802\)](#) section) or any XQuery processor that provides an XQJ API implementation.

The Saxon 12.5 EE processor also supports XQuery 3.1 transformations.

Related Information:

[XQuery and Databases \(on page 1801\)](#)

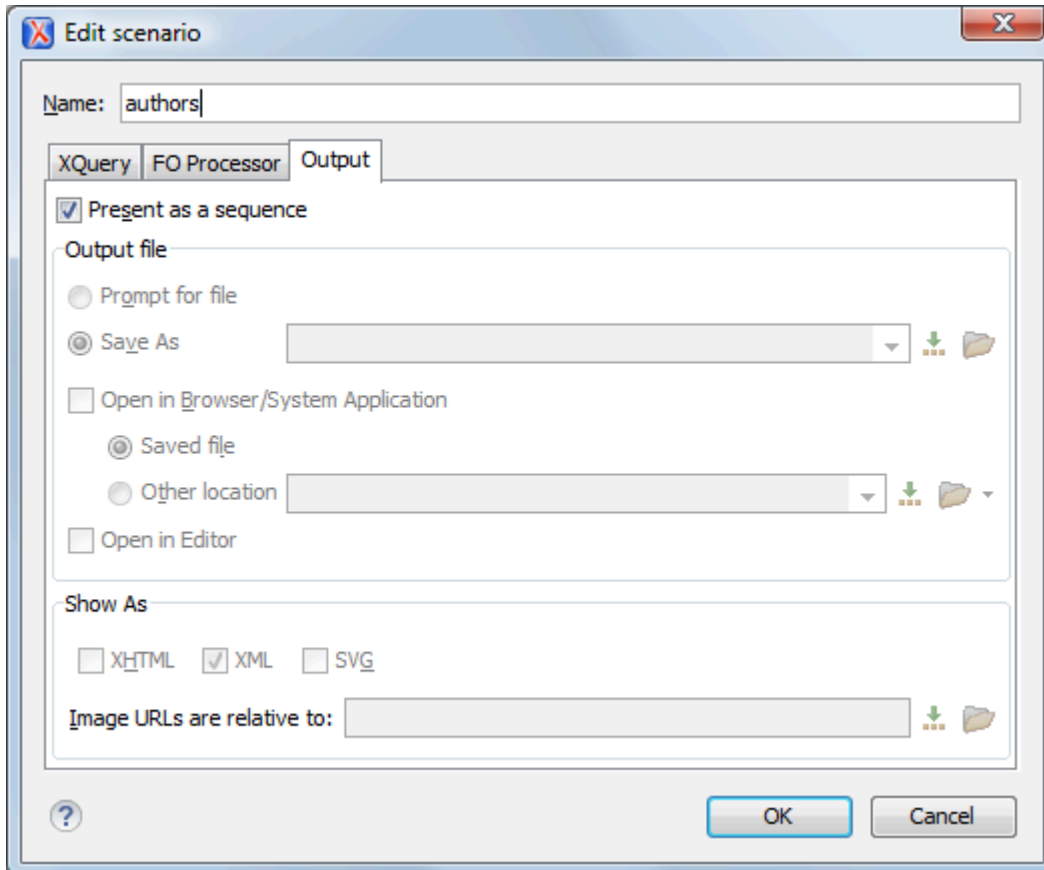

Display XQuery Result in Sequence View

The result of an XQuery executed on a database can be very large and sometimes only a part of the full result is needed. To avoid the long time necessary for fetching the full result, select the **Present as a sequence** option [\(on page 1152\)](#) in the **Output** tab of the **Edit scenario** dialog box. This option fetches only the first

chunk of the result. Clicking the **More results available** label that is displayed at the bottom of the **Sequence** view fetches the next chunk of results.

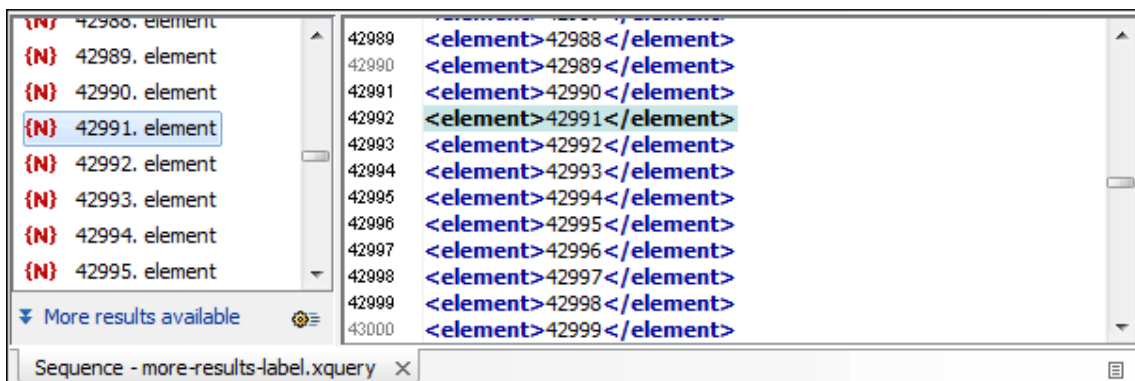

The size of a chunk can be set with the **Size limit of Sequence view** option (on page 222). The **XQuery options** button from the **More results available** label provides a quick access to this option by opening the **XQuery preferences page** (on page 222) where the option can be modified.

Figure 262. XQuery transformation result displayed in Sequence view

A chunk of the XQuery transformation result is displayed in the **Sequence** view.

Figure 263. XQuery transformation result displayed in Sequence view

**Tip:**

You can right-click the results in the **Sequence** view and if the item is an XML element, the **Go to definition** action will open the XML file from where the queried node was obtained.

Advanced Saxon HE/PE/EE XQuery Transformation Options

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as [those in the Saxon HE/PE/EE preferences page \(on page 223\)](#) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the [global options \(on page 2269\)](#) defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 12.5 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Use a configuration file ("-config")

Sets a Saxon 12.5 configuration file that is used for XQuery transformation and validation scenarios.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Use linked tree model ("-tree:linked")

This option activates the linked tree model.

Strip whitespaces ("-strip")

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

Enable profiling ("-TP")

If selected, profiling of the execution time in a query is enabled. The corresponding text field is used to specify the path to the output file where the profiling information will be saved. As long as the option is selected, and the output file specified, it will gather timed tracing information and create a profile report to the specified file.

Note:

The profiling support works only if the **Present as a sequence** transformation option ([on page 1152](#)) is not set.

Saxon-PE/EE Options

The following advanced options are specific for Saxon 12.5 Professional Edition (PE) and Enterprise Edition (EE) only:

Allow calls on extension functions ("-ext")

If selected, calls on external functions are allowed. Selecting this option is not recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

Saxon-EE Options

The advanced options that are specific for Saxon 12.5 Enterprise Edition (EE) are as follows:

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable XQuery update ("-update:(on|off)")

This option controls whether or not XQuery update syntax is accepted. The default value is off.

Backup files updated by XQuery ("-backup:(on|off)")

If selected, backup versions for any XML files updated with an XQuery Update are generated.

This option is available when the **Enable XQuery update** option is selected.

Other Options

Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the *net.sf.saxon.lib.Initializer* interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

Updating XML Documents using XQuery Update 1.0

Using the bundled Saxon 12.5 EE XQuery processor Oxygen XML Developer offers support for XQuery Update 1.0. The XQuery Update Facility provides expressions that can be used to make persistent changes to instances of the XQuery 1.0 and XPath 2.0 Data Model. Thus, besides querying XML documents, you can modify them using the various insert/delete/modify/create methods available in the [XQuery Update 1.0](#) standard.

Choose Saxon 12.5 EE as a transformer in the scenario associated with the XQuery files containing update statements and Oxygen XML Developer will notify you if the update was successful.

Example: Using XQuery Update to modify a tag name in an XML file

```
rename node doc("books.xml")//publisher[1]//book[1] as "firstBook"
```

XQuery Unit Test (XSpec)

XSpec is a behavior driven development (BDD) *framework* for XSLT, XQuery, and Schematron. XSpec consists of syntax for describing the behavior of your XSLT, XQuery, or Schematron code, and some code that enables you to test your code against those descriptions.

Creating an XQuery Unit Test

To create a XQuery Unit Test, go to **File > New > XQuery Unit Test**. This is simple document template to help you get started.

Running an XQuery Unit Test

To run a Unit Test, open the XSpec file in an editor and click  **Apply Transformation Scenario(s)** on the main toolbar. This will run the built-in **Run XSpec Test** transformation scenario that is defined in the XSpec *framework* (on page 2269).

Testing an XQuery file

An XSpec file contains one or more test scenarios.

Example:

Suppose you have this XQuery function that takes a string as its argument. The first character of the string passed to the function is capitalized and concatenated to the rest of the string. Finally, the new string with the first character capitalized is returned to the calling method.

```
module namespace functx = "http://www.functx.com";

declare function functx:capitalize-first
($arg as xs:string?) as xs:string? {

concat(upper-case(substring($arg, 1, 1)),
substring($arg, 2))

};
```

The XSpec test invokes the XQuery function and passes the string `hello` as a parameter. The expected value that should be returned by the function (the string `Hello`) is contained in the `@select` attribute of the `x:expect` element.

```
<x:scenario label="Calling function capitalize-first">
  <x:call function="functx:capitalize-first">
    <x:param select="'hello'"/>
  </x:call>

  <x:expect label="should capitalize the first character of the string" select="'Hello'"/>
</x:scenario>
```

For more details about how to write XQuery tests and various samples, see <https://github.com/xspec/xspec/wiki/Getting-Started-with-XSpec-and-XQuery>.

Editing WSDL Documents (Deprecated)

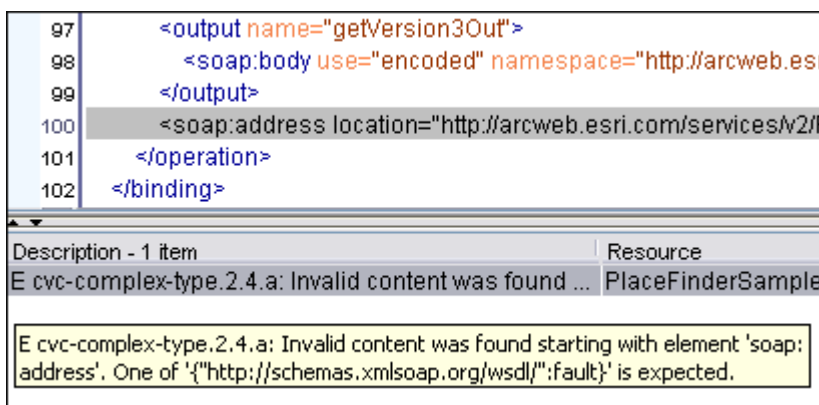

WSDL is an XML format for describing network services as a set of endpoints operating on messages containing either document-oriented or procedure-oriented information. The operations and messages are described abstractly, and then bound to a concrete network protocol and message format to define an endpoint. Related concrete endpoints are combined into abstract endpoints (services).

Oxygen XML Developer provides a special type of editor dedicated to WSDL documents. The WSDL editor offers support for validation, a specialized *Content Completion Assistant* (on page 2267), a component oriented **Outline view** (on page 823), searching and refactoring operations, and support to generate documentation.

Both WSDL version 1.1 and 2.0 are supported and SOAP versions 1.1 and 1.2. That means that in the location where a SOAP extension can be inserted the *Content Completion Assistant* offers elements from both SOAP 1.1 and SOAP 1.2. Validation of SOAP requests is executed first against a SOAP 1.1 schema and then against a SOAP 1.2 schema. In addition to validation against the XSD schemas, Oxygen XML Developer also checks if the WSDL file conforms with the WSDL specification (available only for WSDL 1.1 and SOAP 1.1).

In the following example you can see how the errors are reported.

Figure 264. Validating a WSDL file

Resources

For more information about the WSDL editing support in Oxygen XML Developer, watch our video demonstration:

<https://www.youtube.com/embed/OS5Ucm9b8sY>

Related Information:

[Editing XML Documents in Text Mode \(on page 471\)](#)

Modular Contextual WSDL Editing Using 'Main Files' Support

Smaller interrelated modules that define a complex WSDL structure cannot be correctly edited or validated individually, due to their interdependency with other modules. Oxygen XML Developer provides the support for defining the main module (or modules), allowing you to edit any of the imported/included files in the context of the larger WSDL structure.

You can set a main WSDL document either using the *main files* support from the **Project view** (on page 381), or using a validation scenario.

To set a *main file* using a validation scenario, add validation units that point to the main modules. Oxygen XML Developer warns you if the current module is not part of the dependencies graph computed for the main WSDL document. In this case, it considers the current module as the main WSDL document.

The advantages of editing in the context of a *main file* (on page 2270) include:

- Correct validation of a module in the context of a larger WSDL structure.
- *Content Completion Assistant* (on page 2267) displays all components valid in the current context.
- The **Outline view** (on page 823) displays the components collected from the entire WSDL structure.

**Note:**

When you edit an XML schema document that has a WSDL document set as the main file, the validation operation is performed over the main WSDL document.

Resources

For more information about editing WSDL documents in the *main files* context, watch our video demonstration:

https://www.youtube.com/embed/gn_YPD5xDCo

Validating WSDL Documents

By default, WSDL files are validated as you type. To change this, open the **Preferences** dialog box (**Options > Preferences**) (on page 114), go to **Editor > Document Checking**, and deselect the **Enable automatic validation** option (on page 195).

To validate a WSDL document manually, select the  **Validate** action from the  **Validation** toolbar drop-down menu or the **Document > Validate** menu. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

Content Completion Assistance in WSDL Documents

The *Content Completion Assistant* (on page 2267) is a powerful feature that enhances the editing of WSDL documents. It helps you define WSDL components by proposing context-sensitive element names. It can be manually activated with the **Ctrl + Space** shortcut.

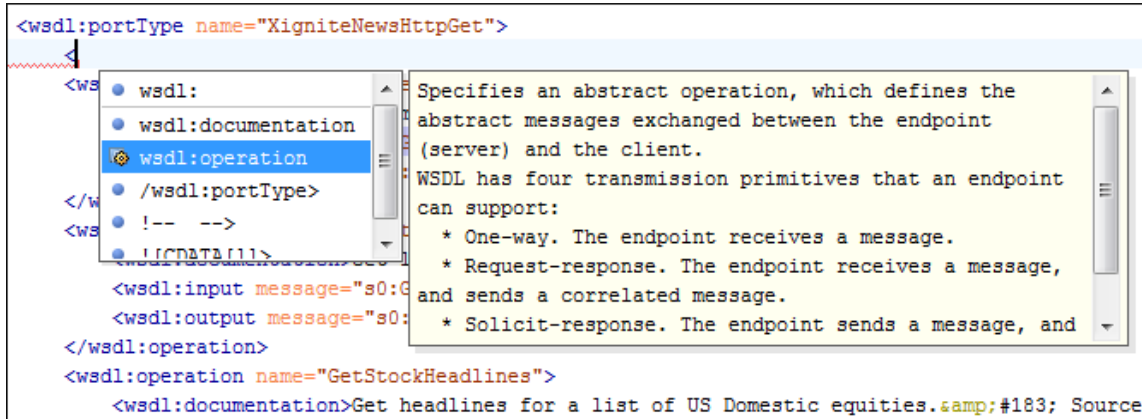

Another important capability of the *Content Completion Assistant* is to propose references to the defined components when you edit attribute values. For example, when you edit the `@type` attribute of a `<binding>` element, the *Content Completion Assistant* proposes all the defined port types. Each proposal that the *Content Completion Assistant* offers is accompanied by a documentation hint.

Note:

XML schema-specific elements and attributes are offered when the current editing context is the internal XML schema of a WSDL document.

Figure 265. WSDL Content Completion Assistant

Note:

If you are using the concept of *main files* (on page 2270) to import/include modules, the *Content Completion Assistant* collects its components starting from the *main files*. The *main files* can be defined in the project or in the associated validation scenario. For more information about the *Main Files* support in Oxygen XML Developer, see *Defining Main Files at Project Level* (on page 381).

Namespace prefixes in the scope of the current context are presented at the top of the content completion assistance window to speed up the insertion into the document of prefixed elements.

Figure 266. Namespace Prefixes in the Content Completion Assistant

For the common namespaces, such as XML Schema namespace (<http://www.w3.org/2001/XMLSchema>) or SOAP namespace (<http://schemas.xmlsoap.org/wsdl/soap/>), Oxygen XML Developer provides an easy mode to declare them by proposing a prefix for these namespaces.

WSDL Syntax Highlighting

Oxygen XML Developer supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for WSDL files, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (*on page 114*).
2. Go to **Editor > Syntax Highlight** (*on page 193*).
3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XML** tab in the **Preview** pane to see the effects of your changes.

**Tip:**

Oxygen XML Developer also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the **Editor > Syntax Highlight > Elements/Attributes by Prefix** preferences page (*on page 193*).

Related Information:

[Customize Syntax Highlight colors \(*on page 193*\)](#)

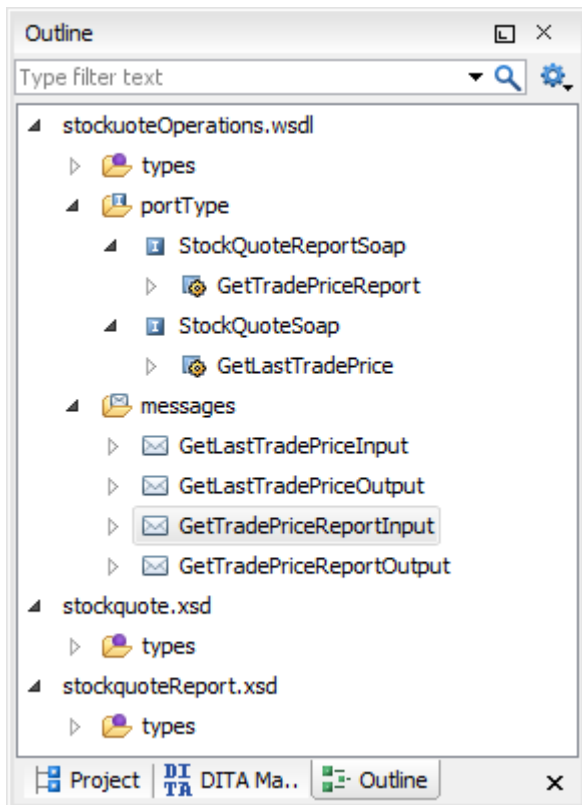

WSDL Outline View

The **Outline** view for WSDL documents displays the list of all the components (services, bindings, port types and so on) of the currently open WSDL document along with the components of its imports.

If you use the **Main Files** support (*on page 381*), the **Outline** view collects the components of a WSDL document starting from the *main files* of the current document.

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 267. WSDL Outline View

The **Outline** view can display both the components of the current document and its XML structure, organized in a tree-like fashion. You can switch between the display modes by using the  **Show XML structure** and  **Show components** actions in the  **Settings** menu on the **Outline** view toolbar. The following actions are available:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

Selection update on cursor move

Controls the synchronization between the **Outline** view and the current document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the WSDL editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the current document.

When the  **Show components** option is selected, the following actions are available:

Show XML structure

Displays the XML structure of the current document in a tree-like manner.

Sort

Sorts the components in the **Outline** view alphabetically.

Show all components

Displays all the components that were collected starting from current document or from the main document, if it is defined.

Show referable components

Displays all the components that you can reference from the current document.

Show only local components

Displays the components defined in the current file only.

Group by location

Groups the WSDL components by their location.

Group by type

Groups the WSDL components by their type.

Group by namespace

Groups the WSDL components by their namespace.

Note:

By default, all the three grouping criteria are active.

When the  **Show XML structure** option is selected, the following actions are available:

Show components

Switches the **Outline** view to the components display mode.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

Show element name

Show/hide element name.

Show text

Show/hide additional text content for the displayed elements.

Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from [the Outline preferences panel \(on page 272\)](#).

Configure displayed attributes

Displays the [XML Structured Outline preferences page \(on page 272\)](#).

The following contextual menu actions are available in the **Outline** view when the  **Show components** option is selected in the  **Settings** menu:

 **Edit Attributes**

Opens a dialog box that allows you to edit the attributes of the currently selected component.

 **Cut**

Cuts the currently selected component.

 **Copy**

Copies the currently selected component.

 **Delete**

Deletes the currently selected component.

 **Search references**

Searches for the references of the currently selected component.

Search references in

Searches for the references of the currently selected component in the context of a scope that you define.

Component dependencies

Opens the **Component Dependencies view** (*on page 830*) that displays the dependencies of the currently selected component.

Show referenced resources

Opens the **Referenced/Dependent Resources view** (*on page 828*) that displays the references for the currently selected resource.

Show dependent resources

Opens the **Referenced/Dependent Resources view** (*on page 828*) that displays the dependencies of the currently selected resource.

 **Rename Component in**

Renames the currently selected component in the context of a scope that you define.

The following contextual menu actions are available in the **Outline** view when the  **Show XML structure** option is selected in the  **Settings** menu:

Append Child

Displays a list of elements that you can insert as children of the current element.

Insert Before

Displays a list of elements that you can insert as siblings of the current element, before the current element.

Insert After

Displays a list of elements that you can insert as siblings of the current element, after the current element.

 **Edit Attributes**

Opens a dialog box that allows you to edit the attributes of the currently selected component.

 **Toggle Comment**

Comments/uncomments the currently selected element.

 **Search references**

Searches for the references of the currently selected component.

Search references in

Searches for the references of the currently selected component in the context of a scope that you define.

 **Component dependencies**

Opens the **Component Dependencies** view (*on page 830*) that displays the dependencies of the currently selected component.

 **Rename Component in**

Renames the currently selected component in the context of a scope that you define.

 **Cut**

Cuts the currently selected component.

 **Copy**

Copies the currently selected component.

 **Delete**

Deletes the currently selected component.

 **Expand More**

Expands the structure of a component in the **Outline** view.

 **Collapse All**

Collapses the structure of all the component in the **Outline** view.

To switch from the tree structure to the text filter, use **Tab** and **Shift-Tab**.

**Tip:**

The search filter is case insensitive. The following wildcards are accepted:

i

- * - any string
- ? - any character
- , - patterns separator

If no wildcards are specified, the string to search is used as a partial match.

The content of the **Outline** view and the editing area are synchronized. When you select a component in the **Outline** view, its definition is highlighted in the editing area.

WSDL Referenced/Dependent Resources View in WSDL Documents

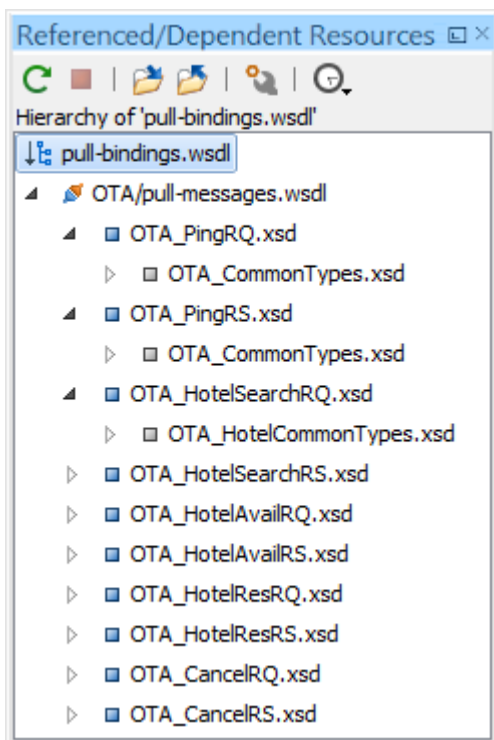

The **Referenced/Dependent Resources** view displays the hierarchy or dependencies for a WSDL resource. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Note:

The hierarchy of a WSDL resource includes the hierarchy of imported XML Schema resources. The dependencies of an XML Schema resource present the WSDL documents that import the schema.

To view the references or dependencies of a WSDL document, select the document in the **Project view** (on page 365) and choose **Show referenced resources** or **Show dependent resources** from the contextual menu.

Figure 268. Referenced/Dependent Resources View

The following actions are available on the toolbar of the **Referenced/Dependent Resources** view:

Refresh

Refreshes the resource structure.

 **Stop**

Stops the computing.

 **Show hierarchy for**

Computes the hierarchical structure of the references for a resource.

 **Show dependencies for**

Computes the structure of the dependencies for a resource.

 **Configure dependencies search scope**

Allows you to configure a scope to compute the dependencies. There is also an option for automatically using the defined scope for future operations.

 **History**

Provides access to the list of previously computed dependencies. Use the  **Clear history** button to remove all items from this list.

The contextual menu for a resource listed in the **Referenced/Dependent Resources** view contains the following actions:

Open

Opens the resource. You can also double-click a resource within the hierarchical structure to open it.

Go to reference

Opens the source document where the resource is referenced.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show references resources

Shows the references for the selected resource.

Show dependent resources

Shows the dependencies for the selected resource.

 **Add to Main Files**

Adds the currently selected resource in the **Main Files** directory.

Expand More

Expands more of the children of the selected resource from the hierarchical structure.

Collapse All

Collapses all children of the selected resource from the hierarchical structure.

Tip:

When a recursive reference is encountered in the view, the reference is marked with a special icon .

Note:

The **Move resource** or **Rename resource** actions give you the option to [update the references to the resource \(on page 830\)](#).

Related Information:

[Modular Contextual XML Editing Using 'Main Files' Support \(on page 596\)](#)

[Search and Refactor Operations Scope \(on page 598\)](#)

Moving/Renaming WSDL Resources

You can move and rename a resource presented in the **Referenced/Dependent Resources** view, using the **Rename resource** and **Move resource** refactoring actions from the contextual menu.

When you select the **Rename** action in the contextual menu of the **Referenced/Dependent Resources** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource(s)** - Select this option to update the references to the resource you are renaming. A **Preview** option is available that allows you to see what will be updated before selecting **Rename** to process the operation.

When you select the **Move** action from the contextual menu of the **Referenced/Dependent Resources** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, in accordance with the new location and name. A **Preview** option is available that allows you to see what will be updated before selecting **Move** to process the operation.

WSDL Component Dependencies View

The **Component Dependencies** view allows you to see the dependencies for a selected component. This is helpful if you want to see where components are used in the entire hierarchy. For example, if you want to find all the references where a given component is used.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

To see the dependencies of a WSDL component:

1. Right-click the desired component in the editor or **Outline** view.
2. Select the **Component Dependencies** action from the contextual menu.

This action is available for all WSDL components (`messages`, `port types`, `operations`, `bindings`, and so on).

If a component contains multiple references, a small table is displayed at the bottom of the view that contains all the references. When a recursive reference is encountered, it is marked with a special icon ☞.

Figure 269. Component Dependencies View

The **Component Dependencies** view includes the following toolbar actions:

Refresh

Refreshes the dependencies structure.

Stop

Stops the dependency computation.

Configure

Allows you to choose the search scope for computing the dependencies structure. This is helpful for making sure all imported/included resources are computed.

History

Allows you to select from a list of the most recently used dependency computations.

In addition, the following actions are available in the contextual menu:

Go to First Reference

Selects the first reference of the currently selected component in the dependencies tree.

Go to Component

Shows the definition of the currently selected component in the dependencies tree.

Related Information:

[Searching and Refactoring Operations Scope in WSDL Documents \(on page 834\)](#)

Highlight Component Occurrences in WSDL Documents

When you position your mouse cursor over a component in a WSDL document, Oxygen XML Developer searches for the component declaration and all its references and highlights them automatically.

Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected.

To change the default behavior of **Highlight Component Occurrences**, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Editor > Mark Occurrences**. You can also trigger a search using the **Search > Search Occurrences in File** () action from contextual menu. Matches are displayed in separate tabs of the **Results** view (on page 503).

Searching and Refactoring Operations in WSDL Documents

Search Actions

The following search actions are available from the **Search** submenu in the contextual menu of the current editor or from the **Document > References** menu:

Search References

Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the currently edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.

Search References in

Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.

Search Declarations

Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the currently edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.

Search Declarations in

Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.

Search Occurrences in File

Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the **Document > Schema** menu:

Go to Definition

Takes you to the location of the definition of the current item.

Note:

You can also use the **Ctrl + Single-Click (Command + Single-Click on macOS)** shortcut on a reference to display its definition.

Refactoring Actions

The following refactoring actions are available from the **Refactoring** submenu from the **Document > Refactoring** menu or in the contextual menu of the current editor:

Rename Component

Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.

Rename Component in

Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

Figure 270. Rename Identity Constraint Dialog Box

Searching and Refactoring Operations Scope in WSDL Documents

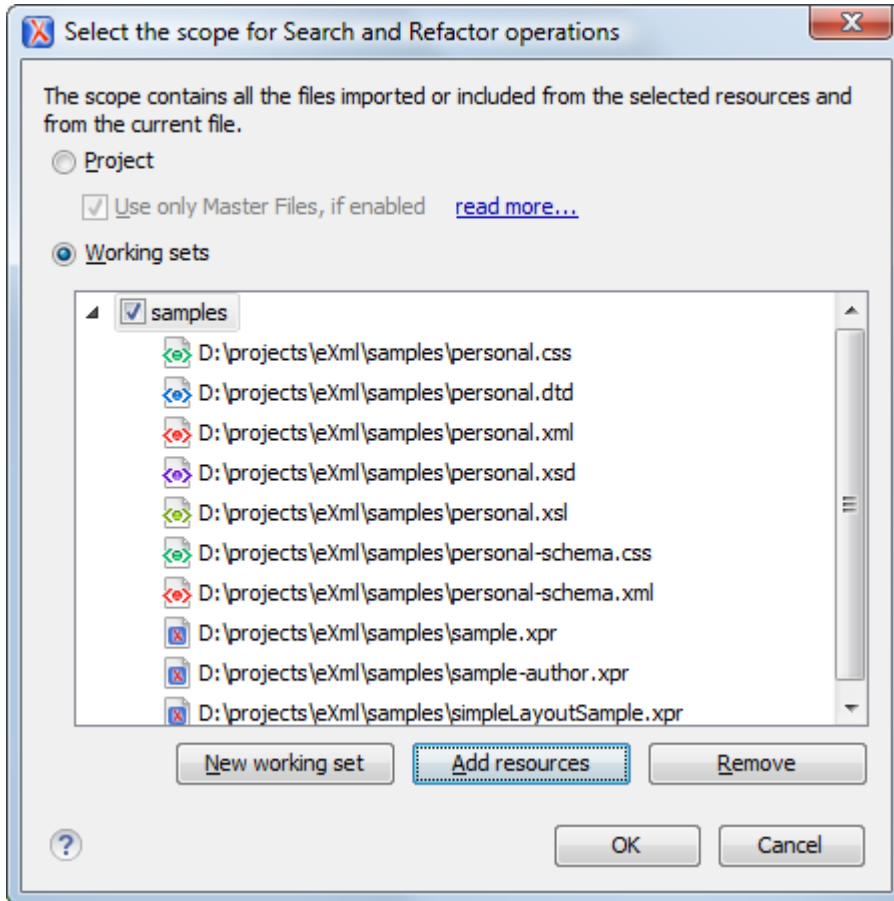

The *scope* is a collection of documents that define the context of a search and refactor operation. To control it you can use the  **Change scope** operation, available in the *Quick Assist* action set or on the **Referenced/Dependent Resources** view's toolbar. You can restrict the scope to the current project or to one or multiple *working sets* (on page 2273). The **Use only Main Files, if enabled** checkbox allows you to restrict the scope of the search and refactor operations to the resources from the **Main Files** directory. Click **read more** for details about the *Main Files* support (on page 381).

Figure 271. Change Scope Dialog Box

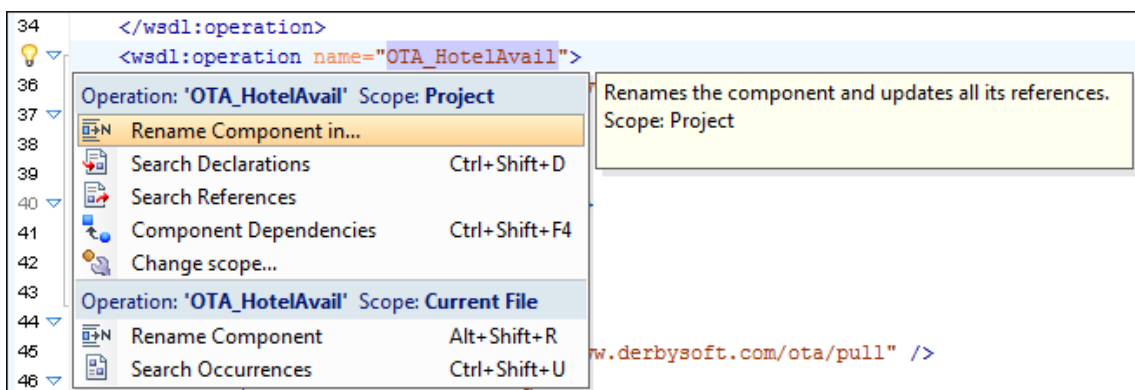

The scope you define is applied to all future search and refactor operations until you modify it. Contextual menu actions allow you to add or delete files, folders, and other resources to the *working set* (on page 2273) structure.

Quick Assist Support in WSDL Documents

The *Quick Assist* feature (on page 2272) is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb icon (💡) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the *quick assist* menu by using the **Alt + 1** (**Meta + Alt + 1** on macOS) keyboard shortcuts.

Figure 272. WSDL Quick Assist Support

The *Quick Assist* support offers direct access to the following actions:

Rename Component in

Renames the component and all its dependencies.

Search Declarations

Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

Search References

Searches all references of the component in a predefined scope.

Component Dependencies

Searches the component dependencies in a predefined scope.

Change Scope

Configures the scope that will be used for future search or refactor operations.

Rename Component

Allows you to rename the current component in-place.

Search Occurrences

Searches all occurrences of the component within the current file.

Generating Documentation for WSDL Documents (Deprecated)

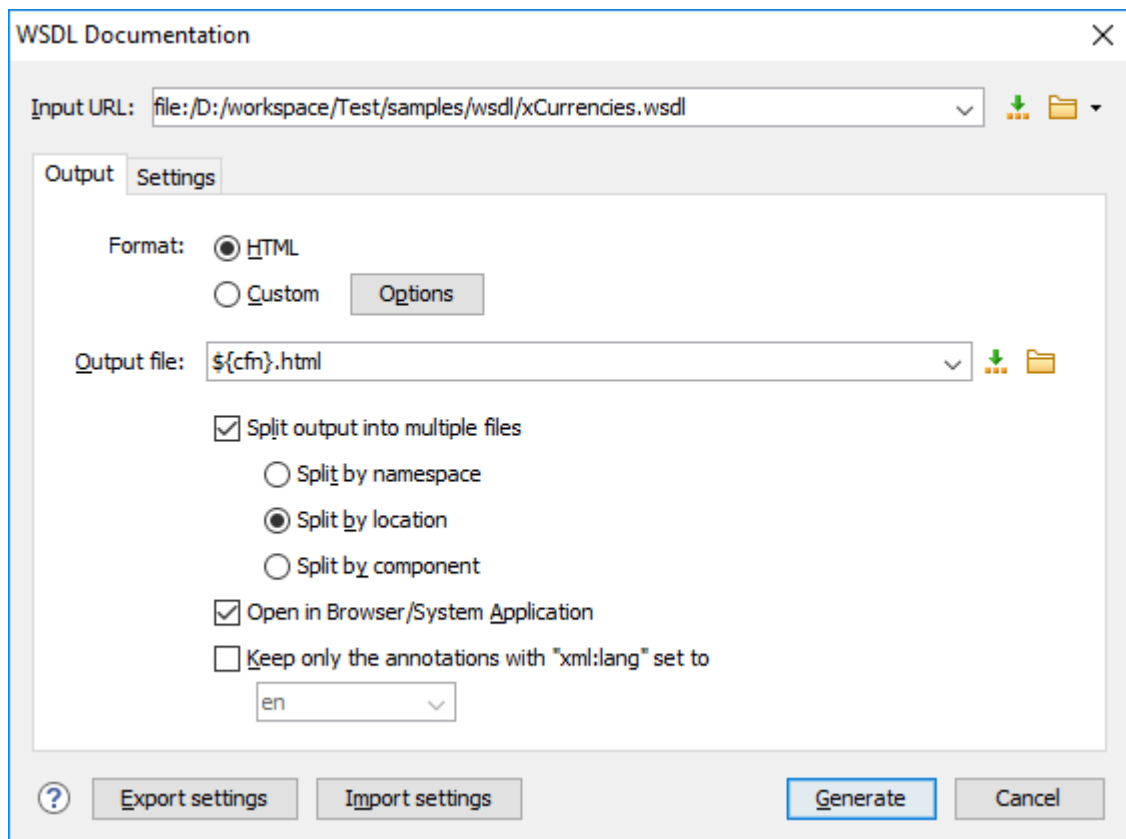

You can use Oxygen XML Developer to generate detailed documentation for the components of a WSDL document in HTML format. You can select the WSDL components to include in your output and the level of details to present for each of them. Also, the components are hyperlinked. You can also generate the documentation in a *custom output format* ([on page 841](#)) by using a custom stylesheet.

Note:

The WSDL documentation includes the XML Schema components that belong to the internal or imported XML schemas.

To generate documentation for a WSDL document, select **WSDL Documentation** from the **Tools > Generate Documentation** menu or from the **Generate Documentation** submenu in the contextual menu of the **Project view** ([on page 365](#)). You can also open the tool by using the **Generate Documentation** toolbar button.

Figure 273. WSDL Documentation Dialog Box

The **Input URL** field of the dialog box must contain the full path to the WSDL document that you want to generate documentation for. The WSDL document may be a local or a remote file. You can specify the path to the WSDL file by entering it in the text field, or by using the  **Insert Editor Variables** button or the options in the  **Browse** drop-down menu.

Output Tab

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
 - **HTML** - The documentation is generated in [HTML output format \(on page 840\)](#).
 - **Custom** - The documentation is generated in a [custom output format \(on page 841\)](#), allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.
- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the  **Insert Editor Variables** button or the options in the  **Browse** drop-down menu.
- **Split output into multiple files** - Instructs the application to split the output into multiple files. For large WSDL documents, choosing a different split criterion may generate smaller output files providing a

faster documentation browsing. You can choose to split them by namespace, location, or component name.

- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

Note:

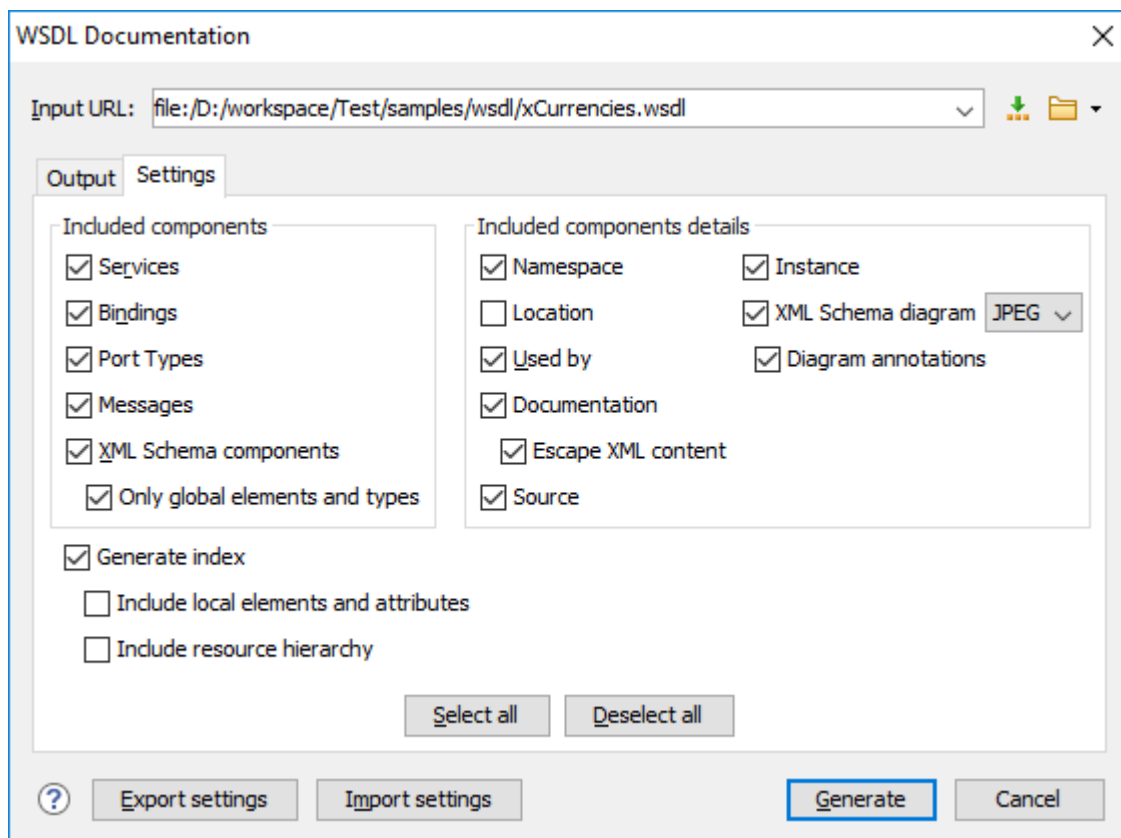

To set the browser or system application that will be used, open the **Preferences dialog box (Options > Preferences)** (on page 114), go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

- **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the `@xml:lang` attribute set to the selected language. If you choose a primary language code (for example, **en** for English), this includes all its possible variations (**en-us**, **en-uk**, etc.).

Setting Tab

When you generate documentation for a WSDL document, you can choose what components to include in the output and the details to be included in the documentation.

Figure 274. Settings Tab of the WSDL Documentation Dialog Box

The **Settings** tab allows you to choose whether or not to include the following:

- **Components**

- **Services** - Specifies whether or not the generated documentation includes the WSDL services.
- **Bindings** - Specifies whether or not the generated documentation includes the WSDL bindings.
- **Port Types** - Specifies whether or not the generated documentation includes the WSDL port types.
- **Messages** - Specifies whether or not the generated documentation includes the WSDL messages.
- **XML Schema Components** - Specifies whether or not the generated documentation includes the XML Schema components.
- **Only global elements and types** - Specifies whether or not the generated documentation includes only global elements and types.

- **Component Details**

- **Namespace** - Presents the namespace information for WSDL or XML Schema components.
- **Location** - Presents the location information for each WSDL or XML Schema component.
- **Used by** - Presents the list of components that reference the current one.
- **Documentation** - Presents the component documentation. If you choose **Escape XML Content**, the XML tags are presented in the documentation.
- **Source** - Presents the XML fragment that defines the current component.
- **Instance** - Generates a sample XML instance for the current component.

Note:

This option applies to the XML Schema components only.

- **XML Schema Diagram** - Displays the diagram for each XML Schema component. You can choose the image format (JPEG, PNG, GIF, SVG) to use for the diagram section.
- **Diagram annotations** - Specifies whether or not the annotations of the components presented in the diagram sections are included.
- **Generate index** - Displays an index with the components included in the documentation.
 - **Include local elements and attributes** - If selected, local elements and attributes are included in the documentation index.
 - **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is deselected by default.

Export settings - Save the current settings in a settings file for further use (for example, if you need the exported settings file for [generating the documentation from the command-line interface](#)).

Import settings - Reloads the settings from the exported file.

Generate - Use this button to generate the WSDL documentation.

Tip:

This function can be executed from an automated command-line script, for more details, see [Scripting Oxygen \(on page 2233\)](#).

Generating WSDL Documentation in HTML Format

The WSDL documentation generated in HTML format is presented in a visual diagram style with various sections, hyperlinks, and options.

Figure 275. WSDL Documentation in HTML Format

The documentation of each component is presented in a separate section. The title of the section is composed of the component type and the component name. The component information (namespace, documentation, etc.) is presented in a tabular form.

If you choose to split the output into multiple files, the table of contents is displayed in the left frame and is divided in two tabs: **Components** and **Resource Hierarchy**.

The **Components** tab allows you to group the contents by namespace, location, or component type. The WSDL components from each group are sorted alphabetically. The **Resource Hierarchy** tab displays the dependencies between WSDL and XML Schema modules in a tree-like fashion. The root of the tree is the WSDL document that you generate documentation for.

After the documentation is generated, you can collapse or expand details for some WSDL components by using the **Showing** options or the  **Collapse** or  **Expand** buttons.

Figure 276. Showing Options

Generating WSDL Documentation in a Custom Format

To obtain the default HTML documentation output from a WSDL document, Oxygen XML Developer uses an intermediary XML document to which it applies an XSLT stylesheet. To create a custom output from your WSDL document, edit the `wslDocHtml.xsl` XSLT stylesheet or create your own.

Note:

The `wslDocHtml.xsl` stylesheet that is used to obtain the HTML documentation is located in the `[OXYGEN_INSTALL_DIR]/frameworks/wsl_documentation/xsl` folder.

Note:

The intermediary XML document complies with the `wslDocSchema.xsd` XML Schema. This schema is located in the `[OXYGEN_INSTALL_DIR]/frameworks/wsl_documentation` folder.

Figure 277. Custom Format Options Dialog Box

When using a custom format, you can also copy additional resources into the output folder or choose to keep the intermediate XML files created during the documentation process.

WSDL SOAP Analyzer Tool (Deprecated)

WSDL SOAP Analyzer is a tool that helps you test if the messages defined in a Web Service Descriptor (WSDL) are accepted by a Web Services server.

After you edit and validate your Web service descriptor against a mix of the XML Schemas for WSDL and SOAP, it is easy to check if the defined SOAP messages are accepted by the remote Web Services server by using the integrated **WSDL SOAP Analyzer** tool (available from the toolbar or **Tools** menu).

Oxygen XML Developer provides two ways of testing, one for the currently edited WSDL document and another for the remote WSDL documents that are published on a web server. To open the **WSDL SOAP Analyzer** tool for the currently edited WSDL document do one of the following:

- Click the  **WSDL SOAP Analyzer** toolbar button.
- Use the  **WSDL SOAP Analyzer** action from the **Tools** menu.
- Go to **Open with >**  **WSDL SOAP Analyzer** in the contextual menu of the **Project** (*on page 365*) view.

Figure 278. WSDL SOAP Analyzer Dialog Box

This tool contains a SOAP analyzer and sender for Web Services Description Language file types. The analyzer fields are as follows:

- **Services** - The list of services defined by the WSDL file.
- **Ports** - The ports for the selected service.
- **Operations** - The list of available operations for the selected service.
- **Action URL** - The script that serves the operation.
- **SOAP Action** - Identifies the action performed by the script.
- **Version** - Choose between 1.1 and 1.2. The SOAP version is selected automatically depending on the selected port.

- **Request Editor** - It allows you to compose the web service request. When an action is selected, Oxygen XML Developer tries to generate as much content as possible for the SOAP request. The envelope of the SOAP request has the correct namespace for the selected SOAP version, that is *http://schemas.xmlsoap.org/soap/envelope/* for SOAP 1.1 or *http://www.w3.org/2003/05/soap-envelope* for SOAP 1.2. Usually you just have to change a few values for the request to be valid. The [Content Completion Assistant \(on page 2267\)](#) is available for this editor and is driven by the schema that defines the type of the current message. While selecting various operations, Oxygen XML Developer remembers the modified request for each one. You can click the **Regenerate** button to overwrite your modifications for the current request with the initial generated content.
- **Attachments List** - You can define a list of file URLs to be attached to the request.
- **Response Area** - Initially it displays an auto generated server sample response so you can have an idea about how the response looks like. After pressing the **Send** button, it presents the message received from the server in response to the Web Service request. It may show also error messages. If the response message contains attachments, Oxygen XML Developer prompts you to save them, then tries to open them with the associated system application.
- **Errors List** - There may be situations where the WSDL file is respecting the WSDL XML Schema, but it fails to be valid (for example, in the case of a message that is defined by means of an element that is not found in the types section of the WSDL). In such a case, the errors are listed here. This list is presented only when there are errors.
- **Send Button** - Executes the request. A status dialog box is displayed when Oxygen XML Developer is connecting to the server.

The testing of a WSDL file is straight-forward. Click the WSDL analysis button, then select the service, the port, and the operation. The editor generates the skeleton for the SOAP request. You can edit the request, eventually attach files to it and send it to the server. Watch the server response in the response area. You can find more details in the [Testing Remote WSDL Files \(on page 844\)](#) section.

**Note:**

SOAP requests and responses are automatically validated in the **WSDL SOAP Analyzer** using the XML Schemas specified in the WSDL file.

Once defined, a request derived from a Web Service descriptor can be saved with the **Save** button to a Web Service SOAP Call (WSSC) file for later reuse. In this way, you save time in configuring the URLs and parameters.

You can open the result of a Web Service call in an editor panel using the **Open** button.

Testing Remote WSDL Files

To open and test a remote WSDL file the steps are the following:

1. Go to **Tools >**  **WSDL SOAP Analyzer** .
2. On the **WSDL File** tab enter the URL of the remote WSDL file.

3. Click the **OK** button.

This will open the **WSDL SOAP Analyzer tool** ([on page 841](#)). In the **Saved SOAP Request** tab you can open directly a previously saved Web Service SOAP Call (WSSC) file, thus skipping the analysis phase.

Editing CSS Stylesheets

Oxygen XML Developer includes a built-in editor for CSS stylesheets. This section presents the features of the CSS editor and how these features should be used. The features of the CSS editor include:

- **Create new CSS files and templates** - You can use the built-in new file wizards to [create new CSS documents or templates](#) ([on page 330](#)).
- **Open and Edit CSS files** - CSS files can be opened and edited in a source editing mode.
- **Validation** - Presents validation errors in CSS files.
- **Content completion** - Offers proposals for properties and the values that are available for each property.
- **Syntax highlighting** - The syntax highlighting in Oxygen XML Developer makes CSS files more readable.
- **Shortcut to open resources** - You can use **Ctrl + Single-Click (Command + Single-Click on macOS)** to open imported stylesheets or other resources (such as images) in the default system application for the particular type of resource.

Validating CSS Stylesheets

Oxygen XML Developer includes a built-in *CSS Validator*, integrated with general validation support. This makes the usual validation features for presenting errors also available for CSS stylesheets.

When you edit a CSS document, you can access the [CSS validator options](#) ([on page 202](#)) by selecting

 **Validation options** from the **Document > Validate** menu.

The CSS properties accepted by the validator are those included in the current CSS profile that is selected in [the CSS validation preferences](#) ([on page 202](#)). The **CSS 3 with Oxygen extensions** profile includes all the CSS 3 standard properties and the CSS extensions specific for **Oxygen**. That means all **Oxygen**-specific extensions are accepted in a CSS stylesheet by [the built-in CSS validator](#) ([on page 845](#)) when this profile is selected.

Specify Custom CSS Properties

To specify custom CSS properties, follow these steps:

1. Create a file named `CustomProperties.xml` that has the following structure:

```
<?xml version="1.0" encoding="UTF-8"?>
<css_keywords
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://www.oxygenxml.com/ns/css
  http://www.oxygenxml.com/ns/css/CssProperties.xsd"
  xmlns="http://www.oxygenxml.com/ns/css">
  <property name="custom">
```

```

<summary>Description for custom property.</summary>

<value name="customValue"/>

<value name="anotherCustomValue"/>

</property>

</css_keywords>

```

2. Go to your desktop and create the `builtin/css-validator/` folder structure.
3. Press and hold **Shift** and right-click anywhere on your desktop. From the contextual menu, select **Open Command Window Here**.
4. In the command line, run the `jar cvf custom_props.jar builtin/` command. The `custom_props.jar` file is created.
5. Go to `[OXYGEN_INSTALL_DIR]/lib` and create the `endorsed` folder. Copy the `custom_props.jar` file to `[OXYGEN_INSTALL_DIR]/lib/endorsed`.

Content Completion in CSS Stylesheets

A *Content Completion Assistant* (on page 2267), similar to the one available for XML documents (on page 486), offers the CSS properties and the values available for each property. It can be manually activated with the **Ctrl + Space** shortcut and is context-sensitive when invoked for the value of a property. The *Content Completion Assistant* also includes [code templates that can be used to quickly insert code fragments](#) (on page 491) into CSS stylesheets. The code templates that are proposed include form controls, actions, and **Author** mode operations.

Figure 279. Content Completion in CSS Stylesheets

The properties and values available are dependent on the CSS Profile selected in the **CSS preferences** (on page 202). The CSS 2.1 set of properties and property values is used for most of the profiles. However, with CSS 1 and CSS 3 specific proposal sets are used.

Proposals for CSS Selectors - After inserting a *CSS selector*, the content completion assistance will propose a list of pseudo-elements and pseudo-classes that are available for the selected CSS profile.

Proposals for @media and @import Rules - After inserting `@media` or `@import <url>` rules, the content completion assistance will propose a list of supported media types.

Related Information:

[Specify Custom CSS Properties](#) (on page 845)

Syntax Highlighting in CSS Files

Oxygen XML Developer supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for CSS files, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (*on page 114*).
2. Go to **Editor > Syntax Highlight** (*on page 193*).
3. Select and expand the **CSS** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

Related Information:

[Syntax Highlight Preferences](#) (*on page 193*)

CSS Outline View

The **Outline** view for CSS stylesheets presents the import declarations for other CSS stylesheet files and all the selectors defined in the current CSS document. The selector entries can be presented as follows:

- In the order they appear in the document.
- Sorted by the element name used in the selector.
- Sorted by the entire selector string representation.

You can synchronize the selection in the **Outline** view with the cursor moves or changes you make in the stylesheet document. When you select an entry from the **Outline** view, Oxygen XML Developer highlights the corresponding import or selector in the CSS editor.

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 280. CSS Outline View

The selectors presented in this view can be found quickly using the key search field. When you press a sequence of character keys while the focus is in the view, the first selector that starts with that sequence is selected automatically.

Folding in CSS Stylesheets

In a large CSS stylesheet document, some styles can be collapsed so that only the styles that are needed remain in focus. The same folding features available for XML documents are also available in CSS stylesheets.

**Note:**

To enhance your editing experience, you can select entire blocks (parts of text delimited by brackets) by double-clicking somewhere inside the brackets.

Formatting and Indenting CSS Stylesheets (Pretty Print)

If the edited CSS stylesheet becomes unreadable because of the bad alignment of the text lines, the format and indent operation available for XML documents is also available for CSS stylesheets. It works in the same way as for XML documents and is available as the same menu and toolbar action.

Minifying CSS Stylesheets

Minification (or *compression*) of a CSS document is the practice of removing unnecessary code without affecting the functionality of the stylesheet.

To minify a CSS, invoke the contextual menu anywhere in the edited document and choose the **Minify CSS** action. Oxygen XML Developer opens a dialog box that allows you to:

- Set the location of the resulting CSS.
- Place each style rule on a new line.

After pressing **OK**, Oxygen XML Developer performs the following actions:

- All spaces are normalized (all leading and trailing spaces are removed, while sequences of white spaces are replaced with single space characters).
- All comments are removed.

Note:

The CSS minifier relies heavily upon the W3C CSS specification. If the content of the CSS file you are trying to minify does not conform with the specifications, an error dialog box will be displayed, listing all errors encountered during the processing.

The resulting CSS stylesheet gains a lot in terms of execution performance, but loses in terms of readability. The source CSS document is left unaffected.

Note:

To restore the readability of a minified CSS, invoke the **Format and Indent** action from the **Document > Source** menu, the **Source** submenu from the contextual menu, or **Source** toolbar. However, this action will not recover any of the deleted comments.

Editing LESS Stylesheets

Oxygen XML Developer provides support for stylesheets coded with the LESS dynamic stylesheet language. LESS extends the CSS language by adding features that allow mechanisms such as *variables*, *nesting*, *mixins*, *operators*, and *functions*. Oxygen XML Developer offers additional LESS-editing features that include:

- **Create new LESS files and templates** - You can use the built-in new file wizards to [create new LESS documents or templates \(on page 330\)](#).
- **Open and Edit LESS files** - LESS files can be opened and edited in a source editing mode.
- **Validation** - Presents validation errors in LESS files.
- **Content completion** - Offers proposals for properties and the values that are available for each property.
- **Compile to CSS** - Options are available to compile LESS files to CSS.
- **Syntax highlighting** - Oxygen XML Developer supports syntax highlighting in LESS files, although there may be some limitations in supporting all the LESS constructs.
- **Shortcut to open resources** - While editing LESS files, you can use **Ctrl + Single-Click (Command + Single-Click on macOS)** to open imported stylesheets or other resources (such as images) in the default system application for the particular type of resource.

For more information about LESS go to: <http://lesscss.org/>.

Validating LESS Stylesheets

Oxygen XML Developer includes a built-in *LESS CSS Validator*, integrated with general validation support. The usual validation features for presenting errors also available for LESS stylesheets.

Oxygen XML Developer provides three validation methods:

- Automatic validation as you type - marks validation errors in the document as you are editing.
- Validation upon request, by pressing the  **Validate** button from the  **Validation** toolbar drop-down menu. An error list is presented in the message panel at the bottom of the editor.
- Validation scenarios, by selecting  **Configure Validation Scenario(s)** from the  **Validation** toolbar drop-down menu. Errors are presented in the message panel at the bottom of the editor. This is useful when you need to validate the current file as part of a larger LESS import hierarchy (for instance, you may change the URL of the file to validate to the root of the hierarchy).

Content Completion in LESS Stylesheets

A *Content Completion Assistant* (on page 2267) offers the LESS properties and the values available for each property. It can be manually activated with the **Ctrl + Space** shortcut and is context-sensitive when invoked for the value of a property in a LESS file. The *Content Completion Assistant* also includes [code templates that can be used to quickly insert code fragments](#) (on page 491) into LESS stylesheets. The code templates that are proposed include form controls, actions, and **Author** mode operations.

Figure 281. Content Completion in LESS Stylesheets

The properties and values available are dependent on the CSS Profile selected in the [CSS preferences](#) (on page 202).

Syntax Highlighting in LESS Files

Oxygen XML Developer supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for LESS files, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114).
2. Go to **Editor > Syntax Highlight** (on page 193).

3. Select and expand the **LESS** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

Related Information:

[Syntax Highlight Preferences \(on page 193\)](#)

Compiling LESS Stylesheets to CSS

When editing LESS files, you can compile the files into CSS. Oxygen XML Developer provides both manual and automatic options to compile LESS stylesheets into CSS.

**Important:**

The LESS processor works well only with files having the *UTF-8* encoding. Thus, it is highly recommended that you always use the `utf-8` encoding when working with LESS files or the files they import (other LESS or CSS files). You can use the following directive at the beginning of your files:

```
@charset "utf-8";
```

You have two options for compiling LESS files to CSS:

1. Use the contextual menu in a LESS file and select **Compile to CSS (Ctrl + Shift + C (Command + Shift + C on macOS))**.
2. Select the **Automatically compile LESS to CSS when saving option (on page 170)** (in the **Save** preferences page). If selected, when you save a LESS file it will automatically be compiled to CSS (this option is deselected by default).

**Important:**

If this option is selected, when you save a LESS file, the CSS file that has the same name as the LESS file is overwritten without warning. Make sure all your changes are made in the LESS file. Do not edit the CSS file directly, as your changes might be lost.

Editing Relax NG Schemas

An XML Schema describes the structure of an XML document and is used to validate XML document instances against it, to check that the XML instances conform to the specified requirements. If an XML instance conforms to the schema then it is said to be valid. Otherwise, it is invalid.

Oxygen XML Developer offers support for editing Relax NG schema files in the following editing modes:

- **Text editing mode (on page 759)** - Allows you to edit Relax NG schema files in a source editing mode, along with a schema design pane with two tabs that offer a **Full Model View (on page 853)** and **Logical Model View (on page 854)**.
- **Grid editing mode (on page 316)** - Displays Relax NG schema files in a structured spreadsheet-like grid.

For information about applying and detecting schemas, see [Associating a Schema to XML Documents \(on page 582\)](#).

Related Information:

[Associating a Schema to XML Documents \(on page 582\)](#)

Modular Contextual Relax NG Schema Editing Using 'Main Files' Support

Smaller interrelated modules that define a complex Relax NG Schema cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, an element defined in a main schema document is not visible when you edit an included module. Oxygen XML Developer provides the support for defining the main module (or modules), thus allowing you to edit any of the imported/included schema files in the context of the larger schema structure.

You can set a main Relax NG document either using the *main files support from the Project view (on page 381)*, or using a validation scenario.

To set a *main file* using a validation scenario, add validation units that point to the main schemas. Oxygen XML Developer warns you if the current module is not part of the dependencies graph computed for the main schema. In this case, it considers the current module as the main schema.

The main advantage of editing in the context of a *main file (on page 2270)* is that it provides correct validation of a module in the context of a larger schema structure.

Related Information:

[Creating a New Validation Scenario \(on page 555\)](#)

[XML Schema Outline View \(on page 763\)](#)

Relax NG Schema Diagram Editor

This section explains how to use the graphical diagram editor for Relax NG schemas.

Introduction to Relax NG Schema Diagram Editor

Oxygen XML Developer provides a simple, expressive, and easy-to-read schema diagram editor for Relax NG schemas.

With this new feature you can easily develop complex schemas, print them on multiple pages or save them as JPEG, PNG, or BMP images. It helps both schema authors in developing the schema and content authors who are using the schema to understand it.

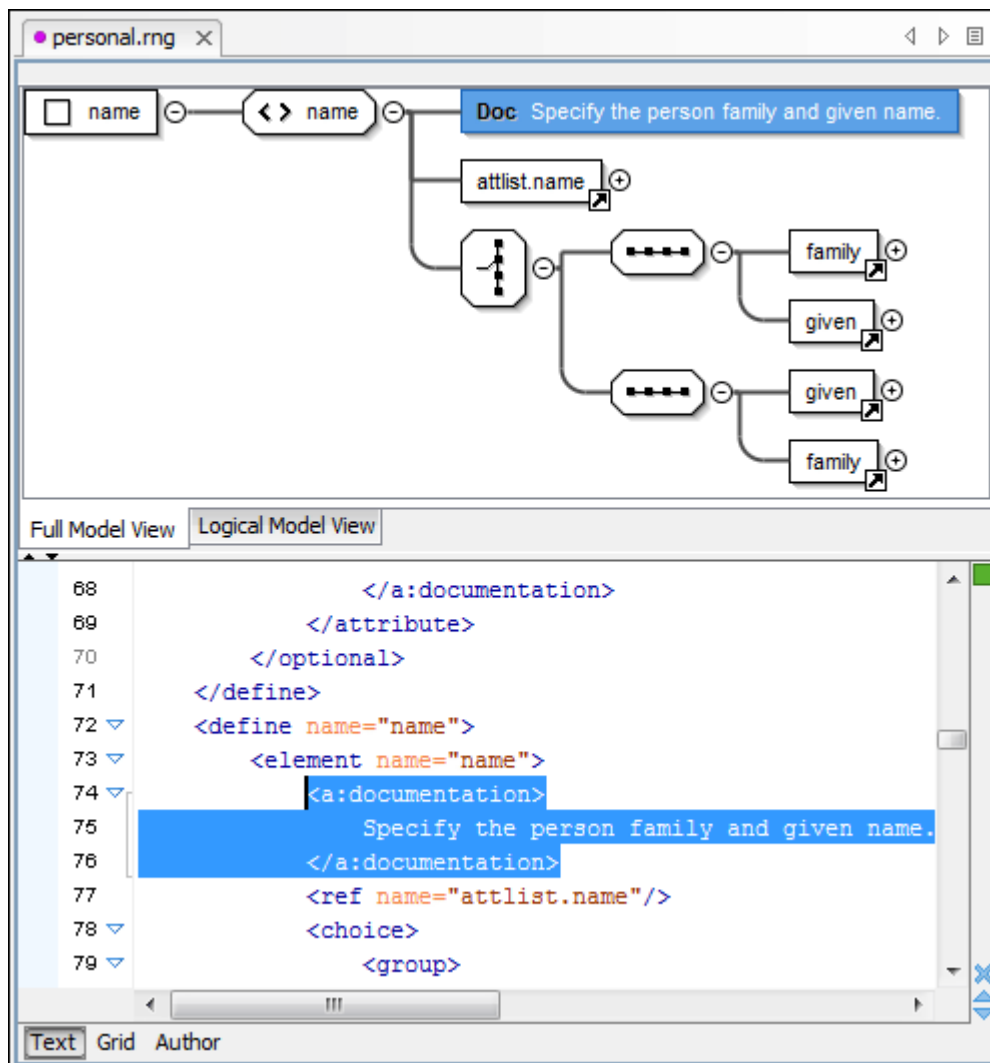

Oxygen XML Developer provides a side-by-side source and diagram presentation with real-time synchronization:

- The changes you make in the editor are immediately visible in the Diagram (no background parsing).
- Changing the selected element in the diagram selects the underlying code in the source editor.

Full Model View

When you create a new schema document or open an existing one, the editor panel is divided in two sections: one containing the schema diagram and the second the source code. The schema diagram editor has two tabs that offer a **Full Model View** and **Logical Model View** (on page 854).

Figure 282. Relax NG Schema Editor - Full Model View

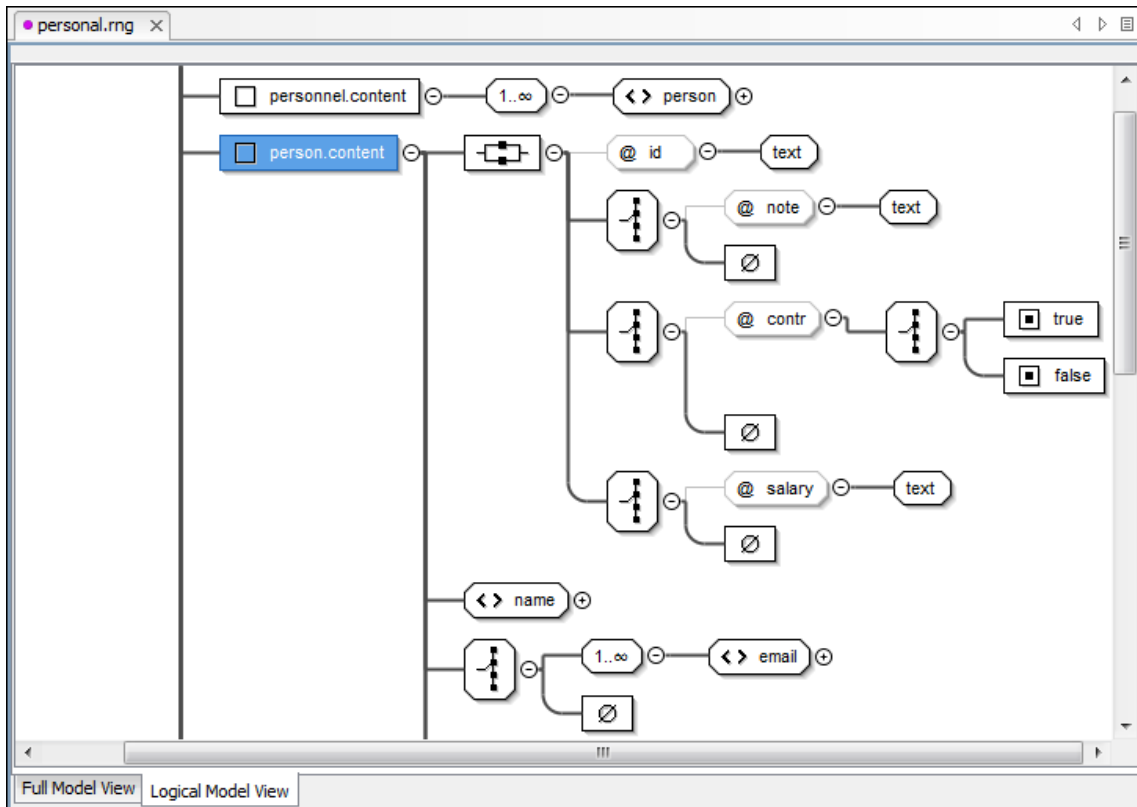

The following references can be expanded in place: patterns, includes, and external references. This expansion mechanism, coupled with the synchronization support, makes the schema navigation easy.

All the element and attribute names are editable by double-clicking the names.

Logical Model View

The **Logical Model View** presents the compiled schema in the form of a single pattern. The patterns that form the element content are defined as top-level patterns with generated names. These names are generated depending of the elements name class.

Figure 283. Logical Model View for a Relax NG Schema

Symbols Used in the Schema Diagram

The views in the schema diagram editor renders all the Relax NG schema patterns with the following intuitive symbols:

-  name  - `define` pattern with the `@name` attribute set to the value shown inside the rectangle (in this example `name`).
-  attlist.person  - `define` pattern with the `@combine` attribute set to `interleave` and the `@name` attribute set to the value shown inside the rectangle (in this example `attlist.person`).
-  attlist.person  - `define` pattern with the `@combine` attribute set to `choice` and the `@name` attribute set to the value shown inside the rectangle (in this example `attlist.person`).
-  name  - `element` pattern with the `@name` attribute set to the value shown inside the rectangle (in this example `name`).

-  - attribute pattern with the @name attribute set to the value shown inside the rectangle (in this case note).
-  - ref pattern with the @name attribute set to the value shown inside the rectangle (in this case family).
-  - oneOrMore pattern.
-  - zeroOrMore pattern.
-  - optional pattern.
-  - choice pattern.
-  - value pattern (for example, used inside a choice pattern).
-  - group pattern.
-  - A pattern from the Relax NG Annotations namespace (<http://relaxng.org/ns/compatibility/annotations/1.0>) that is treated as a documentation element in a Relax NG schema.
-  - text pattern.
-  - empty pattern.

Actions Available in the Schema Diagram Editor

When editing Relax NG schemas in **Full Model View** (on page 853), the contextual menu offers the following actions:

Go to definition (Available for imported components)

This action is available for imported components from other RNG files, and it shows where that component is defined.

Append child

Appends a child to the selected component.

Insert Before

Inserts a component before the selected component.

Insert After

Inserts a component after the selected component.

Edit attributes

Edits the attributes of the selected component.

Remove

Removes the selected component.

Show only the selected component

Depending on its state (selected/not selected), either the selected component or all the diagram components are shown.

Show Annotations

Depending on its state (selected/not selected), the documentation nodes are shown or hidden.

Auto expand to references

This option controls how the schema diagram is automatically expanded. If you select it and then edit a top-level element or you make a refresh, the diagram is expanded until it reaches referenced components. If this option is left unchecked, only the first level of the diagram is expanded, showing the top-level elements. For large schemas, the editor disables this option automatically.

Collapse Children

Collapses the children of the selected view.

Expand Children

Expands the children of the selected view.

Print Selection

Prints the selected view.

Save as Image

Saves the current selection as JPEG, BMP, SVG or PNG image.

Refresh

Refreshes the schema diagram according to the changes in your code. They represent changes in your imported documents or changes that are not reflected automatically in the compiled schema).

If the schema is not valid, you see only an error message in the **Logical Model View** (*on page 854*) instead of the diagram.

Validating Relax NG Schema Documents

By default, Relax NG schema files are validated as you type. To change this, [open the Preferences dialog box \(Options > Preferences\)](#) (*on page 114*), go to **Editor > Document Checking**, and deselect the **Enable automatic validation** option (*on page 195*).

To validate a Relax NG schema document manually, select the  **Validate** action from the  ▾ **Validation** toolbar drop-down menu or the **Document > Validate** menu. When Oxygen XML Developer validates a Relax NG schema file, it expands all the included modules so the entire schema hierarchy is validated. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

Content Completion in Relax NG Schemas

The intelligent *Content Completion Assistant* (on page 2267) allows you to quickly identify and insert elements, attributes, and attribute values that are valid in the current editing context. All available proposals are listed in a pop-up menu displayed at the current cursor position.

The *Content Completion Assistant* is enabled by default. To disable it, open the **Preferences** dialog box (**Options > Preferences**) (on page 114), go to **Editor > Content Completion**, and deselect the **Enable content completion** option (on page 179).

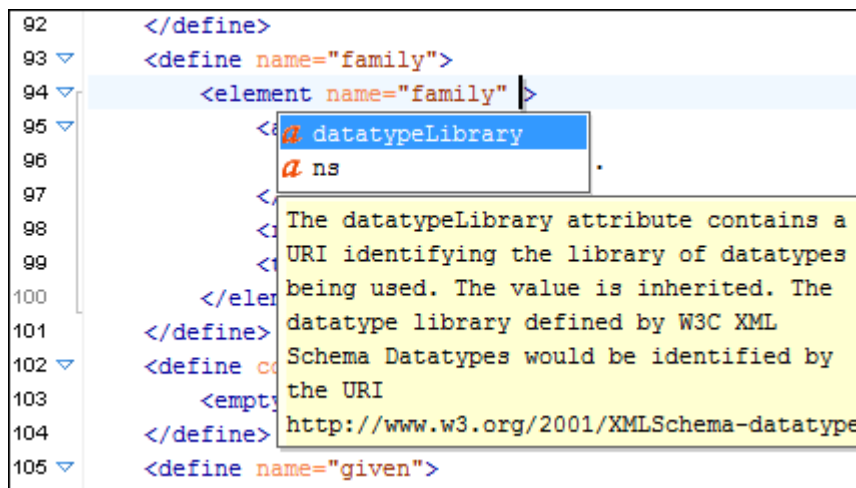

When active, the *Content Completion Assistant* displays a list of context-sensitive proposals valid at the current cursor position. It can be manually activated with the **Ctrl + Space** shortcut. You can navigate through the list of proposals by using the **Up** and **Down** keys on your keyboard. For each selected item in the list, the *Content Completion Assistant* displays a documentation window. You can customize the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal in **Text** mode, do one of the following:

- Press **Enter** or **Tab** to insert both the start and end tags and position the cursor inside the start tag in a position suitable for inserting attributes.
- Press **Ctrl + Enter** (**Command + Enter on macOS**) to insert both the start and end tags and positions the cursor between the tags in a position where you can start typing content.

If you are using the concept of *main files* (on page 2270) to import/include modules, the *Content Completion Assistant* collects its components starting from the *main files*. The *main files* can be defined in the project or in the associated validation scenario. For more information about the *Main Files* support in Oxygen XML Developer, see [Defining Main Files at Project Level](#) (on page 381).

The *Content Completion Assistant* also offers additional information for the element and attribute proposals in the form of schema annotations that is displayed in a tooltip.

Figure 284. Relax NG Content Completion Assistant

Syntax Highlighting in Relax NG Schemas

Oxygen XML Developer supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for Relax NG schemas, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114).
2. Go to **Editor > Syntax Highlight** (on page 193).
3. Select and expand the **XML** section in the top pane (for RELAX NG Compact Syntax schemas, select and expand the **RNC** section).
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XML** tab in the **Preview** pane to see the effects of your changes (for RELAX NG Compact Syntax schemas, the tab is **RNC**).

Tip:

Oxygen XML Developer also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the **Editor > Syntax Highlight > Elements/Attributes by Prefix** preferences page (on page 193).

Related Information:

[Syntax Highlight Preferences](#) (on page 193)

Quick Fixes for DTD, XSD, and Relax NG Errors

Oxygen XML Developer offers *Quick Fixes* (on page 2272) for common errors that appear in XML documents that are validated against DTD, XSD, or Relax NG schemas.

**Note:**

For XML documents validated against XSD schemas, the *Quick Fixes* are only available if you use the default Xerces validation engine.

Quick Fixes are available in **Text** mode .

Oxygen XML Developer provides *Quick Fixes* for numerous types of problems, including the following:

Problem Type	Available Quick Fixes
A specific element is required in the current context	Insert the required element
An element is invalid in the current context	Remove the invalid element
The content of the element should be empty	Remove the element content
An element is not allowed to have child elements	Remove all child elements
Text is not allowed in the current element	Remove the text content
A required attribute is missing	Insert the required attribute
An attribute is not allowed to be set for the current element	Remove the attribute
The attribute value is invalid	Propose the correct attribute values
ID value is already defined	Generate a unique ID value
References to an invalid ID	Change the reference to an already defined ID

[Schematron Quick Fixes \(SQF\) \(on page 582\)](#)

[Ignoring/Unignoring Validation Problems \(on page 578\)](#)

Relax NG Outline View

The **Outline** view for Relax NG schemas presents a list with the patterns that appear in the diagram in both the **Full Model View** (on page 853) and **Logical Model View** (on page 854) cases and it allows for quick access to a component by name. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 285. Relax NG Outline View

This view has two modes, with the tree showing either the XML structure or the defined pattern (components) collected from the current document. By default, the **Outline** view presents the components.

When the  **Show components** option is selected in the  **Settings** menu on the **Outline** view toolbar, the following option is available:

 **Show XML structure**

Shows the XML structure of the current document in a tree-like manner.

The following actions are available in the  **Settings** menu on the **Outline** view toolbar when the  **Show XML structure** option is selected:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

 **Selection update on cursor move**

Allows a synchronization between **Outline** view and schema diagram. The selected view from the diagram will be also selected in the **Outline** view.

 **Show components**

Shows the defined pattern collected from the current document.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

Show element name

Show/hide element name.

Show text

Show/hide additional text content for the displayed elements.

Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the [Outline preferences panel \(on page 272\)](#).

Configure displayed attributes

Displays the [XML Structured Outline preferences page \(on page 272\)](#).

The following contextual menu actions are also available in the **Outline** view when the  **Show XML structure** option is selected in the  **Settings** menu:

Append Child

Displays a list of elements that you can insert as children of the current element.

Insert Before

Displays a list of elements that you can insert as siblings of the current element, before the current element.

Insert After

Displays a list of elements that you can insert as siblings of the current element, after the current element.

Edit Attributes

Opens a dialog box that allows you to edit the attributes of the currently selected component.

Toggle Comment

Comments/uncomments the currently selected element.

Search references

Searches for the references of the currently selected component.

Search references in

Searches for the references of the currently selected component in the context of a scope that you define.

 **Component dependencies**

Opens the **Component Dependencies** view (*on page 865*) that displays the dependencies of the currently selected component.

 **Rename Component in**

Renames the currently selected component in the context of a scope that you define.

**Cut**

Cuts the currently selected component.

**Copy**

Copies the currently selected component.

**Delete**

Deletes the currently selected component.

**Expand More**

Expands the structure of a component in the **Outline** view.

**Collapse All**

Collapses the structure of all the component in the **Outline** view.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as * or ?) and separate multiple patterns with commas.

RNG Referenced/Dependent Resources View

The **Referenced/Dependent Resources** view displays the references or dependencies for resources included in an RNG schema. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

If you want to see the hierarchy or dependencies of an RNG schema, select the desired schema in the **Project** view (*on page 365*) and choose **Show referenced resources** or **Show dependent resources** from the contextual menu.

Figure 286. Referenced View

The following actions are available on the toolbar of the **Referenced/Dependent Resources** view:

 **Refresh**

Refreshes the resource structure.

 **Stop**

Stops the computing.

 **Show hierarchy for**

Computes the hierarchical structure of the references for a resource.

 **Show dependencies for**

Computes the structure of the dependencies for a resource.

 **Configure dependencies search scope**

Allows you to configure a scope to compute the dependencies. There is also an option for automatically using the defined scope for future operations.

 **History**

Provides access to the list of previously computed dependencies. Use the  **Clear history** button to remove all items from this list.

The contextual menu for a resource listed in the **Referenced/Dependent Resources** view contains the following actions:

Open

Opens the resource. You can also double-click a resource within the hierarchical structure to open it.

Go to reference

Opens the source document where the resource is referenced.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show references resources

Shows the references for the selected resource.

Show dependent resources

Shows the dependencies for the selected resource.

Add to Main Files

Adds the currently selected resource in the **Main Files** directory.

Expand More

Expands more of the children of the selected resource from the hierarchical structure.

Collapse All

Collapses all children of the selected resource from the hierarchical structure.

Tip:

When a recursive reference is encountered in the view, the reference is marked with a special icon .

Note:

The **Move resource** or **Rename resource** actions give you the option to [update the references to the resource \(on page 830\)](#).

Related Information:

[Modular Contextual XML Editing Using 'Main Files' Support \(on page 596\)](#)

[Search and Refactor Operations Scope \(on page 598\)](#)

Moving/Renaming RNG Resources

You can move and rename a resource presented in the **Referenced/Dependent Resources** view, using the **Rename resource** and **Move resource** refactoring actions from the contextual menu.

When you select the **Rename** action in the contextual menu of the **Referenced/Dependent Resources** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource(s)** - Select this option to update the references to the resource you are renaming. A **Preview** option is available that allows you to see what will be updated before selecting **Rename** to process the operation.

When you select the **Move** action from the contextual menu of the **Referenced/Dependent Resources** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, in accordance with the new location and name. A **Preview** option is available that allows you to see what will be updated before selecting **Move** to process the operation.

Note:

Updating the references of a resource that is resolved through a catalog is not supported. Also, the update references operation is not supported if the path to the renamed or moved resource contains entities.

Relax NG Schema Component Dependencies View

The **Component Dependencies** view allows you to see the dependencies for a selected component. This is helpful if you want to see where components are used in the entire hierarchy. For example, if you want to find all the references where a given component is used.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

To see the dependencies of a Relax NG component:

1. Right-click the desired component in the editor or **Outline** view.
2. Select the **Component Dependencies** action from the contextual menu.

The action is available for all named defines.

If a component contains multiple references, a small table is displayed at the bottom of the view that contains all the references. When a recursive reference is encountered, it is marked with a special icon .

Figure 287. Component Dependencies View

The **Component Dependencies** view includes the following toolbar actions:

Refresh

Refreshes the dependencies structure.

Stop

Stops the dependency computation.

Configure

Allows you to choose the search scope for computing the dependencies structure. This is helpful for making sure all imported/included resources are computed.

History

Allows you to select from a list of the most recently used dependency computations.

In addition, the following actions are available in the contextual menu:

Go to First Reference

Selects the first reference of the currently selected component in the dependencies tree.

Go to Component

Shows the definition of the currently selected component in the dependencies tree.

Related Information:

[Search and Refactor Operations Scope \(on page 598\)](#)

Searching and Refactoring Actions in RNG Schemas

Search Actions

The following search actions can be applied on named *defines* and are available from the **Search** submenu in the contextual menu of the current editor or from the **Document > References** menu:

Search References

Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the currently edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.

Search References in

Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.

Search Declarations

Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the currently edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.

Search Declarations in

Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.

Search Occurrences in File

Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the contextual menu and the **Document > Schema** menu:

Go to Definition

Moves the cursor to the definition of the current element in the Relax NG (full syntax) schema.

Note:

You can also use the **Ctrl + Single-Click (Command + Single-Click on macOS)** shortcut on a reference to display its definition.

Refactoring Actions

The following refactoring actions can be applied on named *defines* and are available from the **Refactoring** submenu in the contextual menu of the current editor or from the **Document > Refactoring** menu:

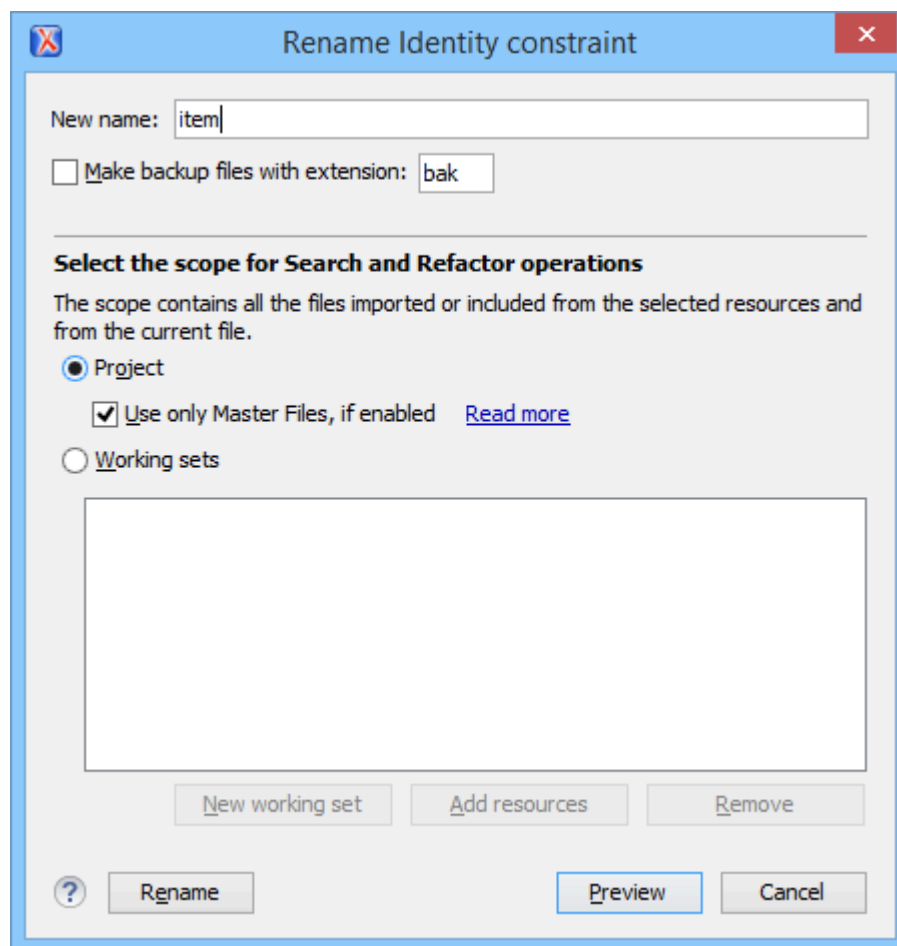

Rename Component

Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.

Rename Component in

Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

Figure 288. Rename Identity Constraint Dialog Box

RNG Quick Assist Support

The *Quick Assist* support (on page 2272) improves the development work flow, offering fast access to the most commonly used actions when you edit schema documents.

The *Quick Assist* feature (on page 2272) is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb icon (💡) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the *quick assist* menu by using the **Alt + 1** (**Meta + Alt + 1** on macOS) keyboard shortcuts.

Figure 289. RNG Quick Assist Support

The *Quick Assist* support offers direct access to the following actions:

Rename Component in

Renames the component and all its dependencies.

Search Declarations

Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

Search References

Searches all references of the component in a predefined scope.

Component Dependencies

Searches the component dependencies in a predefined scope.

Change Scope

Configures the scope that will be used for future search or refactor operations.

Rename Component

Allows you to rename the current component in-place.

Search Occurrences

Searches all occurrences of the component within the current file.

Related Information:

[Component Dependencies View \(on page 865\)](#)

[Referenced/Dependent Resources View \(on page 862\)](#)

[Search and Refactor Operations Scope \(on page 598\)](#)

Configuring a Custom Datatype Library for a RELAX NG Schema

A RELAX NG schema can declare a custom datatype library for the values of elements found in XML document instances. The datatype library must be developed in Java and it must implement the pluggable datatypes specification.

The *JAR* (on page 2270) file containing the custom library and any other dependent *JAR* file must be added to the classpath of the application, that is the *JAR* files must be added to the folder

`[OXYGEN_INSTALL_DIR]/lib` .

To load the custom library, restart Oxygen XML Developer.

Editing NVDL Schemas

Some complex XML documents are composed by combining elements and attributes from namespaces. Furthermore, the schemas that define these namespaces are not even developed in the same schema language. In such cases, it is difficult to specify in the document all the schemas that must be taken into account for validation of the XML document or for content completion. An NVDL (Namespace Validation Definition Language) schema can be used. This schema allows the application to combine and interleave multiple schemas of different types (W3C XML Schema, RELAX NG schema, Schematron schema) in the same XML document.

Oxygen XML Developer offers support for editing NVDL schema files in the following editing modes:

- **Text editing mode** (on page 759) - Allows you to edit NVDL schema files in a source editing mode, along with a schema design pane with two tabs that offer a **Full Model View** (on page 871) and **Logical Model View** (on page 872).
- **Grid editing mode** (on page 316) - Displays NVDL schema files in a structured spreadsheet-like grid.

For information about applying and detecting schemas, see [Associating a Schema to XML Documents](#) (on page 582).

Related Information:

[Associating a Schema to XML Documents](#) (on page 582)

NVDL Schema Diagram

This section explains how to use the graphical diagram of a NVDL schema.

Introduction to NVDL Schema Diagram Editor

Oxygen XML Developer provides a simple, expressive, and easy-to-read schema diagram editor for NVDL schemas.

With this new feature you can easily develop complex schemas, print them on multiple pages or save them as JPEG, PNG, and BMP images. It helps both schema authors in developing the schema and content authors that are using the schema to understand it.

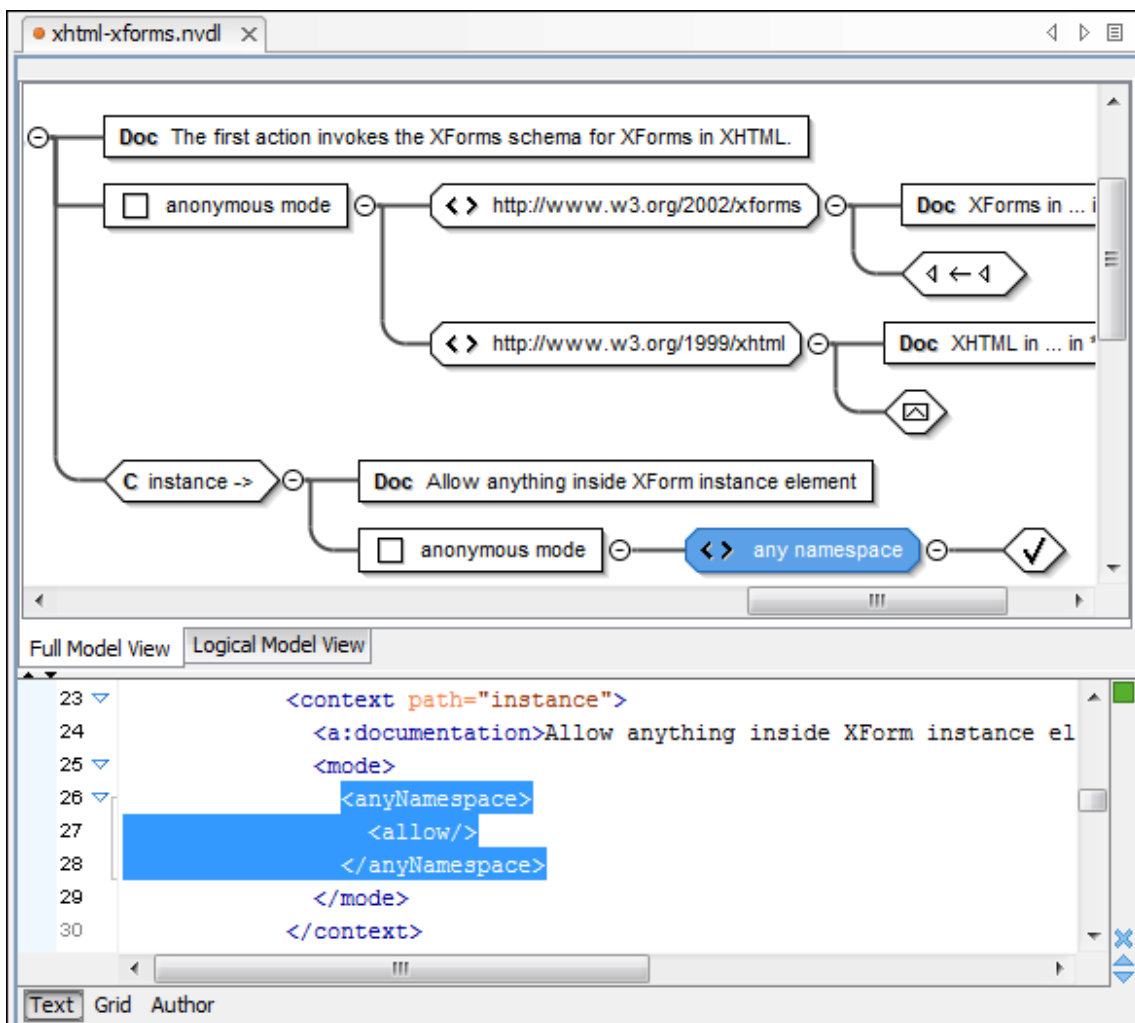

Oxygen XML Developer provides a side-by-side source and diagram presentation with real-time synchronization:

- The changes you make in the editor are immediately visible in the Diagram (no background parsing).
- Changing the selected element in the diagram selects the underlying code in the source editor.

Full Model View

When you create a schema document or open an existing one, the editor panel is divided in two sections: one containing the schema diagram and the second the source code. The diagram view has two tabbed panes offering a **Full Model View** and a **Logical Model View** (on page 872).

Figure 290. NVDL Schema Editor - Full Model View

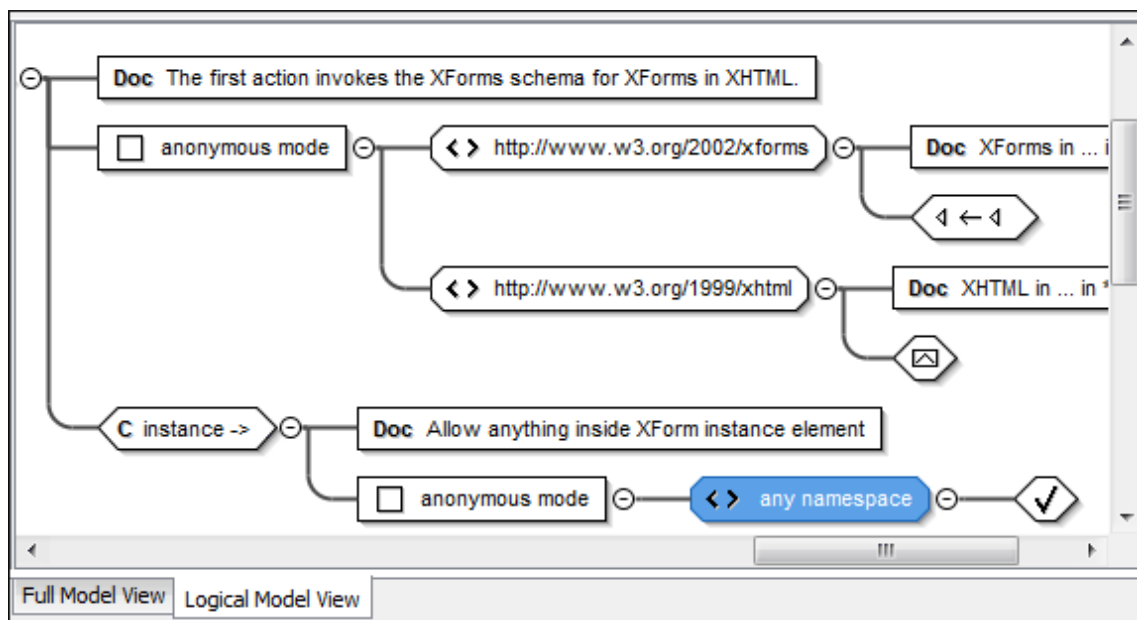

The **Full Model View** renders all the NVDL elements with intuitive icons. This representation coupled with the synchronization support makes the schema navigation easy.

Double-click any diagram component to edit its properties.

Logical Model View

The **Logical Model View** presents the compiled schema in the form of a single pattern. The patterns that form the element content are defined as top-level patterns with generated names. These names are generated depending of the elements name class.

Figure 291. Logical Model View for an NVDL Schema

Actions Available in the Diagram Editor

The contextual menu offers the following actions:

Show only the selected component

Depending on its state (selected/not selected), either the selected component or all the diagram components are shown.

Show Annotations

Depending on its state (selected/not selected), the documentation nodes are shown or hidden.

Auto expand to references

This option controls how the schema diagram is automatically expanded. For instance, if you select it and then edit a top-level element or you trigger a diagram refresh, the diagram will be expanded until it reaches the referenced components. If this option is left unchecked, only the first level of the diagram is expanded, showing the top-level elements. For large schemas, the editor disables this option automatically.

Collapse Children

Collapses the children of the selected view.

Expand Children

Expands the children of the selected view.

Print Selection

Prints the selected view.

Save as Image

Saves the current selection as image, in JPEG, BMP, SVG or PNG format.

Refresh

Refreshes the schema diagram according to the changes in your code (changes in your imported documents or those that are not reflected automatically in the compiled schema).

If the schema is not valid, you see only an error message in the **Logical Model View** ([on page 872](#)) instead of the diagram.

Validating NVDL Schema Documents

By default, NVDL schema files are validated as you type. To change this, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#), go to **Editor > Document Checking**, and deselect the **Enable automatic validation** option ([on page 195](#)).

To validate an NVDL schema document manually, select the  **Validate** action from the  **Validation** toolbar drop-down menu or the **Document > Validate** menu. When Oxygen XML Developer validates an NVDL schema file, it expands all the included modules so the entire schema hierarchy is validated. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

Related Information:

[Validating XML Documents Against a Schema \(on page 545\)](#)

[Presenting Validation Errors in Text Mode \(on page 548\)](#)

Content Completion in NVDL Schemas

The intelligent *Content Completion Assistant* ([on page 2267](#)) allows you to quickly identify and insert elements, attributes, and attribute values that are valid in the current editing context. All available proposals are listed in a pop-up menu displayed at the current cursor position.

The *Content Completion Assistant* is enabled by default. To disable it, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#), go to **Editor > Content Completion**, and deselect the **Enable content completion** option ([on page 179](#)).

When active, the *Content Completion Assistant* displays a list of context-sensitive proposals valid at the current cursor position. It can be manually activated with the **Ctrl + Space** shortcut. You can navigate through the list of proposals by using the **Up** and **Down** keys on your keyboard. For each selected item in the list, the *Content Completion Assistant* displays a documentation window. You can customize the size of the documentation window by dragging its top, right, and bottom borders.

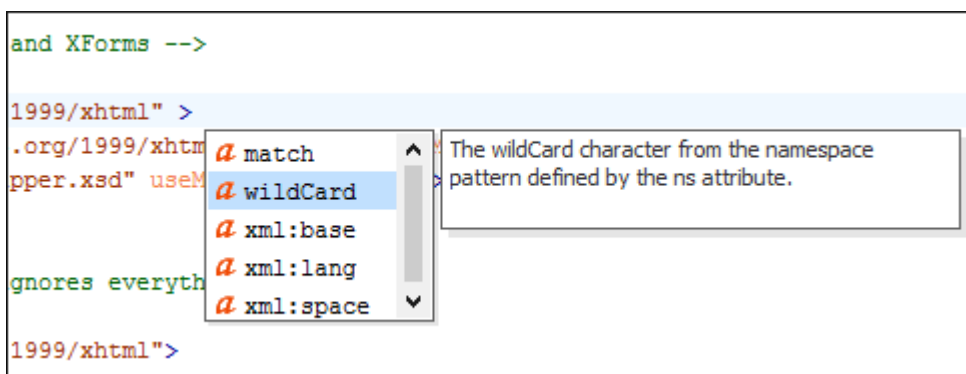

To insert the selected proposal in **Text** mode, do one of the following:

- Press **Enter** or **Tab** to insert both the start and end tags and position the cursor inside the start tag in a position suitable for inserting attributes.
- Press **Ctrl + Enter (Command + Enter on macOS)** to insert both the start and end tags and positions the cursor between the tags in a position where you can start typing content.

If you are using the concept of *main files* (on page 2270) to import/include modules, the *Content Completion Assistant* collects its components starting from the *main files*. The *main files* can be defined in the project or in the associated validation scenario. For more information about the *Main Files* support in Oxygen XML Developer, see [Defining Main Files at Project Level](#) (on page 381).

The *Content Completion Assistant* also offers additional information for the element and attribute proposals in the form of schema annotations that is displayed in a tooltip.

Figure 292. NVDL Content Completion Assistant

Syntax Highlighting in NVDL Schemas

Oxygen XML Developer supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for NVDL schemas, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114).
2. Go to **Editor > Syntax Highlight** (on page 193).
3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XML** tab in the **Preview** pane to see the effects of your changes.

Tip:

Oxygen XML Developer also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the **Editor > Syntax Highlight > Elements/Attributes by Prefix** preferences page (on page 193).

Related Information:

[Syntax Highlight Preferences \(on page 193\)](#)

NVDL Outline View

The **Outline** view for NVDL schemas presents a list with the named or anonymous rules that appear in the diagram and it allows for quick access to a rule by name. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

NVDL Schema Component Dependencies View

The **Component Dependencies** view allows you to see the dependencies for a selected component. This is helpful if you want to see where components are used in the entire hierarchy. For example, if you want to find all the references where a given component is used.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

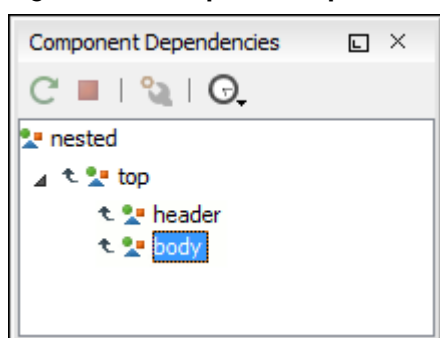

To see the dependencies of an NVDL component:

1. Right-click the desired component in the editor or **Outline** view.
2. Select the **Component Dependencies** action from the contextual menu.

The action is available for all named modes.

If a component contains multiple references, a small table is displayed at the bottom of the view that contains all the references. When a recursive reference is encountered, it is marked with a special icon ☞.

Figure 293. Component Dependencies View

The **Component Dependencies** view includes the following toolbar actions:

 **Refresh**

Refreshes the dependencies structure.

 **Stop**

Stops the dependency computation.

 **Configure**

Allows you to choose the search scope for computing the dependencies structure. This is helpful for making sure all imported/included resources are computed.

History

Allows you to select from a list of the most recently used dependency computations.

In addition, the following actions are available in the contextual menu:

Go to First Reference

Selects the first reference of the currently selected component in the dependencies tree.

Go to Component

Shows the definition of the currently selected component in the dependencies tree.

Searching and Refactoring Actions in NVDL Schemas

Search Actions

The following search actions can be applied on `@name`, `@useMode`, and `@startMode` attributes and are available from the **Search** submenu in the contextual menu of the current editor or from the **Document > References** menu:

Search References

Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the currently edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.

Search References in

Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.

Search Declarations

Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the currently edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.

Search Declarations in

Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.

Search Occurrences in File

Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the contextual menu and the **Document > Schema** menu:

Go to Definition

Moves the cursor to its definition in the schema used by the NVDL to validate it.

**Note:**

You can also use the **Ctrl + Single-Click (Command + Single-Click on macOS)** shortcut on a reference to display its definition.

Refactoring Actions

The following refactoring actions can be applied on `@name`, `@useMode`, and `@startMode` attributes and are available from the **Refactoring** submenu in the contextual menu of the current editor or from the **Document > Refactoring** menu:

Rename Component

Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.

Rename Component in

Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

Figure 294. Rename Identity Constraint Dialog Box

Editing JSON Documents

This section explains the features of the Oxygen XML Developer and how to use them.

Resources

For more information about the JSON support in Oxygen XML Developer, see the following resources:

- [Video: JSON Editing](#)
- [Video: JSON Tools in Oxygen](#)
- [Webinar: JSON and JSON Schema Support in Oxygen](#)
- [Webinar: Introducing Oxygen JSON Editor - The Ultimate Solution for JSON Editing](#)

JSON Editor

Oxygen XML Developer includes a specialized JSON editor with various editing features for files that have the `.json` file extension. It also includes a document template to help you get started with JSON documents. The template is called **JSON** and it can be found in the **New Document** folder in the **New document wizard** (on [page 330](#)).

**Tip:**

You can experiment with a sample of a JSON file available at: `[OXYGEN-INSTALL-DIR]/samples/json/personal.json`.

Text Mode Editor

When editing JSON documents in the **Text** editing mode, the usual text editing actions are available, along with other editor-specific actions, including:

- [Search and Find/Replace](#) (*on page 385*)
- Drag and Drop
- [Validation](#) (*on page 883*)
- Format and Indent (Pretty Print)

The JSON Text mode editor also offers unique features. For example, the property name is displayed after the ending bracket:

```

        "five.worker"
      ] /subordinates
    } /link
  }, /person[0]
  {
    "id": "one.worker",

```

This default behavior of displaying the property name after the ending bracket can be disabled by deselecting the **Show property name after ending bracket** option (*on page 163*) in the **Editor > Edit Modes > Text** preferences page. The option also has a slider that you can use to adjust the transparency level.

**Note:**

You can run XPath expressions on open JSON documents, but in **Text** mode the XPath results cannot be mapped in the document. However, they can be mapped in the **Grid** editing mode. You can use the **Grid** button at the bottom of the editor panel to switch to that editing mode.

Grid Mode Editor

Oxygen XML Developer allows you to view and edit the JSON documents in the **Grid** mode. The JSON is represented in **Grid** mode as a compound layout of nested tables and the JSON data and structure can be easily manipulated with table-specific operations or drag and drop operations on the grid components.

Figure 295. JSON Editor Grid Mode

	id	name	family	given	email	link
1	"Big.Boss"	name	"Boss"	"chief@oxyg enxml.com"	link	
2	"one.worker"	name	"Worker"	"one@oxygen xml.com"	link	
3	"two.worker"	name	"Worker"	"two@oxygen xml.com"	link	
4	"three.worker"	name	"Worker"	"three@oxyg enxml.com"	link	
5	"four.worker"	name	"Worker"	"four@oxyge nxml.com"	link	
6	"five.worker"	name	"Worker"	"five@oxyge nxml.com"	link	

You can also use the following JSON-specific contextual actions:

Array

Useful when you want to convert a JSON *value* to *array*.

Insert value before

Inserts a value before the currently selected one.

Insert value after

Inserts a value after the currently selected one.

Append value as child

Appends a value as a child of the currently selected value.

You can [customize the JSON grid appearance \(on page 165\)](#) according to your needs. For instance, you can change the font, the cell background, foreground, or even the colors from the table header gradients. The default width of the columns can also be changed.

Navigating References in JSON Documents

When editing JSON documents (or JSON Schema), you can easily navigate *JSON Pointer* references and hyperlinks by using the **CTRL + Click** shortcut. Holding the **CTRL** key while hovering over a *JSON Pointer* reference or hyperlink will change the reference to a clickable link.

JSON Schema References

Referencing allows you to create modular, maintainable, and reusable schemas. It is particularly useful when you have multiple instances of a similar structure in your data and want to enforce consistency in validation rules.

A schema can reference another schema using the `$ref` (or `$dynamicRef`) keyword. Its value is a URI-reference that is resolved against the schema's [Base URI](#). When evaluating a `$ref`, an implementation uses the resolved identifier to retrieve the referenced schema and applies that schema to the instance. For more details about structuring JSON schemas, see [Understanding JSON Schema: Structuring a complex schema](#).

- **Defining Reusable Schemas** - You can define reusable schema components using the `definitions` (or `$defs` for latest drafts) keyword. These definitions act as named schemas that you can reference using `$ref` (or `$dynamicRef`).

```
{
  "$defs": {
    "person": {
      "type": "object",
      "properties": {
        "name": { "type": "string" },
        "age": { "type": "integer" }
      }
    }
  }
}
(my_schema.json)
```

- **Referencing a Schema** - To reference a schema defined in a definitions block, use the `$ref` keyword followed by the JSON Pointer of the definition.

```
{
  ...
  "type": "object",
  "properties": {
    "person1": { "$ref": "#/$defs/person" },
    "person2": { "$ref": "#/$defs/person" }
  }
}
```

In this example, both `"person1"` and `"person2"` properties refer to the `"person"` schema defined in `$defs`.

- **External References** - You can also reference schemas from external files using their URI. This can be useful when you have multiple schema files.

```
{
  "$ref": "my_schema.json#/$defs/person"
}
```

Here, the schema at the specified URI is being referenced. You can also use `$id` to uniquely identify a schema resource and then reference it from another file using the same mechanism. The following example sets a custom id for the `"person"` schema:

```
{
  "$defs": {
    "person": {
      "$id": "#person_info"
      "type": "object",
      "properties": {
        "name": { "type": "string" },
        "age": { "type": "integer" }
      }
    }
  }
}
```

You can now reference this definition by its `$id`, not by its JSON Pointer:

```
{
  "$ref": "my_schema.json/#person_info"
}
```

Note:

Oxygen XML Developer allows `$id` only as an URI fragment, not as a relative pointer.

- **Combining References with Other Keywords** - You can use `$ref` in combination with other keywords. For instance, you might reference a schema within the `items` keyword to define an array of a specific type:

```
{
  ...
  "type": "array",
  "items": { "$ref": "#/$defs/person" }
}
```

Starting with latest drafts, you can use `$ref` in conjunction with other type-specific keywords for stricter validation. For example, the previous schema can be modified to not allow extraneous properties for a "person" object:

```
{
  ...
  "type": "array",
  "items": {
    "$ref": "#/$defs/person",
    "additionalProperties": false
  }
}
```

Validating JSON Documents

Oxygen XML Developer includes a built-in JSON validator that is used to validate JSON documents against JSON Schemas, as well as a built-in JSON *Well-Formedness* validator (based on the free JAVA source code available at www.json.org). A built-in JSON Schematron Validator engine is also provided to validate JSON documents against a specified Schematron schema.

Resources

For more information, see the following video demonstration:

<https://www.youtube.com/embed/3JEL6nFUozQ>

Checking Well-Formedness in JSON Documents

A *Well-formed* JSON document is a sequence of Unicode code points that strictly conforms to the JSON grammar defined by the [JSON Data Interchange Syntax specification](#). By default, Oxygen XML Developer automatically checks the document for *Well-formedness* as you type.

Check for Well-Formedness Manually

To manually check documents for *Well-Formedness*:

- Select the  **Check Well-Formedness (Ctrl + Shift + W (Command + Shift + W on macOS))** action from the  **Validation** drop-down menu on the toolbar or from the **Document > Validate** menu.
- A selection of files can be checked for well-formedness by selecting the  **Check Well-Formedness** action from the **Validate** submenu when invoking the contextual menu in the **Project view** ([on page 365](#)).

Result: If any errors are found, the result is displayed in the message panel at the bottom of the editor. Each error is displayed as one record in the result list and is accompanied by an error message. Clicking the record will open the document containing the error and highlight its approximate location.

Example: A non *Well-formed* JSON Document

```
{ "person": { "name": "John Doe" }
```

This would result in the following error:

```
Expected a ',', or '}'
```

To resolve the error, click the record in the result list and it will locate and highlight the approximate position of the error. In this case, you would need to identify where the missing end bracket needs to be placed.

Validating JSON Documents Against JSON Schema or Schematron

A *valid* JSON document is a *well-formed* document that also conforms to the rules of a JSON Schema that defines the legal syntax of a JSON document. The purpose of the JSON schema is to define the legal properties and values of a JSON document.

This section contains topics that explain the automatic and manual validation possibilities in Oxygen XML Developer, how validation errors are presented, and information about built-in validation scenarios.

Oxygen XML Developer also includes a built-in JSON Schematron Validator engine to validate JSON documents against a Schematron schema specified in a custom validation scenario or using the **Validate with action** (on page 885).

**Tip:**

Inside the samples folder, there are a few files you can use to see how Schematron validation can be done with JSON files. The path of the folder containing these sample files is:

```
[OXYGEN_INSTALL_DIR]/samples/json/schematron/.
```

For information about how to associate a schema for the purposes of validation, see [Associating a JSON Schema Through a Validation Scenario](#) (on page 893).

Automatic Validation

By default, Oxygen XML Developer is configured to automatically mark validation errors in the JSON document as you are editing. The **Enable automatic validation** option (on page 195) in the **Document Checking preferences page** (on page 194) controls whether or not all validation errors and warnings will automatically be highlighted in the editor pane.

The automatic validation starts parsing the document and marking the errors after a [configurable delay](#) (on page 195) from the last typed key. Errors are highlighted with underline markers in the main editor pane and small rectangles on the right side ruler. Hovering over a validation error presents a tooltip message with more details about the error.

If the error message is too long to be displayed completely in the error line at the bottom of the editing area, double-clicking the error icon at the left of the error line, or on the error line itself, displays an information dialog box with the full error message. You can use the arrow buttons in this dialog box to navigate through the errors issued by the automatic validation feature.

Related Information:

[Manual Validation Actions](#) (on page 885)

[Presenting Validation Errors in JSON Documents](#) (on page 885)

Manual Validation Actions

You can choose to validate JSON documents at any time by using the manual validation actions that are available in Oxygen XML Developer.

Manual Validation Actions

To manually validate the currently edited document, use one of the following actions:

Validate

Available from the  **Validation** drop-down menu on the toolbar, the **Document > Validate** menu, or from the **Validate** submenu when invoking the contextual menu on one or more JSON documents in the **Project view** (*on page 365*).

Validate with

Available from the  **Validation** drop-down menu on the toolbar or the **Document > Validate** menu. This action opens a dialog box that allows you to [specify a schema for validating the current document](#) (*on page 894*).

Note:

The **Validate with** action does not work for files loaded through a [custom protocol plugin](#) (*on page 1879*) developed independently and added to Oxygen XML Developer after installation.

Validate with Schema

Available from the **Validate** submenu when invoking the contextual menu on one or more JSON documents in the **Project view** (*on page 365*). This action opens a dialog box that allows you to specify a JSON or Schematron schema to be used for the validation.

Other Validation Options

Tip:

If a large number of validation errors are detected and the validation process takes too long, you can [limit the maximum number of reported errors in the Document Checking preferences page](#) (*on page 194*).

Related Information:

[Automatic Validation](#) (*on page 884*)

[Presenting Validation Errors in JSON Documents](#) (*on page 885*)

Presenting Validation Errors in JSON Documents

Validation errors and warnings in JSON documents are presented in various locations within the interface.

Validation Marker Locations

Validation issues are marked in the following locations:

- In the main editing pane, with the issue underlined in a color according to the type of issue.
- In the right-side vertical stripe, with a marker that is colored according to the type of issue.
- In the **Outline** view, with an icon that is colored according to the type of issue.

Validation Marker Colors

The colors for each type of issue are as follows:

- **Validation Errors** [Red] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in red.
- **Validation Warnings** [Yellow] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in yellow.
- **Validation Info** [Blue] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in blue.

You can configure the color for each type in the [Document Checking preferences page \(on page 194\)](#).

Validation Markers in the Right-Side Stripe

Also, the stripe on the right side of the editor panel is designed to display the issues found during the validation process and to help you locate them in the document. The stripe contains the following:

Upper Part of the Stripe

A success indicator square will turn green if the validation is successful or only info messages are found, red if validation errors are found, or yellow if only validation warnings are found. More details about the issues are displayed in a tooltip when you hover over indicator square. If there are numerous problems, only the first three are presented in the tooltip.

Middle Part of the Stripe

Errors are presented with red markers, warnings with yellow markers, and info message with blue markers. If you want to limit the number of markers that are displayed, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#), go to **Editor > Document checking**, and specify the desired limit in the **Maximum number of validation highlights** option [\(on page 195\)](#).

Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tooltip (when hovering over the marker) and in the message area on the bottom of the editor panel (clicking the  **Document checking options** button opens the [Document Checking preferences page \(on page 194\)](#).

Bottom Part of the Stripe

Two navigation arrows () can be used to jump to the next or previous issue. The same actions can be triggered from **Document > Automatic validation > Next Error/Highlight** (**Ctrl + Period** (**Command + Period on macOS**)) and **Document > Automatic validation > Previous Error/Highlight** (**Ctrl + Comma** (**Command + Comma on macOS**)). Also, the  **Remove All** button can be used to clear all the validation markers.

Hovering Over Validation Issues

Hovering over a validation issue presents a tooltip message with more details about the problem. Also, when hovering over an issue, pressing **F2** will change the focus to the tooltip.

Details About Validation Issues

- Information about the issue is also displayed in the message area on the bottom of the editor panel (clicking the  **Document checking options** button opens the **Document Checking preferences page** ([on page 194](#)) where you can configure some validation options (such as the colors used to present the validation issues). Some validation messages have an icon () and clicking it opens a dialog box with additional information and a link to specifications.
- If you want to see all the validation messages grouped in the **Results view** ([on page 503](#)) view, use the  **Validate** action from the toolbar or **Document > Validate** menu. To see more information about a validation message, right-click the item in the **Results** view and select **Show message**. Some validation messages have an icon () in the **Info** column and clicking it opens a dialog box with additional information and a link to specifications.

Creating a JSON Validation Scenario

Validation scenarios can be used to [associate one or more JSON Schemas with a JSON document](#) ([on page 893](#)). Oxygen XML Developer also includes a built-in JSON Schematron Validator engine that can be specified in the validation scenario to validate JSON documents against a specified Schematron schema.

Creating a JSON Validation Scenario

To create a validation scenario, follow these steps:

1. Select the  **Configure Validation Scenario(s)** action in one of the following ways:
 - From the  **Validation** toolbar drop-down menu.
 - From the **Document > Validate** menu.
 - From the **Validate** submenu, when invoking the contextual menu on a file in the **Project view** ([on page 365](#)).

Step Result: The **Configure Validation Scenario(s)** dialog box is displayed.

2. Click the **New** button.

Step Result: A validation scenario configuration dialog box is displayed.

Figure 296. Validation Scenario Configuration Dialog Box

The dialog box is titled "New scenario" and contains the following elements:

- Name:** A text input field containing "personal".
- Storage:** Two radio buttons: "Project Options" (selected) and "Global Options".
- Table:** A table with 5 columns: "URL of the file to validate", "File type", "Validation engine", "Automatic validation", and "Schema".

URL of the file to validate	File type	Validation engine	Automatic validation	Schema
`\${currentFileURL}`	JSON Document	<Default engine>	<input checked="" type="checkbox"/>	<No JSON schem...
- Buttons:** "Add", "Remove", "OK", and "Cancel".
- Icons:** Up and down arrow icons, and a help icon.

This scenario configuration dialog box allows you to configure the following information and options:

Name

The name of the validation scenario.

Storage

You can choose between storing the scenario in the **Project Options** (on page 2272) or **Global Options** (on page 2269).

URL of the file to validate

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, double-click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the **Browse** drop-down button to browse for a local, remote, or archived file.
- Use the **Insert Editor Variable** button to insert an [editor variable \(on page 289\)](#) or a [custom editor variable \(on page 297\)](#).

Figure 297. Insert an Editor Variable

```

${_Desktop} - My Desktop
${start-dir} - Start directory of custom validator
${standard-params} - List of standard params for command line
${cfn} - The current file name without extension
${currentFileURL} - The path of the currently edited file (URL)
${cfdu} - The path of current file directory (URL)
${frameworks} - Oxygen frameworks directory (URL)
${pdu} - Project directory (URL)
${oxygenHome} - Oxygen installation directory (URL)
${home} - The path to user home directory (URL)
${pn} - Project name
${env(VAR_NAME)} - Value of environment variable VAR_NAME
${system(var.name)} - Value of system variable var.name

```

File type

The type of the document that is validated in the current validation unit. Oxygen XML Developer automatically selects the file type depending on the value of the **URL of the file to validate** field.

Validation engine

You can choose between the following types of validation engines for validating JSON documents:

- **Default engine** - The built-in JSON Validator will be used. For JSON Schema documents, this type should not be chosen unless the document has a schema version specified.
- **JSON Schema Validator** - This type is for JSON Schema documents only. It will use the version specified in the JSON Schema, or if a version is not specified, the [JSON Schema draft-04](#) will be used.
- **JSON Schematron Validator** - The built-in JSON Schematron Validator will be used to validation JSON documents against a specified Schematron schema.

**Note:**

For proper error localization, the root element of the Schematron schema should include the `@queryBinding` attribute with the value of **xslt2** after the Schematron namespace declaration:

```
<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2">
```

Automatic validation

If this option is selected, the validation operation defined by this row is also applied by the automatic validation feature. If the **Automatic validation** feature is disabled in the

[Document Checking preferences page \(on page 194\)](#), then this option is ignored, as the preference setting has a higher priority.

Schema

Displays the specified schema.

Specify Schema

Opens the **Specify Schema** dialog box that allows you to set a schema to be used for validating JSON documents.

Move Up

Moves the selected scenario up one spot in the list.

Move Down

Moves the selected scenario down one spot in the list.

Add

Adds a new validation unit to the list.

Remove

Removes an existing validation unit from the list.

3. Configure any of the existing validation units according to the information above. You can use the buttons at the bottom of the table to add, remove, or move validation units.
4. Click **OK**.

Result: The newly created validation scenario will now be included in the list of scenarios in the **Configure Validation Scenario(s)** dialog box. You can select the scenario in this dialog box to associate it with the current document and click the **Apply associated** button to run the validation scenario.

Sharing JSON Validation Scenarios

The validation scenarios and their settings can be shared with other users by saving them at [project level \(on page 2272\)](#) or by [exporting them to a specialized scenarios file \(on page 288\)](#) that can then be imported. When you create a new validation scenario or edit an existing one, there is a **Storage** option to control whether the scenarios are stored in [Project Options \(on page 2272\)](#) or [Global Options \(on page 2269\)](#).

Storage: Project Options Global Options

Selecting **Project Options (on page 2272)** stores the scenario in the project file and can be shared with other users that have access to the project. If your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) then your team will have access to the scenarios that you define. When you create a scenario at the project level, the URLs from the scenario become relative to the project URL.

Selecting **Global Options (on page 2269)** stores the scenario in the global options that are stored in the user home directory.

You can also change the storage options of existing validation scenarios by using the **Change storage** action from the contextual menu of the list of scenarios in the **Configure Validation Scenario(s)** dialog box.

Resolving References with an XML Catalog

If a reference to a remote JSON schema must be used but a local copy of the schema should actually be preferred for performance reasons, the reference can be resolved to the local copy with an [XML Catalog \(on page 2273\)](#).

For example, if the JSON schema contains a reference to a remote schema such as:

```
{"$ref": "http://json-schema.org/example/geo.json"}
```

the reference can be resolved to a local copy of the schema by inserting the following catalog entry:

```
<uri name="http://json-schema.org/example/geo.json" uri="schemas/geo.json"/>
```

Related information

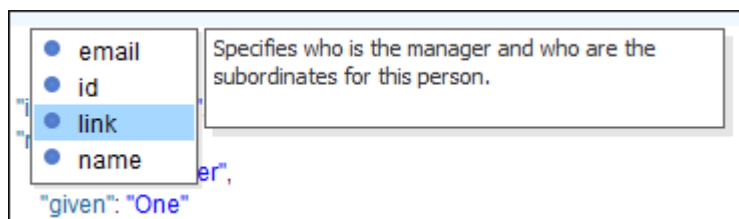

[Working with XML Catalogs \(on page 593\)](#)

Content Completion Assistant in JSON

Oxygen XML Developer includes an intelligent [Content Completion Assistant \(on page 2267\)](#) that offers proposals for inserting JSON structures that are valid at the current editing location.

The *Content Completion Assistant* is enabled by default. To disable it, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#), go to **Editor > Content Completion**, and deselect the **Enable content completion** option [\(on page 179\)](#).

Figure 298. Content Completion Assistant in JSON

Content Completion and the Associated Schema

The *Content Completion Assistant* feature is schema-driven and the list of proposals in the [Content Completion Assistant \(on page 2267\)](#) depend on the associated JSON Schema. For information about ways to associate a schema to a JSON document, see the [Associating a Schema to JSON Documents \(on page 893\)](#) section.

If a JSON document does not have a schema associated, Oxygen XML Developer automatically learns the document structure as editing events occur and will offer content completion proposals accordingly. Note that this feature is disabled for documents that contain more than one million characters.

Using the Content Completion Assistant in JSON

The feature is activated in **Text** mode for JSON documents by:

- Typing a quote symbol (") to insert a property or value.
- Pressing **Ctrl + Space** or **Alt + ForwardSlash (Command + Option + ForwardSlash on macOS)**.

You can navigate through the list of proposals by using the **Up** and **Down** keys on your keyboard. In some cases, the *Content Completion Assistant* displays a [documentation window with information about the particular proposal \(on page 892\)](#). You can also change the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal, press **Enter** or **Tab**.

Types of Proposals Listed in the Content Completion Assistant for JSON

The proposals that populate the *Content Completion Assistant* for JSON documents depend on the structure defined in the associated JSON Schema. The types of structure proposed in the content completion window include:

- JSON properties
- JSON values
- JSON arrays
- JSON objects

The number and type of proposals displayed by the *Content Completion Assistant* is dependent on the cursor's current position in the JSON document and the child items displayed within a given context are defined by the structure of the specified JSON Schema.

Code Templates in the Content Completion

Oxygen XML Developer includes a set of built-in code templates for JSON documents that can be selected from the *Content Completion Assistant*. The code templates are displayed with a  symbol in the content completion list. You can also define your own code templates and share them with others. For more information, see [Code Templates \(on page 491\)](#).

Schema Annotations in JSON Content Completion

A schema annotation is a documentation snippet that appears in the *Content Completion Assistant (on page 2267)* offering more information about the current proposal.

This feature is enabled by default, but you can disable it by deselecting the **Show annotations in Content Completion Assistant (on page 185)** option in the **Annotations** preferences page.

Collecting Annotations from the JSON Schema

In a JSON Schema, the annotations are specified in the value of the `title` and `description` properties like this:

```
"idType": {
  "title": "The 'id' property",
  "description": "Specifies a required ID for this person.",
  "type": "string",
  "maxLength": 20
}
```

Associating a Schema to JSON Documents

To provide as-you-type validation and to compute valid proposals for the *Content Completion Assistant* (on page 2267), Oxygen XML Developer requires a schema to be associated with the JSON document. The schema specifies how the internal structure is defined.

Detecting the Schema(s) for Validation and Content Completion

For validation, Oxygen XML Developer tries to detect the JSON Schema by searching in the following order:

1. The schema [referenced in validation stages from the validation scenario\(s\)](#) (on page 893) associated with the current JSON document.
2. If a schema is not detected, then it falls back to the [schema associated directly in the JSON document](#) (on page 896).

Tip:

To quickly open the schema used for validating the current document, select the **Open Associated Schema** action from the toolbar (or **Document > Schema** menu).

Associating a JSON Schema Through a Validation Scenario

Oxygen XML Developer uses the rules defined in the detected schema to report errors and warnings during automatic and manual validations that help maintain the structural integrity of your JSON documents. Oxygen XML Developer includes built-in validation engines for validating JSON documents against a JSON Schema or Schematron schema. There are several methods that can be used to validate JSON document with a schema.

Configure a Validation Scenario and Specify the Schema

You can specify the schema to be used for validation directly in the [JSON validation scenario](#) (on page 887).

To associate a schema to a validation scenario to be used whenever the scenario is invoked, follow these steps:

1. Select the **Configure Validation Scenario(s)** from the **Validation** toolbar drop-down menu, from the **Document > Validate** menu, or from the **Validate** submenu when invoking the contextual menu on a JSON file in the **Project view** (on page 365)).
2. Click the **New** button to [create a new validation scenario](#) (on page 887) or the **Edit** button to modify an existing one.

3. Add or configure validation units according to your needs. For details about all of the configuration options, see [Creating a JSON Validation Scenario \(on page 887\)](#).
4. Click the  **Specify Schema** button to select the schema to be associated with the validation unit.
5. Click **OK** on both dialog boxes.

Result: The schema is now associated with that validation scenario whenever it is invoked.

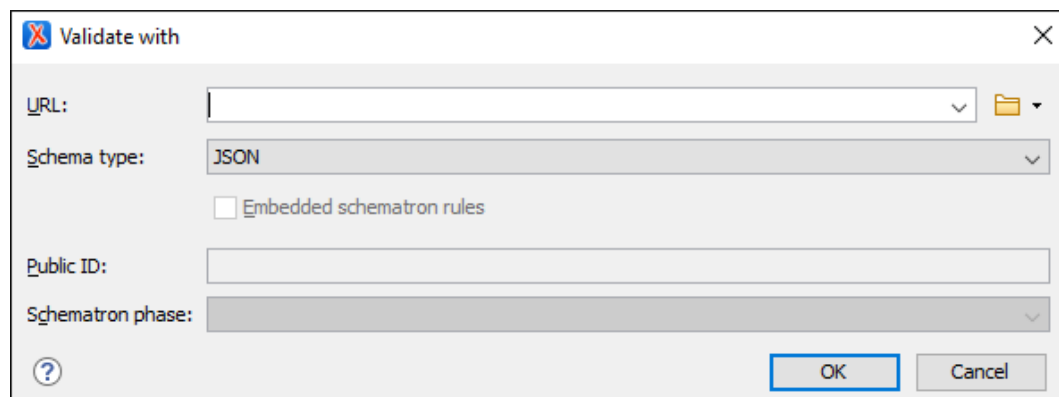

Use the Validate with Action to Specify a Schema for Validating the Current Document

To validate the current document using a specified schema, follow these steps:

1. Select the **Validation with** action from the  **Validation** drop-down menu on the toolbar (or **Document > Validate** menu).

Step Result: The **Validate with** dialog box is displayed:

Figure 299. Validate with Dialog Box

This dialog box contains the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S) or SFTP (or a [custom protocol \(on page 1896\)](#)). You can specify the URL by using the text field, the history drop-down, the  **Insert Editor Variables (on page 289)** button, or the browsing actions in the  **Browse** drop-down list.
- **Schema type** - You can select one of the following two types (other types of schema will not work with JSON documents):
 - **JSON** - Used for validating JSON documents against a specified JSON Schema.
 - **Schematron** - Used for validating JSON documents against a specified Schematron schema. You can also select a **Schematron phase** that you want to use for the validation.

**Note:**

For proper error localization, the root element of the Schematron schema should include the `@queryBinding` attribute with the value of **xslt2** after the Schematron namespace declaration:

```
<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2">
```

2. Select the schema to be associated with the manual validation.
3. Click **OK**.

Result: The current document is validated using the schema you specified.

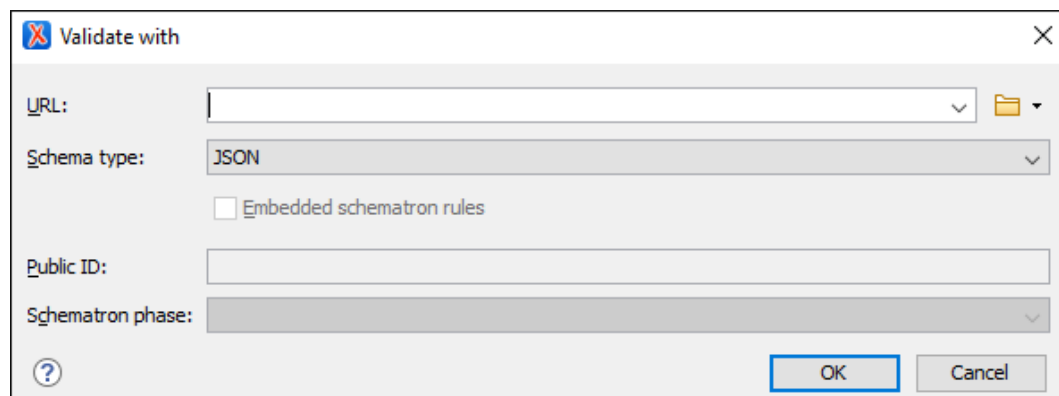

Use the Validate with Schema Action to Specify a Schema for Validating all Selected JSON Documents

To validate multiple JSON documents using a specified schema, follow these steps:

1. Select all the JSON documents you want to validate in the **Project** view.
2. Invoke the contextual menu (right-click) and select the **Validate with Schema** action from the **Validate** submenu.

Step Result: The **Validate with** dialog box is displayed:

Figure 300. Validate with Dialog Box

This dialog box contains the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), SFTP or a [custom protocol \(on page 1896\)](#). You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables (on page 289)** button, or the browsing actions in the **Browse** drop-down list.
- **Schema type** - You can select one of the following two types (other types of schema will not work with JSON documents):

- **JSON** - Used for validating JSON documents against a specified JSON Schema.
- **Schematron** - Used for validating JSON documents against a specified Schematron schema. You can also select a **Schematron phase** that you want to use for the validation.

**Note:**

For proper error localization, the root element of the Schematron schema should include the `@queryBinding` attribute with the value of **xslt2** after the Schematron namespace declaration:

```
<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2">
```

3. Select the JSON schema that you want to use to validate all selected JSON documents.
4. Click **OK**.

Result: The selected JSON documents are validated using the JSON schema you specified.

Associating a JSON Schema Directly in JSON Documents

Associate Schema Action

The schema used by the *Content Completion Assistant (on page 2267)* and document validation engine can be associated with the current document by using the  **Associate Schema** action. The association can specify a relative file path or a URL of the schema.

To associate a JSON Schema to the current JSON document, follow these steps:

1. Select the  **Associate Schema** action from the toolbar (or **Document > Schema** menu).

Step Result: The **Associate Schema** dialog box is displayed:

Figure 301. Associate Schema Dialog Box

This dialog box contains the following options for JSON documents:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S) or SFTP (or a *custom protocol (on page 1896)*).
- **Use path relative to file location** - Select this option if the JSON instance document and the associated schema contain relative paths. The location of the schema file is inserted in the

JSON instance document as a relative file path. This practice allows you, for example, to share these documents with other users without running into problems caused by multiple project locations on physical disk.

2. Select the JSON Schema that will be associated with the JSON document.
3. Click **OK**.

Result: A `schema` property is added at the beginning of the document with its value set to the specified URL. If the document already contained a schema association, the old association is replaced with the new one.

Tip:

To quickly open the schema used for validating the current document, select the **Open Associated Schema** action from the toolbar (or **Document > Schema** menu).

Associating a JSON Schema in a Framework (Document Type) Configuration

The JSON schema used to compute valid proposals in the *Content Completion Assistant* (on page 2267) and by the document validation engine to report errors and warnings can be defined in each particular *framework* (on page 2269) (document type). This schema will be used only if one is not detected in the current JSON file (on page 896).

To associate a JSON schema in a particular *framework* (document type), follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Document Type Association**.
2. Select your particular document type and click the **Edit** (on page 128), **Extend** (on page 129), or **Duplicate** (on page 129) button to modify an existing *framework* (or use the **New** button to create a new one).

Step Result: This opens a **Document type** configuration dialog box (on page 130).

3. Go to the **Schema** tab (on page 134).
4. Select the schema type and its URI.
5. Click **OK**.

Result: The schema is now associated with the particular document type and will be used by the *Content Completion Assistant* and validation engine if a schema is not detected in the current JSON document.

Learn Document Structure When JSON Schema is not Detected

When there is no JSON schema associated with a JSON document, Oxygen XML Developer can learn the document structure by parsing the document internally to provide an initialization source for content completion and validation.

This feature is controlled by the [Learn on open document option \(on page 179\)](#) that is available in the **Editor > Content Completion** preferences page. This feature enabled by default. If you want to disable it, deselect the **Learn on open document** option.

You can choose to create a schema from the learned structure and save it as a file using the **Learn Structure** and **Save Structure** actions.

Creating a JSON Schema from Learned Document Structure

To create a JSON schema from the learned structure of a JSON document, follow these steps:

1. Open the JSON document that will be used to create the schema.
2. Go to **Document > JSON Document > Learn Structure (Ctrl + Shift + L (Command + Shift + L on macOS))**. The **Learn Structure** action reads the mark-up structure of the current document. A **Learn completed** message is displayed in the application status bar when the action is finished.
3. Go to **Document > JSON Document > Save Structure** and enter the file path for the JSON schema.
4. Click the **Save** button.

Syntax Highlighting in JSON Documents

Oxygen XML Developer supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for JSON files, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) ([on page 114](#)).
2. Go to **Editor > Syntax Highlight** ([on page 193](#)).
3. Select and expand the **JSON** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

Related Information:

[Syntax Highlight Preferences \(on page 193\)](#)

Folding in JSON

In a large JSON document, the data enclosed in the curly bracket characters `{ }` can be collapsed so that only the needed data remains in focus. The folding features available for XML documents are also available in JSON documents.

JSON Outline View

The **Outline** view for JSON documents displays the list of all the components of the JSON document you are editing. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 302. JSON Outline View

Outline View Features

Some of the features provided by the **Outline** view include:

- You can quickly navigate through the document by selecting nodes in the **Outline** tree.
- You can move elements by dragging them to a new position in the tree structure.
- It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the **Outline** view, and vice versa.
- Document errors are highlighted in the **Outline** view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.
- Arrays and array elements have the number of their children elements displayed in their label and each child is prefixed with the index in the array.

Outline View Interface

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as `*` or `?`) and separate multiple patterns with commas.

It also includes a  **Settings** menu in the top-right corner that presents the following options to help you filter the view even further.

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

Selection update on cursor move

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Drag and Drop Actions in the Outline View

Entire JSON properties, objects, and arrays can be moved or copied in the edited document using only the mouse in the **Outline** view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag a JSON node within the **Outline** view and drop it on another node, then the dragged node will be moved after the drop target.
- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target node will be expanded first and the dragged node will be moved inside the drop target.
- You can also drop a node before or after another node if you hold the mouse pointer towards the upper or lower part of the target. A marker will indicate whether the drop will be performed before or after the target node.
- If you hold down the **Ctrl (Command on macOS)** key after dragging, a copy operation will be performed instead of a move.

Contextual Menu Actions

The following actions are available in the contextual menu of the JSON **Outline** view:

Cut

Cuts the currently selected component.

Copy

Copies the currently selected component.

Paste

Pastes the copied component.

Delete

Deletes the currently selected component.

Expand More

Expands the structure of a component in the **Outline** view.

Collapse All

Collapses the structure of all the component in the **Outline** view.

Online JSON to XML Converter

Attention:

For a simple **ONLINE** tool for converting a single JSON file to XML, or vice versa, go to: https://www.oxygenxml.com/xml_json_converter.html.

Converting JSON to XML in Oxygen

Oxygen XML Developer includes a useful and simple tool for converting JSON files to XML. The **JSON to XML** action for invoking the tool can be found in the **Tools > JSON Tools** menu.

To convert a JSON document to XML, follow these steps:

1. Select the **JSON to XML** action from the **Tools > JSON Tools** menu.

The **JSON to XML** dialog box is displayed:

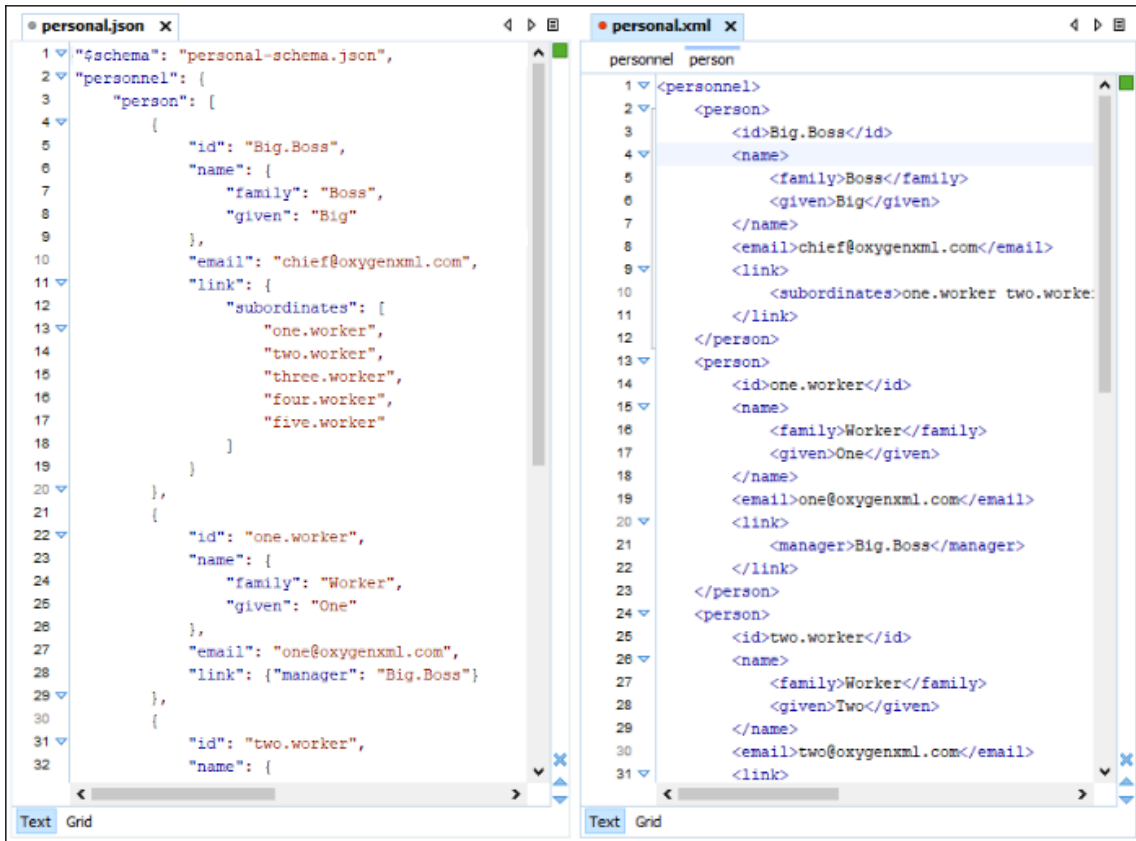

Figure 303. JSON to XML Dialog Box

2. Choose or enter the **Input URL** of the JSON document.
3. Choose the path of the **Output file** that will contain the resulting XML document.
4. Select the **Open in Editor** option to open the resulting XML document in the main editing pane.
5. Click the **Convert** button.

Result: The original JSON document is now converted to an XML document.

Figure 304. Example: XML to JSON Operation Result

Conversion Details

- If the JSON document has more than one property on the first level, the converted XML document will have an additional root element called `<JSON>`.

For example, the following JSON document:

```

{
  "personnel": {
    "person": [
      {"name": "Boss"},
      {"name": "Worker"}
    ]
  },
  "id": "personnel-id"
}

```

it is converted to:

```

<?xml version="1.0" encoding="UTF-8"?>
<JSON>
  <personnel>

```

```

<person>
  <name>Boss</name>
</person>
<person>
  <name>Worker</name>
</person>
</personnel>
<id>personnel-id</id>
</JSON>

```

- If the JSON document is an array, the converted XML document will have a root element called `<array>` and for each item within the array, another `<array>` is created.

```

[
  { "name": "Boss" },
  { "name": "Worker" }
]

```

it is converted to:

```

<?xml version="1.0" encoding="UTF-8"?>
<array>
  <array>
    <name>Boss</name>
  </array>
  <array>
    <name>Worker</name>
  </array>
</array>

```

- If the name of a JSON property contains characters that are not valid in XML element names (for example, \$), then the invalid characters will be escaped as its hexadecimal equivalent in the converted XML.

```

{"$id": "personnel-id"}

```

is converted to:

```

<_X24_id>personnel-id</_X24_id>

```

XML to JSON Converter

Discover the Oxygen JSON Editor!
Tailored for Working with JSON and JSON Schema Documents

Online XML to JSON Converter

! Attention:

For a simple ONLINE tool for converting a single XML file to JSON, or vice versa, go to: https://www.oxygenxml.com/xml_json_converter.html.

Converting XML to JSON in Oxygen

Oxygen XML Developer includes a useful and simple tool for converting XML files to JSON. The **XML to JSON** action for invoking the tool can be found in the **Tools > JSON Tools** menu.

To convert an XML document to JSON, follow these steps:

1. Select the **XML to JSON** action from the **Tools > JSON Tools** menu.

Step Result: The **XML to JSON** dialog box is displayed:

Figure 305. XML to JSON Dialog Box

2. Choose or enter the **Input URL** of the XML document.
3. Choose the path of the **Output file** that will contain the resulting JSON document.
4. Select how you want empty elements to be converted (default is **object**).
5. Select the **Open in Editor** option to open the resulting JSON document in the main editing pane.
6. Click the **Convert** button.

Result: The original XML document is now converted to a JSON document.

Figure 306. Example: XML to JSON Operation Result

Conversion Details

- Some XML components are ignored (e.g. comments and processing instructions).
- If any elements contain attributes in the XML document, the attributes are converted to properties in the converted JSON document. If the XML document contains more than one element with the same name, they will be converted into an array of object in the converted JSON document.

For example, the following XML document:

```

<personnel>
  <person id="person.one">
    <name>Boss</name>
  </person>
  <person id="person.two">
    <name>Worker</name>
  </person>
</personnel>

```

it is converted to:

```

{
  "personnel": {
    "person": [
      {

```

```

    "id": "person.one",
    "name": "Boss"
  },
  {
    "id": "person.two",
    "name": "Worker"
  }
]
}
}

```

- If the XML document contains elements with mixed content (text plus elements), the converted JSON document will contain a `#text` property with its value set as the text content. If there are multiple text nodes, the subsequent `#text` properties will contain a number (e.g. `#text1`, `#text2`). If there are multiple elements with the same name, the first property will have the element name and the subsequent properties will contain a number (e.g. `b`, `b#1`, `b#2`).

```
<p>This <b>is</b> an <b>example</b>!</p>
```

is converted to:

```

{
  "p": {
    "#text": "This ",
    "b": "is",
    "#text1": " an ",
    "b#1": "example",
    "#text2": "!"
  }
}

```

- If the XML document contains element names that contains hexadecimal codes (for example, if they were escaped during a [JSON to XML conversion \(on page 901\)](#)), it will be converted to the normal character value in the converted JSON document.

```
<_X24_id>personnel-id</_X24_id>
```

is converted to:

```
{"$id": "personnel-id"}
```

JSON to YAML Converter

Converting JSON to YAML in Oxygen

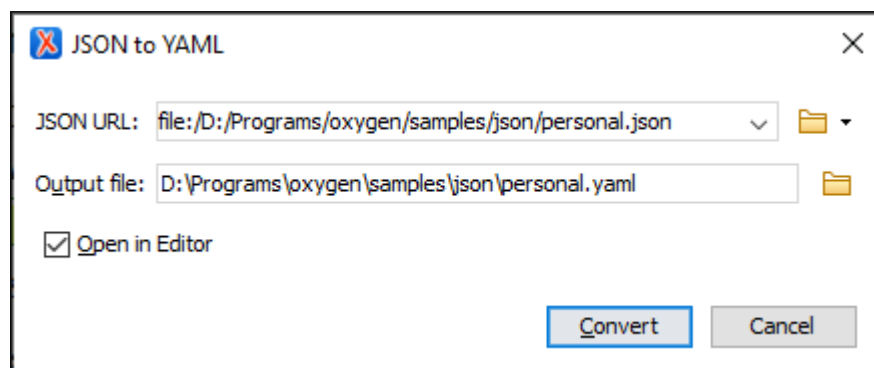

Oxygen XML Developer includes a useful and simple tool for converting JSON files to YAML. The **JSON to YAML** action for invoking the tool can be found in the **Tools > JSON Tools** menu.

To convert a JSON document to YAML, follow these steps:

1. Select the **JSON to YAML** action from the **Tools > JSON Tools** menu.

The **JSON to YAML** dialog box is displayed:

Figure 307. JSON to YAML Dialog Box

2. Choose or enter the **JSON URL** for the document you want to convert.
3. Choose the path of the **Output file** that will contain the resulting YAML document.
4. **[Optional]** Select the **Open in Editor** option to open the resulting YAML document in the main editing pane.
5. Click the **Convert** button.

Result: The original JSON document is now converted to a YAML document.

Related Information:

[YAML to JSON Converter \(on page 907\)](#)

YAML to JSON Converter

Converting YAML to JSON in Oxygen

Oxygen XML Developer includes a useful and simple tool for converting YAML files to JSON. It even works on files that consist of multiple YAML documents, each separated by three dashes (---), in which case the conversion creates multiple JSON files with a number in the name.

The **YAML to JSON** action for invoking the tool can be found in the **Tools > JSON Tools** menu.

To convert a YAML document to JSON, follow these steps:

1. Select the **YAML to JSON** action from the **Tools > JSON Tools** menu.

The **YAML to JSON** dialog box is displayed:

Figure 308. YAML to JSON Dialog Box

2. Choose or enter the **YAML URL** for the document you want to convert.
3. Choose the path of the **Output file** that will contain the resulting JSON document.
4. **[Optional]** Select the **Open in Editor** option to open the resulting JSON document in the main editing pane.
5. Click the **Convert** button.

Result: The original YAML document is now converted to a JSON document.

Related Information:

[JSON to YAML Converter \(on page 907\)](#)

Contextual Menu Actions in JSON Documents

When editing JSON documents, Oxygen XML Developer provides the following actions in the contextual menu:

 **Cut**,  **Copy**,  **Paste**

Executes the typical editing actions on the currently selected content.

Copy JSON Pointer

Creates a *JSON Pointer* at the current cursor location and copies the expression that denotes the JSON pointer to the system clipboard.

Copy XPath

Copies the XPath expression of the current property from the current editor to the clipboard.

Toggle Line Wrap (**Ctrl + Shift + Y (Command + Shift + Y on macOS)**)

Enables or disables line wrapping. When enabled, if text exceeds the width of the displayed editor, content is wrapped so that you do not have to scroll horizontally.

Go to Matching Bracket (Ctrl + Shift + G (Command + Shift + G on macOS))

Moves the cursor to the end bracket that matches the start bracket, or vice versa.

Source submenu

This submenu includes the following actions:

To Lower Case

Converts the content selection to lower case characters. This works with contiguous and multiple selections.

To Upper Case

Converts the selected content to upper case characters. This works with contiguous and multiple selections.

Capitalize Lines

It capitalizes the first letter found on every new line that is selected. Only the first letter is affected, the rest of the line remains the same. If the first character on the new line is not a letter then no changes are made.

Convert Hexadecimal Sequence to Character (**Ctrl + Shift + X (Command + Shift + X on macOS)**)

Converts a sequence of hexadecimal characters to the corresponding [Unicode character \(on page 422\)](#). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the `0x` or `0X` prefix. Examples of valid sequences and the characters they will be converted to:

- `0x0045` will be converted to `É`
- `0x0125` to `ĥ`
- `265` to `ı`
- `2190` to `←`

Note:

For more information about finding the hexadecimal value of a character, see [Finding the Decimal, Hexadecimal, or Character Entity Equivalent \(on page 425\)](#).

Base64 Encode/Decode submenu

This submenu include the following actions for encoding or decoding **base 64** schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page (*on page 159*) will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page (*on page 273*).

Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page (*on page 159*) will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page (*on page 273*).

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you to select whether you want to modify only matches with the same letter case or all matches.

Base32 Encode/Decode submenu

This submenu include the following actions for encoding or decoding **base32** schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page (*on page 159*) will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page (*on page 273*).

Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page (*on page 159*) will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page (*on page 273*).

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you to select whether you want to modify only matches with the same letter case or all matches.

Hex Encode/Decode submenu

This submenu include the following actions for encoding or decoding **hex** schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page (*on page 159*) will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page (*on page 273*).

Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page (*on page 159*) will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page (*on page 273*).

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Join and Normalize Lines (Ctrl + J (Command + J on macOS))

For the current selection, this action joins the lines by replacing the *line separator* with a single space character. It also normalizes the whitespaces by replacing a sequence of such characters with a single space.

Insert new line after (Ctrl + Alt + Enter (Command + Option + Enter on macOS))

This action has the same result as moving the cursor to the end of the current line and pressing the *ENTER* key.

 **Indent selection (Ctrl + I (Command + I on macOS))**

Corrects the indentation of the selected block of lines.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Go to Definition

Navigates to the definition of the current property.

Flatten Schema

Available only if the JSON document is a JSON schema, it flattens the entire hierarchy of the JSON schema. For more details, see [Flatten JSON Schema \(on page 950\)](#).

Open submenu

The following actions are available in this submenu:

Open File at Cursor

Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a **Create new file** button that starts the **New document** wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel. If the file is an image file, it will be opened in the [Image Preview pane \(on page 428\)](#).

Open File at Cursor in System Application

Opens the file (identified by its link) or web page (identified by a web link) found at the cursor position. The target is opened in the default system application associated with that file type.

Compare

Opens the current file in [the Compare Files tool \(on page 433\)](#).

Transforming and Querying JSON Documents

Oxygen XML Developer provides the ability to transform JSON documents to XML or HTML through XSLT or XQuery processing. You also have access to some powerful tools for querying JSON through XPath expressions or XQuery.

Resources

For more information about transforming and querying in JSON, watch our video demonstrations:

- Video: [Transform JSON Documents with XSLT/XQuery](#)
- Video: [Support for Querying and Transforming JSON Documents](#)

Transforming JSON Documents with XSLT

There are several methods that can be used to transform JSON documents through XSLT processing.

Transforming a JSON Document Directly with XSLT

1. Create a new transformation scenario (*on page 1129*) using one of the following types of transformations:
 - **JSON Transformation with XSLT** (*on page 1173*) - This scenario is useful if you want to develop a JSON document and the XSLT document is in its final form.
 - **XSLT Transformation on JSON** (*on page 1208*) - This scenario is useful if you want to develop an XSLT document and the JSON document is in its final form.
2. Configure the transformation scenario to suit your needs. In the **XSLT** tab, make sure you select the JSON file in the **JSON URL** field and the XSL file in the **XSL URL** field.
3. Run the transformation.

Transforming Multiple JSON Documents at Once

It is also possible to transform multiple JSON documents at once with XSLT processing. To achieve this, select the JSON documents in the **Project** view, right-click, and apply or configure a transformation scenario.

Transforming a JSON Document Using XSLT and XPath Functions

1. Create an XSLT 3.0 stylesheet that has the `xsl:initial-template`. You can use one of the following two templates available in the New Document Wizard.
 - **XSLT Stylesheet for JSON** - Processes a JSON document by using a `json-doc()` function and matches the JSON properties from the JSON map.
 - **XSLT Stylesheet for JSON to XML** - Processes a JSON document by using a `json-to-xml()` function and matches the converted XML content.
2. Create a new **XSLT transformation** scenario for your stylesheet.
3. Reference the JSON document that you want to transform using one of these two methods:
 - In the transformation scenario, click the **Parameters** button in the **XSLT** tab and add a parameter that specifies the URL to your JSON document in its value. For example, if you are transforming one of the built-in templates mentioned above, the `input` parameter is added by default and you could specify the URL in its value.
 - Specify the URL to your JSON document in the stylesheet you created. For example, if you use one of the built-in templates mentioned above, you would specify the URL in the value of the `input` parameter (in the `xsl:param` element).
4. Run the transformation.

**Tip:**

There are some sample files in the `[OXYGEN_INSTALL_DIR]/samples/json/transform` folder that can be used to transform a JSON document to XML or HTML.

Related Information:

[Blog: Transforming JSON](#)

[XSLT Functions on JSON Data](#)

Transforming JSON Documents with XQuery

There are several methods that can be used to transform JSON documents through XQuery processing.

Transforming a JSON Document Directly with XQuery

1. Create a new transformation scenario (*on page 1129*) using one of the following types of transformations:
 - **JSON Transformation with XQuery** (*on page 1180*) **JSON Transformation with XQuery** - This scenario is useful if you want to develop a JSON document and the XQuery document is in its final form.
 - **XQuery Transformation on JSON** (*on page 1228*) **XQuery Transformation on JSON** - This scenario is useful if you want to develop an XQuery document and the JSON document is in its final form.
2. Configure the transformation scenario to suit your needs. In the **XQuery** tab, make sure you select the JSON file in the **JSON URL** field and the XQuery file in the **XQuery URL** field.
3. Run the transformation.

Transforming Multiple JSON Documents at Once

It is also possible to transform multiple JSON documents at once with XQuery processing. To achieve this, select the JSON documents in the **Project** view, right-click, and apply or configure a transformation scenario.

Transforming a JSON Document Using XQuery

It is possible to transform JSON documents through XQuery processing.

1. Create an XQuery file.
2. Create a new **XQuery transformation** scenario for your XQuery file.
3. Reference the JSON document that you want to transform using one of these two methods:
 - In the transformation scenario, click the **Parameters** button in the **XQuery** tab and add a parameter that specifies the URL to your JSON document in its value.
 - Specify the URL to your JSON document in the XQuery file you created.
4. Run the transformation.

**Tip:**

There is a sample XQuery file in the `[OXYGEN_INSTALL_DIR]/samples/json/transform` folder that can be used to transform a JSON document.

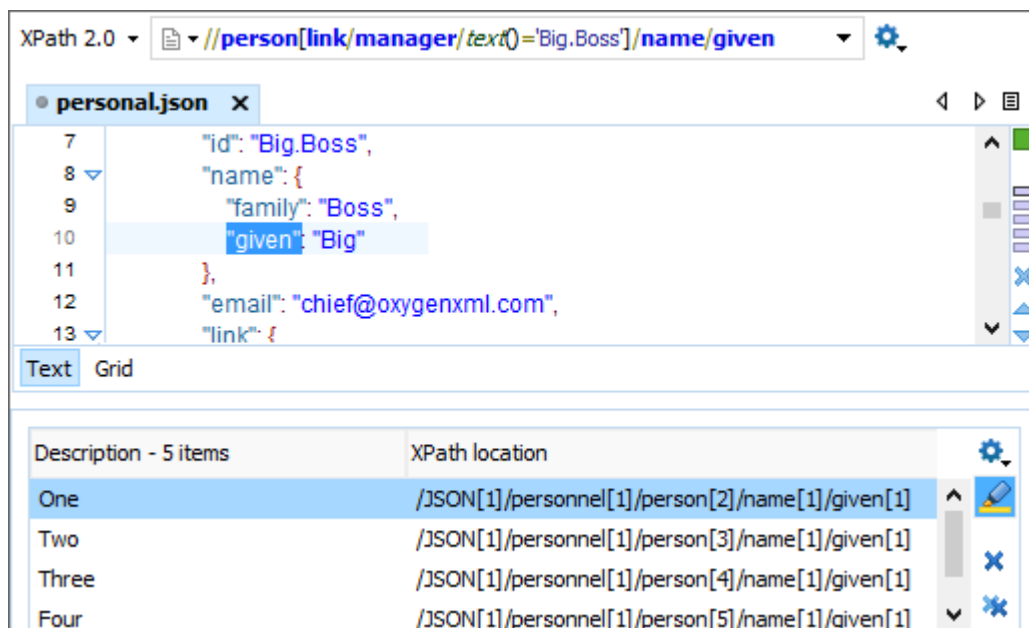

Querying JSON Documents with XPath or XQuery

Oxygen XML Developer provides an XPath toolbar that makes it easy to quickly query JSON documents using XPath expressions. You can also use the dedicated **XPath/XQuery Builder** view that allows you to compose more complex XPath or XQuery expressions and execute them over JSON documents in **Text** mode.

XPath Toolbar

When an XPath expression is run over a JSON document, the document is converted to XML and the XPath is executed over the converted XML document. For more information about this toolbar, see [XPath Toolbar \(on page 1733\)](#).

Figure 309. XPath Toolbar for JSON

XPath/XQuery Builder View

You can also use the **XPath/XQuery** view to run XPath and XQuery expressions over a JSON document. For XQuery, you need to reference the JSON document in your XQuery content. For more information about this view, see [XPath Builder View \(on page 1735\)](#).

Figure 310. XPath/XQuery Builder View for JSON

Details About Querying JSON Documents Using XPath Expressions

To execute XPath expressions over a JSON document, the document is converted to XML and the XPath is executed over the converted XML document. For this conversion, Oxygen XML Developer uses the built-in [JSON to XML Converter tool \(on page 901\)](#). The results are mapped back to the original JSON document.

For example, if you have the following JSON document:

```

{
  "personnel": {
    "person": [
      { "name": "Boss" },
      { "name": "Worker" }
    ]
  },
  "id": "personnel-id"
}

```

and you want to match the name of the second person, the XPath expression would look like this:

```
/JSON/personnel/person[2]/name
```

The reason why the first element is `JSON` is because if the JSON document contains more than one property on the first level, the converted XML document will have an additional root element called `<JSON>`. For more information, see [JSON to XML Conversion Details \(on page 902\)](#).

The `[2]` in the expression represents the index of the `person` in the array and in this case, it matches the second `person` because the index counting starts with 1.

XQuery Builder View

The **XPath/XQuery Builder** view allows you to compose complex XQuery expressions and execute them over the currently edited XML or JSON document. You can use the `doc()` function to specify the source file that

will have the expressions executed. When you connect to a database, the expressions are executed over that database. If you are using the **XPath/XQuery Builder** view and the current file is an XSLT document, Oxygen XML Developer executes the expressions over the XML document in the associated scenario.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the view contains the following actions:

XPath version chooser drop-down menu

A drop-down menu that allows you to select the type of the expression you want to execute. You can choose between:

- XPath 1.0 (Xerces-driven)
- XPath 2.0, XPath 2.0 SA, XPath 3.1, XPath 3.1 SA, Saxon-HE XQuery, Saxon-PE XQuery, or Saxon-EE XQuery (all of them are Saxon-driven)
- Custom connection to XML databases that can execute XQuery expressions

Note:

The results returned by XPath 2.0 SA and XPath 3.1 SA have a location limited to the line number of the start element (there are no column information and no end specified).

Note:

Oxygen XML Developer uses Saxon to execute XPath 3.1 expressions. Since Saxon implements a part of the 3.1 functions, when using a function that is not implemented, Oxygen XML Developer returns a compilation error.

Execute XPath button

Use this button to start the execution of the XPath or XQuery expression you are editing. The result of the execution is displayed in the **Results** view at the bottom of the application.

Favorites button

Allows you to save certain expressions that you can later reuse. To add an expression as a favorite, click this button and enter a name for it. The star turns yellow to confirm that the expression was saved. Expand the drop-down menu next to the star button to see all your favorites. Oxygen XML Developer automatically groups favorites in folders named after the method of execution.

History drop-down menu

Keeps a list of the last 15 executed XPath or XQuery expressions. Use the  **Clear history** action from the bottom of the list to remove them.

Settings drop-down menu

Contains the following three options:

Update on cursor move

When selected and you navigate through a document, the XPath expression corresponding to the XML node at the current cursor position is displayed. For JSON documents, it displays the XPath expression for the current property.

Evaluate as you type

When you select this option, the XPath expression you are composing is evaluated in real time.

Note:

This option and the automatic validation are disabled when you edit [huge documents \(on page 428\)](#) or when the scope is other than **Current file**.

Options

Opens the Preferences page of the currently selected processing engine.

XPath scope menu

Oxygen XML Developer allows you to define a scope for the XPath operation to be executed. You can choose where the XPath expression will be executed:

-  **Current file** - Currently selected file only.
-  **Project** - All the files in the project.
-  **Selected project resources** - The files selected in the project.
-  **All opened files** - All files that are opened in the application.
-  **Opened archive** - Files that are opened in the **Archive Browser view (on page 1741)**.
-  **Working sets** - The selected *working sets (on page 2273)*.

At the bottom of the scope menu the following scope configuration actions are available:

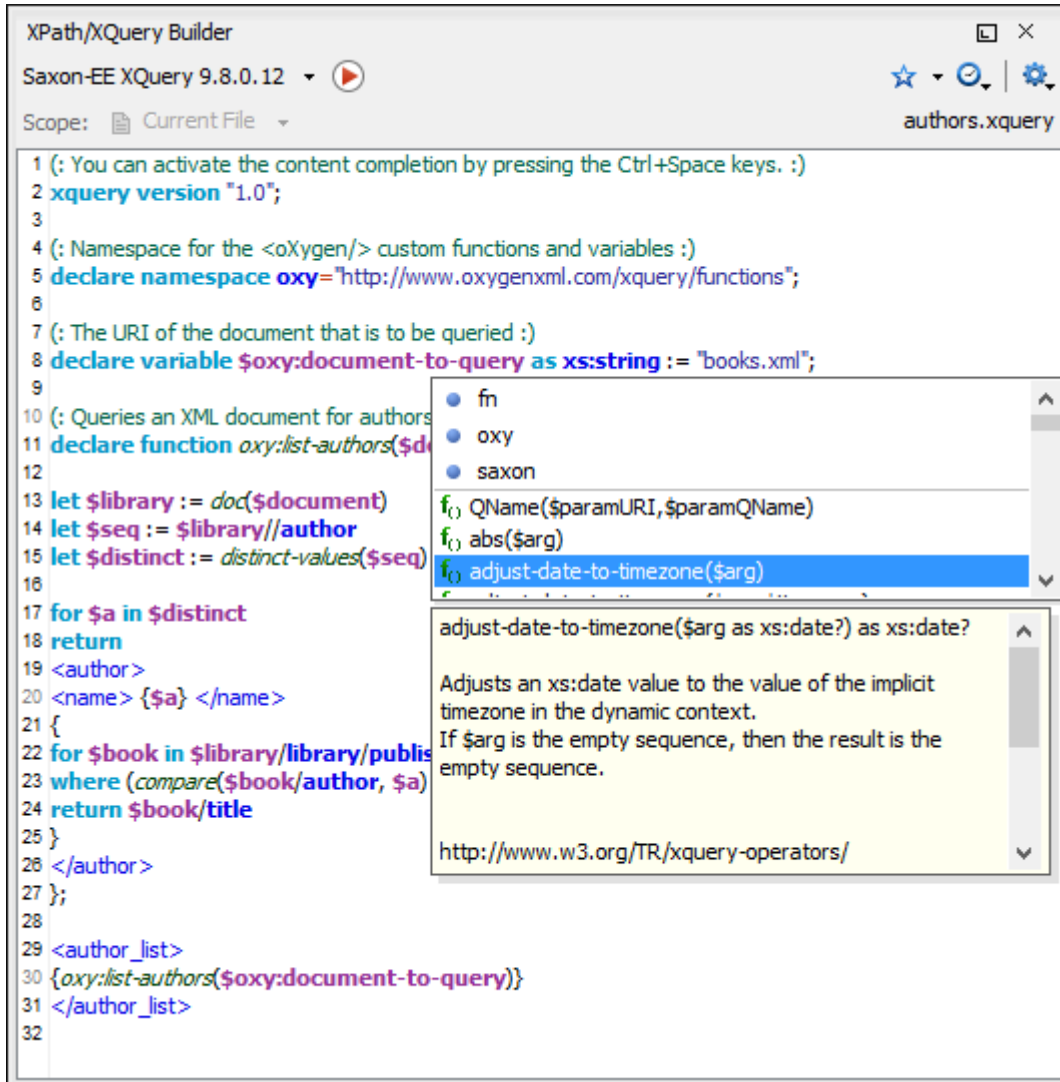

-  **Configure XPath working sets** - Allows you to configure and manage collections of files and folders, encapsulated in logical containers called *working sets (on page 2273)*.
-  **XPath file filter** - You can filter the files from the selected scope that will have the XPath expression executed. By default, the XPath expression will be executed only on XML or JSON files, but you can also define a set of patterns that will filter out files from the current scope. If you select the **Include archive** option, the XPath expression will be also executed on the files in any archive (including EPUB and DocX) found at the current scope.

Figure 311. XPath/XQuery Builder View

While you edit an XPath or XQuery expression, Oxygen XML Developer assists you with the following features:

- *Content Completion Assistant (on page 2267)* - It offers context-dependent proposals and takes into account the cursor position in the document you are editing. The set of functions proposed by the *Content Completion Assistant* also depends on the engine version. Select the engine version from the drop-down menu available in the toolbar.
- Syntax Highlighting - Allows you to identify the components of an expression. To customize the colors of the components of the expression, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Editor > Syntax Highlight** (on page 193).
- Automatic validation of the expression as you type.

Note:

When you type invalid syntax, a red serrated line underlines the invalid fragments.

- Function signature and documentation balloon, when the cursor is located inside a function.

The usual edit actions ( **Cut**,  **Copy**,  **Paste**, **Select All**,  **Undo**,  **Redo**) are available in the contextual menu of the top editable part of the view.

Editing JSON Schema Documents

Oxygen XML Developer offers powerful tools that allow you to design, develop, and edit JSON Schemas.

These tools include:

- **Text editing mode** (*on page 922*) (packed full of editing helpers)
- **Schema Design mode** (*on page 922*) (a visual, intuitive schema diagram editor)
- **Grid mode** (*on page 922*) (a compact layout of nested tables)
- **JSON Schema documentation tool** (*on page 945*) for producing high quality output
- **JSON Schema instance generator** (*on page 943*) for producing JSON Schema documents from a JSON file
- **XSD to JSON Schema converter tool** (*on page 947*) for producing a JSON Schema from an XML schema

This section describes the features included in Oxygen XML Developer for editing JSON Schema documents and how to use them.

Resources

For more information about the JSON support in Oxygen XML Developer, see the following resources:

- Video: [Introducing JSON Schema Design Mode](#)
- Video: [JSON Editing](#)
- Video: [JSON Tools in Oxygen](#)
- Video: [JSON Schema Search and Refactoring Actions in Oxygen](#)
- Video: [JSON Schema Version 2020-12 Support in Oxygen](#)
- Webinar: [JSON and JSON Schema Support in Oxygen](#)
- Webinar: [Creating and Designing JSON Schemas](#)

JSON Schema Editor

Oxygen XML Developer includes a specialized JSON Schema editor with various editing features for files that have the `jsonschema` file extension, or for files that have `json` file extension and includes a [meta-schema URL](#) (*on page 948*) in the "\$schema" key . The purpose of the JSON schema is to define the legal properties and values of a JSON document to keep it valid and well-formed.

New Document Templates

Oxygen XML Developer includes a new document template to help you get started creating a JSON Schema document. The template is called **JSON Schema** and it can be found in the **New Document** folder in the **New document wizard** (*on page 330*). You can also [customize your own JSON Schema templates](#) (*on page 340*) and specify other versions (Draft 04, 06, 07, 2019-09, or 2020-12).

**Tip:**

You can experiment with a sample of a JSON Schema file available at: `[OXYGEN-INSTALL-DIR] / samples/json/personal-schema.json`.

Text Mode Editor

When editing JSON Schema documents in **Text** editing mode, the usual text editing actions are available, along with various other actions, including:

- [JSON Outline View \(on page 898\)](#)
- [JSON-specific Syntax Highlighting \(on page 949\)](#)
- [Search and Find/Replace \(on page 385\)](#)
- Drag and Drop
- [Validation \(on page 883\)](#)
- Format and Indent (Pretty Print)

Grid Mode Editor

Oxygen XML Developer allows you to view and edit the JSON Schema documents in the **Grid** mode. The JSON Schema is represented in **Grid** mode as a compound layout of nested tables and the JSON data and structure can be easily manipulated with table-specific operations or drag and drop operations on the grid components. For more details, see [JSON Grid Mode Editor \(on page 879\)](#).

Design Mode Editor

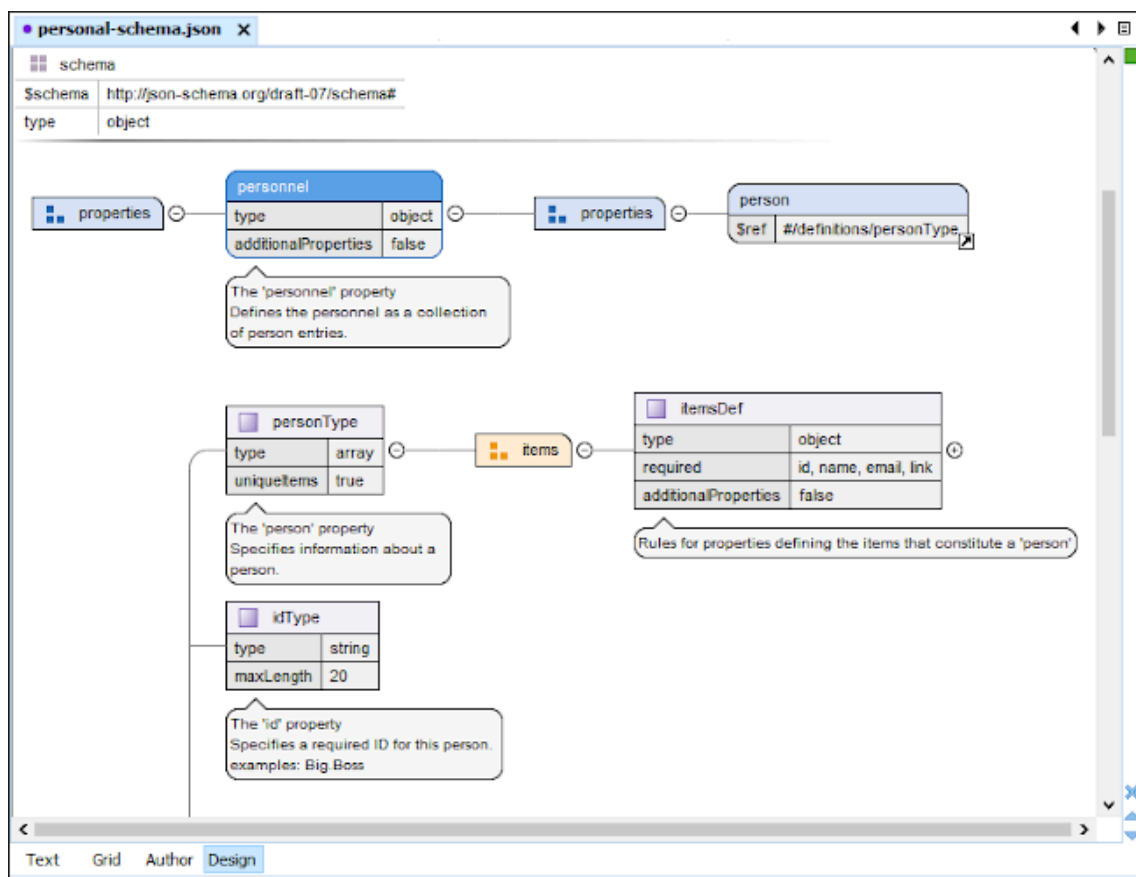

Oxygen XML Developer provides a powerful, expressive visual schema diagram editor (**Design** mode) for editing JSON Schemas. It is helpful for both content authors who want to visualize or understand a schema and schema designers who develop complex schemas. For all the details, see [JSON Schema Design Mode \(on page 922\)](#).

JSON Schema Design Mode (JSON Schema Diagram Editor)

Oxygen XML Developer provides a powerful, expressive visual schema diagram editor (**Design** mode) for editing JSON Schemas. The structure of the diagram editor is designed to be intuitive and easy to use. The **Design** mode was created to help both content authors who want to visualize or understand a schema and schema designers who develop complex schemas.

The JSON Schema **Design** mode includes various [navigation features \(on page 924\)](#), [contextual menu actions \(on page 927\)](#), automatic [validation \(on page 942\)](#), and you can [move and edit components directly within the diagram \(on page 926\)](#).

Figure 312. JSON Schema Design Mode

To switch to the JSON Schema diagram editing mode, select **Design** at the bottom of the editing area.

The diagram font can be increased using the usual Oxygen XML Developer shortcuts: **(Ctrl + "+"** (**Meta + "+"** on macOS)), **(Ctrl + "-"** (**Meta + "-"** on macOS)), **(Ctrl + 0** (**Meta + 0** on macOS)) or **(Ctrl + mouse wheel** (**Meta + mouse wheel** on macOS)). The whole diagram can also be zoomed with one of the predefined factors available in the Schema preferences panel (on page 166). The same zoom factor is applied for the print and save actions.

Resources

For more information about the JSON Schema Design mode, see the following resources:

- Video: [Introducing JSON Schema Design Mode](#)
- Video: [JSON Schema Search and Refactoring Actions in Oxygen](#)
- Video: [JSON Schema Version 2020-12 Support in Oxygen](#)
- Webinar: [The New JSON Schema Diagram Editor](#)
- Webinar: [Create JSON Schema in Design Mode](#)
- Webinar: [Creating and Designing JSON Schemas](#)

Navigation in the JSON Schema Design Mode

The following editing and navigation features work for all types of schema components in the JSON Schema **Design** mode:

- Select consecutive components on the diagram (components from the same level) using the *Shift* key. You can also make discontinuous selections in the schema diagram using the **Ctrl (Meta on macOS)** key. To deselect one of the components, use **Ctrl + Single-Click (Command + Single-Click on macOS)**.
- Use the arrow keys to navigate the diagram vertically and horizontally.
- To expand a component, click the  widget to the right of the component.
- Use *Home/End* keys to jump to the first/last component from the same level. Use **Ctrl + Home (Command + Home on macOS)** key combination to go to the diagram root and **Ctrl + End (Command + End on macOS)** to go to the last child of the selected component.
- You can easily go back to a previously visited component while moving from left to right. The path will be preserved only if you use the left arrow key or right arrow key. For example, if the current selection is on the second property from a properties parent and you press the left arrow key to jump to the properties parent, when you press the right arrow key, then the selection will be moved to the second property.
- Go back and forward between components viewed or edited in the diagram by using the following toolbar actions:
 -  **Back** (go to previous schema component).
 -  **Forward** (go to next schema component).
 -  **Go to Last Modification** (go to last modified schema component).
- Go to the definition of a property by clicking on the **Go to Definition** widget (). You can then use the  **Back** or  **Forward** toolbar buttons to go back and forth between the properties.
- The dedicated **Outline** view displays all of the properties, pattern properties, and definitions found in the document and you can click on any property/definition to navigate to it within the document.
- Search in the diagram using the [Find/Replace dialog box \(on page 394\)](#) or the [Quick find toolbar \(on page 408\)](#). You can find components only in the current file scope.

JSON Schema Palette View (Available in Design Mode)

The **Palette** view is designed to offer quick access to JSON schema components and to improve the usability of the JSON schema diagram builder. You can use the **Palette** to drag and drop components into the **Design** mode. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 313. JSON Palette View (for schema versions draft-04, draft-06, draft-07)

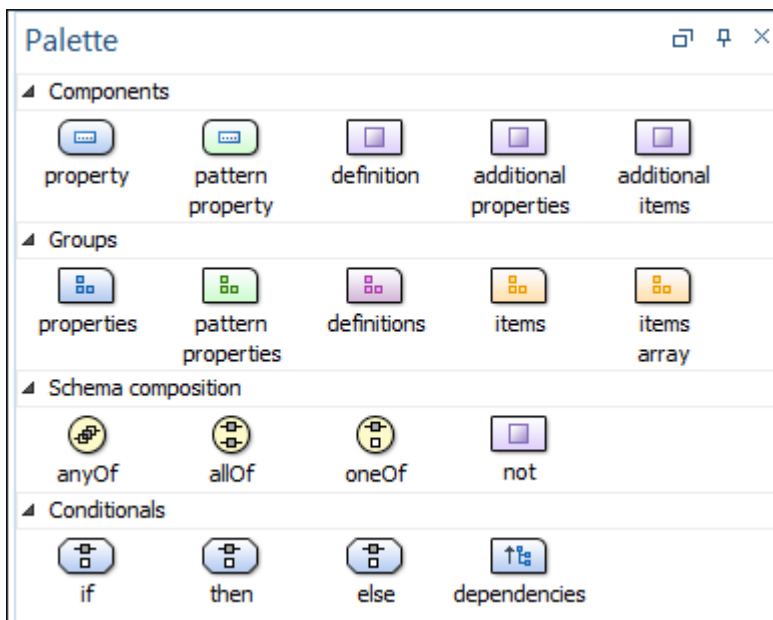

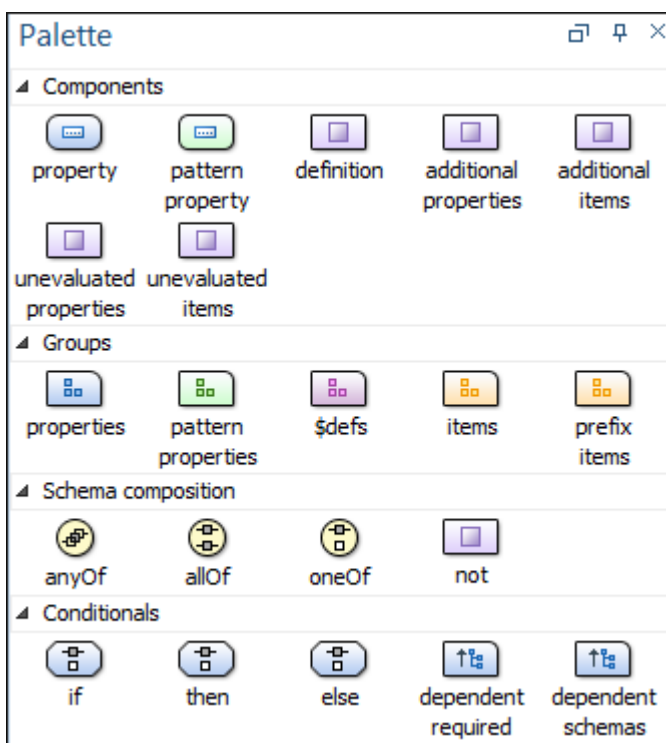

Figure 314. JSON Palette View (for schema versions 2019-09, 2020-12)

Components are organized functionally into 4 collapsible categories:

- **Components:** *property*, *patternProperty*, *definition*, *additionalProperties*, *additionalItems*, *unevaluatedProperties* (for 2019-09 or 2020-12 schemas), *unevaluatedItems* (for 2019-09 or 2020-12 schemas).
- **Groups:** *properties*, *patternProperties*, *definitions/\$defs* (for draft 2019-09 or 2020-12 schemas), *items*, *itemsArray*, *prefixItems* (for 2019-09 or 2020-12 schemas).

**Note:**

Two of the group palette components presented above (*itemsArray* and *patternProperty*), have no match in JSON schema keywords. They were introduced only as a design convenience and their use does not generate code that would affect the validity of the edited schema.

- **Schema composition:** *anyOf*, *allOf*, *oneOf*, *not*.
- **Conditionals:** *if*, *then*, *else*, *dependencies* (for draft-04, draft-06, or draft-07 schemas), *dependentRequired* (for 2019-09 or 2020-12 schemas), *dependentSchemas* (for 2019-09 or 2020-12 schemas).

To add a component to the edited schema:

- Click and hold a graphic symbol from the **Palette** view, then drag the component into the **Design** view.
- A line dynamically connects the component with the XML schema structure.
- Release the component into a valid position.

**Note:**

You cannot drop a component into an invalid position. When you hover the component into an invalid position, the mouse cursor changes its shape into . Also, the connector line changes its color from the usual dark gray to the color defined in the **Validation error highlight color** option (*on page 194*) (default color is red).

**Tip:**

When dragging and dropping a property/definition or pattern property on a component, if it does not have the corresponding group component (*properties*, *definitions*, *patternProperties*), it will automatically be created.

Resources

For more information about the Schema palette, watch our video demonstration:

<https://www.youtube.com/embed/r5SLk3XL0Us>

Editing Actions in JSON Schema Design Mode

The JSON Schema **Design** mode includes various editing features, including:

- You can edit a JSON Schema using various **contextual menu actions** (*on page 927*).
- You can copy/paste or drag/drop to move existing components to other locations in an JSON Schema. You can also use the Move Up/Down actions to change the order of the components in a parent.
- You can edit schema components directly in the diagram. For these components, you can edit the name and the additional properties presented in the diagram by double-clicking the value you want

to edit. If you want to edit the name of a selected component, you can also press **Enter**. The list of properties that can be displayed for each component can be customized [in the JSON Schema Properties preferences page \(on page 167\)](#).

- When switching between editing modes, the cursor position is synchronized. For example, if you switch from **Design** to **Text** mode, the cursor will be in the same position within the document in **Text** mode as it was in **Design** mode, and vice versa.
- The content completion assistant can be used for in-place editing within the JSON schema **Design** mode. For example, when editing properties, you can use **Ctrl+Space** to invoke the content completion window and the proposals are offered based on the defined JSON schema, according to the version used.
- You can drag properties/definitions from the **Outline** view and drop them into appropriate location in the diagram editor.

Contextual Menu Actions in the JSON Schema Design Mode

The contextual menu of the **Design** mode includes the following actions:

Go to Definition [Ctrl + Shift + Enter]

Navigates to the referenced schema component. This action is also available by clicking the arrow displayed in its bottom right corner.

Edit Properties

Allows you to edit the properties of the selected component in a in-place editor.

Properties that have set values are rendered in bold while unset properties are rendered with a gray foreground. You can edit any property (set or unset) by double-clicking or by pressing **Ctrl + Enter (Command + Enter on macOS)**.

You can delete any property already set by pressing **Delete**. This operation does not mean the selected property is deleted from the table. It means the property is *unset* (rendered with gray foreground). The **Edit** and **Remove** actions are also available on the contextual menu in the table.

If the `type` property changes as a result of an editing/removal action, then the list of properties presented in the table is updated according to the new schema type.

Note:

When filling in string values they should not be enclosed in quotation marks, these are added automatically.

Note:

For array values simply fill in the items that will constitute the array, separated by commas.

Edit Annotations

Allows you to edit the annotations for the selected schema component in the **Edit Annotations** dialog box. Annotations are not required, but they are encouraged as a good practice and can make the schema “self-documenting”.

The **title** and **description** must be strings. A **title** is preferably short, whereas a **description** provides a more lengthy explanation about the data described by the schema. The **default** keyword specifies a default schema value that can be anything. The **examples** keyword is meant to provide an array of examples that validate against the schema. Its items must be separated by a comma.

Annotations that have set values are rendered in bold while unset annotations are rendered with a gray foreground. You can unset an annotation by using the **Delete** key or the **Remove** action that is available in the contextual menu of the table.

By default, annotations are rendered under the graphical representation of the component. To edit the annotations, use the **Edit Annotations** action from the contextual menu or simply double-click the annotations area (if any).

Edit Dependencies

Available for `dependencies` and `dependentRequired` components, this action allows you to add, rename, delete, and edit the values for dependencies.

Make Required

Marks the selected property as being required in the parent object. By default, the defined properties are not required in the JSON schema. You can set a list of required properties in the `required` keyword. By invoking the action, the name of the property is added in the parent object's `required` keyword.

Make Optional

Marks the selected property as being optional in the parent object. By default, the defined properties are optional in the JSON schema. You can set a list of required properties in the `required` keyword. By invoking the action, the name of the property is deleted from the parent object's `required` keyword.

Refactoring > Extract definition in another file

Extracts a definition to a new file. If the file does not already exist, the action will create a new file and a document preset will be used to match the current schema specification. If the file does exist, the action will find a corresponding group (or create one) to append the extracted definition. This action can also be used on a selection of multiple definitions.

Refactoring > Extract definition in current file

Extracts a definition as a global definition and references it. It can be used on a property to extract its definition (in case you want to reuse it) or on a local definition to extract it as global one. This action can also be used on a selection of multiple definitions. Note that this action is not available for global definitions.

Refactoring > Convert type to 'any' type

Converts the `type` for the selected property, definition, or conditional into an `any type` with the value `true` or `false`. You can set `true` value to represent a schema that matches anything, or `false` for a schema that matches nothing.

Refactoring > Convert 'any' type to standard type

Converts the `any type` for the selected property, definition, or conditional into a standard `type`.

Append child

Offers a list of valid components, depending on the context, and appends your selection as a child of the currently selected component. You can set a name for a named component after it has been added in the diagram.

Insert before

Offers a list of valid components, depending on the context, and inserts your selection before the selected component, as a sibling. You can set a name for a named component after it has been added in the diagram.

Insert after

Offers a list of valid components, depending on the context, and inserts your selection after the selected component, as a sibling. You can set a name for a named component after it has been added in the diagram.

 **Undo [Ctrl + Z (Command + Z on macOS)]**

Reverses the last editing action.

 **Redo [Ctrl + Y (Command + Shift + Z on macOS, Ctrl + Shift + Z on Linux/Unix)]**

Recreates the last editing action that was reversed by the **Undo** function.

Rename Component in

Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action. These files are identified by searching the references of the selected component in the scope provided.

 **Cut [Ctrl + X (Command + X on macOS)]**

Cuts the selected component(s).

 **Copy [Ctrl + C (Command + C on macOS)]**

Copies the selected component(s) to the clipboard.

 **Paste [Ctrl + V (Command + V on macOS)]**

Pastes the component(s) from the clipboard as children of the selected component.

Remove [Delete key]

Removes the selected component(s).

Move Up [Alt + UpArrow (Option + UpArrow on macOS)]

Moves a component up in its parent.

Move Down [Alt + DownArrow (Option + DownArrow on macOS)]

Moves a component down in its parent.

Search > Search References

Available on components that have a *Definition* type in the diagram, it searches all references of the selected definition in a scope determined by the schemas referenced in the file and the schemas declared in the validation scenarios associated with them. You can also use it on the *Schema* type component (the root of the schema diagram) to search for all references to the schema name.

Search > Search References in

Available on components that have a *Definition* type in the diagram, it is an extension of the **Search References** action, where the search for references is additionally done in the file(s) specified when defining a scope in the resulting dialog box. You can also use it on the *Schema* type component (the root of the schema diagram) to search for references to the schema name.

Search > Search Occurrences in File [Ctrl + Shift + U (Command + Shift + U on macOS)]

Available on all components that have a *Definition* type in the diagram, it searches all occurrences of the currently selected definition in the current file. You can also use it on the *Schema* type component (the root of the schema diagram) to search for all occurrences of the schema name in the current file.

Flatten Schema

Flattens the entire hierarchy of JSON schemas. For more details, see [Flatten JSON Schema \(on page 950\)](#).

 **Expand All**

Recursively expands all sub-components of the selected component.

 **Collapse All**

Recursively collapses all sub-components of the selected component.

Print Selection

Prints the selected component diagram.

Save as Image

Saves the selected component diagram as image, in JPEG, BMP, SVG or PNG format.

 **Options**

Opens the [JSON Schema preferences page \(on page 167\)](#) where you can control which properties to display for JSON Schema components in the JSON Schema **Design** mode.

JSON Schema Design Mode Components and Properties

A schema diagram contains a series of interconnected components. In the JSON Schema **Design** mode, each component is displayed with distinguishable graphics and the thickness of the lines that connect the components identify whether the connected component is required or optional (a thick line denotes a required component while a thin line denotes an optional component).

Figure 315. Example: Required Component

Figure 316. Example: Optional Component

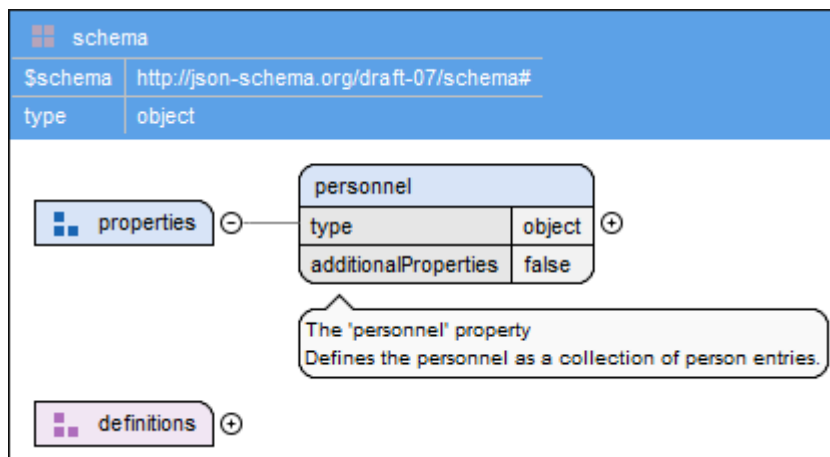

This section provide details about the available components and their corresponding graphics, along with details about component properties.

JSON Schema Components

Schema

Figure 317. The schema Component

Description: Defines the root element of a JSON schema. A JSON schema document contains all the steps that are necessary to be performed to validate JSON documents and it contains a collection of JSON schema components.

Property

Figure 318. Example of a property Component

Description: Each `key:value` pair is known as a **property** of the object. The value can be any JSON data type.

Properties

Figure 319. The properties Component

Description: An object is valid against the **properties** keyword if every property that is present in both the object and the value of this keyword validates against the corresponding schema. The value must be an object, where properties must contain valid JSON schemas (object or boolean). Only the property names that are present in both the object and the keyword value are checked.

Note:

Properties with a boolean value are presented in diagram as components. You can change the boolean value by modifying the `any type` property value. You can also convert a boolean `any type` property into a standard `type` property using the **Convert property to standard type** contextual menu action.

Pattern Property

Figure 320. Example of a patternProperty Component

Description: Maps regular expressions to schemas. If a property name matches the given regular expression, the property value must validate against the corresponding schema.

Pattern Properties

Figure 321. The patternProperties Component

Description: An object is valid against the **patternProperties** keyword if every property where a property name (key) matches a regular expression from the value of this keyword is also valid against the corresponding

schema. The value must be an object where the keys must be valid regular expressions and the corresponding values must be valid JSON schemas (object or boolean).

Unevaluated Properties (for 2019-09 or 2020-12 schemas)

Figure 322. The `unevaluatedProperties` Component

Description: An object is valid against the `unevaluatedProperties` keyword if every unevaluated property is valid against the schema defined by the value of this keyword. Unevaluated properties are the properties that were not evaluated anywhere in the current schema. This keyword can see through adjacent keywords, such as `allOf`.

Definition

Figure 323. Example of a definition Component

Description: The definition of a component of a schema. It can be referenced from a property to define its specification.

Definitions

Figure 324. The definitions Component

or

Description: The optional `definitions` keyword (or `$defs` for *draft 2019-09* or *2020-12* schemas) does not directly validate data, but it contains a map of validation schemas. The value can be anything.

Note:

Definitions with a boolean value are presented in diagram as components. You can change the boolean value by modifying the definition's `any type` property value. You can also convert a definition's boolean `any type` property into a standard `type` property using the **Convert definition to standard type** contextual menu action.

Additional Properties

Figure 325. The additionalProperties Component

Description:

An object is valid against the **additionalProperties** keyword if all *unchecked* properties are valid against the schema defined by the value of this keyword. *Unchecked* properties are the properties not checked by the **properties** and **patternProperties** keywords (if a property name is not present in the **properties** keyword and does not match any regular expression defined by the **patternProperties** keyword, then it is considered *unchecked*). The value must be a valid JSON schema (object or boolean).

To be more concise, if there are *unchecked* properties:

- If the value of the **additionalProperties** keyword is *true*, it is always valid.
- If the value is *false*, it is never valid.
- If the value contains an object (schema), every property must be valid against that schema.

Additional Items

Figure 326. The additionalItems Component

Description: An array is valid against the **additionalItems** keyword if all *unchecked* items are valid against the schema defined by the keyword value. An item is considered *unchecked* if the **items** keyword or **prefixItems** keyword (starting with 2020-12) contains an array of schemas and does not have a corresponding position (index). The value must be a valid JSON schema (object or boolean).

Items

Figure 327. The items Component

Description: An array is valid against the **items** keyword if the items are valid against the corresponding schemas provided by the keyword value. The value can be:

- A valid JSON schema (object or boolean). Every item must be valid against this schema.
- An array of valid JSON schemas. Each item must be valid against the schema defined at the same position (index). Items that do not have a corresponding position (e.g. an array contains 5 items but this keyword only has 3) are considered valid unless the **additionalItems** keyword is present, which will decide the validity.

Prefix Items (for 2020-12 schemas)

Figure 328. The prefixItems Component

Description: An array is valid against the **prefixItems** keyword if items are valid against the corresponding schemas provided by the keyword value. The value of this keyword must be an array of valid JSON schemas and each item must be valid against the schema defined at the same position (index). Items that do not have a corresponding position (an array contains 5 items and this keyword only has 3) will be considered valid, unless the **items** keyword is present (which will decide the validity).

Unevaluated Items (for 2019-09 or 2020-12 schemas)

Figure 329. The unevaluatedItems Component

Description: An object is valid against the **unevaluatedItems** keyword if every unevaluated item is valid against the schema defined by the value of this keyword. Unevaluated items are the items that were not evaluated anywhere in the current schema. This keyword can see through adjacent keywords, such as **allOf**.

AllOf

Figure 330. Example of an allOf Component

Description: An instance is valid against the **allOf** keyword if it is valid against all schemas defined by the value of this keyword. The value of this keyword must be an array of valid JSON schemas (objects or boolean).

AnyOf

Figure 331. Example of an anyOf Component

Description: An instance is valid against the **anyOf** keyword if it is valid against at least one schema defined by the value of this keyword. The value must be an array of valid JSON schemas (objects or boolean).

OneOf

Figure 332. Example of an oneOf Component

Description: An instance is valid against the **oneOf** keyword if it is valid against exactly one schema defined by the value of this keyword. The value must be an array of valid JSON schemas (object or boolean).

Not

Figure 333. Example of a not Component

Description: An instance is valid against the **not** keyword if it is not valid against the schema defined by the value of this keyword. The value must be a valid JSON schema (object or boolean).

If/Then/Else

Figure 334. Examples of an if, then, and else Components

Description: A conditional structure that contains three keywords: **if**, **then**, and **else**. Every keyword value must be a valid JSON schema (object or boolean). When the **if** keyword is not present, the **then** and **else** keywords are ignored. When the **if** keyword is present, at least one of the **then** or **else** keywords should also be present (or both). The instance is valid against this keyword in one of the following cases:

- The **if** keyword validates the instance and the **then** keyword also validates it.
- The **if** keyword does not validate the instance but the **else** keyword validates it.

Dependencies

Figure 335. The dependencies Component

Description: An object is valid against the **dependencies** keyword if it meets all dependencies specified by this keyword value. Only property names (from this keyword value) that are also present in the object are checked. The value of this keyword must be an object, where property values can be:

- Objects representing valid JSON schemas and the whole object must match the entire schema.

Important:

For *draft 2019-09* and *2020-12* schemas, you should use the **dependentSchemas** keyword ([on page 937](#)) instead.

- Arrays of strings representing property names, then the object must contain all property names.

Important:

For *draft 2019-09* and *2020-12* schemas, you should use the **dependentRequired** keyword ([on page 937](#)) instead.

Dependent Required (for 2019-09 or 2020-12 schemas)

Figure 336. The dependentRequired Component

Description: An object is valid against the **dependentRequired** keyword if it meets all dependencies specified by this keyword value. The value of this keyword must be an object where property values must be arrays of strings representing property names, and the object must contain all property names. Only property names (from this keyword value) that are also present in the object are checked.

Dependent Schemas (for 2019-09 or 2020-12 schemas)

Figure 337. The dependentSchemas Component

Description: An object is valid against the **dependentSchemas** keyword if it meets all dependencies specified by this keyword value. The value of this keyword must be an object where property values must be objects

representing valid JSON schemas, and the whole object must match the entire schema. Only property names (from this keyword value) that are also present in the object are checked.

[JSON Schema Component Properties \(on page 938\)](#)

JSON Schema Component Properties

Table 33. JSON Schema Diagram Component Properties

Prop-er-ties Group	Prop-erty Name	Description
Com-mon Prop-er-ties	type	<p>Specifies the type of data that the schema is expecting to validate. This keyword is not mandatory and the value must be a string representing a valid data type, or an array of strings representing a valid list of data types.</p> <p>When specifying multiple types, their order is irrelevant to the validation process, but make sure that a data type is specified only once.</p>
	\$ref	<p>An instance is valid against this keyword if it is valid against the schema that points to the location indicated in its value. The value must be a string representing a URI, URI reference, URI template, or JSON pointer.</p> <div data-bbox="400 1240 1437 1554" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p> Note: A schema version 2019-09 or 2020-12 that contains a <code>\$ref</code> in conjunction with other type-specific keywords (such as <i>properties</i> or <i>items</i>) is processed as a combined schema, under the <i>allOf</i> criterion. This means that for an instance to be valid, it has to validate against both the referenced schema and the schema defined in-place by those keywords.</p> </div>
	\$id	<p>Specifies a unique ID for a document or a document sub-schema. The value must be a string representing a URI. All sub-schema IDs are resolved relative to the document ID. It is not a required keyword, but it is considered best practice to use it.</p>
	enum	<p>An instance validates against this keyword if its value can be found in the items defined by its value. The value must be an array that contains anything (an empty array is not allowed).</p>
	const	<p>An instance validates against this keyword if its value equals the value of this keyword. The value can be anything.</p>
	\$comment	<p>Contains an observation about the schema. The value must be a string.</p>

Table 33. JSON Schema Diagram Component Properties (continued)

Prop- er- ties Group	Prop- er- ty Name	Description
	readOnly	Used to mark specific properties as <i>read-only</i> .
	writeOnly	Used to mark specific properties as <i>write-only</i> .
	deprecated	Used to indicate that the instance value is deprecated and should not be used since it might be removed in the future.
Ob- ject Prop- er- ties	additional- Properties	<p>An object is valid against this keyword if all <i>unchecked</i> properties are valid against the schema defined by its value. <i>Unchecked</i> properties are the properties not checked by the properties and patternProperties keywords (if a property name is not present in the properties keyword and does not match any regular expression defined by the patternProperties keyword, then it is considered <i>unchecked</i>). The value must be a valid JSON schema (object or boolean).</p> <p>To be more concise, if we have <i>unchecked</i> properties:</p> <ul style="list-style-type: none"> • If the value of this keyword is <i>true</i>, it is always valid. • If the value is <i>false</i>, it is never valid. • If the value contains an object (schema), every property must be valid against that schema.
	unevaluat- edProp- er- ties	Similar to the additionalProperties keyword except that this one can recognize properties that declared in subschemas.
	maxProp- er- ties	An object is valid against this keyword if the number of properties it contains is lower than or equal to its value. The value must be a non-negative integer. Using 0 as a value means that the object must be empty (no properties).
	minProp- er- ties	An object is valid against this keyword if the number of properties it contains is greater than or equal to its value. The value of this keyword must be a non-negative integer. Using 0 as a value has no effect.
	pattern- Properties	An object is valid against this keyword if every property where a property name (key) matches a regular expression from its value and is also valid against the corresponding schema. The value must be an object where the keys must be valid regular expressions and the corresponding values must be valid JSON schemas (object or boolean).

Table 33. JSON Schema Diagram Component Properties (continued)

Prop-er-ties Group	Prop-er-ty Name	Description
	property-Names	An object is valid against this keyword if every property name (key) is valid against its value. The value must be a valid JSON schema (an object or a boolean).
	required	An object is valid against this keyword if it contains all property names (keys) specified by its value. The value must be a non-empty array of strings that represent property names.
	dependencies	An object is valid against this keyword if it meets all dependencies specified by its value. <div data-bbox="400 797 1437 976" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; margin-top: 10px;">  Note: For 2019-09 and 2020-12 schemas, you should use the dependentRequired and dependentSchemas keywords instead. </div>
	dependent-Required	An object is valid against this keyword if it meets all dependencies specified by its value. The value must be an object where property values must be arrays of strings representing property names, and the object must contain all property names.
	dependent-Schemas	An object is valid against this keyword if it meets all dependencies specified by its value. The value must be an object where property values must be objects representing valid JSON schemas, and the whole object must match the entire schema.
Ar-ray Prop-er-ties	additional-Items	An array is valid against this keyword if all <i>unchecked</i> items are valid against the schema defined by its value.
	unevaluatedItems	An array is valid against this keyword if the value is a valid JSON schema that will be applied to all array items that were not evaluated by other keywords for items (<code>prefix-Items</code> , <code>items</code> , <code>contains</code>).
	contains	An array is valid against this keyword if at least one item is valid against the schema defined by its value. The value must be a valid JSON schema (object or boolean).
	maxContains	An array is valid against this keyword if the number of <i>contains</i> is lower than or equal to its value. The value must be a non-negative integer.
	minContains	An array is valid against this keyword if the number of <i>contains</i> is greater than or equal to its value. The value must be a non-negative integer.

Table 33. JSON Schema Diagram Component Properties (continued)

Prop- er- ties Group	Prop- erty Name	Description
	items	<p>An array is valid against this keyword if the items are valid against the corresponding schemas provided by its value. The value of this keyword can be:</p> <ul style="list-style-type: none"> • A valid JSON schema (object or boolean). Every item must be valid against this schema. • An array of valid JSON schemas. Each item must be valid against the schema defined at the same position (index). Items that do not have a corresponding position (e.g. an array contains 5 items but this keyword only has 3) will be considered valid unless the additionalItems keyword is present, which will decide the validity.
	maxItems	An array is valid against this keyword if the number of items it contains is lower than or equal to its value. The value must be a non-negative integer.
	minItems	An array is valid against this keyword if the number of items it contains is greater than or equal to its value. The value must be a non-negative integer.
	prefixItems	An array is valid against this keyword if each item is a schema that corresponds to each index of the document's array (where the first element validates the first element of the input array, the second element validates the second element of the input array, and so on).
	uniqueItems	An array is valid against this keyword if an item cannot be found more than once in the array. The value must be boolean. If set to <i>false</i> , the keyword validation will be ignored.
Num- ber/In- te- ger Prop- er- ties	exclusive- Maximum	A number is valid against this keyword if it is strictly lower than its value. The value must be a number (integer or float) or boolean.
	exclusiveM- inimum	A number is valid against this keyword if it is strictly greater than its value. The value must be a number (integer or float) or boolean.
	maximum	A number is valid against this keyword if it is lower than or equal to its value. The value must be a number (integer or float).

Table 33. JSON Schema Diagram Component Properties (continued)

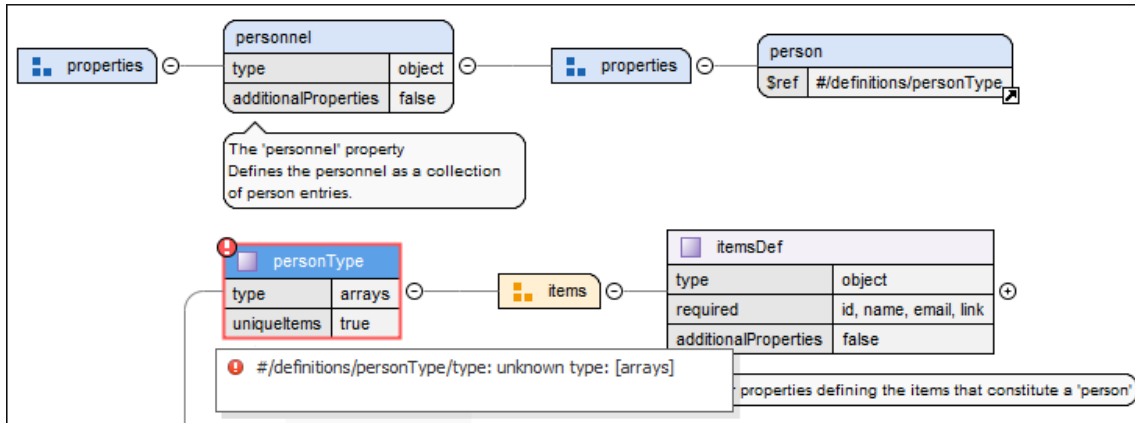

Prop- er- ties Group	Prop- er- ty Name	Description
	minimum	A number is valid against this keyword if it is greater than or equal to its value. The value must be a number (integer or float).
	multipleOf	A number is valid against this keyword if the division between the number and its value results in an integer. The value must be a strictly positive number (zero is not allowed).
String Prop- er- ties	contentEn- coding	A string is valid against this keyword if it is encoded using the method indicated by its value. The value must be a string.
	content- MediaType	A string is valid against this keyword if its content has the media type (MIME type) indicated by its value. If the contentEncoding keyword is also specified, the decoded content must have the indicated media type. The value must be a string.
	format	Performs a semantic validation on data. The value must be a string that represents a format. The keyword behavior depends on the data type, meaning that the same format name for a string behaves differently on a number, or is missing, because not all data types must implement a format and usually differing data types have different formats.
	maxLength	A string is valid against this keyword if its length is lower than or equal to its value. The value must be a non-negative integer.
	minLength	A string is valid against this keyword if its length is greater than or equal to its value. The value must be a non-negative integer.
	pattern	A string is valid against this keyword if it matches the regular expression specified by its value. The value must be a string that represents a valid regular expression.

Related information

[JSON Schema Components \(on page 931\)](#)

JSON Schema Design Mode Validation

Validation for the **Design** mode is seamlessly integrated in the Oxygen XML Developer [JSON Schema validation support \(on page 948\)](#). You can ensure that the JSON Schemas you develop comply with JSON standards by using the built-in validation engine. You can also configure a validation scenario to use an external JSON Schema validation engine. A validation scenario can also be configured to define a main module of a complex JSON Schema to validate modules in the context of the larger schema structure.

Figure 338. JSON Schema Design Mode Validation

Visual Error Markers

A schema validation error is presented by highlighting the invalid component in the following locations:

- The component is surrounded with a red or yellow border within the diagram (you can customize these colors in the [Document Validation preferences page \(on page 194\)](#)).
- A tooltip contains information about the error when hovering over the error within the diagram.
- The vertical stripe at the right side of the editor displays error markers.
- In the message area at the bottom of the editor (denoted with a red icon).

If you validate the entire schema using the **Validate** action from the **Validation** toolbar drop-down menu, all validation errors will be presented in the **Results** pane at the bottom of the application. To resolve an error, just click it and the corresponding schema component will be displayed as the diagram root so that you can easily correct the error.

Generating JSON Schema from a JSON File

Oxygen XML Developer includes a tool for generating a sample JSON Schema from a JSON file. To generate a sample JSON Schema, select **Generate JSON Schema** from the **Tools > JSON Tools** menu. The action opens a dialog box where you can configure some options for generating the JSON Schema.

Figure 339. Generate JSON Schema Dialog Box

The **Generate JSON Schema** dialog box includes the following fields and options:

JSON Document URL

The URL of the JSON file. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the  **Browse** drop-down list.

Output JSON Schema

The path to the folder where the generated JSON Schema will be saved.

Open in Editor

If selected, the generated JSON Schema is opened in the editor.

JSON Schema version

The version of the resulting JSON schema. The possible choices are: **Draft 4**, **Draft 6**, **Draft 7**, **2019-09**, and **2020-12**.

Extract matching format for strings

If selected, the generator will attempt to find a format that matches the string values from the JSON Document.

Restrict additional content

If selected, *additionalProperties* (for objects) and *additionalItems* (for arrays) will be set to *false* in the resulting schema. By default, these keys are not in the schema, meaning that providing additional content (according to the schema) is allowed.

Add default values for simple types

If selected, the *default* values (*0* for number, *""* for string, *false* for boolean) and *examples* for strings will be added.

Make all properties required

If selected, the generator will mark all the properties as required in the resulting schema.

You can click **Generate** at any point to generate the JSON Schema.

Generating JSON Schema Documentation

Oxygen XML Developer includes a tool for generating documentation for a JSON Schema file in HTML format. To generate JSON Schema documentation, select **JSON Schema Documentation** from the **Tools > Generate Documentation** menu. You can also open the tool by using the  **Generate Documentation** toolbar button. This opens a dialog box where you can specify the location of the JSON Schema file and HTML output file.

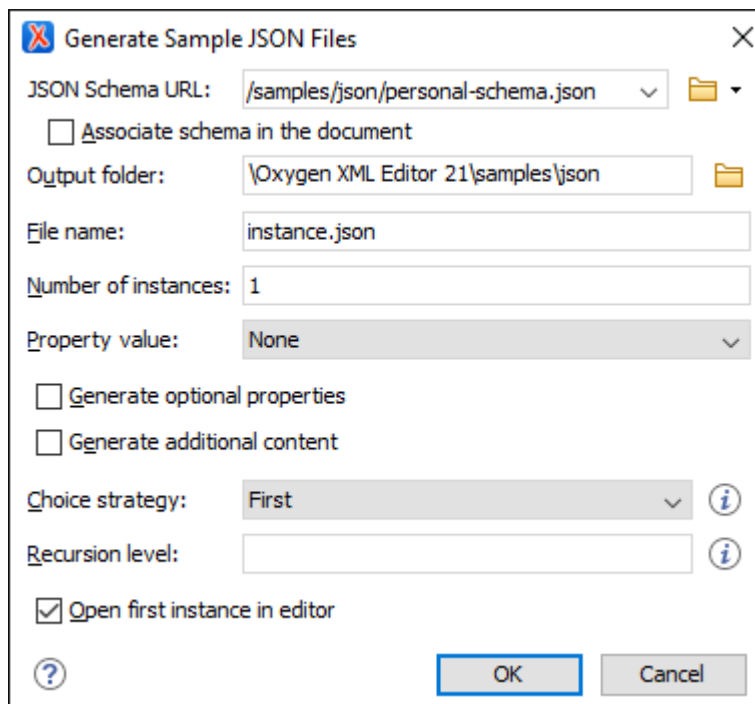

This tool requires an additional add-on to be installed, so the first time you invoke the action, Oxygen XML Developer presents a dialog box asking if you want to install it. Once installed, you need to restart Oxygen XML Developer and the **JSON Schema Documentation** action will invoke the tool.

[Add-on documentation and installation details.](#)

Generating Sample JSON Files from a JSON Schema

Oxygen XML Developer includes a tool for generating sample JSON files. To generate sample JSON files from a JSON Schema, select **Generate Sample JSON Files** from the **Tools > JSON Tools** menu. The action opens a dialog box where you can configure a variety of options for generating the files.

Figure 340. Generate Sample JSON Files Dialog Box

The **Generate Sample JSON Files** dialog box includes the following fields and options:

Schema URL

The URL of the Schema location. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the  **Browse** drop-down list. The tool supports schemas with versions *Draft 04, 06, 07, 2019-09, and 2020-12*.

Associate schema in the document

If enabled, the specified schema will be associated with the generated files.

Output folder

Path to the folder where the generated JSON instances will be saved.

File name

The name of the instance(s) that will be generated. By default, `instance.json` is used.

Number of instances

The desired number of JSON instances to be generated. When more than one instance is generated, the index of the instance will be added to its file name.

Property value

You can specify the way the values of the properties are generated. The following options are available:

- *None* - Assigns empty values for properties (a template file will be generated). This is the default value.
- *Default* - Assigns the name of the property as the value (for strings) or assigns the specified minimum value (for numbers).
- *Random* - Assigns random values according to schema restrictions.

Generate optional properties

If selected, the JSON instance will be generated with optional properties that are defined in the JSON schema. Otherwise, only the required properties will be generated.

Generate additional content

If selected, the JSON instance will be generated with additional properties that are defined in the JSON schema as `additionalProperties` and additional items that are defined as `additionalItems` (in the case of an Array).

Choice strategy

You can specify the way an instance will be generated from a schema that contains a `CombinedSchema` (with either *oneOf* or *anyOf*). The following options are available:

- *First* - The first defined schema in *oneOf* or *anyOf* will be used.
- *Random* - A random schema defined in *oneOf* or *anyOf* will be used.

Recursion level

This option controls the maximum allowed depth (must be a number), in case the selected schema contains recursive calls of `$ref` schemas referencing one another. By default, it is set to 1, meaning that the generation for the recursive calls will stop after the first iteration.

Open first instance in editor

If selected, the first generated instance is opened in the editor.

You can click **OK** at any point to generate the sample JSON files.

XSD to JSON Schema Converter

Oxygen XML Developer includes a tool for converting an XML Schema file (XSD) to a JSON Schema file. The **XSD to JSON Schema** action for invoking the tool can be found in the **Tools > JSON Tools** menu. It requires an additional add-on to be installed, so the first time you invoke the action, Oxygen XML Developer will present a dialog box asking if you want to install it. Once installed, you need to restart Oxygen XML Developer and the **XSD to JSON Schema** action will invoke the tool.

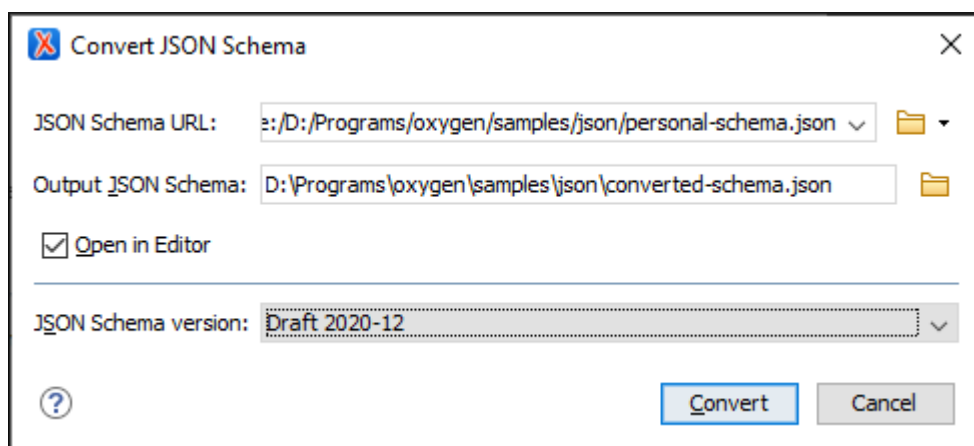

[Addon documentation and installation details.](#)

JSON Schema Converter

Oxygen XML Developer includes a tool for converting an older version of a JSON schema (Draft 4, 6, or 7) to the latest versions (2019-09 or 2020-12).

To convert a JSON schema, select **Convert JSON Schema** from the **Tools > JSON Tools** menu. The action opens a dialog box where you can configure some options for converting the JSON Schema.

Figure 341. Convert JSON Schema Dialog Box

The **Convert JSON Schema** dialog box includes the following fields and options:

JSON Schema URL

The URL of the JSON schema file. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the **Browse** drop-down list.

Output JSON Schema

The path to the folder where the converted JSON schema will be saved.

Open in Editor

If selected, the converted JSON schema is opened in the editor.

JSON Schema version

The version of the resulting JSON schema. The possible choices are: **Draft 2019-09** or **2020-12**.

You can click **Convert** at any point to generate the JSON Schema.

Conversion Notes

- The `$schema` declaration is changed according to the selected JSON schema version.
- The `definitions` keyword is converted to `$defs` and all the references are updated.
- The `dependencies` keyword is split into `dependentRequired` and `dependentSchemas`.
- The `items` keyword (tuple array) is converted to `prefixItems` (2020-12).
- The `additionalItems` keyword is converted to `items` (2020-12, only if `prefixItems` is present).
- The `exclusiveMinimum` and `exclusiveMaximum` keywords with boolean values (Draft 4) are removed.
- The `id` keyword (Draft 4) is converted to `$id`.
- The `$ref` keyword wrapped into 1-item `allOf` is unwrapped because the latest versions allow processing `$ref` along with other keywords.

Validating JSON Schema Documents

A *valid* JSON Schema document is a *well-formed* document that also conforms to the JSON meta-schema rules that defines the legal syntax of a JSON Schema document.

If a JSON document includes a meta-schema URL in the document root with the "**\$schema**" key, the file will be validated as a JSON Schema against the specified meta-schema.

Quick Reference

- If there is a "**\$schema**": "<http://json-schema.org/draft-04/schema>" property in the schema root, then [Draft 4](#) will be used.
- If there is a "**\$schema**": "<http://json-schema.org/draft-06/schema>" property in the schema root, then [Draft 6](#) will be used.
- If there is a "**\$schema**": "<http://json-schema.org/draft-07/schema>" property in the schema root, then [Draft 7](#) will be used.
- If there is a "**\$schema**": "<http://json-schema.org/draft/2019-09/schema>" property in the schema root, then [2019-09](#) will be used.
- If there is a "**\$schema**": "<http://json-schema.org/draft/2020-12/schema>" property in the schema root, then [2020-12](#) will be used.
- If there is a "**\$schema**" property in the schema root, but with a different draft value, then an error will be displayed ("*could not determine version*").

- If none of these are found, then it is validated as a simple JSON instance.
- You could also select the **JSON Schema Validator** in a [JSON validation scenario \(on page 887\)](#) and it will use the version specified in the JSON Schema, or if a version is not specified, the [JSON Schema draft-04](#) will be used.

For information about how to associate a JSON Schema for the purposes of validation, see [Associating a JSON Schema Through a Validation Scenario \(on page 893\)](#).

For information about using a JSON Schema to validate documents, see [Validating JSON Documents Against JSON Schema or Schematron \(on page 884\)](#).

2019-09 and 2020-12 Validator Limitations

The JSON Schema Validator handles all the newly introduced keywords in 2019-09 and 2020-12 specifications. However, there are still some limitations:

1. The keywords "**\$recursiveRef**" and "**\$recursiveAnchor**" (2019-09) are not supported. This is also indicated by a validation warning.
2. The keyword "**\$dynamicRef**" has the same functionality as "**\$ref**", and "**\$dynamicAnchor**" (2020-12) is not supported. This is also indicated by a validation warning.
3. The keywords "**unevaluatedProperties**" / "**unevaluatedItems**" can "see through" the subschemas of adjacent keywords "**if**", "**then**", "**else**", but do not know about successfully validated *properties* / *items*. This means that all the *properties* / *items* defined by those subschemas are considered evaluated.
4. The keywords "**unevaluatedProperties**" / "**unevaluatedItems**" can "see through" the nested subschemas of adjacent keywords "**oneOf**", "**anyOf**", "**allOf**", but all the *properties* / *items* defined by those subschemas are considered evaluated, regardless of other nested restrictions.

Syntax Highlighting in JSON Schema Documents

Oxygen XML Developer supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for JSON Schema files, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114).
2. Go to **Editor > Syntax Highlight** (on page 193).
3. Select and expand the **JSON Schema** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

Related Information:

[Syntax Highlight Preferences \(on page 193\)](#)

Flatten JSON Schema

Oxygen XML Developer includes a **Flatten Schema** action that is available in the contextual menu when editing in **JSON Schema Design mode** (on page 922) and in the Text mode. It allows you to flatten an entire hierarchy of JSON schemas. Starting with the main JSON schema, Oxygen XML Developer calculates its hierarchy by processing the `$ref` keys and determining all the other referenced schema files. This means that the flattened JSON schema is obtained by recursively adding the components of all referenced schemas into the main one, and by updating all the `$ref` keys to point to the components from the resulting schema.

Resolving schema references is done through **XML Catalogs**. That means that the sub-schemas referenced through URIs and not mapped accordingly cannot be parsed for integration into the resulting flattened schema, affecting its logic.

The **Flatten Schema** action opens a small dialog box that allows you to configure the operation by choosing the resulting schema name and the directory to save it, and opting whether to open the resulting schema in the editing area after the operation completes.

Editing JSON Lines Documents

Oxygen XML Developer includes some basic support for working with **JSON Lines** documents. *JSON Lines* is a convenient format for storing structured data that may be processed one record at a time.

Editing JSON Lines Documents

You can edit JSON Lines documents in the **Text** mode editor in Oxygen XML Developer and you have access to its various features and actions that are common for basic text files.

Validation

Validation support is available for JSON Lines documents if you have associated a schema through a configured validation scenario.

Content Completion

Content completion support is also available for JSON Lines documents if you have associated a schema through a configured validation scenario.

Editing JSON5 Documents

Oxygen XML Developer includes support for working with **JSON5** documents (files that have the `json5` file extension). The *JSON5* format is a superset of JSON that aims to alleviate some of the limitations of JSON by expanding its syntax to include some productions from *ECMAScript 5.1*.

Editing JSON5 Documents

You can edit JSON5 documents in the **Text** mode editor in Oxygen XML Developer and you have access to its usual text editing actions, along with other JSON5 editor-specific actions, including syntax highlighting, validation, formatting and indenting.

Note:

The  **Format and Indent** action works for JSON5 documents with limitations being that quotes are removed for keys and values are always double quoted (regardless of the initial quotation).

It also includes a document template to help you get started with JSON5 documents. The template is called **JSON5** and it can be found in the **New Document** folder in the **New document wizard** (*on page 330*).

Outline View

The **Outline** view for JSON5 documents displays the list of all the components of the document you are editing in a hierarchical (tree-like) representation. It is synchronized with the main editor so you can use the view to navigate to specific parts of the document and move or delete components. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Validation

Oxygen XML Developer includes built-in validation engine for JSON5 documents to help keep them well-formed. JSON5 documents are validated automatically as you type and the validation engine detects syntax errors, based on the [JSON5 specification](#). One limitation is that hexadecimal values are not supported.

Editing YAML Documents

This section discusses the various features that are included in the Oxygen XML Developer YAML Editor and how to use them.

Resources

For more information about the YAML (and JSON) support in Oxygen XML Developer, see the following resources:

- [Video: YAML Support in Oxygen](#)
- [Webinar: Exploring Oxygen's YAML Support](#)
- [Webinar: JSON and JSON Schema Support in Oxygen](#)

YAML Editor

Oxygen XML Developer includes a specialized YAML editor with various editing features for files that have the `yaml/yml` file extension. It also includes a document template to help you get started with YAML documents.

The template is called **YAML** and it can be found in the **New Document** folder in the **New document wizard** (*on page 330*).

**Tip:**

You can experiment with a sample of a YAML file available at: `[OXYGEN-INSTALL-DIR]/samples/yaml/personal.yaml`.

Text Mode Editor

When editing YAML documents in the **Text** editing mode, the usual text editing actions are available, along with other YAML editor-specific actions, including:

- [Syntax highlighting](#) (*on page 958*)
- [Automatic validation](#) (*on page 952*)
- [Formatting and indenting](#) (*on page 958*)

Validating YAML Documents

Automatic Validation

Oxygen XML Developer includes built-in validation engine for YAML documents to help you keep them well-formed. YAML documents are validated automatically as you type and the validation engine detects syntax errors (such as improper indentation or duplicate keys), based on the [YAML specification](#). The built-in validation also works on files that consist of multiple YAML documents.

Manual Validation Actions

To manually validate the currently edited YAML document, use one of the following actions:

**Validate**

Available from the  **Validation** drop-down menu on the toolbar, the **Document > Validate** menu, or from the **Validate** submenu when invoking the contextual menu on one or more YAML documents in the [Project view](#) (*on page 365*). The validation is done based on the [YAML specification](#).

Validate with

Available from the  **Validation** drop-down menu on the toolbar or the **Document > Validate** menu. This action opens a dialog box that allows you to specify a JSON Schema for validating the current YAML document (it also works on files that consist of multiple YAML documents).

**Note:**

The **Validate with** action does not work for files loaded through a [custom protocol plugin](#) (*on page 1879*) developed independently and added to Oxygen XML Developer after installation.

Check Well-Formedness (Ctrl + Shift + W (Command + Shift + W on macOS))

Available from the  **Validation** drop-down menu on the toolbar, the **Document > Validate** menu, or from the **Validate** submenu when invoking the contextual menu in the **Project view** (on [page 365](#)). This action checks the document for syntax errors to make sure it is well-formed.

Validate with Schema

Available from the **Validate** submenu when invoking the contextual menu on one or more YAML documents in the **Project view** (on [page 365](#)). This action opens a dialog box that allows you to specify a JSON Schema to be used for the validation.

Batch Validation

The built-in validation engine can also be used to batch validation multiple YAML files at once by selecting multiple files in the **Project view**, right-click, and select **Validate >  Check Well-Formedness** or **Validate >  Validate**. This automatically validates the selected files using the built-in YAML validation engine, based on the [YAML specification](#).

Creating a YAML Validation Scenario

The built-in *YAML Validator* engine that can be specified in a validation scenario to validate YAML documents. In this case, the validation is done against a specified JSON Schema.

Creating a YAML Validation Scenario

To create a validation scenario, follow these steps:

1. Select the  **Configure Validation Scenario(s)** action in one of the following ways:
 - From the  **Validation** toolbar drop-down menu.
 - From the **Document > Validate** menu.
 - From the **Validate** submenu, when invoking the contextual menu on a file in the **Project view** (on [page 365](#)).

Step Result: The **Configure Validation Scenario(s)** dialog box is displayed.

2. Click the **New** button.

Step Result: A validation scenario configuration dialog box is displayed.

Figure 342. Validation Scenario Configuration Dialog Box

New scenario

Name:

Storage: Project Options Global Options

URL of the file to validate	File type	Validation engine	Automatic validation	Schema
`\${currentFileURL}`	YAML Document	<Default engine>	<input checked="" type="checkbox"/>	<No JSON schem...

This scenario configuration dialog box allows you to configure the following information and options:

Name

The name of the validation scenario.

Storage

You can choose between storing the scenario in the **Project Options** (on page 2272) or **Global Options** (on page 2269).

URL of the file to validate

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, double-click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the **Browse** drop-down button to browse for a local, remote, or archived file.
- Use the **Insert Editor Variable** button to insert an [editor variable](#) (on page 289) or a [custom editor variable](#) (on page 297).

Figure 343. Insert an Editor Variable

<code>\${Desktop}</code>	- My Desktop
<code>\${start-dir}</code>	- Start directory of custom validator
<code>\${standard-params}</code>	- List of standard params for command line
<code>\${cfn}</code>	- The current file name without extension
<code>\${currentFileURL}</code>	- The path of the currently edited file (URL)
<code>\${cfdu}</code>	- The path of current file directory (URL)
<code>\${frameworks}</code>	- Oxygen frameworks directory (URL)
<code>\${pdu}</code>	- Project directory (URL)
<code>\${oxygenHome}</code>	- Oxygen installation directory (URL)
<code>\${home}</code>	- The path to user home directory (URL)
<code>\${pn}</code>	- Project name
<code>\${env(VAR_NAME)}</code>	- Value of environment variable VAR_NAME
<code>\${system(var.name)}</code>	- Value of system variable var.name

File type

The type of the document that is validated in the current validation unit. Oxygen XML Developer automatically selects the file type depending on the value of the **URL of the file to validate** field.

Validation engine

For YAML documents, the built-in *YAML Validator* engine (**Default engine**) is used.

Automatic validation

If this option is selected, the validation operation defined by this row is also applied by the automatic validation feature. If the **Automatic validation** feature is disabled in the [Document Checking preferences page \(on page 194\)](#), then this option is ignored, as the preference setting has a higher priority.

Schema

Displays the specified schema.

 **Specify Schema**

Opens the **Specify Schema** dialog box that allows you to set a schema to be used for validating YAML documents.

 **Move Up**

Moves the selected scenario up one spot in the list.

 **Move Down**

Moves the selected scenario down one spot in the list.

Add

Adds a new validation unit to the list.

Remove

Removes an existing validation unit from the list.

- Configure any of the existing validation units according to the information above. You can use the buttons at the bottom of the table to add, remove, or move validation units.
- Click **OK**.

Result: The newly created validation scenario will now be included in the list of scenarios in the **Configure Validation Scenario(s)** dialog box. You can select the scenario in this dialog box to associate it with the current document and click the **Apply associated** button to run the validation scenario.

Related Information:

[Associating a JSON Schema Directly in YAML Documents \(on page 956\)](#)

Associating a JSON Schema Directly in YAML Documents

Associate Schema Action

The schema used by the validation engine can be associated with the current document by using the  **Associate Schema** action. The association can specify a relative file path or a URL of the schema.

To associate a JSON Schema to the current YAML document, follow these steps:

- Select the  **Associate Schema** action from the toolbar (or **Document > Schema** menu).

Step Result: The **Associate Schema** dialog box is displayed:

Figure 344. Associate Schema Dialog Box

This dialog box contains the following options for YAML documents:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S) or SFTP (or a [custom protocol \(on page 1896\)](#)).
- **Use path relative to file location** - Select this option if the YAML instance document and the associated schema contain relative paths. The location of the schema file is inserted in the YAML instance document as a relative file path. This practice allows you, for example, to share these documents with other users without running into problems caused by multiple project locations on physical disk.

2. Select the JSON Schema that will be associated with the YAML document.
3. Click **OK**.

Result: A `$schema` property is added at the beginning of the document with its value set to the specified URL. If the document already contained a schema association, the old association will be replaced with the new one.

**Tip:**

To quickly open the schema used for validating the current document, select the  **Open Associated Schema** action from the toolbar (or **Document > Schema** menu).

Related Information:

[Creating a YAML Validation Scenario \(on page 953\)](#)

Content Completion Assistant in YAML

Oxygen XML Developer includes an intelligent *Content Completion Assistant (on page 2267)* that offers proposals for inserting YAML structures that are valid at the current editing location.

The *Content Completion Assistant* is enabled by default. To disable it, open the **Preferences** dialog box (**Options > Preferences**) (on page 114), go to **Editor > Content Completion**, and deselect the **Enable content completion** option (on page 179).

Content Completion and the Associated Schema

The *Content Completion Assistant* feature is schema-driven and the list of proposals in the *Content Completion Assistant (on page 2267)* depend on the associated JSON schema. For information about ways to associate a schema to a YAML document, see [Associating a JSON Schema Directly in YAML Documents \(on page 956\)](#).

Using the Content Completion Assistant in YAML

The feature is activated in **Text** mode for YAML documents by pressing **Ctrl + Space** or **Alt + ForwardSlash** (**Command + Option + ForwardSlash on macOS**).

You can navigate through the list of proposals by using the **Up** and **Down** keys on your keyboard. You can also change the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal, press **Enter** or **Tab**.

Content Completion Options for YAML

The content that is inserted by the content completion mechanism in YAML is generated automatically from the associated schema. You can control the inserted content with options available in the **Options > Preferences > Editor > Content Completion > YAML preferences page (on page 184)**. You can specify whether or not required content, optional content, and additional content should be generated.

Syntax Highlighting in YAML Documents

Oxygen XML Developer supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for YAML files, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114).
2. Go to **Editor > Syntax Highlight** (on page 193).
3. Select and expand the **YAML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

Related Information:

[Syntax Highlight Preferences \(on page 193\)](#)

Folding in YAML Documents

In a large YAML document, the data corresponding to complex keys can be collapsed so that only the needed data remains in focus. The usual *folding features available for XML documents* are also available in YAML documents.

Formatting/Indenting YAML Documents

Oxygen XML Developer includes support for formatting and indenting YAML documents. You can trigger a format and indent operation for your YAML document using the  **Format and Indent** toolbar button.

Some of the formatting actions that are performed include:

- Indents the document with the indent size specified in the **Editor > Format preferences page (on page 171)**.
- Removes empty lines and extra spaces between keys and values.
- Compacts the string values (for example, *description*) and limits it to 80 characters on a row.

To batch format/indent multiple YAML files, select and right-click the files in the **Project** view, then select  **Format and Indent Files**.

YAML Outline View

The **Outline** view for YAML documents displays the list of all the components of the document you are editing in a hierarchical (tree-like) representation. It is synchronized with the main editor so you can use the view to navigate to specific parts of the document and move or delete components. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 345. YAML Outline View

Outline View Features

The **Outline** view allows you to:

- Quickly navigate through the document by selecting nodes in the **Outline** tree.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the **Outline** view, and vice versa.

Outline View Interface

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as `*` or `?`) and separate multiple patterns with commas.

It also includes a  **Settings** menu in the top-right corner that presents the following options to help you filter the view even further.

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

Selection update on cursor move

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Contextual Menu Actions

The following actions are available in the contextual menu of the YAML **Outline** view:

Cut

Cuts the currently selected component.

Copy

Copies the currently selected component.

Paste

Pastes the copied component.

Delete

Deletes the currently selected component.

Expand More

Expands the structure of a component in the **Outline** view.

Collapse All

Collapses the structure of all the component in the **Outline** view.

YAML to JSON Converter

Converting YAML to JSON in Oxygen

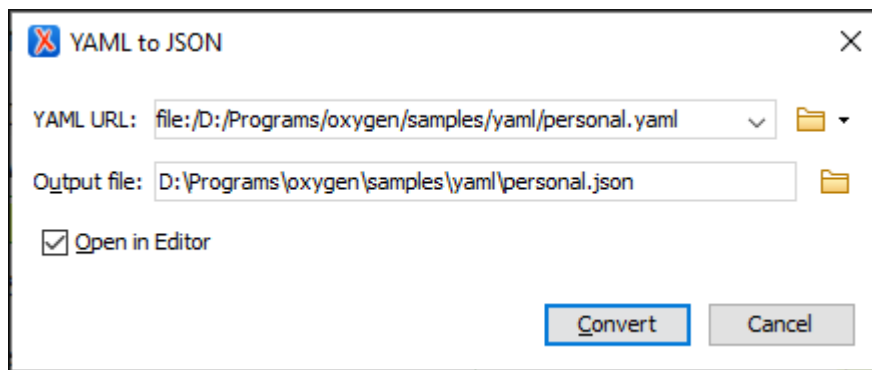

Oxygen XML Developer includes a useful and simple tool for converting YAML files to JSON. It even works on files that consist of multiple YAML documents, each separated by three dashes (---), in which case the conversion creates multiple JSON files with a number in the name.

The **YAML to JSON** action for invoking the tool can be found in the **Tools > JSON Tools** menu.

To convert a YAML document to JSON, follow these steps:

1. Select the **YAML to JSON** action from the **Tools > JSON Tools** menu.

The **YAML to JSON** dialog box is displayed:

Figure 346. YAML to JSON Dialog Box

2. Choose or enter the **YAML URL** for the document you want to convert.
3. Choose the path of the **Output file** that will contain the resulting JSON document.
4. **[Optional]** Select the **Open in Editor** option to open the resulting JSON document in the main editing pane.
5. Click the **Convert** button.

Result: The original YAML document is now converted to a JSON document.

Related Information:

[JSON to YAML Converter \(on page 907\)](#)

JSON to YAML Converter

Converting JSON to YAML in Oxygen

Oxygen XML Developer includes a useful and simple tool for converting JSON files to YAML. The **JSON to YAML** action for invoking the tool can be found in the **Tools > JSON Tools** menu.

To convert a JSON document to YAML, follow these steps:

1. Select the **JSON to YAML** action from the **Tools > JSON Tools** menu.

The **JSON to YAML** dialog box is displayed:

Figure 347. JSON to YAML Dialog Box

2. Choose or enter the **JSON URL** for the document you want to convert.
3. Choose the path of the **Output file** that will contain the resulting YAML document.
4. **[Optional]** Select the **Open in Editor** option to open the resulting YAML document in the main editing pane.
5. Click the **Convert** button.

Result: The original JSON document is now converted to a YAML document.

Related Information:

[YAML to JSON Converter \(on page 907\)](#)

Contextual Menu Actions in YAML Documents

In addition to the usual text editing actions being available in the YAML editor, it also includes some unique editor-specific actions available in the contextual menu:

 **Cut**,  **Copy**,  **Paste**

Executes the typical editing actions on the currently selected content.

Copy JSON Pointer

Creates a *JSON Pointer* at the current cursor location and copies the expression that denotes the JSON pointer to the system clipboard.

Copy XPath

Copies the XPath expression of the current property from the current editor to the clipboard.

Toggle Line Wrap (**Ctrl + Shift + Y (Command + Shift + Y on macOS)**)

Enables or disables line wrapping. When enabled, if text exceeds the width of the displayed editor, content is wrapped so that you do not have to scroll horizontally.

Toggle Line Comment (Ctrl + ForwardSlash (Command + ForwardSlash on macOS)**)**

Allows you to comment (or uncomment) the current selection (or current line if no content is selected) in the YAML document you are editing.

Source submenu

This submenu includes the following actions:

To Lower Case

Converts the content selection to lower case characters. This works with contiguous and multiple selections.

To Upper Case

Converts the selected content to upper case characters. This works with contiguous and multiple selections.

Capitalize Lines

It capitalizes the first letter found on every new line that is selected. Only the first letter is affected, the rest of the line remains the same. If the first character on the new line is not a letter then no changes are made.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + X (Command + Shift + X on macOS))

Converts a sequence of hexadecimal characters to the corresponding [Unicode character \(on page 422\)](#). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the `0x` or `0X` prefix. Examples of valid sequences and the characters they will be converted to:

- `0x0045` will be converted to `Ě`
- `0X0125` to `ĥ`
- `265` to `ı`
- `2190` to `←`

Note:

For more information about finding the hexadecimal value of a character, see [Finding the Decimal, Hexadecimal, or Character Entity Equivalent \(on page 425\)](#).

Base64 Encode/Decode submenu

This submenu include the following actions for encoding or decoding **base 64** schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page \(on page 159\)](#) will be used.

Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page (*on page 273*).

Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page (*on page 159*) will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page (*on page 273*).

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you to select whether you want to modify only matches with the same letter case or all matches.

Base32 Encode/Decode submenu

This submenu include the following actions for encoding or decoding **base32** schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page (*on page 159*) will be used.

Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page (*on page 273*).

Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page (*on page 159*) will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page (*on page 273*).

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you to select whether you want to modify only matches with the same letter case or all matches.

Hex Encode/Decode submenu

This submenu include the following actions for encoding or decoding **hex** schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page (*on page 159*) will be used.

Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page (*on page 273*).

Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page (*on page 159*) will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page (*on page 273*).

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Join and Normalize Lines (Ctrl + J (Command + J on macOS))

For the current selection, this action joins the lines by replacing the *line separator* with a single space character. It also normalizes the whitespaces by replacing a sequence of such characters with a single space.

Insert new line after (Ctrl + Alt + Enter (Command + Option + Enter on macOS))

This action has the same result as moving the cursor to the end of the current line and pressing the *ENTER* key.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Go to Definition

Navigates to the definition of the current key (if a JSON schema is associated with the YAML document and that schema contains a definition for the key).

Associating a JSON schema can be done using either of the following methods:

- By creating a [YAML validation scenario \(on page 953\)](#).
- By directly [associating a JSON schema in the YAML document \(on page 956\)](#).

**Tip:**

Holding down **CTRL (Command on macOS)** while hovering over a YAML *key-value* pair reveals a hyperlink that navigates to the key definition in the associated JSON schema (if a definition for that key is found).

Open submenu

The following actions are available in this submenu:

Open File at Cursor

Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a **Create new file** button that starts the **New document** wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel. If the file is an image file, it will be opened in the [Image Preview pane \(on page 428\)](#).

Open File at Cursor in System Application

Opens the file (identified by its link) or web page (identified by a web link) found at the cursor position. The target is opened in the default system application associated with that file type.

Compare

Opens the current file in [the Compare Files tool \(on page 433\)](#).

Editing XLIFF Documents

XLIFF (*XML Localization Interchange File Format*) is an XML-based format that was designed to standardize the way multilingual data is passed between tools during a localization process. Oxygen XML Developer provides the following support for editing XLIFF documents:

XLIFF Version 1.2, 2.0, and 2.1 Support:

- New document templates for XLIFF documents.
- A default CSS file (`xliff.css`) used for rendering XLIFF content in **Author** mode is stored in `[OXYGEN_INSTALL_DIR]/frameworks/xliff/css/`.
- Validation and content completion support using local catalogs. The default catalog (`catalog.xml`) for version 1.2 is stored in `[OXYGEN_INSTALL_DIR]/frameworks/`

`xliff/schemas/1.2`, for version 2.0 in `[OXYGEN_INSTALL_DIR]/frameworks/xliff/schemas/2.0`, and for version 2.1 in `[OXYGEN_INSTALL_DIR]/frameworks/xliff/schemas/2.1`.

XLIFF Version 2.0 and 2.1 Enhanced Support:

Support for validating XLIFF 2.0 and 2.1 documents using modules. For version 2.0, the default modules are stored in `[OXYGEN_INSTALL_DIR]/frameworks/xliff/schemas/2.0/modules` and for version 2.1, they are stored in `[OXYGEN_INSTALL_DIR]/frameworks/xliff/schemas/2.1`.

Editing XLIFF Documents in Author Mode

By default, when you create a new XLIFF document [from a template \(on page 330\)](#), Oxygen XML Developer opens it in **Text** mode. Aside from the normal editing features found in **Text** mode, you can also switch to **Author** mode where Oxygen XML Developer offers some special form controls specifically for XLIFF documents. These form controls simply allow you to add or edit XLIFF attribute values and content in a visual mode.

For XLIFF version 2.0 and 2.1 documents, you can also change the style of the visual editing mode. The **Styles** drop-down menu on the toolbar offers the following styles that are specifically designed to render XLIFF 2.0 and 2.1 documents in **Author** mode:

- **Default**
- **Classic**
- **Translate**

Editing JavaScript Documents

This section explains the features of the Oxygen XML Developer JavaScript Editor and how you can use them.

JavaScript Editing Actions

Oxygen XML Developer allows you to create and edit JavaScript files and assists you with useful features such as syntax highlight, content completion, and outline view. To enhance your editing experience, you can select entire blocks (parts of text delimited by brackets) by double-clicking somewhere inside the brackets.

Figure 348. JavaScript Editor Text Mode

```

90 ▾ function change_sides(front) {
91 ▾   switch ($('#version-switch').text()) {
92     case 'Original':
93       $('#holder').html($('#div .original[id]').html());
94       make_clickable();
95       $('#version-switch').text('Translation 1');
96       break;
97     case 'Translation 1':
98       $('#holder').html($('#div .translation[id]').filter(':first').html());
99       $('#version-switch').text('Translation 2');
100      break;
101     case 'Translation 2':
102       $('#holder').html($('#div .translation[id]').filter(':last').html());
103       $('#version-switch').text('Original');
104       break;
105   }
106 }

```

The contextual menu of the **JavaScript** editor offers the following actions:

Cut

Allows you to cut fragments of text from the editing area.

Copy

Allows you to copy fragments of text from the editing area.

Paste

Allows you to paste fragments of text in the editing area.

→! **Toggle Comment**

Allows you to comment a line or a fragment of the JavaScript document you are editing. This option inserts a single comment for the entire fragment you want to comment.

→! **Toggle Line Comment**

Allows you to comment a line or a fragment of the JavaScript document you are editing. This option inserts a comment for each line of the fragment you want to comment.

Go to Matching Bracket

Use this option to find the closing, or opening bracket, matching the bracket at the cursor position. When you select this option, Oxygen XML Developer moves the cursor to the matching bracket, highlights its row, and decorates the initial bracket with a rectangle.

Note:

A rectangle decorates the opening or closing bracket that matches the current one, at all times.

Source

Allows you to select one of the following actions:

To Lower Case

Converts the selection content to lower case characters.

To Upper Case

Converts the selection content to upper case characters.

Capitalize Lines

Converts to upper case the first character of every selected line.

Join and Normalize Lines

Joins all the rows you select to one row and normalizes the content.

Insert new line after

Inserts a new line after the line at the cursor position.

Modify all matches

Use this option to modify (in-place) all the occurrences of the selected content. When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Open

Allows you to select one of the following actions:

- **Open File at Cursor** - select this action to open the source of the file located at the cursor position
- **Open File at Cursor in System Application** - select this action to open the source of the file located at the cursor position with the application that the system associates with the file

Compare

Select this option to open the **Compare Files** tool to compare the file you are editing with a file you choose in the dialog box.

Folding

When you invoke the contextual menu from the *folding (on page 2269)* triangles in the stripe on the left side of the editor, the following actions are available:

 **Collapse Other Folds**

Folds all the elements except the current element.

 **Collapse Child Folds**

Folds the elements indented with one level inside the current element.

 **Expand Child Folds**

Unfolds all child elements of the currently selected element.

 **Expand All**

Unfolds all elements in the current document.

Validating JavaScript Files

You have the possibility to validate the JavaScript document you are editing. Oxygen XML Developer uses the Mozilla Rhino library for validation. For more information about this library, go to <https://github.com/mozilla/rhino>. The JavaScript validation process checks for errors in the syntax. Calling a function that is not defined is not treated as an error by the validation process. The interpreter discovers this error when executing the faulted line. Oxygen XML Developer can validate a JavaScript document both on-request and automatically.

Content Completion in JavaScript Documents

When you edit a JavaScript document, the *Content Completion Assistant (on page 2267)* presents you a list of the elements you can insert at the cursor position. It can be manually activated with the **Ctrl + Space** shortcut.

For an enhanced assistance, JQuery methods are also presented. The following icons decorate the elements in the content completion list of proposals depending on their type:

-  - function
-  - variable
-  - object
-  - property
-  - method

**Note:**

These icons decorate both the elements from the content completion list of proposals and from the **Outline view (on page 973)**.

Figure 349. JavaScript Content Completion Assistant

```

12 function newPage(filename, overlay) {
13     divs = document.getElementsByTagName("div");
14
15     if (divs) {
16         var xdiv = divs[0];
17
18         if (xdiv) {
19             var xid =
20                 var mytoc
21                 if (mytoc
22                 mytoc.lastU
23             }
24         }
25         var tdiv
26
27
28         if (tdiv) {
29             var ta = tdiv.getElementsByTagName("a").item(0);
30             ta.style.textDecoration = "underline";
31             mytoc.lastUnderlined = ta;
32         }
33     }
34 }
35
36 if (overlay != 0) {
37     overlaySetup('lc');
38 }

```

The completion list shows the following items:

- TypeInfo - TypeInfo
- UIEvent - UIEvent
- UserDataHandler - UserDataHandler
- alert(msg)
- blur()
- clearInterval(id_setinterval)
- clearTimeout(id_settimeout)

The *Content Completion Assistant* collects:

- Method names from the current file and from the library files.
- Functions and variables defined in the current file.

If you edit the content of a function, the content completion list of proposals contains all the local variables defined in the current function, or in the functions that contain the current one.

Syntax Highlighting in JavaScript Documents

Oxygen XML Developer supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for JavaScript files, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114).
2. Go to **Editor > Syntax Highlight** (on page 193).
3. Select and expand the **JavaScript** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

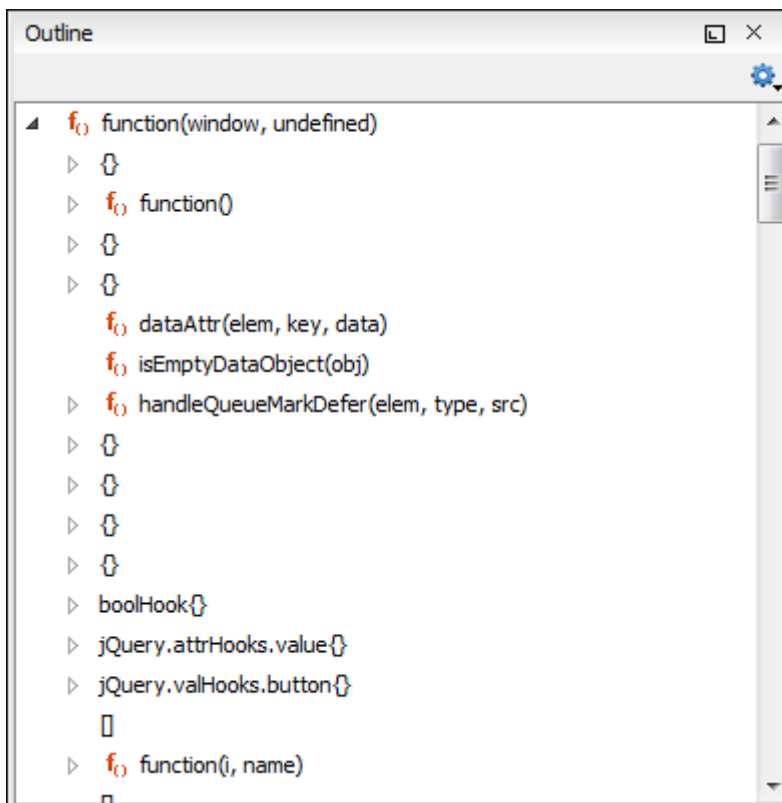

Related Information:

[Syntax Highlight Preferences \(on page 193\)](#)

JavaScript Outline View

Oxygen XML Developer present a list of all the components of the JavaScript document you are editing in the **Outline** view. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 350. JavaScript Outline View

The following icons decorate the elements in the **Outline** view depending on their type:

-  - function
-  - variable
-  - object
-  - property
-  - method

The contextual menu of the JavaScript **Outline** view contains the usual  **Cut**,  **Copy**,  **Paste**, and  **Delete** actions. From the  **Settings** menu, you can select the **Update selection on cursor move** option to synchronize the **Outline** view with the editing area.

Editing XProc Scripts

XProc is an XML pipeline language that can be used to script transformations. An XProc script is edited as an XML document that is validated against a RELAX NG schema, or if the script has an associated validation scenario, then the XProc engine selected in the scenario is used as the validating engine (if the XProc engine supports validation). The default engine for XProc scenarios is a version of the *Calabash* engine that comes bundled with Oxygen XML Developer version 27.1. The default engine supports content completion and validation of XProc 1.0, 3.0, and 3.1 files.

Note:

If a custom engine is used, the validation support for XProc version 3.x depends on whether it is available for the particular custom engine.

Notice:

Oxygen XML Developer supports running XSLT stylesheets that contain AI functions. For information about the supported AI functions, see [Oxygen AI Positron Assistant: Function Calls](#).

XProc Content Completion

Oxygen XML Developer helps you edit XProc scripts through the *Content Completion Assistant* (on page 2267), offering proposals that are valid at the cursor position. It can be manually activated with the **Ctrl + Space** shortcut.

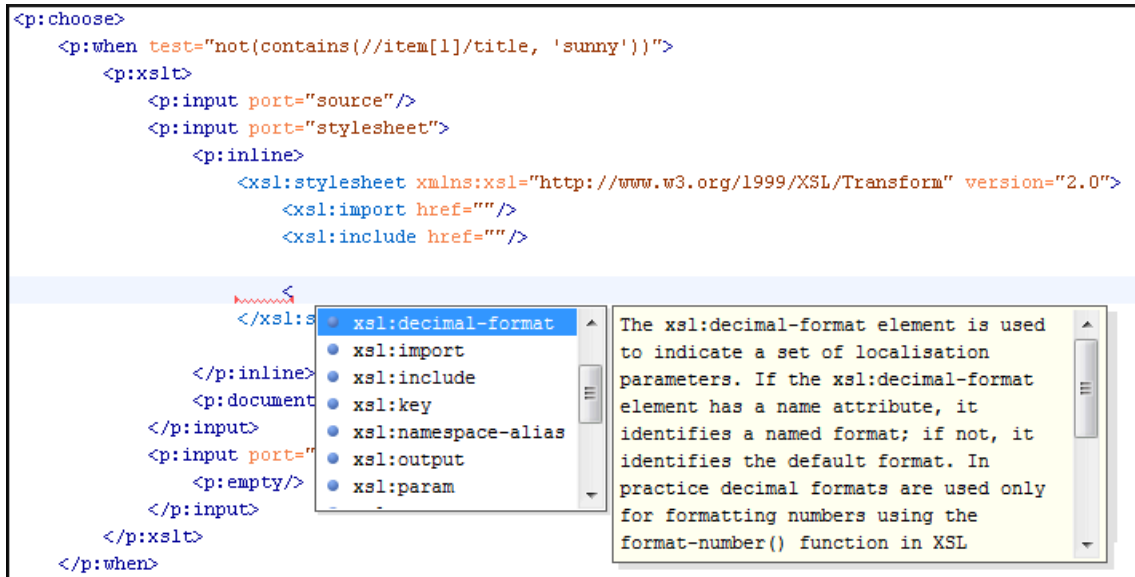

The content completion inside the `<input/inline>` element from the XProc namespace `http://www.w3.org/ns/xproc` offers elements from the following schemas depending both on the `@port` attribute and the parent of the `<input>` element. When invoking the content completion inside the `<inline>` XProc element, the list of content completion proposals is populated as follows:

- If the value of the `@port` attribute is `stylesheet` and the `<xslt>` element is the parent of the `<input>` elements, the *Content Completion Assistant* offers XSLT elements.
- If the value of the `@port` attribute is `schema` and the `<validate-with-relax-ng>` element is the parent of the `<input>` element, the *Content Completion Assistant* offers RELAX NG schema elements.
- If the value of the `@port` attribute is `schema` and the `<validate-with-xml-schema>` element is the parent of the `<input>` element, the *Content Completion Assistant* offers XML Schema schema elements.
- If the value of the `@port` attribute is `schema` and the `<validate-with-schematron>` element is the parent of the `<input>` element, the *Content Completion Assistant* offers either ISO Schematron elements or Schematron 1.5 schema elements.
- If the above cases do not apply, then the *Content Completion Assistant* offers elements from all the schemas from the above cases.

Tip:

XPath 3.0 functions are also available in the *Content Completion Assistant* for XProc 3.0 documents.

Figure 351. XProc Content Completion

XProc Syntax Highlighting

The XProc editor assists you in writing XPath expressions by offering dedicated coloring schemes for syntax highlighting.

To customize the colors or styles used for the syntax highlighting colors for XProc, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114).
2. Go to **Editor > Syntax Highlight** (on page 193).
3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XML** tab in the **Preview** pane to see the effects of your changes.

Enabling Extensions in Calabash

To configure an extension:

1. Edit the following file: `OXYGEN_INSTALL_DIR/lib/xproc/calabash/engine.xml`.
2. Add the extension and its value as a `system-property`, as in the following example:

```
<system-property name="com.xmlcalabash.allow-text-results" value="true"/>
```

Editing Schematron Schemas

Schematron is a simple and powerful Structural Schema Language for making assertions about patterns found in XML documents. It relies almost entirely on XPath query patterns for defining rules and checks. Schematron validation rules allow you to specify a meaningful error message. This error message is provided to you if an error is encountered during the validation stage.

There are numerous online resources out there to help you get started with writing Schematron rules. Here are just a few that might help you:

- [Guide to Schema Writing with Schematron](#)
- [Presentation: Schematron Development with Oxygen](#)

Oxygen XML Developer assists you in editing Schematron documents with schema-based content completion, syntax highlight, search and refactor actions, and dedicated icons for the **Outline view** ([on page 996](#)). You can create a new Schematron schema using one of the Schematron templates available in the **New document wizard** ([on page 330](#)).

For information about applying and detecting Schematron schemas, see [Associating a Schema to XML Documents](#) ([on page 582](#)).

Validating XML Documents Against Schematron

The Skeleton XSLT processor is used for validation and conforms with ISO Schematron or Schematron 1.5. It allows you to [validate XML documents against Schematron schemas](#) ([on page 990](#)) or against combined RELAX NG / W3C XML Schema and Schematron.

How to Specify the Query Language Binding

You can specify the query language binding to be used in the Schematron schema by doing the following:

- For embedded ISO Schematron, [open the Preferences dialog box \(Options > Preferences\)](#) ([on page 114](#)), go to **XML > XML Parser > Schematron**, and select it in the **Embedded rules query language binding option** ([on page 209](#)).
- For standalone ISO Schematron, specify the version by setting the query language to be used in a `@queryBinding` attribute on the schema root element. For more information, see the [Query Language Binding section of the Schematron specifications](#).
- For Schematron 1.5 (standalone and embedded), [open the Preferences dialog box \(Options > Preferences\)](#) ([on page 114](#)), go to **XML > XML Parser > Schematron**, and select the version in the **XPath Version option** ([on page 210](#)).

Multi-Lingual Support in Schematron Messages

You can specify the desired language for the validation messages in the [Schematron Preferences page](#) ([on page 209](#)). The Schematron validation messages can be presented in multiple languages by defining the language for each message using the Schematron `<diagnostics>` element.

For example, you can define a diagnostic for each language and reference the ID of the diagnostics in the `<assert>` element. You can specify the language of the diagnostic message by adding the `xml:lang` attribute on the `sch:diagnostic` element or on its parent:

```
<sch:assert test="bone" diagnostics="d_en d_de">
  A dog should have a bone.
</sch:assert>
...
<sch:diagnostics>
  <sch:diagnostic id="d_en" xml:lang="en">
    A dog should have a bone.
  </sch:diagnostic>
  <sch:diagnostic id="d_de" xml:lang="de">
    Das Hund muss ein Bein haben.
  </sch:diagnostic>
</sch:diagnostics>
```

How to Customize Color Schemes in Schematron

The Schematron editor renders the XPath expressions with dedicated color schemes. To customize the coloring schemes, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Editor > Syntax Highlight**.

Schematron Transformation Scenario

When you create a Schematron document, Oxygen XML Developer provides a built-in transformation scenario. You can use this scenario to obtain the XSLT style-sheet corresponding to the Schematron schema. You can apply this XSLT stylesheet to XML documents to obtain the Schematron validation results.

Using Schematron with AI

An **Oxygen AI Positron Assistant** add-on is available that provides support for helping writers generate content by using the **Oxygen AI Positron** service. This add-on also contributes two XPath extension functions that can be used from custom Schematron schemas to rephrase content or to perform validation checks on existing content. The `ai:transform-content(instruction, content)` function can be used to automatically transform content using AI and the `ai:verify-content(instruction, content)` function can be used to automatically validate content using AI.

For more details, see [Oxygen AI Positron Assistant: Custom Schematron Validation Rules](#).

Examples of Schematron Rules and Quick Fixes

This topic is meant to provide some basic examples of Schematron Rules and Schematron Quick Fixes (SQF) to help you create and impose your own rules and quick fixes.

Other examples and ideas can also be found at:

- [Public GitHub project with the Schematron file used for Oxygen's User Guide](#)
- [Public GitHub project with sample Schematron Quick Fixes](#)

Schematron Examples

Schematron Use Case 1: Impose a Relax NG Schema Declaration

Description: The following sample rule is useful if, for example, you need to enforce the use of Relax NG schema declarations in all of your documents (i.e. instead of using DTD schemas).

Sample Code:

```
<?xml version="1.0" encoding="UTF-8"?>
<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron"
  queryBinding="xslt2" xmlns:saxon="http://saxon.sf.net/">
  <sch:let name="rngDeclaration"
    value="processing-instruction('xml-model')
    [saxon:get-pseudo-attribute('schematypens')='http://relaxng.org/ns/structure/1.0']"/>
  <sch:pattern>
    <sch:rule context="/element()">
      <sch:assert test="exists($rngDeclaration)">You must define a Relax NG schema
        declaration in the document (DTD schemas are not supported).</sch:assert>
    </sch:rule>
  </sch:pattern>
</sch:schema>
```

Result: The engine checks for a Relax NG schema declaration in the document and displays an error if it is missing. The error is reported on the document's root element (`/element()`).

Schematron Use Case 2: Check for Missing IDs

Description: The following sample rule checks for missing or undefined IDs in a TEI document. Specifically, it looks for IDs from the `tei:rs/@ref` attribute defined in the document named `persons.xml` (as `xml:id` of a TEI `person` element).

Sample Code:

```
<?xml version="1.0" encoding="UTF-8"?>

<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2">

  <sch:ns uri="http://www.tei-c.org/ns/1.0" prefix="tei"/>

  <sch:let name="personIds"

    value="document('../persons.xml')/tei:TEI//tei:person/@xml:id"/>

  <sch:pattern>

    <sch:rule context="tei:rs">

      <sch:let name="refIds"

        value="for $id in tokenize(@ref, ' ') return substring-after($id, '#')"/>

      <sch:let name="missingIds"

        value="for $id in $refIds return (if($id = $personIds) then '' else $id)"/>

      <sch:report test="$missingIds != ''">

        The following ids "<sch:value-of select="$missingIds"/>"

        are not defined in "<sch:value-of select="$personIds"/>"

      </sch:report>

    </sch:rule>

  </sch:pattern>

</sch:schema>
```

where the XML document looks something like this:

```
<tei xmlns="http://www.tei-c.org/ns/1.0">

  <rs ref="../../SomePerson/persons.xml#EDP ../personography/HAMpersons.xml#SD">text</rs>

  <rs ref="../../SomePerson/persons.xml#EDP">text</rs>

</tei>
```

Result: The engine displays an error message listing the missing/undefined IDs.

Schematron Use Case 3: Check for Broken Links

Description: The following sample rule detects broken links in DITA `<xref>` or `<link>` elements. The first example only checks links that do not contain an anchor (`#`).

Sample Code:

```
<rule

  context="*[contains(@class, ' topic/xref ') or contains(@class, ' topic/link ')]

  [@href][not(contains(@href, '#'))][not(@scope = 'external')]
```

```
[not(@type) or @type='dita']">

<assert test="doc-available(resolve-uri(@href, base-uri(.)))">

  The document linked by <value-of select="local-name()"/>

  "<value-of select="@href"/>" does not exist!</assert>

</rule>
```

For links that contain an anchor, the Schematron rule must look something like this:

```
<rule

  context="*[contains(@class, ' topic/xref ') or contains(@class, ' topic/link ')]

  [@href][contains(@href, '#')][not(@scope = 'external')]

  [not(@type) or @type='dita']">

  <let name="file" value="substring-before(@href, '#')"/>

  <let name="idPart" value="substring-after(@href, '#')"/>

  <let name="topicId"

    value="if (contains($idPart, '/')) then substring-before($idPart, '/') else $idPart"/>

  <let name="id" value="substring-after($idPart, '/')"/>

  <assert test="document($file, .)//*[@id=$topicId]">

    Invalid topic id "<value-of select="$topicId"/>" </assert>

  <assert test="$id = '' or document($file, .)//*[@id=$id]">

    No such id "<value-of select="$id"/>" is defined! </assert>

  <assert test="$id = '' or document($file, .)//*[@id=$id]

    [ancestor::*[contains(@class, ' topic/topic ')]][1][@id=$topicId]">

    The id "<value-of select="$id"/>" is not in the scope of the referenced topic id

    "<value-of select="$topicId"/>". </assert>

</rule>
```

Result: The engine displays an error message when a broken link or cross reference is detected.

Schematron Use Case 4: Check for Duplicate IDs

Description: The following sample rule detects if there are two sibling `<step>` elements with the same `@id` value in a DITA Task document.

Sample Code:

```
<sch:rule context="*[contains(@class, ' task/step ')]">

  <sch:let name="id" value="@id"/>

  <sch:report

    test="preceding-sibling::element()[contains(@class, ' task/step ')][@id = $id]">

    Element with duplicate ID "<sch:value-of select="$id"/>" detected.

  </sch:report>

</sch:rule>
```

Result: The engine displays an error message when a duplicate ID is detected in sibling `<step>` elements within a DITA Task document.

Schematron Use Case 5: Check for Duplicate DITA Topic References

Description: The following sample rule checks a DITA map for duplicate `<topicref>` elements with the same `@href` value.

Sample Code:

```
<sch:rule context="*[contains(@class, ' map/topicref ')]">
  <sch:let name="href" value="@href"/>
  <sch:report
    test="preceding::element()[contains(@class, ' map/topicref ')][@href = $href]">
    Duplicate topicref "<sch:value-of select="$href"/>" detected in map.
  </sch:report>
</sch:rule>
```

Result: The engine displays an error message when multiple `<topicref>` elements with the same `@href` value are detected in a DITA map.

Schematron Use Case 6: Restrict Certain Words from the Title

Description: The following sample rule checks for instances of specified words to be restricted from a `<title>` element (in this example, the words *test* and *hello* are restricted).

Sample Code:

```
<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron"
  queryBinding="xslt2">
  <sch:let name="words" value="'test,hello'"/>
  <sch:let name="wordsToMatch" value="replace($words, ',', '|')"/>
  <sch:pattern>
    <sch:rule context="title">
      <sch:report test="matches(text(), $wordsToMatch)" role="warn">
        The following words should not be added in the title:
        <sch:value-of select="$words"/>
      </sch:report>
    </sch:rule>
  </sch:pattern>
</sch:schema>
```

Result: The engine displays an error message if one of the specified restricted words appear in a title.

Schematron Use Case 7: Check the Location of a Resource

Description: The following sample rule checks if the path to a resource (in this case, an image) is specified correctly. Specifically, this sample rule reports that the image must be located in the current project (the images location must be relative to the parent folder and no more than one `../` in the path).

Sample Code:

```
<sch:rule context="image">
  <sch:report test="count(tokenize(@href, '\\.\\.\/')) > 2">
    The image must be located in the current project. It is currently located
    in: <sch:value-of select="@href"/>
  </sch:report>
</sch:rule>
```

Result: The engine displays an error message if an image is detected in a location other than the current project, relative to the parent folder.

Schematron Use Case 8: Check for Extra Spaces at Beginning/End of Elements

Description: The following sample rule checks for spaces at the beginning and end of elements.

Tip:

You could specify a list of elements to check to make the rule context-sensitive.

Sample Code:

```
<rule context="p|ph|codeph|filename|indexterm|xref|user-defined|user-input">
  <let name="firstNodeIsElement" value="node()[1] instance of element()"/>
  <let name="lastNodeIsElement" value="node()[last()] instance of element()"/>
  <report test="(not($firstNodeIsElement) and matches(.,'^\s',';j'))
    or (not($lastNodeIsElement) and matches(.,'\s$',';j'))"
    role="warning">
    Textual elements should not begin or end with whitespace.</report>
</rule>
```

Result: The engine displays an error message if a whitespace is detected at the beginning or end of a textual element.

Schematron Use Case 9: Impose Capitalizing the First Letter

Description: The following sample rule detects if elements start with a capital letter or a number. The rule is implemented using abstract patterns. The abstract pattern `starts-with-capital` has one argument representing the element to be checked. There are two implementations of the abstract pattern, one that specifies the `<tittle>` element as the element to verify, and one that specifies the `` element.

Sample Code:

```

<sch:pattern abstract="true" id="starts-with-capital">
  <sch:rule context="$element" role="information">
    <sch:let name="firstNodeIsElement" value="node()[1] instance of element()"/>
    <sch:report test="(not($firstNodeIsElement) and (not(matches(.., '^[A-Z|0-9]'))))">
      Start the element &lt;$element&gt; with a capital letter.</sch:report>
    </sch:rule>
  </sch:pattern>
</sch:pattern>
<sch:pattern is-a="starts-with-capital">
  <sch:param name="element" value="title"/>
</sch:pattern>
<sch:pattern is-a="starts-with-capital">
  <sch:param name="element" value="li"/>
</sch:pattern>

```

Result: The engine displays an error message if a title begins with a word that does not contain a capital letter or number as its first character.

Schematron Use Case 10: Check for Specified Terms in a Paragraph

Description: The following sample rule checks if any DITA `<p>` elements contain certain keywords defined in an external document.

Sample Code:

```

<sch:pattern>
  <sch:let name="keys" value="document('keys-common.ditamap')//keyword"/>
  <sch:rule context="p">
    <sch:let name="text" value="."/>
    <sch:let name="matchedKeys" value="$keys[contains($text, normalize-space())]"/>
    <sch:report id="now001" test="count($matchedKeys) > 0" role="error">
      The paragraph text contains the keywords: <sch:value-of select="$matchedKeys"/>
    </sch:report>
  </sch:rule>
</sch:pattern>

```

Result: The engine displays an error message if any of the keywords listed in an external document are detected within a DITA `<p>` element.

Schematron Use Case 11: Impose a Minimum Value

Description: The following sample rule determines the `<type>` element value with the minimum version specified by the `@version` attribute and then verifies that they are all equal to the determined value.

Sample Code:

```

<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2">
  <sch:let name="typeValue" value="//Node1[not(@version >

```

```

        ../Node1/@version)][1]/Type/text()"/>

<sch:pattern>
  <sch:rule context="Type">
    <sch:assert test="text() = $typeValue">
      The Type value must be "<sch:value-of select="$typeValue"/>"
    </sch:assert>
  </sch:rule>
</sch:pattern>
</sch:schema>

```

where the XML file would look something like this:

```

<root>
  <Node1 version="1">
    <Element1>Value1</Element1>
    <Type>123456</Type>
  </Node1>
  <Node1 version="2">
    <Element1>Value1</Element1>
    <Type>123456</Type>
  </Node1>
  <Node1 version="3">
    <Element1>Value1</Element1>
    <Type>1234567</Type>
  </Node1>
</root>

```

Result: The engine displays an error message if a `<type>` element value does not equal the minimum version specified by the `@version` attribute.

SQF (Schematron Quick Fix) Examples

SQF Use Case 1: Impose a DITA Prolog

Description: The following sample Schematron rule checks a DITA topic to make sure it contains `<prolog>`, `<critdates>`, `<revised>` elements and the sample Quick Fix proposes options for inserting the missing elements.

Sample Code:

```

<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2"
  xmlns:sqf="http://www.schematron-quickfix.com/validator/process">
  <sch:pattern>
    <sch:rule context="*[contains(@class, ' topic/topic ')]">
      <sch:assert sqf:fix="add_prolog" test="prolog" role="warn">Every topic must contain
        prolog/critdates/revised elements where the revised modified date is in

```

```

        YYYY-MM-DD format.</sch:assert>

<sqf:fix id="add_prolog">
  <sqf:description>
    <sqf:title>Add prolog/critdates/revised elements, where the revised element's
      @modified attribute value is the current date in YYYY-MM-DD
      format.</sqf:title>
  </sqf:description>
  <sqf:add match="*[contains(@class, ' topic/body ')]" node-type="element"
    position="before" target="prolog">
    <critdates>
      <revised modified=""> </revised>
    </critdates>
  </sqf:add>
</sqf:fix>
</sch:rule>

<sch:rule context="*[contains(@class, ' topic/prolog ')]">
  <sch:report role="warn" test="not(critdates)" sqf:fix="add_critdates">The prolog
    element must have critdates/revised elements with the @modified attribute value
    in YYYY-MM-DD format.</sch:report>
  <sqf:fix id="add_critdates">
    <sqf:description>
      <sqf:title>Add the critdates element.</sqf:title>
    </sqf:description>
    <sqf:add node-type="element" target="critdates">
      <revised modified=""> </revised>
    </sqf:add>
  </sqf:fix>
</sch:rule>

<sch:rule context="*[contains(@class, ' topic/critdates ')]">
  <sch:report role="warn" test="not(revised)" sqf:fix="add_revised">The critdates
    element must have revised @modified in YYYY-MM-DD format. </sch:report>
  <sqf:fix id="add_revised">
    <sqf:description>
      <sqf:title>Add the revised element.</sqf:title>
    </sqf:description>
    <sqf:add node-type="element" target="revised"/>
  </sqf:fix>
</sch:rule>
</sch:pattern>
</sch:schema>

```

Result: The engine displays an error message if the `<prolog>`, `<critdates>`, or `<revised>` elements are missing from a DITA topic and the Quick Fix mechanism proposes options for inserting the missing elements.

SQF Use Case 2: Impose an ID for all DITA Section Elements

Description: The following sample Schematron rule checks if each DITA `<section>` element has a specified ID and the sample Quick Fix proposes options for inserting the missing IDs.

Sample Code:

```
<<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron"
  queryBinding="xslt2"
  xmlns:sqf="http://www.schematron-quickfix.com/validator/process">
  <sch:pattern>
    <!-- Add IDs to all sections to impose link targets -->
    <sch:rule context="section">
      <sch:assert test="@id sqf:fix="addId addIds"> [Bug] All sections should
        have an @id attribute </sch:assert>
      <sqf:fix id="addId">
        <sqf:description>
          <sqf:title>Add @id to the current section</sqf:title>
          <sqf:p>Add an @id attribute to the current section. The ID is
            generated from the section title.</sqf:p>
        </sqf:description>
        <!-- Generate an id based on the section title. If there is no title then
          generate a random id. -->
        <sqf:add target="id" node-type="attribute"
          select="
            concat('section_',
              if (exists(title) and string-length(title) > 0)
                then
                  substring(lower-case(replace(replace(
                    normalize-space(string(title)), '\s', '_'),
                    '^[^a-zA-Z0-9_]', '')), 0, 50)
                else
                  generate-id()"/>
        </sqf:fix>
      <sqf:fix id="addIds">
        <sqf:description>
          <sqf:title>Add @id to all sections</sqf:title>
          <sqf:p>Add an @id attribute to each section from the document. The ID
            is generated from the section title.</sqf:p>
        </sqf:description>
```

```

<!-- Generate an id based on the section title. If there is no title then
generate a random id. -->
<sqf:add match="//section[not(@id)]" target="id" node-type="attribute"
select="
concat('section_',
if (exists(title) and string-length(title) > 0)
then substring(lower-case(replace(replace(
normalize-space(string(title)), '\s', '_'),
'^a-zA-Z0-9_', '')), 0, 50)
else generate-id())"/>
</sqf:fix>
</sch:rule>
</sch:pattern>
</sch:schema>

```

Result: The engine displays an error message if an `@id` attribute is missing for any `<section>` element in a DITA topic and the Quick Fix mechanism proposes options for inserting the missing ID.

SQF Use Case 3: Impose a Short Description in an Abstract Element

Description: The following sample Schematron rule checks a DITA topic to make sure it contains a `<shortdesc>` element inside an `<abstract>` element and the sample Quick Fix proposes options for correcting the missing structure.

Sample Code:

```

<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2"
xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
xmlns:xsl="http://www.w3.org/1999/XSL/Transform">
<sch:pattern>
<sch:rule context="shortdesc">
<sch:assert test="parent::abstract" sqf:fix="moveToAbstract moveToExistingAbstract">
The short description must be added in an abstract element
</sch:assert>
<!-- Check if there is an abstract element -->
<sch:let name="abstractElem" value="preceding-sibling::abstract |
following-sibling::abstract"/>
<!-- Create an abstract element and add the short description -->
<sqf:fix id="moveToAbstract" use-when="not($abstractElem)">
<sqf:description>
<sqf:title>Move short description in an abstract element</sqf:title>
</sqf:description>
sqf:replace>
<abstract>

```

```

        <xsl:apply-templates mode="copyExceptClass" select="."/>

        </abstract>

        </sqf:replace>

    </sqf:fix>

    <!-- Move the short description in the abstract element-->
    sqf:fix id="moveToExistingAbstract" use-when="$abstractElem">

        <sqf:description>

            <sqf:title>Move short description in the abstract element</sqf:title>

        </sqf:description>

        <sch:let name="shortDesc">

            <xsl:apply-templates mode="copyExceptClass" select="."/>

        </sch:let>

        <sqf:add match="$abstractElem" select="$shortDesc"/>

        <sqf:delete/>

    </sqf:fix>

</sch:rule>

</sch:pattern>

<!-- Template used to copy the current node -->
<xsl:template match="node() | @" mode="copyExceptClass">

    <xsl:copy copy-namespaces="no">

        <xsl:apply-templates select="node() | @" mode="copyExceptClass"/>

    </xsl:copy>

</xsl:template>

<!-- Template used to skip the @class attribute from being copied -->
<xsl:template match="@class" mode="copyExceptClass"/>

</sch:schema>

```

Result: The engine displays an error message if an `<abstract>` element does not contain a `<shortdesc>` element and the Quick Fix mechanism proposes options for inserting the missing structure or to move the `<shortdesc>` element inside the `<abstract>` element.

SQF Use Case 4: Impose a Certain Article Type

Description: The following sample Schematron rule checks the `@article-type` attribute to make sure its value is one of the specified allowed values (**abstract**, **addendum**, **announcement**, **article-commentary**) and the sample Quick Fix proposes options for replacing any other detected value with one of the allowed values.

Sample Code:

```

<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2"
  xmlns:sqf="http://www.schematron-quickfix.com/validator/process">

```

```

<sch:let name="articleTypes" value=('abstract', 'addendum', 'announcement',
  'article-commentary')"/>

<sch:pattern>
  <sch:rule context="article/@article-type">
    <sch:assert test=". = $articleTypes" sqf:fix="setArticleType">
      Should be one of the article types:
      <sch:value-of select="$articleTypes"/></sch:assert>

    <sqf:fix id="setArticleType" use-for-each="$articleTypes">
      <sqf:description>
        <sqf:title>Set article type to '<sch:value-of select="$sqf:current"/>'</sqf:title>
      </sqf:description>
      <sqf:replace node-type="attribute" target="article-type" select="$sqf:current"/>
    </sqf:fix>
  </sch:rule>
</sch:pattern>
</sch:schema>

```

Result: The engine displays an error message if an `@article-type` attribute has any other value other than **abstract**, **addendum**, **announcement**, or **article-commentary** and the Quick Fix mechanism proposes options for replacing the disallowed value with one of those four allowed values (using the `use-for-each` construct).

SQF Use Case 5: Impose Certain Attributes and Values

Description: The following sample Schematron rule checks the `@rowsep` and `@colsep` attributes are added on the `<colspec>` element and their value is set to 1. The Quick Fix proposes options for adding the attributes in case they are missing or set the correct value .

Sample Code:

```

<?xml version="1.0" encoding="UTF-8"?>

<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2"
  xmlns:sqf="http://www.schematron-quickfix.com/validator/process">
  <sch:pattern>
    <sch:rule context="colspec">
      <sch:assert test="@rowsep = 1" sqf:fix="addRowsep">The @rowsep should be
        set to 1</sch:assert>
      <sch:assert test="@colsep = 1" sqf:fix="addColsep">The @colsep should be
        set to 1</sch:assert>

      <sqf:fix id="addRowsep">
        <sqf:description>
          <sqf:title>Add @rowsep attribute</sqf:title>

```

```

    </sqf:description>

    <sqf:add node-type="attribute" target="rowsep" select="'1'"/>
  </sqf:fix>

  <sqf:fix id="addColsep">
    <sqf:description>
      <sqf:title>Add @colsep attribute</sqf:title>
    </sqf:description>
    <sqf:add node-type="attribute" target="colsep" select="'1'"/>
  </sqf:fix>
</sch:rule>
</sch:pattern>
</sch:schema>

```

Modular Contextual Schematron Editing Using 'Main Files' Support

Smaller interrelated modules that define a complex Schematron cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, a diagnostic defined in a main schema document is not visible when you edit an included module. Oxygen XML Developer provides the support for defining the main module (or modules), thus allowing you to edit any of the imported/included schema files in the context of the larger schema structure.

You can set a main Schematron document either using the [main files support from the Project view \(on page 381\)](#), or using a validation scenario.

To set a main file using a validation scenario, add validation units that point to the main schemas. Oxygen XML Developer warns you if the current module is not part of the dependencies graph computed for the main schema. In this case, it considers the current module as the main schema.

The advantages of editing in the context of main file include:

- Correct validation of a module in the context of a larger schema structure.
- [Content Completion Assistant \(on page 2267\)](#) displays all the referable components valid in the current context. This includes components defined in modules other than the currently edited one.

Presenting Schematron Validation Issues

The possible issues that might occur during the validation process when validating XML documents against Schematron are presented with colored underlines in the editing pane, colored markers in the right vertical stripe, and details about the issues are presented in the **Errors** panel at the bottom area of the Oxygen XML Developer window. Each error is flagged with a severity level that can be: *warning*, *error*, *fatal* or *info*.

To set a severity level, Oxygen XML Developer looks for the following information:

- The **role** attribute, which can have one of the following values:
 - **warn** or **warning** - Sets the severity level to *warning*. By default, underlined with a yellow squiggly line in the editing pane and a yellow marker in the right vertical stripe.
 - **error** - Sets the severity level to *error*. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
 - **fatal** - Sets the severity level to *fatal*. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
 - **info** or **information** - Sets the severity level to *information*. By default, underlined with a blue squiggly line in the editing pane and a blue marker in the right vertical stripe.
- The start of the message, after trimming leading white-spaces. Oxygen XML Developer looks to match the following exact string of characters (case-sensitive):
 - **Warning:** - Sets the severity level to *warning*. By default, underlined with a yellow squiggly line in the editing pane and a yellow marker in the right vertical stripe.
 - **Error:** - Sets the severity level to *error*. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
 - **Fatal:** - Sets the severity level to *fatal*. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
 - **Info:** - Sets the severity level to *info*. By default, underlined with a blue squiggly line in the editing pane and a blue marker in the right vertical stripe.
- If none of the previous rules match, Oxygen XML Developer sets the severity level to *error*. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.

**Tip:**

You can configure the color for each type in the [Document Checking preferences page \(on page 194\)](#).

Integrating Schematron Rules in a Framework and Sharing Them

Custom **Schematron** rules are a great way to ensure consistency for XML authoring, especially when there is a large team working on the same set of documents. You can use **Schematron** for numerous use cases. For example, to restrict certain elements from being used, to impose restrictions on the amount of text for an element, or to impose restrictions on certain elements based on various attribute values or text content set in other elements. Furthermore, you can [define quick fixes for each Schematron rule \(on page 1019\)](#) to offer technical writers proposed solutions for reported problems.

Once you define the **Schematron** rules, they can be shared with the other members of your team by integrating them in a [framework \(on page 2269\)](#) (document type) configuration.

How to Integrate Schematron Rules in a Framework

To integrate a Schematron rule in an existing framework bundled with the application, follow these steps:

1. Create a folder structure for an extended framework and save it somewhere on disk where you have full write access (for example, `custom_frameworks/dita-extension`).
2. In that new folder structure, create another folder that will contain all of your custom Schematron files (for example, `custom_frameworks/dita-extension/rules`).
3. Define the Schematron rules in an existing or new Schematron file and save it in the folder you created in step 2. There are numerous online resources out there to help you get started with writing Schematron rules. Here are just a few that might help you:
 - [Guide to Schema Writing with Schematron](#)
 - [Presentation: Schematron Development with Oxygen](#)
4. Open the **Preferences** dialog box (**Options > Preferences**) (*on page 114*) and go to **Document Type Association > Locations** (*on page 129*). In this preferences page, add the path to your `custom_frameworks` folder in the **Additional frameworks directories** list, then click **OK** or **Apply** to save your changes.
5. Go to the **Document Type Association** preferences page (*on page 128*) and select a *framework* configuration (for example, **DITA**) and use the **Extend** button to create an extension for it.
6. Give the extension an appropriate name (for example, *DITA - Custom*), select **External** for the **Storage** option, and specify an appropriate path to your framework configuration file (for example, `path/to/.../custom_frameworks/dita-extension/dita-extension.framework`).
7. Make whatever changes you desire to the extension, then go to the **Validation** tab, edit the default validation scenario (select the scenario and click the  **Edit** button), and add an extra validation unit to it (one that uses your custom Schematron file).
8. Click **OK** to close the dialog box and then **OK** or **Apply** to save the changes to the **Document Type Association** preferences page (*on page 128*).
9. Open an XML document that matches your framework configuration and test the new rule.
10. You can continue to refine the Schematron and develop additional rules as needed.

Sharing Schematron Rules

To share Schematron rules with other members of your team, you simply need to share the framework where you integrated the Schematron rules.

Related Information:

[Defining Schematron Quick Fixes](#) (*on page 1019*)

[Associating a Schema in Validation Scenarios Defined in the Document Type](#) (*on page 588*)

Validating Schematron Documents

By default, a Schematron schema is validated as you type. To change this, [open the Preferences dialog box \(Options > Preferences\)](#) (*on page 114*), go to **Editor > Document Checking**, and deselect the **Enable automatic validation** option (*on page 195*).

To validate a Schematron document manually, select the  **Validate** action from the  **Validation** toolbar drop-down menu or the **Document > Validate** menu. When Oxygen XML Developer validates a Schematron schema, it expands all the included modules so the entire schema hierarchy is validated. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

Oxygen XML Developer offers an error management mechanism capable of pinpointing errors in XPath expressions and in the included schema modules.

Related Information:

[Presenting Schematron Validation Issues \(on page 990\)](#)

Content Completion in Schematron Documents

Oxygen XML Developer helps you edit a Schematron schema through the *Content Completion Assistant (on page 2267)*, offering proposals that are valid at the cursor position. It can be manually activated with the **Ctrl + Space** shortcut.

When you edit the value of an attribute that refers a component, the proposed components are collected from the entire schema hierarchy. For example, if the editing context is `phase/active/@pattern`, the *Content Completion Assistant* proposes all the defined patterns.

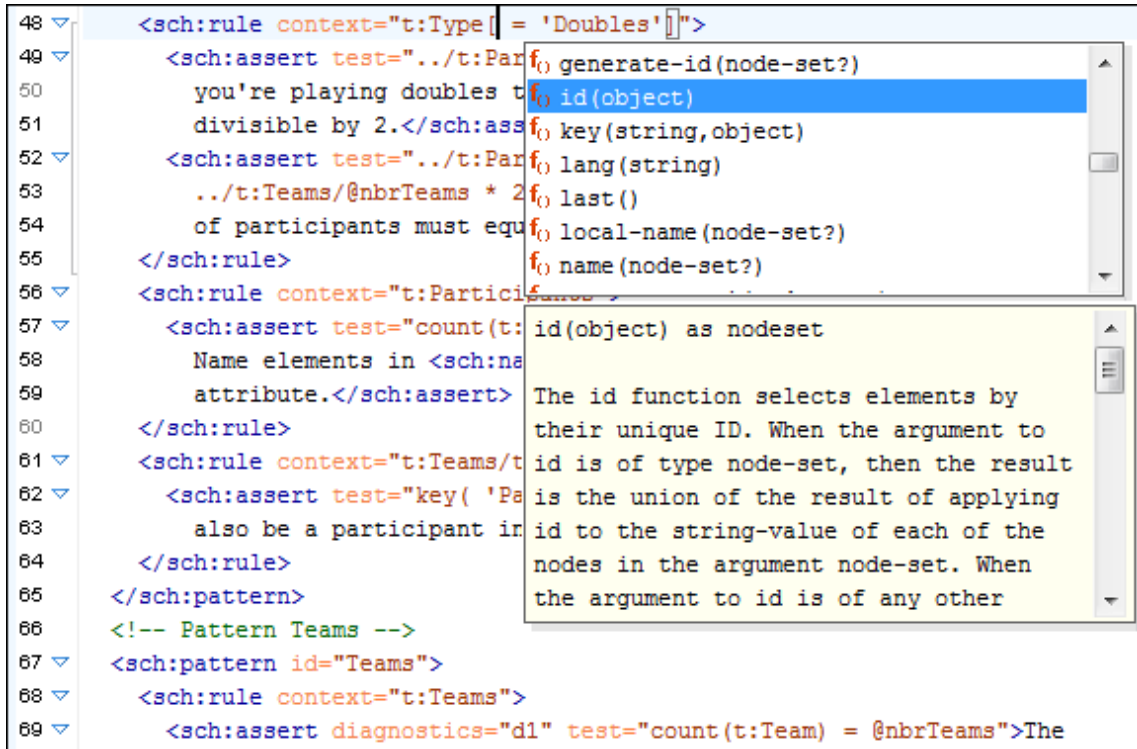

Note:

For Schematron resources, the *Content Completion Assistant* collects its components starting from the *main files (on page 2270)*. The *main files* can be defined in the project or in the associated validation scenario. For further details about the *Main Files* support go to [Defining Main Files at Project Level \(on page 381\)](#).

If the editing context is an attribute value that is an XPath expression (such as `assert/@test` or `report/@test`), the *Content Completion Assistant* offers the names of XPath functions, the XPath axes, and user-defined variables.

The *Content Completion Assistant* displays XSLT 1.0 functions and optionally XSLT 2.0 / 3.0 functions in the attributes *path*, *select*, *context*, *subject*, *test* depending on [the Schematron options \(on page 209\)](#) that are set in Preferences pages. If the Saxon 6.5.5 namespace (`xmlns:saxon="http://icl.com/saxon"`) or the Saxon 12.5 namespace is declared in the Schematron schema (`xmlns:saxon="http://saxon.sf.net/"`) the content completion also displays the XSLT Saxon extension functions as in the following figure:

Figure 352. XSLT Extension Functions in Schematron Schema Content Completion

The *Content Completion Assistant* also includes [code templates](#) that can be used to quickly insert code fragments ([on page 491](#)) into Schematron documents.

Syntax Highlighting in Schematron

Oxygen XML Developer supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for Schematron schemas, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) ([on page 114](#)).
2. Go to **Editor > Syntax Highlight** ([on page 193](#)).
3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XML** tab in the **Preview** pane to see the effects of your changes.

Tip:

Oxygen XML Developer also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the **Editor > Syntax Highlight > Elements/Attributes by Prefix** preferences page ([on page 193](#)).

Related Information:

[Syntax Highlight Preferences \(on page 193\)](#)

Embedding Schematron Rules in XML Schema or RELAX NG

Schematron rules can be embedded into an XML Schema through annotations (using the `<appinfo>` element), or in any element on any level of a RELAX NG Schema (taking into account that the RELAX NG validator ignores all elements that are not in the RELAX NG namespace).

Oxygen XML Developer supports Schematron validation schemas and it is able to extract and use the embedded rules.

Validating XML Documents with XML Schema and Embedded Schematron

To validate an XML document with XML Schema and its embedded Schematron, you can associate the document like this:

```
<?xml-model href="percent.xsd" type="application/xml"
    schematypens="http://purl.oclc.org/dsdl/schematron"?>
```

Validating XML Documents with Relax NG and Embedded Schematron

To validate an XML document with RELAX NG schema and its embedded Schematron rules, you need to associate the document with both schemas like this:

```
<?xml-model href="percent.rng" type="application/xml"
    schematypens="http://relaxng.org/ns/structure/1.0"?>
<?xml-model href="percent.rng" type="application/xml"
    schematypens="http://purl.oclc.org/dsdl/schematron"?>
```

The second association validates your document with Schematron rules extracted from the RELAX NG Schema.

**Note:**

When you work with XML Schema or Relax NG documents that have embedded Schematron rules Oxygen XML Developer provides two built-in validation scenarios: **Validate XML Schema with embedded Schematron** for XML schema, and **Validate Relax NG with embedded Schematron** for Relax NG. You can use one of these scenarios to validate the embedded Schematron rules.

Example: Embedded Schematron in XML Schema

```
<xsd:appinfo>
  <sch:pattern>
    <sch:rule context="...">
      <sch:assert test="...">Message.</sch:assert>
    </sch:rule>
```

```
</sch:pattern>

</xsd:appinfo>
```

Example: Embedded Schematron in Relax NG Schema

```
<grammar
  xmlns="http://relaxng.org/ns/structure/1.0"
  xmlns:sch="http://purl.oclc.org/dsdl/schematron" >
  <sch:pattern>
    <sch:rule context="...">
      <sch:assert test="...">Message.</sch:assert>
    </sch:rule>
  </sch:pattern>
  <start>
    .....
  </start>
</grammar>
```

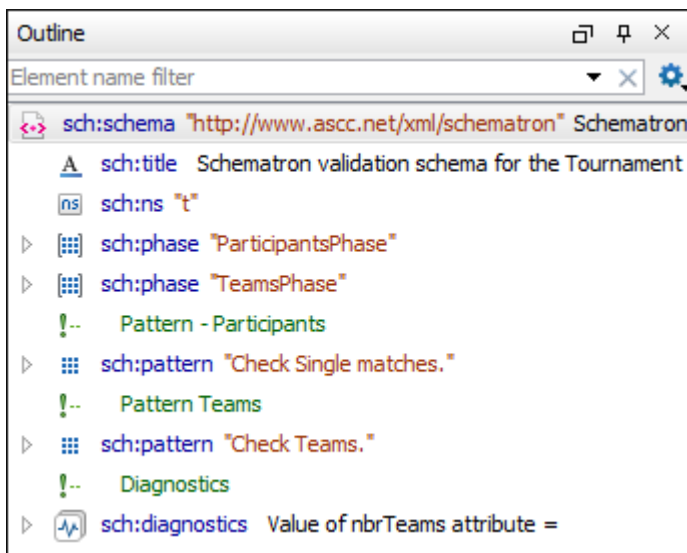

Related Information:

[Embedding Schematron Quick Fixes in Relax NG or XML Schema \(on page 1033\)](#)

Schematron Outline View

The **Outline** view for Schematron schemas presents a list of components in a tree-like structure and it allows for quick access to a component by name. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 353. Schematron Outline View

The following actions are available in the  **Settings** menu on the **Outline** view toolbar:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

 **Selection update on cursor move**

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

 **Flat presentation mode of the filtered results**

When active, the application flattens the filtered result elements to a single level.

 **Show comments and processing instructions**

Show/hide comments and processing instructions in the **Outline** view.

 **Show element name**

Show/hide element name.

 **Show text**

Show/hide additional text content for the displayed elements.

 **Show attributes**

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from [the Outline preferences panel \(on page 272\)](#).

 **Configure displayed attributes**

Displays the [XML Structured Outline preferences page \(on page 272\)](#).

The following contextual menu actions are also available in the **Outline** view:

Append Child

Displays a list of elements that you can insert as children of the current element.

Insert Before

Displays a list of elements that you can insert as siblings of the current element, before the current element.

Insert After

Displays a list of elements that you can insert as siblings of the current element, after the current element.

 **Edit Attributes**

Opens a dialog box that allows you to edit the attributes of the currently selected component.

 **Toggle Comment**

Comments/uncomments the currently selected element.

**Cut**

Cuts the currently selected component.

**Copy**

Copies the currently selected component.

**Delete**

Deletes the currently selected component.

**Expand More**

Expands the structure of a component in the **Outline** view.

**Collapse All**

Collapses the structure of all the component in the **Outline** view.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as * or ?) and separate multiple patterns with commas.

Schematron Referenced/Dependent Resources View

The **Referenced/Dependent Resources** view displays the hierarchy or dependencies for resources included in a Schematron schema. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

If you want to see the hierarchy of a schema, select the desired schema in the **Project view** ([on page 365](#)) and choose **Show referenced resources** from the contextual menu.

If you want to see the dependencies of a schema, select the desired schema in the **Project view** ([on page 365](#)) and choose **Show dependent resources** from the contextual menu.

Figure 354. Referenced/Dependent Resources View

The following actions are available on the toolbar of the **Referenced/Dependent Resources** view:

**Refresh**

Refreshes the resource structure.

**Stop**

Stops the computing.

Show hierarchy for

Computes the hierarchical structure of the references for a resource.

Show dependencies for

Computes the structure of the dependencies for a resource.

Configure dependencies search scope

Allows you to configure a scope to compute the dependencies. There is also an option for automatically using the defined scope for future operations.

History

Provides access to the list of previously computed dependencies. Use the  **Clear history** button to remove all items from this list.

The contextual menu for a resource listed in the **Referenced/Dependent Resources** view contains the following actions:

Open

Opens the resource. You can also double-click a resource within the hierarchical structure to open it.

Go to reference

Opens the source document where the resource is referenced.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show references resources

Shows the references for the selected resource.

Show dependent resources

Shows the dependencies for the selected resource.

Add to Main Files

Adds the currently selected resource in the **Main Files** directory.

Expand More

Expands more of the children of the selected resource from the hierarchical structure.

Collapse All

Collapses all children of the selected resource from the hierarchical structure.

Tip:

When a recursive reference is encountered in the view, the reference is marked with a special icon .

Note:

The **Move resource** or **Rename resource** actions give you the option to [update the references to the resource \(on page 1000\)](#).

Moving/Renaming Schematron Resources

You can move and rename a resource presented in the **Referenced/Dependent Resources** view, using the **Rename resource** and **Move resource** refactoring actions from the contextual menu.

When you select the **Rename** action in the contextual menu of the **Referenced/Dependent Resources** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource(s)** - Select this option to update the references to the resource you are renaming. A **Preview** option is available that allows you to see what will be updated before selecting **Rename** to process the operation.

When you select the **Move** action from the contextual menu of the **Referenced/Dependent Resources** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, in accordance with the new location and name. A **Preview** option is available that allows you to see what will be updated before selecting **Move** to process the operation.

Highlight Component Occurrences in Schematron Documents

When you position your mouse cursor over a component in a Schematron document, Oxygen XML Developer searches for the component declaration and all its references and highlights them automatically.

Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected.

To change the default behavior of **Highlight Component Occurrences**, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **Editor > Mark Occurrences**. You can also trigger a search using the **Search > Search Occurrences in File Ctrl + Shift + U (Command + Shift + U on macOS)** action from contextual menu. Matches are displayed in separate tabs of the **Results view (on page 503)**.

Searching and Refactoring Operations in Schematron Documents

Search Actions

The following search actions can be applied on `pattern`, `phase`, or `diagnostic` types and are available from the **Search** submenu in the contextual menu of the current editor or from the **Document > References** menu:

Search References

Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the currently edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.

Search References in

Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.

Search Declarations

Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the currently edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.

Search Declarations in

Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.

Search Occurrences in File

Searches all occurrences of the item at the cursor position in the currently edited file.

Refactoring Actions

The following refactoring actions can be applied on `pattern`, `phase`, or `diagnostic` types and are available from the **Refactoring** submenu in the contextual menu of the current editor or from the **Document > Refactoring** menu:

Rename Component

Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.

Rename Component in

Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

Figure 355. Rename Identity Constraint Dialog Box

Searching and Refactoring Operations Scope in Schematron Documents

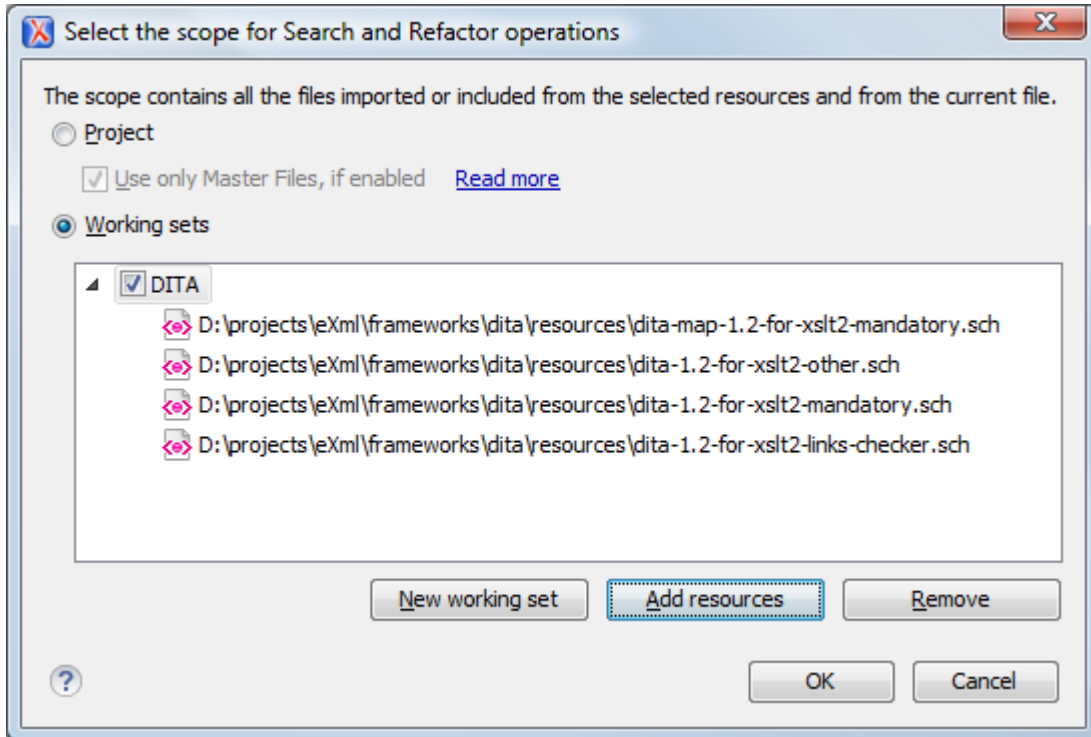

The *scope* is a collection of documents that define the context of a search and refactor operation. To control it you can use the  **Change scope** operation, available in the *Quick Assist* action set or on the **Referenced/Dependent Resources** view's toolbar. You can restrict the scope to the current project or to one or multiple *working sets* (on page 2273). The **Use only Main Files, if enabled** checkbox allows you to restrict the scope of the search and refactor operations to the resources from the **Main Files** directory. Click **read more** for details about the *Main Files* support (on page 381).

Figure 356. Change Scope Dialog Box

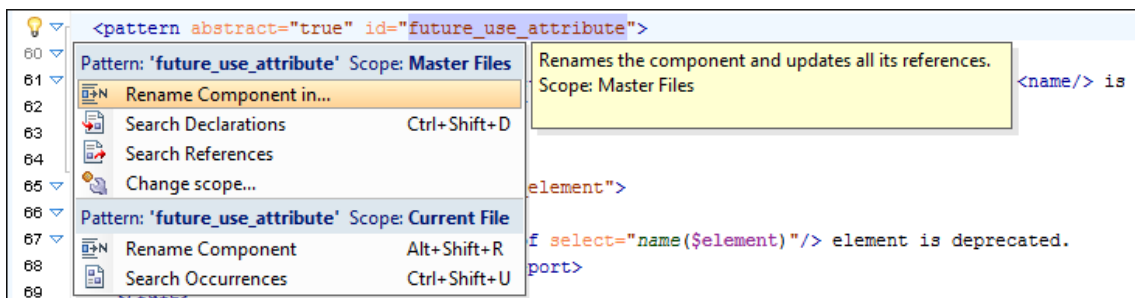

The scope you define is applied to all future search and refactor operations until you modify it. Contextual menu actions allow you to add or delete files, folders, and other resources to the *working set* (on page 2273) structure.

Quick Assist Support in Schematron Documents

The *Quick Assist* support (on page 2272) improves the development work flow, offering fast access to the most commonly used actions when you edit schema documents.

The *Quick Assist* feature (on page 2272) is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb icon (💡) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the *quick assist* menu by using the **Alt + 1** (**Meta + Alt + 1** on macOS) keyboard shortcuts.

Figure 357. Schematron Quick Assist Support

The *Quick Assist* support offers direct access to the following actions:

 **Rename Component in**

Renames the component and all its dependencies.

 **Search Declarations**

Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

 **Search References**

Searches all references of the component in a predefined scope.

 **Component Dependencies**

Searches the component dependencies in a predefined scope.

 **Change Scope**

Configures the scope that will be used for future search or refactor operations.

 **Rename Component**

Allows you to rename the current component in-place.

 **Search Occurrences**

Searches all occurrences of the component within the current file.

Schematron Unit Test (XSpec)

XSpec is a behavior driven development (BDD) *framework* for XSLT, XQuery, and Schematron. XSpec consists of syntax for describing the behavior of your XSLT, XQuery, or Schematron code, and some code that enables you to test your code against those descriptions.

Creating a Schematron Unit Test

To create a Schematron Unit Test, go to **File > New > Schematron Unit Test**. This is simple document template to help you get started.

Running a Schematron Unit Test

To run a Unit Test, open the XSpec file in an editor and click  **Apply Transformation Scenario(s)** on the main toolbar. This will run the built-in **Run XSpec Test** transformation scenario that is defined in the XSpec *framework* ([on page 2269](#)).

Testing a Stylesheet

An XSpec file contains one or more test scenarios.

Example

Suppose you have this Schematron rule that says sections should have a title:

```

<sch:pattern>
  <sch:rule context="section">
    <sch:assert test="title" id="a002">
      section should have a title
    </sch:assert>
  </sch:rule>
</sch:pattern>

```

The XSpec test could look like this:

```

<x:description xmlns:x="http://www.jenitennison.com/xslt/xspec" schematron="demo-01.sch">
  <x:scenario label="section should have a title">
    <x:context>
      <article>
        <section>
          <title>Introduction</title>
          <p>This is an example.</p>
        </section>
        <section>
          <p>This is an example.</p>
        </section>
      </article>
    </x:context>

    <x:expect-not-assert id="a002" location="/article[1]/section[1]"/>
    <x:expect-assert id="a002" location="/article[1]/section[2]"/>
  </x:scenario>
</x:description>

```

The `<sch:assert>` with the `id="a002"` is not expected to be triggered on the first section since it includes a title. This requirement is expressed with the `<x:expect-not-assert>` element.

Since the second section does not have a title, you would expect the Schematron rule to be triggered and this requirement is expressed with the `<x:expect-assert>` element.

For more details about how to write Schematron tests and various samples, see <https://github.com/xspec/xspec/wiki/Writing-Scenarios-for-Schematron#writing-tests>.

Adding a Catalog to an XSpec Transformation

If your Schematron needs a catalog, you can add one to the XSpec transformation by doing one of the following:

- If you are using a [project \(on page 361\)](#) in Oxygen XML Developer, create a `catalog.xml` file in the project directory. This catalog will then be loaded automatically.
- [Edit \(on page 1237\)](#) the **Run XSpec Test** transformation scenario, go to the **Parameters tab (on page 1172)**, and set the value of the `catalog` parameter to the location of your catalog file.

Editing Schematron Quick Fixes

Oxygen XML Developer provides support for editing the [Schematron Quick Fixes \(on page 582\)](#) (SQF). They help you resolve issues that appear in XML documents that are validated against Schematron schemas by offering you solution proposals. The Schematron *Quick Fixes* are an extension of the Schematron language and they allow you to define fixes for Schematron validation messages. Specifically, they are associated with *assert* or *report* messages. You can define a library of *Quick Fixes* by editing them directly in the current Schematron file or in a separate file. Oxygen XML Developer assists you in editing Schematron *Quick Fixes* with schema-based content completion, syntax highlighting, and validation as you type.

A typical use case is using Schematron *Quick Fixes* to assist content authors with common editing tasks. For example, you can use Schematron rules to automatically report certain validation warnings (or errors) when performing regular editing tasks, such as inserting specific elements or changing IDs to match specific naming conventions.

For information about applying and detecting the Schematron schemas that include SQF, see [Associating a Schema to XML Documents \(on page 582\)](#).

Displaying the Schematron Quick Fix Proposals

The defined Schematron *Quick Fixes* are displayed on validation errors in **Text** mode.

Examples of Schematron Rules and Quick Fixes

This topic is meant to provide some basic examples of Schematron Rules and Schematron Quick Fixes (SQF) to help you create and impose your own rules and quick fixes.

Other examples and ideas can also be found at:

- [Public GitHub project with the Schematron file used for Oxygen's User Guide](#)
- [Public GitHub project with sample Schematron Quick Fixes](#)

Schematron Examples

Schematron Use Case 1: Impose a Relax NG Schema Declaration

Description: The following sample rule is useful if, for example, you need to enforce the use of Relax NG schema declarations in all of your documents (i.e. instead of using DTD schemas).

Sample Code:

```
<?xml version="1.0" encoding="UTF-8"?>

<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron"
  queryBinding="xslt2" xmlns:saxon="http://saxon.sf.net/">

  <sch:let name="rngDeclaration"
    value="processing-instruction('xml-model')
    [saxon:get-pseudo-attribute('schematypens')='http://relaxng.org/ns/structure/1.0']"/>

  <sch:pattern>

  <sch:rule context="/element()">

    <sch:assert test="exists($rngDeclaration)">You must define a Relax NG schema
      declaration in the document (DTD schemas are not supported).</sch:assert>

  </sch:rule>

</sch:pattern>

</sch:schema>
```

Result: The engine checks for a Relax NG schema declaration in the document and displays an error if it is missing. The error is reported on the document's root element (`/element()`).

Schematron Use Case 2: Check for Missing IDs

Description: The following sample rule checks for missing or undefined IDs in a TEI document. Specifically, it looks for IDs from the `tei:rs/@ref` attribute defined in the document named `persons.xml` (as `xml:id` of a TEI `person` element).

Sample Code:

```
<?xml version="1.0" encoding="UTF-8"?>

<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2">

  <sch:ns uri="http://www.tei-c.org/ns/1.0" prefix="tei"/>

  <sch:let name="personIds"
    value="document('../persons.xml')/tei:TEI//tei:person/@xml:id"/>

  <sch:pattern>

  <sch:rule context="tei:rs">

    <sch:let name="refIds"
      value="for $id in tokenize(@ref, ' ') return substring-after($id, '#')"/>
```

```

<sch:let name="missingIds"
    value="for $id in $refIds return (if($id = $personIds) then '' else $id)"/>

<sch:report test="$missingIds != ''">
    The following ids "<sch:value-of select="$missingIds"/>"
    are not defined in "<sch:value-of select="$personIds"/>"
</sch:report>
</sch:rule>
</sch:pattern>
</sch:schema>

```

where the XML document looks something like this:

```

<tei xmlns="http://www.tei-c.org/ns/1.0">
  <rs ref="../../SomePerson/persons.xml#EDP ../personography/HAMpersons.xml#SD">text</rs>
  <rs ref="../../SomePerson/persons.xml#EDP">text</rs>
</tei>

```

Result: The engine displays an error message listing the missing/undefined IDs.

Schematron Use Case 3: Check for Broken Links

Description: The following sample rule detects broken links in DITA `<xref>` or `<link>` elements. The first example only checks links that do not contain an anchor (#).

Sample Code:

```

<rule
  context="*[contains(@class, ' topic/xref ') or contains(@class, ' topic/link ')]
  [@href][not(contains(@href, '#'))][not(@scope = 'external')]
  [not(@type) or @type='dita']">
  <assert test="doc-available(resolve-uri(@href, base-uri(.)))">
    The document linked by <value-of select="local-name()"/>
    "<value-of select="@href"/>" does not exist!</assert>
</rule>

```

For links that contain an anchor, the Schematron rule must look something like this:

```

<rule
  context="*[contains(@class, ' topic/xref ') or contains(@class, ' topic/link ')]
  [@href][contains(@href, '#')][not(@scope = 'external')]
  [not(@type) or @type='dita']">
  <let name="file" value="substring-before(@href, '#')"/>
  <let name="idPart" value="substring-after(@href, '#')"/>
  <let name="topicId"
    value="if (contains($idPart, '/')) then substring-before($idPart, '/') else $idPart"/>
  <let name="id" value="substring-after($idPart, '/')"/>

```

```

<assert test="document($file, .)//*[ @id=$topicId]">
  Invalid topic id "<value-of select="$topicId"/>" </assert>
<assert test="$id='' or document($file, .)//*[ @id=$id]">
  No such id "<value-of select="$id"/>" is defined! </assert>
<assert test="$id='' or document($file, .)//*[ @id=$id
  [ancestor::*[contains(@class, ' topic/topic ')]][1][ @id=$topicId]">
  The id "<value-of select="$id"/>" is not in the scope of the referenced topic id
  "<value-of select="$topicId"/>". </assert>
</rule>

```

Result: The engine displays an error message when a broken link or cross reference is detected.

Schematron Use Case 4: Check for Duplicate IDs

Description: The following sample rule detects if there are two sibling `<step>` elements with the same `@id` value in a DITA Task document.

Sample Code:

```

<sch:rule context="*[contains(@class, ' task/step ')]">
  <sch:let name="id" value="@id"/>
  <sch:report
    test="preceding-sibling::element()[contains(@class, ' task/step ')][@id = $id]"
    Element with duplicate ID "<sch:value-of select="$id"/>" detected.
  </sch:report>
</sch:rule>

```

Result: The engine displays an error message when a duplicate ID is detected in sibling `<step>` elements within a DITA Task document.

Schematron Use Case 5: Check for Duplicate DITA Topic References

Description: The following sample rule checks a DITA map for duplicate `<topicref>` elements with the same `@href` value.

Sample Code:

```

<sch:rule context="*[contains(@class, ' map/topicref ')]">
  <sch:let name="href" value="@href"/>
  <sch:report
    test="preceding::element()[contains(@class, ' map/topicref ')][@href = $href]"
    Duplicate topicref "<sch:value-of select="$href"/>" detected in map.
  </sch:report>
</sch:rule>

```

Result: The engine displays an error message when multiple `<topicref>` elements with the same `@href` value are detected in a DITA map.

Schematron Use Case 6: Restrict Certain Words from the Title

Description: The following sample rule checks for instances of specified words to be restricted from a `<title>` element (in this example, the words *test* and *hello* are restricted).

Sample Code:

```
<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron"
  queryBinding="xslt2">
  <sch:let name="words" value="'test,hello'"/>
  <sch:let name="wordsToMatch" value="replace($words, ',', '|')"/>
  <sch:pattern>
    <sch:rule context="title">
      <sch:report test="matches(text(), $wordsToMatch)" role="warn">
        The following words should not be added in the title:
        <sch:value-of select="$words"/>
      </sch:report>
    </sch:rule>
  </sch:pattern>
</sch:schema>
```

Result: The engine displays an error message if one of the specified restricted words appear in a title.

Schematron Use Case 7: Check the Location of a Resource

Description: The following sample rule checks if the path to a resource (in this case, an image) is specified correctly. Specifically, this sample rule reports that the image must be located in the current project (the images location must be relative to the parent folder and no more than one `"../"` in the path).

Sample Code:

```
<sch:rule context="image">
  <sch:report test="count(tokenize(@href, '\.\./')) > 2">
    The image must be located in the current project. It is currently located
    in: <sch:value-of select="@href"/>
  </sch:report>
</sch:rule>
```

Result: The engine displays an error message if an image is detected in a location other than the current project, relative to the parent folder.

Schematron Use Case 8: Check for Extra Spaces at Beginning/End of Elements

Description: The following sample rule checks for spaces at the beginning and end of elements.

**Tip:**

You could specify a list of elements to check to make the rule context-sensitive.

Sample Code:

```
<rule context="p|ph|codeph|filename|indexterm|xref|user-defined|user-input">
  <let name="firstNodeIsElement" value="node()[1] instance of element()"/>
  <let name="lastNodeIsElement" value="node()[last()] instance of element()"/>
  <report test="(not($firstNodeIsElement) and matches(.,'^\s',';j'))
    or (not($lastNodeIsElement) and matches(.,'\s$',';j'))"
    role="warning">
    Textual elements should not begin or end with whitespace.</report>
</rule>
```

Result: The engine displays an error message if a whitespace is detected at the beginning or end of a textual element.

Schematron Use Case 9: Impose Capitalizing the First Letter

Description: The following sample rule detects if elements start with a capital letter or a number. The rule is implemented using abstract patterns. The abstract pattern `starts-with-capital` has one argument representing the element to be checked. There are two implementations of the abstract pattern, one that specifies the `<tittle>` element as the element to verify, and one that specifies the `` element.

Sample Code:

```
<sch:pattern abstract="true" id="starts-with-capital">
  <sch:rule context="$element" role="information">
    <sch:let name="firstNodeIsElement" value="node()[1] instance of element()"/>
    <sch:report test="(not($firstNodeIsElement) and (not(matches(., '^[A-Z|0-9]'))))">
      Start the element <$element> with a capital letter.</sch:report>
    </sch:rule>
  </sch:pattern>
<sch:pattern is-a="starts-with-capital">
  <sch:param name="element" value="title"/>
</sch:pattern>
<sch:pattern is-a="starts-with-capital">
  <sch:param name="element" value="li"/>
</sch:pattern>
```

Result: The engine displays an error message if a title begins with a word that does not contain a capital letter or number as its first character.

Schematron Use Case 10: Check for Specified Terms in a Paragraph

Description: The following sample rule checks if any DITA `<p>` elements contain certain keywords defined in an external document.

Sample Code:

```
<sch:pattern>
  <sch:let name="keys" value="document('keys-common.ditamap')//keyword"/>
  <sch:rule context="p">
    <sch:let name="text" value="."/>
    <sch:let name="matchedKeys" value="$keys[contains($text, normalize-space(.))]/>
    <sch:report id="now001" test="count($matchedKeys) > 0" role="error">
      The paragraph text contains the keywords: <sch:value-of select="$matchedKeys"/>
    </sch:report>
  </sch:rule>
</sch:pattern>
```

Result: The engine displays an error message if any of the keywords listed in an external document are detected within a DITA `<p>` element.

Schematron Use Case 11: Impose a Minimum Value

Description: The following sample rule determines the `<type>` element value with the minimum version specified by the `@version` attribute and then verifies that they are all equal to the determined value.

Sample Code:

```
<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2">
  <sch:let name="typeValue" value="//Node1[not(@version >
    ../Node1/@version)][1]/Type/text()"/>
  <sch:pattern>
    <sch:rule context="Type">
      <sch:assert test="text() = $typeValue">
        The Type value must be "<sch:value-of select="$typeValue"/>"
      </sch:assert>
    </sch:rule>
  </sch:pattern>
</sch:schema>
```

where the XML file would look something like this:

```
<root>
  <Node1 version="1">
    <Element1>Value1</Element1>
    <Type>123456</Type>
```

```

</Node1>

<Node1 version="2">
  <Element1>Value1</Element1>
  <Type>123456</Type>
</Node1>

<Node1 version="3">
  <Element1>Value1</Element1>
  <Type>1234567</Type>
</Node1>

</root>

```

Result: The engine displays an error message if a `<type>` element value does not equal the minimum version specified by the `@version` attribute.

SQF (Schematron Quick Fix) Examples

SQF Use Case 1: Impose a DITA Prolog

Description: The following sample Schematron rule checks a DITA topic to make sure it contains `<prolog>`, `<critdates>`, `<revised>` elements and the sample Quick Fix proposes options for inserting the missing elements.

Sample Code:

```

<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2"
  xmlns:sqf="http://www.schematron-quickfix.com/validator/process">
  <sch:pattern>
    <sch:rule context="*[contains(@class, ' topic/topic ')]">
      <sch:assert sqf:fix="add_prolog" test="prolog" role="warn">Every topic must contain
        prolog/critdates/revised elements where the revised modified date is in
        YYYY-MM-DD format.</sch:assert>
      <sqf:fix id="add_prolog">
        <sqf:description>
          <sqf:title>Add prolog/critdates/revised elements, where the revised element's
            @modified attribute value is the current date in YYYY-MM-DD
            format.</sqf:title>
        </sqf:description>
        <sqf:add match="*[contains(@class, ' topic/body ')]" node-type="element"
          position="before" target="prolog">
          <critdates>
            <revised modified=""> </revised>
          </critdates>
        </sqf:add>
      </sqf:fix>
    </sch:rule>

```

```

<sch:rule context="*[contains(@class, ' topic/prolog ')]">
  <sch:report role="warn" test="not(critdates)" sqf:fix="add_critdates">The prolog
    element must have critdates/revise elements with the @modified attribute value
    in YYYY-MM-DD format.</sch:report>
  <sqf:fix id="add_critdates">
    <sqf:description>
      <sqf:title>Add the critdates element.</sqf:title>
    </sqf:description>
    <sqf:add node-type="element" target="critdates">
      <revised modified="" </revised>
    </sqf:add>
  </sqf:fix>
</sch:rule>

<sch:rule context="*[contains(@class, ' topic/critdates ')]">
  <sch:report role="warn" test="not(revised)" sqf:fix="add_revised">The critdates
    element must have revised @modified in YYYY-MM-DD format. </sch:report>
  <sqf:fix id="add_revised">
    <sqf:description>
      <sqf:title>Add the revised element.</sqf:title>
    </sqf:description>
    <sqf:add node-type="element" target="revised"/>
  </sqf:fix>
</sch:rule>
</sch:pattern>
</sch:schema>

```

Result: The engine displays an error message if the `<prolog>`, `<critdates>`, or `<revised>` elements are missing from a DITA topic and the Quick Fix mechanism proposes options for inserting the missing elements.

SQF Use Case 2: Impose an ID for all DITA Section Elements

Description: The following sample Schematron rule checks if each DITA `<section>` element has a specified ID and the sample Quick Fix proposes options for inserting the missing IDs.

Sample Code:

```

<<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron"
  queryBinding="xslt2"
  xmlns:sqf="http://www.schematron-quickfix.com/validator/process">
  <sch:pattern>
    <!-- Add IDs to all sections to impose link targets -->
    <sch:rule context="section">
      <sch:assert test="@id" sqf:fix="addId addIds"> [Bug] All sections should
        have an @id attribute </sch:assert>
    </sch:rule>
  </sch:pattern>
</sch:schema>

```

```

<sqf:fix id="addId">
  <sqf:description>
    <sqf:title>Add @id to the current section</sqf:title>
    <sqf:p>Add an @id attribute to the current section. The ID is
      generated from the section title.</sqf:p>
  </sqf:description>
  <!-- Generate an id based on the section title. If there is no title then
    generate a random id. -->
  <sqf:add target="id" node-type="attribute"
    select="
      concat('section_',
        if (exists(title) and string-length(title) > 0)
        then
          substring(lower-case(replace(replace(
            normalize-space(string(title)), '\s', '_'),
            '^[a-zA-Z0-9_]', '')), 0, 50)
        else
          generate-id()"/>
  </sqf:fix>
<sqf:fix id="addIds">
  <sqf:description>
    <sqf:title>Add @id to all sections</sqf:title>
    <sqf:p>Add an @id attribute to each section from the document. The ID
      is generated from the section title.</sqf:p>
  </sqf:description>
  <!-- Generate an id based on the section title. If there is no title then
    generate a random id. -->
  <sqf:add match="//section[not(@id)]" target="id" node-type="attribute"
    select="
      concat('section_',
        if (exists(title) and string-length(title) > 0)
        then substring(lower-case(replace(replace(
          normalize-space(string(title)), '\s', '_'),
          '^[a-zA-Z0-9_]', '')), 0, 50)
        else generate-id()"/>
  </sqf:fix>
</sch:rule>
</sch:pattern>
</sch:schema>

```

Result: The engine displays an error message if an `@id` attribute is missing for any `<section>` element in a DITA topic and the Quick Fix mechanism proposes options for inserting the missing ID.

SQF Use Case 3: Impose a Short Description in an Abstract Element

Description: The following sample Schematron rule checks a DITA topic to make sure it contains a `<shortdesc>` element inside an `<abstract>` element and the sample Quick Fix proposes options for correcting the missing structure.

Sample Code:

```
<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2"
  xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform">
  <sch:pattern>
    <sch:rule context="shortdesc">
      <sch:assert test="parent::abstract" sqf:fix="moveToAbstract moveToExistingAbstract">
        The short description must be added in an abstract element
      </sch:assert>
      <!-- Check if there is an abstract element -->
      <sch:let name="abstractElem" value="preceding-sibling::abstract |
        following-sibling::abstract"/>
      <!-- Create an abstract element and add the short description -->
      <sqf:fix id="moveToAbstract" use-when="not($abstractElem)">
        <sqf:description>
          <sqf:title>Move short description in an abstract element</sqf:title>
        </sqf:description>
        sqf:replace>
          <abstract>
            <xsl:apply-templates mode="copyExceptClass" select="."/>
          </abstract>
        </sqf:replace>
      </sqf:fix>
      <!-- Move the short description in the abstract element-->
      sqf:fix id="moveToExistingAbstract" use-when="$abstractElem">
        <sqf:description>
          <sqf:title>Move short description in the abstract element</sqf:title>
        </sqf:description>
        <sch:let name="shortDesc">
          <xsl:apply-templates mode="copyExceptClass" select="."/>
        </sch:let>
        <sqf:add match="$abstractElem" select="$shortDesc"/>
        <sqf:delete/>
      </sqf:fix>
    </sch:rule>
  </sch:pattern>
</sch:schema>
```

```

</sch:pattern>

<!-- Template used to copy the current node -->
<xsl:template match="node() | @" mode="copyExceptClass">
  <xsl:copy copy-namespaces="no">
    <xsl:apply-templates select="node() | @" mode="copyExceptClass"/>
  </xsl:copy>
</xsl:template>

<!-- Template used to skip the @class attribute from being copied -->
<xsl:template match="@class" mode="copyExceptClass"/>
</sch:schema>

```

Result: The engine displays an error message if an `<abstract>` element does not contain a `<shortdesc>` element and the Quick Fix mechanism proposes options for inserting the missing structure or to move the `<shortdesc>` element inside the `<abstract>` element.

SQF Use Case 4: Impose a Certain Article Type

Description: The following sample Schematron rule checks the `@article-type` attribute to make sure its value is one of the specified allowed values (**abstract**, **addendum**, **announcement**, **article-commentary**) and the sample Quick Fix proposes options for replacing any other detected value with one of the allowed values.

Sample Code:

```

<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2"
  xmlns:sqf="http://www.schematron-quickfix.com/validator/process">

  <sch:let name="articleTypes" value="('abstract', 'addendum', 'announcement',
    'article-commentary')"/>

  <sch:pattern>
    <sch:rule context="article/@article-type">
      <sch:assert test=". = $articleTypes" sqf:fix="setArticleType">
        Should be one of the article types:
        <sch:value-of select="$articleTypes"/></sch:assert>
      <sqf:fix id="setArticleType" use-for-each="$articleTypes">
        <sqf:description>
          <sqf:title>Set article type to '<sch:value-of select="$sqf:current"/>'  
</sqf:title>
          </sqf:description>
          <sqf:replace node-type="attribute" target="article-type" select="$sqf:current"/>
        </sqf:fix>
      </sch:rule>

```

```

</sch:pattern>

</sch:schema>

```

Result: The engine displays an error message if an `@article-type` attribute has any other value other than **abstract**, **addendum**, **announcement**, or **article-commentary** and the Quick Fix mechanism proposes options for replacing the disallowed value with one of those four allowed values (using the `use-for-each` construct).

SQF Use Case 5: Impose Certain Attributes and Values

Description: The following sample Schematron rule checks the `@rowsep` and `@colsep` attributes are added on the `<colspec>` element and their value is set to 1. The Quick Fix proposes options for adding the attributes in case they are missing or set the correct value .

Sample Code:

```

<?xml version="1.0" encoding="UTF-8"?>

<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2"
  xmlns:sqf="http://www.schematron-quickfix.com/validator/process">

  <sch:pattern>

    <sch:rule context="colspec">

      <sch:assert test="@rowsep = 1" sqf:fix="addRowsep">The @rowsep should be
        set to 1</sch:assert>

      <sch:assert test="@colsep = 1" sqf:fix="addColsep">The @colsep should be
        set to 1</sch:assert>

      <sqf:fix id="addRowsep">

        <sqf:description>

          <sqf:title>Add @rowsep attribute</sqf:title>

        </sqf:description>

        <sqf:add node-type="attribute" target="rowsep" select="'1'"/>

      </sqf:fix>

      <sqf:fix id="addColsep">

        <sqf:description>

          <sqf:title>Add @colsep attribute</sqf:title>

        </sqf:description>

        <sqf:add node-type="attribute" target="colsep" select="'1'"/>

      </sqf:fix>

    </sch:rule>

  </sch:pattern>

</sch:schema>

```

Defining Schematron Quick Fixes

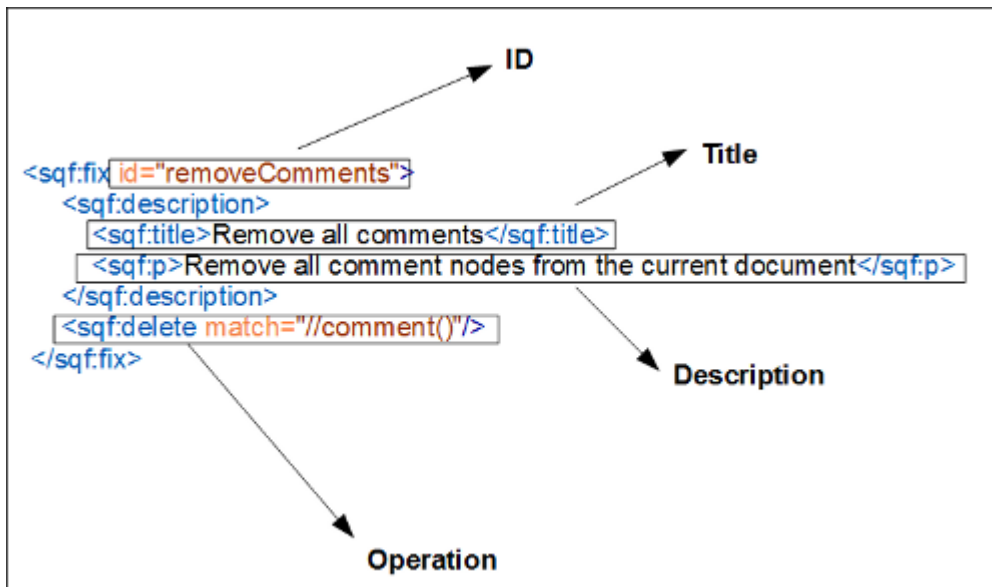

You can define and customize Schematron *Quick Fixes* (on page 2272) directly in the current Schematron file or in a separate Schematron file. The Schematron *Quick Fixes* are an extension of the Schematron language and they allow you to define fixes for Schematron error messages. You can reference the *Quick Fixes* using the `@sqf:fix` attribute inside the `<assert>` or `<report>` elements (for example: `<assert test="title" sqf:fix="removeComments">Remove comments</assert>`).

Defining a Schematron Quick Fix

The basics of a Schematron *Quick Fix* is defined by an ID, name, description, and the operations to be executed.

- **ID** - Defined by the `@id` attribute from the `<sqf:fix>` element and must be unique in the current context. It is used to refer the *Quick Fix* from a `<report>` or `<assert>` element.
- **Name** - The name of the *Quick Fix* is defined by the `<sqf:title>` element.
- **Description** - Defined by the text in the paragraphs (`<sqf:p>`) of the `<sqf:description>` element.
- **Operations** - The following basic types of *operations* (elements) (on page 1020) are supported:
 - `<sqf:add>` Element - To add a new node or fragment in the document.
 - `<sqf:delete>` Element - To remove a node from the document.
 - `<sqf:replace>` Element - To replace a node with another node or fragment.
 - `<sqf:stringReplace>` Element - To replace text content with other text or a fragment.

Figure 359. Schematron Quick Fix Components

The assertion message that generates the *Quick Fix* is added as the `<sqf:description>` of the problem to be fixed. The `<sqf:title>` is presented as the name of the *Quick Fix*. The content of the paragraphs (`<sqf:p>`) within the `<sqf:description>` element are presented in the tooltip message when the *Quick Fix* is selected.

Additional Elements Supported in the Schematron Quick Fixes

`<sqf:user-entry>`

This element defines a value that must be set manually by the user. For more information, see [User Entry SQF Operation \(on page 1025\)](#).

<sqf:call-fix>

This element calls another *Quick Fix* within a *Quick Fix*. The called *Quick Fix* must be defined globally or in the same Schematron rule as the calling *Quick Fix*. A calling *Quick Fix* adopts the activity elements of the called *Quick Fix* and should not include other activity elements. You can also specify which parameters are sent by using the `<sqf:with-param>` child element.

<sqf:group>

Allows you to group multiple *Quick Fixes* and refer them from an `<assert>` or `<report>` element.

<sqf:fixes>

Is defined globally and contains global fixes and groups of fixes.

<sqf:copy-of>

Used to copy the selected nodes that are specified by the `@select` attribute. The element with its attribute is treated as an `xsl:copy-of` with a `@select` attribute, as defined in the XSLT specification.

<sqf:param>

Defines a parameter for a *Quick Fix*. If the parameter is defined as `abstract` then the `type` and default value should not be specified and the fix can be called from an abstract pattern that defines this parameter.

Other SQF Notes

The `sqf:default-fix` attribute is also supported and taken into account when invoking the **Apply all default quick fix proposals** action from:

- The contextual menu in **Text** mode (on page 521).
- The **Tools** menu (on page 645).
- The **Refactoring** sub-menu in the contextual menu of the **Project** view (on page 645).
- The contextual menu in the **Results** view (on page 505).
- The **Quick Fix** menu (on page 2272).

For more details on editing Schematron *Quick Fixes*, go to: [Schematron Quick Fix Specifications](#)

Basic Schematron Quick Fix Operations

There are four basic operations that can be executed in a Schematron *Quick Fix* (on page 2272): **Add**, **Delete**, **Replace**, and **String Replace**.

Add

The `<sqf:add>` element allows you to add a node to the instance. An *anchor* node is required to select the position for the new node. The *anchor* node can be selected by the `@match` attribute. Otherwise, it is selected by the `@context` attribute of the rule.

The `@target` attribute defines the name of the node to be added. It is required if the value of the `@node-type` attribute is set to anything other than "comment".

The `<sqf:add>` element has a `@position` attribute and it determines the position relative to the *anchor* node. The new node could be specified as the first child of the *anchor* node, the last child of the *anchor* node, before the *anchor* node, or after the *anchor* node (`first-child` is the default value). If you want to add an attribute to the *anchor* node, do not use the `@position` attribute.

Note:

If you insert an element and its content is empty, Oxygen XML Developer will insert the required element content.

An Example of the `<sqf:add>` Element:

```
<schema xmlns="http://purl.oclc.org/dsdl/schematron"
  xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
  queryBinding="xslt2">
  <pattern>
    <rule context="head">
      <assert test="title" sqf:fix="addTitle">title element missing.</assert>
      <sqf:fix id="addTitle">
        <sqf:description>
          <sqf:title>Insert title element.</sqf:title>
        </sqf:description>
        <sqf:add target="title" node-type="element">Title text</sqf:add>
      </sqf:fix>
    </rule>
  </pattern>
</schema>
```

Specific Add Operations:

- **Insert Element** - To insert an element, use the `<sqf:add>` element, set the value of the `@node-type` attribute as "element", and specify the element *QName* (on page 2272) with the `@target` attribute. If the element has a prefix, it must be defined in the Schematron using a namespace declaration (`<ns uri="namespace" prefix="prefix"/>`).
- **Insert Attribute** - To insert an attribute, use the `<sqf:add>` element, set the value of the `@node-type` attribute as "attribute", and specify the attribute *QName* (on page 2272) with the `@target` attribute. If the attribute has a prefix, it must be defined in the Schematron using a namespace declaration (`<ns uri="namespace" prefix="prefix"/>`).

- **Insert Fragment** - If the `@node-type` attribute is not specified, the `<sqf:add>` element will insert an XML fragment. The XML fragment must be well-formed. You can specify the fragment in the `<sqf:add>` element or by using the `@select` attribute.
- **Insert Comment** - To insert a comment, use the `<sqf:add>` element and set the value of the `@node-type` attribute as "comment".
- **Insert Processing Instruction** - To insert a processing instruction, use the `<sqf:add>` element, set the value of the `@node-type` attribute as "pi" or "processing-instruction", and specify the name of the processing instruction in the `@target` attribute.

Delete

The `<sqf:delete>` element allows you to remove any type of node (such as elements, attributes, text, comments, or processing instructions). To specify nodes for deletion, the `<sqf:delete>` element can include a `@match` attribute that is an XPath expression (the default value is `.`). If the `@match` attribute is not included, it deletes the context node of the Schematron rule.

An Example of the `<sqf:delete>` Element:

```
<schema xmlns="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2"
  xmlns:sqf="http://www.schematron-quickfix.com/validator/process">
  <pattern>
    <rule context="*[@xml:lang]">
      <report test="@xml:lang" sqf:fix="remove_lang">
        The attribute "xml:lang" is forbidden.</report>
      <sqf:fix id="remove_lang">
        <sqf:description>
          <sqf:title>Remove "xml:lang" attribute</sqf:title>
        </sqf:description>
        <sqf:delete match="@xml:lang"/>
      </sqf:fix>
    </rule>
  </pattern>
</schema>
```

Replace

The `<sqf:replace>` element allows you to replace nodes. Similar to the `<sqf:delete>` element, it can include a `@match` attribute. Otherwise, it replaces the context node of the rule. The `<sqf:replace>` element has three tasks. It identifies the nodes to be replaced, defines the replacing nodes, and defines their content.

An Example of the `<sqf:replace>` Element:

```
<schema xmlns="http://purl.oclc.org/dsdl/schematron"
  xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
  queryBinding="xslt2">
```

```

<pattern>
  <rule context="title">
    <report test="exists(ph)" sqf:fix="resolvePh" role="warn">
      ph element is not allowed in title.</report>
    <sqf:fix id="resolvePh">
      <sqf:description>
        <sqf:title>Change the ph element into text</sqf:title>
      </sqf:description>
      <sqf:replace match="ph">
        <value-of select="."/ >
      </sqf:replace>
    </sqf:fix>
  </rule>
</pattern>
</schema>

```

Other Attributes for Replace Operations:

- **node-type** - Determines the type of the replacing node. The permitted values include:
 - **keep** - Keeps the node type of the node to be replaced.
 - **element** - Replaces the node with an element.
 - **attribute** - Replaces the node with an attribute.
 - **pi** - Replaces the node with a processing instruction.
 - **comment** - Replaces the node with a comment.
- **target** - By using a *QName (on page 2272)* it gives the replacing node a name. This is necessary when the value of the `@node-type` attribute is anything other than "comment".
- **select** - Allows you to choose the content of the replacing nodes. You can use XPath expressions with the `@select` attribute. If the `@select` attribute is not specified then the content of the `<sqf:replace>` element is used instead.

String Replace

The `<sqf:stringReplace>` element is different from the others. It can be used to find a sub-string of text content and replace it with nodes or other strings.

Attributes for the String Replace Operation:

- **match** - Allows you to select text nodes that contain the sub-strings you want to replace.
- **select** - Allows you to select the replacing fragment, in case you do not want to set it in the content of the `<stringReplace>` element.
- **regex** - Matches the sub-strings using a regular expression.

**Note:**

Consider the following information about using regular expressions in the `<stringReplace>` element:

- The regular expressions from this operation are compiled as Java regular expressions. For more information, see <https://docs.oracle.com/javase/7/docs/api/java/util/regex/Pattern.html>.
- The ***j flag*** allows you to use the standard Java regular expression engine, which allows native Java regular expression syntax. This allows, for example, the use of `\b` in a regular expression to match word boundaries. For more information, see <https://www.saxonica.com/html/documentation/functions/fn/matches.html>.
- Regular expressions in the `<sqf:stringReplace>` element always have the *dot matches all* flag set to "true". Therefore, the line terminator will also be matched by the regular expression.

- **flags** - Specifies flags to control the interpretation of the regular expression (given in the `@regex` attribute).

**Attention:**

The context of the content within the `<sqf:stringReplace>` element is set to the whole text node, rather than the current sub-string.

An Example of the `<sqf:stringReplace>` Element:

```
<?xml version="1.0" encoding="UTF-8"?>
<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron"
  xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
  queryBinding="xslt2">
  <sch:pattern>
    <sch:rule context="text()">
      <sch:report test="matches(., 'Oxygen', 'i')">
sqf:fix="changeWord">The oYgen word is not allowed</sch:report>
      <sqf:fix id="changeWord">
        <sqf:description>
          <sqf:title>Replace word with product</sqf:title>
        </sqf:description>
        <sqf:stringReplace regex="Oxygen" flags="i"><ph keyref="product"/>
        </sqf:stringReplace>
      </sqf:fix>
    </sch:rule>
```

```

</sch:pattern>
</sch:schema>

```

[Restricting Quick Fix Operations \(on page 1025\)](#)

[Examples of Schematron Rules and Quick Fixes \(on page 978\)](#)

User Entry SQF Operation

The `<sqf:user-entry>` element defines a value that must be set manually by the user. If multiple `<user-entry>` elements are defined, Oxygen XML Developer will display a dialog box for each one where the user can specify values. Also, the `<user-entry>` element can be used as an XPath variable where the XPath variable is the name of the `<user-entry>`. Note that the `@default` attribute defines a default value for the operation by using an XPath expression (as in the example below) and its value will be presented in the user entry dialog box.

An Example of the `<sqf:user-entry>` Element:

```

<sqf:fix id="editTitle">
  <sqf:description>
    <sqf:title>Edit the journal title</sqf:title>
  </sqf:description>
  <sqf:user-entry name="newTitle" default="@title">
    <sqf:description>
      <sqf:title>Edit the title:</sqf:title>
    </sqf:description>
  </sqf:user-entry>
  <sqf:replace match="@title" target="title" node-type="keep" select="$newTitle"/>
</sqf:fix>

```

Related Information:

[Basic Schematron Quick Fix Operations \(on page 1020\)](#)

[Examples of Schematron Rules and Quick Fixes \(on page 978\)](#)

Restricting Quick Fix Operations

To restrict a *Quick Fix* (on page 2272) or a specific operation to only be available if certain conditions are met, the `@use-when` attribute can be included in the `<sqf:fix>` element or any of the SQF operation elements. The condition of the `@use-when` attribute is an XPath expression and the fix or operation will be performed only if the condition is satisfied. In the following example, the `use-when` condition is applied to the `<sqf:fix>` element:

```

<sqf:fix id="last" use-when="$colWidthSummarized - 100 lt $lastWidth"
  role="replace">
  <sqf:description>
    <sqf:title>Subtract excessive width from the last element.</sqf:title>

```

```

</sqf:description>

<let name="delta" value="$colWidthSummarized - 100"/>

<sqf:add match="html:col[last()]" target="width" node-type="attribute">

  <let name="newWidth" value="number(substring-before(@width,'%')) - $delta"/>

  <value-of select="concat($newWidth,'%')"/>

</sqf:add>

</sqf:fix>

```

Related Information:

[Basic Schematron Quick Fix Operations \(on page 1020\)](#)

Formatting/Indenting Content Inserted by SQF Operations

Content that is inserted by the **Add**, **Replace**, or **String Replace** Schematron *Quick Fix (on page 2272)* operations is automatically indented unless you set the value of the `@xml:space` attribute to `preserve` on the operation element. There are several methods available to format the content that is inserted:

- **xsl:text** - You can use an `<xsl:text>` element to format the inserted content and keep the automatic indentation, as in the following example:

```

<sqf:add position="last-child">

  <row><xsl:text>

    <entry>First column</entry><xsl:text>

    </xsl:text>

    <entry>Second column</entry><xsl:text>

    </xsl:text>

  </row><xsl:text>

</xsl:text>

</sqf:add>

```

- **xml:space** - Use the `@xml:space` attribute and set its value to `preserve` to format the content and specify the spacing between elements, as in the following example:

```

<sqf:add node-type="element" target="codeblock" xml:space="preserve">

  /* a long sample program */

  Do forever

  Say "Hello, World"

  End</sqf:add>

```

Related Information:

[Basic Schematron Quick Fix Operations \(on page 1020\)](#)

Executing Schematron Quick Fixes in Other Documents

You can apply Schematron *Quick Fixes* (on page 2272) over nodes from referenced documents (using XInclude or external entities), and you can access them as nodes in your current document.

Also, you can apply the *Quick Fixes* over other documents using the `doc()` function in the value of the `@match` attribute. For example, you can add a new `<Key>` element with the value of `newVal` as the last child in the `<KeyList>` element from the `keylist.xml` file using the following operation:

```
<sqf:add match="doc('keylist.xml')/KeyList" target="Key" node-type="element"
  select="'newVal'" position="last-child"/>
```

The `keylist.xml` file can have a structure similar to this:

```
<KeyList>
  <Key>one</Key>
  <Key>two</Key>
</KeyList>
```

Generate Multiple Similar Quick Fixes

You can generate the same Schematron *Quick Fix* (on page 2272) for multiple matches. To do this, you can add the `@use-for-each` attribute inside the `<sqf:fix>` element and for each match of the XPath expression in the value of the `@use-for-each` attribute, a Quick Fix will be presented to the user. The XPath expression does not change the context of the Quick Fix. If you want to access the current match from the XPath expression, you can use the `$sqf:current` variable.

Example:

Suppose you want to restrict the user from entering more than 4 list items in a list. The following example presents an error on any list that has more than 4 list items and offers a Quick Fix with multiple proposals where the user would specify which list item to remove.

```
<sch:rule context="ul">
  <sch:report test="count(li) gt 4" sqf:fix="removeAnyItem">
    The list cannot contain more than 4 entries.
  </sch:report>
  <sqf:fix id="removeAnyItem" use-for-each="1 to count(li)">
    <sqf:description>
      <sqf:title>Remove item #<sch:value-of select="$sqf:current"/></sqf:title>
    </sqf:description>
    <sqf:delete match="li[$sqf:current]"/>
  </sqf:fix>
</sch:rule>
```

Localizing SQF Messages

Oxygen XML Developer provides support for presenting Schematron Quick Fix messages in multiple languages. The language used for the SQF messages is the language specified in the **'Message Language** option in the **Schematron preferences page** (on page 209). If you want to provide an alternative message for a specific language, you can reference IDs or key values for the specific alternate text phrase. In Oxygen XML Developer, the alternate text phrase is defined in a `<sch:diagnostic>` element and it can be used in conjunction with `<sch:assert>` or `<sch:report>` elements.

Example:

The following example presents a quick fix with a different message depending on whether the user's language is English or German.

```
<sch:rule context="dog">
  <sch:assert test="bone" diagnostics="d_en d_de" sqf:fix="addBone" >
    A dog should have a bone.</sch:assert>

  <sqf:fix id="addBone">
    <sqf:description>
      <sqf:title ref="fix_en fix_de" xml:lang="en">Add a bone</sqf:title>
      <sqf:p ref="fix_desc_en fix_desc_de" xml:lang="en">Add bone element as child</sqf:p>
    </sqf:description>
    <sqf:add node-type="element" target="bone"/>
  </sqf:fix>
</sch:rule>
...
<sch:diagnostics xml:lang="en">
  <sch:diagnostic id="d_en"> A dog should have a bone. </sch:diagnostic>
  <sch:diagnostic id="fix_en"> Add a bone </sch:diagnostic>
  <sch:diagnostic id="fix_desc_en">Add a bone element as child</sch:diagnostic>
</sch:diagnostics>
<sch:diagnostics xml:lang="de">
  <sch:diagnostic id="d_de"> Ein Hund sollte ein Bein haben. </sch:diagnostic>
  <sch:diagnostic id="fix_de"> Fügen Sie einen Knochen hinzu </sch:diagnostic>
  <sch:diagnostic id="fix_desc_de"> Fügen Sie ein Knochenelement als
    untergeordnetes Element hinzu </sch:diagnostic>
</sch:diagnostics>
```

Integrating SQF in a Framework and Sharing Them

You can use Schematron *Quick Fixes* (on page 2272) to assist your content authors by imposing rules for an entire *framework* (on page 2269) (document type) and offering fixes when a rule violation is detected.

For example, if you are using DITA, you may want your contributors to avoid inserting a figure (`<fig>` element) inside a paragraph (`<p>` element) that contains other content since it may result in undesirable placement or spacing in the output. The Schematron rule and its *Quick Fix* for this particular use-case could look like this:

```
<schema xmlns="http://purl.oclc.org/dsdl/schematron"
  xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
  queryBinding="xslt2">
  <pattern id="check.figure.location">
    <rule context="p/fig">
      <report test="true()" role="warn" sqf:fix="moveAfter">
        A figure inside a paragraph doesn't transform well into PDF. </report>
      <sqf:fix id="moveAfter">
        <sqf:description>
          <sqf:title>Move after the paragraph.</sqf:title>
        </sqf:description>
        <let name="figToMove" value="."/>
        <sqf:add match="parent::p" select="$figToMove" position="after"/>
        <sqf:delete match="."/>
      </sqf:fix>
    </rule>
  </pattern>
</schema>
```

The result of this example would be that the user will see a warning if they insert a `<fig>` element inside a `<p>` element and they are presented with the option of selecting the *Quick Fix* that would move the figure outside the paragraph.

How to Integrate SQF in a Framework

To integrate a Schematron *Quick Fix* in a *framework (on page 2269)*, follow these steps:

1. Create a folder structure for an extended framework and save it somewhere on disk where you have full write access (for example, `custom_frameworks/dita-extension`).
2. In that new folder structure, create another folder that will contain all of your custom Schematron files (for example, `custom_frameworks/dita-extension/rules`).
3. Define the Schematron *Quick Fix* for a rule (*on page 1019*) in an existing or new Schematron file and save it in the folder you created in step 2.
4. Open the **Preferences** dialog box (**Options > Preferences**) (*on page 114*) and go to **Document Type Association > Locations** (*on page 129*). In this preferences page, add the path to your `custom_frameworks` folder in the **Additional frameworks directories** list, then click **OK** or **Apply** to save your changes.
5. Go to the **Document Type Association** preferences page (*on page 128*) and select a *framework* configuration (for example, **DITA**) and use the **Extend** button to create an extension for it.

6. Give the extension an appropriate name (for example, *DITA - Custom*), select **External** for the **Storage** option, and specify an appropriate path to your framework configuration file (for example, `path/to/.../custom_frameworks/dita-extension/dita-extension.framework`).
7. Make whatever changes you desire to the extension, then go to the **Validation** tab, edit the default validation scenario (select the scenario and click the  **Edit** button), and add an extra validation unit to it (one that uses your custom Schematron file that includes the SQF).
8. Click **OK** to close the dialog box and then **OK** or **Apply** to save the changes to the **Document Type Association** preferences page (*on page 128*).
9. Add a reference to the Schematron file that includes the SQF in your *framework* by following the procedure in *Associating a Schema in Validation Scenarios Defined in the Document Type* (*on page 588*).
10. Open a document in your *framework* and test the new rule and *Quick Fix*.
11. You can continue to refine the Schematron and develop additional rules as needed.

Sharing Schematron Quick Fixes

To share Schematron Quick Fixes with other members of your team, you simply need to share the framework where you integrated the SQF.

[Basic Schematron Quick Fix Operations](#) (*on page 1020*)

[Associating a Schema in Validation Scenarios Defined in the Document Type](#) (*on page 588*)

Validating Schematron Quick Fixes

By default, Schematron *Quick Fixes* (*on page 2272*) are validated as you edit them within the Schematron file or while editing them in a separate file. To change this, [open the Preferences dialog box \(Options > Preferences\)](#) (*on page 114*), go to **Editor > Document Checking**, and deselect the **Enable automatic validation** option (*on page 195*).

To validate Schematron *Quick Fixes* manually, select the  **Validate** action from the  **Validation** toolbar drop-down menu or the **Document > Validate** menu. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

Related Information:

[Validating XML Documents Against a Schema](#) (*on page 545*)

[Validation Scenario](#) (*on page 554*)

[Presenting Validation Errors in Text Mode](#) (*on page 548*)

Content Completion in SQF

Oxygen XML Developer helps you edit Schematron *Quick Fixes* (on page 2272) embedded in a Schematron document by offering proposals that are valid at the cursor position in a *Content Completion Assistant* (on page 2267). It can be manually activated with the **Ctrl + Space** shortcut.

When you edit the value of an attribute that references a *Quick Fix ID*, the ids are collected from the entire definition scope. For example, if the editing context is `assert/@sqf:fix`, the *Content Completion Assistant* proposes all fixes defined locally and globally.

If the editing context is an attribute value that is an XPath expression (such as `sqf:add/@match` or `replace/@select`), the *Content Completion Assistant* offers the names of XPath functions, the XPath axes, and user-defined variables and parameters.

The *Content Completion Assistant* displays XSLT 1.0 functions (and optionally XSLT 2.0 / 3.0 functions) in the `@path`, `@select`, `@context`, `@subject`, and `@test` attributes, depending on the Schematron options (on page 209) that are set in Preferences pages. If the Saxon namespace (`xmlns:saxon="http://icl.com/saxon"`) or the Saxon namespace is declared in the Schematron schema (`xmlns:saxon="http://saxon.sf.net/"`) the content completion also displays the XSLT Saxon extension functions.

Highlight Quick Fix Occurrences in SQF

When you position your mouse cursor over a *Quick Fix* (on page 2272) ID in a Schematron document, Oxygen XML Developer searches for the *Quick Fix* declaration and all its references and highlights them automatically.

Customizable colors are used: one for the *Quick Fix* definition and another one for its references. Occurrences are displayed until another *Quick Fix* is selected.

To change the default behavior of **Highlight Component Occurrences**, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Editor > Mark Occurrences**. You can also trigger a search using the **Search > Search Occurrences in File** (**Ctrl + Shift + U** (**Command + Shift + U on macOS**)) action from contextual menu. Matches are displayed in separate tabs of the **Results view** (on page 503).

Searching and Refactoring Operations in SQF

Search Actions

The following search actions can be applied on *Quick Fix* (on page 2272) IDs and are available from the **Search** submenu in the contextual menu of the current editor or from the **Document > References** menu:

Search References

Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the currently edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.

Search References in

Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.

Search Declarations

Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the currently edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.

Search Declarations in

Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.

Search Occurrences in File

Searches all occurrences of the item at the cursor position in the currently edited file.

Refactoring Actions

The following refactoring actions can be applied on *Quick Fix* IDs and are available from the **Refactoring** submenu in the contextual menu of the current editor or from the **Document > Refactoring** menu:

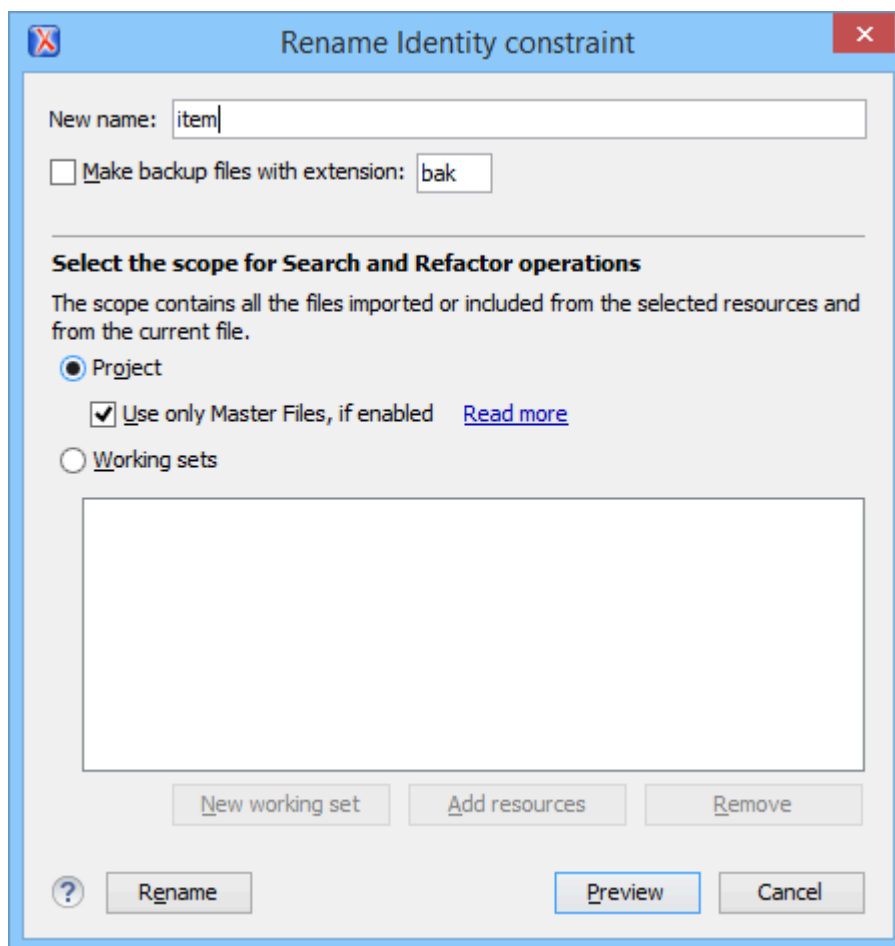

Rename Component

Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.

Rename Component in

Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

Figure 360. Rename Identity Constraint Dialog Box

Embedding Schematron Quick Fixes in Relax NG or XML Schema

Schematron *Quick Fixes* (on page 2272) can be embedded into an XML Schema through annotations (using the `<appinfo>` element), or in a Schematron rule embedded in the RELAX NG Schema. For more information about embedding Schematron in XML Schema or Relax NG, see [Embedding Schematron Rules in XML Schema or RELAX NG](#) (on page 995).

Oxygen XML Developer is able to extract and use the embedded Schematron *Quick Fixes*. To make the embedded Schematron *Quick Fixes* available, follow these steps:

1. Define a [validation against a schema](#) (on page 545).
2. For the **Schema type**, choose XML Schema OR Relax NG.
3. Select the **Embedded Schematron rules** option.

Example: Embedded Schematron Quick Fix in XML Schema

```
<xsd:appinfo>
  <sch:pattern>
    <sch:rule context="...">
      <sch:assert test="..." sqf:fix="fixId">Message.</sch:assert>
      <sqf:fix id="fixId">
```

```

.....

</sqf:fix>

</sch:rule>

</sch:pattern>

</xsd:appinfo>

```

Example: Embedded Schematron Quick Fix in Relax NG

```

<grammar
  xmlns="http://relaxng.org/ns/structure/1.0"
  xmlns:sch="http://purl.oclc.org/dsdl/schematron" >
  <sch:pattern>
    <sch:rule context="...">
      <sch:assert test="..." sqf:fix="fixId">Message.</sch:assert>
      <sqf:fix id="fixId">
        .....
      </sqf:fix>
    </sch:rule>
  </sch:pattern>
  <start>
    .....
  </start>
</grammar>

```

Tip:

For more extensive examples, see the samples in the `[OXYGEN_INSTALL_DIR]/samples/schematron` folder.

[Embedding Schematron Rules in XML Schema or RELAX NG \(on page 995\)](#)

[Defining Schematron Quick Fixes \(on page 1019\)](#)

Editing SVG Files

SVG (Scalable Vector Graphics) is a platform for two-dimensional graphics. It has two parts: an XML-based file format and a programming API for graphical applications. Some of the key features include support for shapes, text, and embedded raster graphics with many painting styles, scripting through languages such as *ECMAScript*, and support for animation.

SVG is a vendor-neutral, open standard that has important industry support. Companies such as Adobe, Apple, and IBM have contributed to its W3C specifications. Many documentation *frameworks* (on page 2269) (including DocBook) have support for SVG by defining the graphics directly in the document.

Oxygen XML Developer adds SVG support by using the [Batik distribution](#) package (an open source project developed by the Apache Software Foundation) and the [default XML Catalog \(on page 593\)](#) resolves the SVG DTD.

**Note:**

Batik partially supports SVG 1.1. For a detailed list of supported elements, attributes, and properties, see the [Batik Implementation Status](#) page.

How to Render SVG Images that Use Java Scripting

1. Copy the `js.jar` library from the [Batik distribution](#) into the Oxygen XML Developer `lib` folder.
2. Restart the application.

SVG 1.2 Rendering Issues

Oxygen XML Developer uses the *Apache Batik* open source library to render SVG images and it only has partial support for SVG 1.2. For more information, see <http://xmlgraphics.apache.org/batik/dev/svg12.html>.

This partial support could lead to some rendering issues in Oxygen XML Developer. For example, if you are using the *Inkscape* SVG editor, it is possible for it to save the SVG as 1.1, while using SVG 1.2 elements (such as `<flowRoot>`) inside it. This means that the image will not be properly rendered inside the application.

Standalone SVG Viewer

Oxygen XML Developer includes a simple **SVG Viewer** that allows you to work with SVG images.

To open the viewer, select **SVG Viewer** from the **Tools** menu.

Figure 361. SVG Viewer

You can browse for and open any SVG file that has the `.svg` or `.svgz` extension.

If the file is included in the current project, you can open it in the viewer by right-clicking the image file in the **Project view** (on page 365) and selecting **Open with > SVG Viewer**.

Actions Available in the SVG Viewer

The following actions are available in the **SVG Viewer**:

Zoom in

To zoom in on an image, use any of the following methods:

- Scroll **forward** with the mouse wheel.
- Select **Zoom in** from the contextual menu.
- Use the **Ctrl + I (Command + I on macOS)** keyboard shortcut.

Zoom out

To zoom in on an image, use any of the following methods:

- Scroll **backward** with the mouse wheel.
- Use the **Ctrl + O (Command + O on macOS)** keyboard shortcut.
- Select **Zoom out** from the contextual menu.

Rotate

To rotate an image, use either of the following methods:

- Use the **Ctrl + Right-Click + Drag (Command + Right-Click + Drag on macOS)** shortcut.
- Select **Rotate** from the contextual menu. This rotates the image exactly 90 degrees clockwise.

Refresh

To refresh (or reset) an image, use either of the following methods:

- Use the **Ctrl + T (Command + T on macOS)** keyboard shortcut.
- Select **Refresh** from the contextual menu.

Move

To move an image, use either of the following methods:

- Use the **Arrow Keys** on your keyboard.
- Use the **Shift + Left-Click + Drag** shortcut.

Pan

To pan an image, **click and drag** the image with your mouse.

Related Information:[Editing SVG Files \(on page 1034\)](#)

Integrated SVG Viewer in the Results Panel

Oxygen XML Developer includes an integrated **SVG Viewer** that can render the results of an XSLT transformation scenario that generates SVG images in the **Results panel (on page 503)** at the bottom of the editor. This is useful for developing XSL stylesheets with the capability of producing SVG graphics.

To enable this feature, select **Show in results view as > SVG** in the **Output tab of the XSLT transformation scenario configuration dialog box (on page 1140)**. When you run the transformation, the SVG result is then rendered in an integrated SVG viewer in the **Results panel (on page 503)**.

Example of a Use-Case

Suppose you have an XML document that describes the evolution of your sales over a time period and you want to create a graphic for it. You could use the following steps to accomplish this task:

1. Start with a static SVG image, written directly in Oxygen XML Developer or exported from an external graphics tool.
2. Extract the parts that are dependent upon the data from the XML document and create an XSL template to produce the image.
3. Create an **XML transformation with XSLT scenario (on page 1130)**.
4. While configuring the transformation scenario, select **Show in results view as > SVG** in the **Output tab (on page 1140)** of the configuration dialog box.
5. Run the transformation.

The SVG image is rendered in an integrated SVG viewer in the **Results panel (on page 503)** at the bottom of the editor.

Figure 362. Integrated SVG Viewer

Editing HTML Documents

Oxygen XML Developer provides a special framework for editing HTML files (*html* or *htm* file extensions) with a variety of specialized editing features, including validation, content completion, syntax highlighting, HTML-specific actions, and more.

Oxygen XML Developer also includes a [built-in XHTML framework \(on page 1084\)](#) (files with the *http://www.w3.org/1999/xhtml* namespace or with the *xhtml* or *xht* file extension) that has a full set of features (full editing support, document templates, enhanced CSS rendering, specific actions, validation, content completion, transformation scenarios, and more). Oxygen XML Developer also includes support for [importing HTML files as an XML document \(on page 1828\)](#).

Resources

For more information about the HTML support in Oxygen XML Developer, see the following resources:

- Webinar: [HTML5 Support in Oxygen](#).
- Video: [HTML Support in Oxygen](#).

Related information

[XHTML Document Type \(Framework\) \(on page 1084\)](#)

HTML Editor

Oxygen XML Developer includes a specialized HTML editor and various editing features for files that have the *html* or *htm* file extensions. The encoding is detected automatically based on the value specified in the `@charset` attribute of the `<meta>` element.

Note:

If an HTML document has an XHTML namespace, or there is an XSD schema declared, or there is a PUBLIC ID specified in a DOCTYPE, or there is a SYSTEM ID with a value other than *"about:legacy-compat"*, then the document will be opened as an XHTML file.

New Document Template

Oxygen XML Developer includes a new document template to help you get started creating HTML content. It is available when creating [new documents from templates \(on page 330\)](#) and can be found in the **New Document** folder or by typing *html* in the search field.

Text Mode Editor

You can edit HTML files in the **Text** editing mode using all of its useful features. It includes content completion based on a special HTML schema, [syntax highlighting \(on page 1041\)](#), a specialized [Outline view \(on page 1042\)](#) that presents the structure, [folding support \(on page 1042\)](#), and more.

HTML documents support formatting and indenting single or multiple documents to make them more readable. The formatting works even if the document is not XML well-formed and it also works on embedded CSS or JavaScript code. The HTML formatting details are similar to those for XML documents. For details, see [Formatting and Indenting XML Documents \(on page 510\)](#).

HTML-Specific Contextual Menu Actions

There are some specialized actions (available in the contextual menu when you right-click anywhere in the current HTML document) that invoke features unique to HTML documents. These contextual menu actions include:

View in Browser/System Application

Opens the HTML document in your default browser.

Minify HTML

Compresses the HTML document by removing unnecessary white spaces, without affecting the functionality of the document, but significantly reducing the loading time in Web browsers.

HTML to XML Well-formed

Converts the currently edited HTML document to be XML well-formed. This means that unclosed tags will be properly closed, unquoted attribute values will be quoted, and more. This is helpful if, for example, you use XSLT stylesheets while applying transformations on HTML documents (since the transformation will require the HTML document to be XML well-formed).

HTML Validation

Oxygen XML Developer includes a built-in default validator used for validating HTML documents. It is based upon the W3C HTML Validator and the HTML documents are validated against the [W3C HTML5 specification](#). The validator in Oxygen XML Developer only supports HTML5 structure. It presents the errors in the editor similar to XML documents. It also checks the embedded CSS content and the warnings and errors are presented similar to the [CSS editor \(on page 845\)](#).

Validating HTML Against a Schematron

It is also possible to validate HTML documents against a Schematron schema. Besides the default HTML validator, Oxygen XML Developer also includes a built-in *HTML Schematron Validator* engine. There are several ways to validate an HTML document against a Schematron:

- **Configure a Validation Scenario** - You can create or edit a validation scenario, change the **File type** column to *HTML Document*, change the **Validation engine** column to *HTML Schematron Validator*, and specify the Schematron document in the **Schema** column.
- **Manually Validate a Single Document** - You can use the **Validate with** action from the  **Validation** drop-down menu on the toolbar. This opens a dialog box where you can specify the Schematron document to validate the current document against.
- **Batch Validate Multiple Documents** - You can select multiple HTML documents in the **Project** view, right-click, and use the **Validate with schema** action from the **Validate** submenu. This opens a dialog box where you can specify the Schematron document to validate the selected documents against.

**Notes:**

- The Schematron must use the HTML5 namespace to reference the elements from the instance.
- Implicit HTML elements (i.e. `<html>`, `<body>`, `<tbody>`) must be included in an XPath expression in the Schematron document, even if they are missing from the HTML document.

**Tip:**

The Oxygen XML Developer installation directory includes a `samples` folder that contains numerous sample files to help you learn about features, certain file types, and XML technologies. For example, inside the `samples` folder, there is an `html` folder with a `schematron` subfolder where you can find some samples that illustrate HTML validation against a Schematron schema.

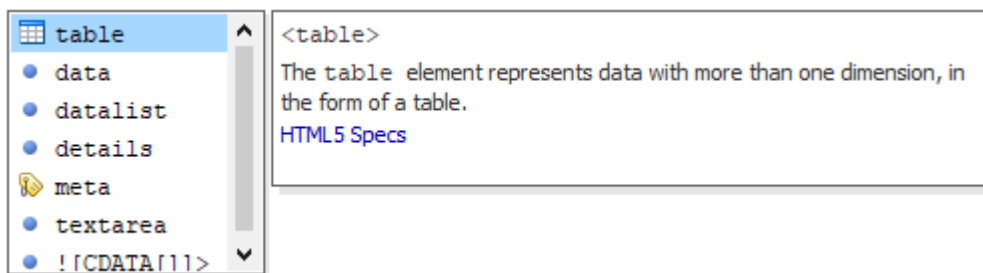

Validating HTML Against Other Types of Schema

If your HTML document is XML well-formed, you could also configure a validation scenario to validate it as an XML document against other types of schemas. You would create or edit a validation scenario, make sure the **File type** column is set to *XML Document*, select the appropriate **Validation engine**, and specify the schema document in the **Schema** column.

HTML Content Completion Assistant

Oxygen XML Developer includes an intelligent *Content Completion Assistant* (on page 2267) that offers proposals for inserting HTML structures that are valid at the current editing location. Content completion is even available for CSS and JavaScript code that is embedded in an HTML document.

The *Content Completion Assistant* is enabled by default. To disable it, open the **Preferences** dialog box (**Options > Preferences**) (on page 114), go to **Editor > Content Completion**, and deselect the **Enable content completion** option (on page 179).

Figure 363. Content Completion Assistant in HTML

Using the Content Completion in HTML

For HTML documents, the *Content Completion Assistant* uses a built-in schema and the list of proposals depend on the RELAX NG schema specified in the HTML framework. Using the content completion feature is the same as with any other XML document. For more details, see:

- [Using the Content Completion Assistant in Text Mode \(on page 487\)](#)

Code Templates in the Content Completion

Oxygen XML Developer includes a set of built-in code templates for HTML documents that can be selected from the *Content Completion Assistant*. The code templates are displayed with a  symbol in the content completion list. You can also define your own code templates and share them with others. For more information, see [Code Templates \(on page 491\)](#).

Content Completion for XPath Expressions

When entering XPath expressions in the **XPath** toolbar or **XPath Builder** view, the *Content Completion Assistant* is available as you type to help you compose query patterns.

Syntax Highlighting in HTML Documents

Oxygen XML Developer supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

For HTML documents, it handles attributes without quotes, unclosed or void elements, and it also offers highlighting for embedded CSS or JavaScript content.

To customize the colors or styles used for the syntax highlighting colors for HTML files, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114).
2. Go to **Editor > Syntax Highlight** (on page 193).
3. Select and expand the **XHTML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

Related Information:[Syntax Highlight Preferences \(on page 193\)](#)

Folding in HTML

In a large HTML document, elements can be collapsed so that only the needed data remains in focus. The [folding features available for XML documents \(on page 483\)](#) are also available in HTML documents, but it also provides folding for nested elements that are not closed.

Minifying HTML Documents

Minification (or compression) of an HTML document is the practice of removing unnecessary white spaces, without affecting the functionality of the document, but significantly reducing the loading time in Web browsers. While a minified HTML document gains in terms of execution performance, it is more difficult to read.

To minify an HTML document, right-click anywhere in the editor for an HTML document that is open in **Text** mode (or right-click an HTML document in the **Project** view and select the **Minify HTML** action. This opens a dialog box with the following options:

Output file

Use this option to set the name and location of the resulting compressed/minified HTML document.

Remove comments

If selected (default), all the HTML comments and also the comments from embedded CSS or JavaScript code blocks will be removed from the resulting output file.

Compress on a single line

If selected (default), the resulting output file will consist of a single line, as all the *'new line'* characters from the source document are removed.

Open output file in editor

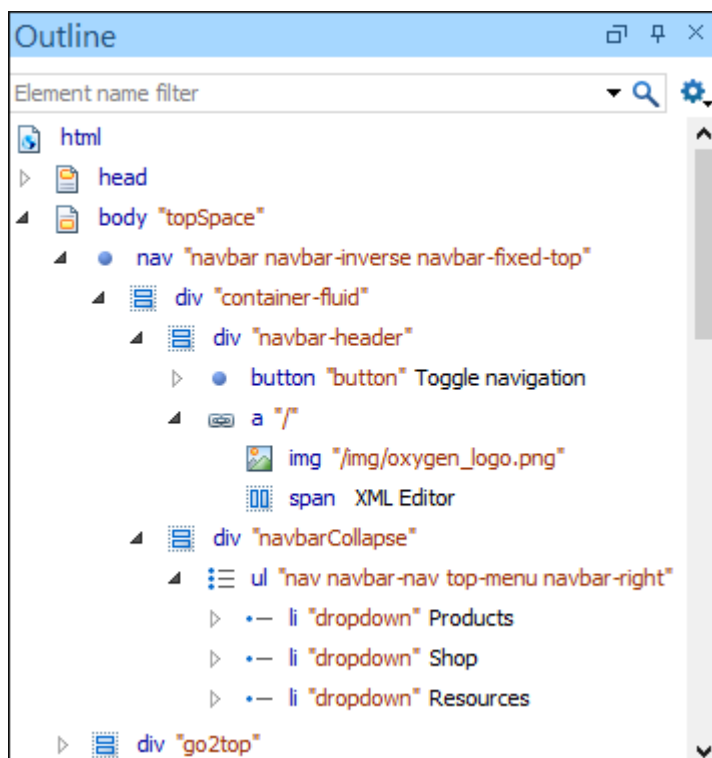

If selected (default), the resulting output file will be opened in Oxygen XML Developer.

When you click **OK**, the resulting HTML document is a compressed version of the original file for the purpose of enhanced performance, while losing some readability. The source HTML document is not affected.

HTML Outline View

The **Outline** view for HTML documents displays the structure of the HTML document you are editing. By default, it is displayed on the left side of the editor. In addition to the normal features available in the **Outline** view for XML documents, the HTML **Outline** view also handles void elements, elements that are not closed, or attributes without quotes, and presents the tree structure of the HTML document correctly.

Figure 364. HTML Outline View

Querying HTML Documents with XPath

Oxygen XML Developer provides an **XPath** toolbar that makes it easy to quickly query HTML documents using XPath expressions. You can also use the dedicated **XPath Builder** view ([on page 1735](#)) that allows you to compose more complex XPath expressions and execute them over HTML documents (even if they are not well-formed according to XML standards). Both the **XPath** toolbar and **XPath Builder** view offer content completion as you type to help you compose expressions.

XPath Toolbar

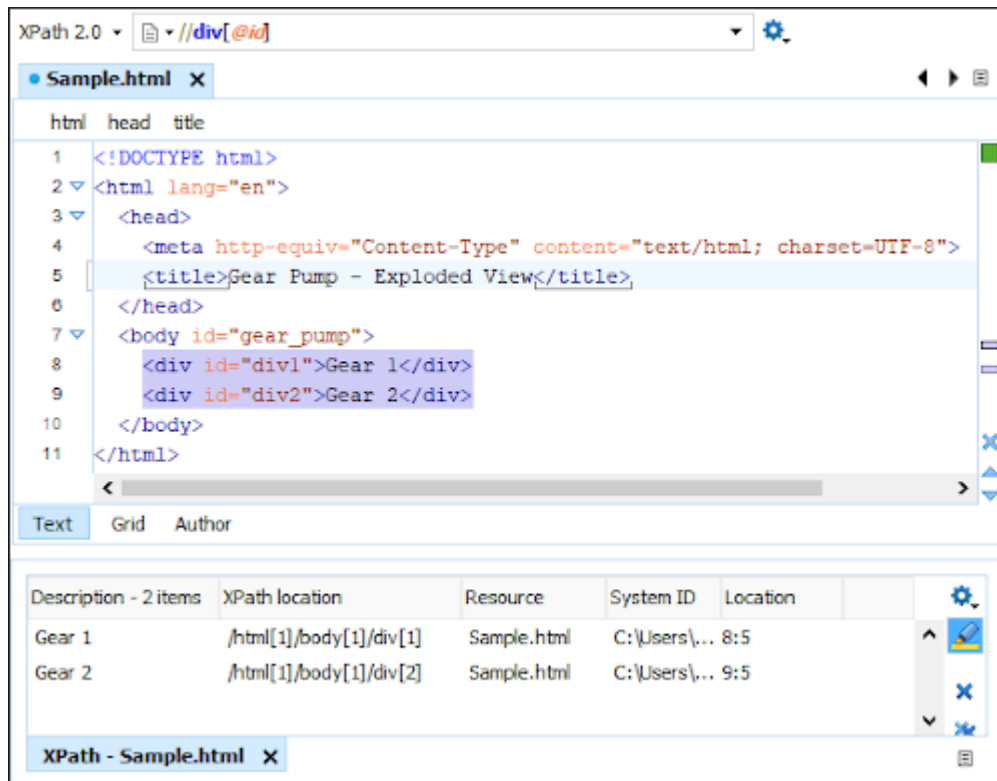

You can run an XPath expression over an HTML document or on an entire project. For more information about this toolbar, see [XPath Toolbar \(on page 1733\)](#).

Note:

Implicit HTML elements (i.e. `<html>`, `<body>`, `<tbody>`) must be included in the XPath expression, even if they are missing from the HTML document.

Figure 365. XPath Toolbar for HTML

Editing Markdown Documents

Markdown was created as a lightweight markup language with plain text formatting syntax designed to provide syntax that is very easy to read and write, and to convert it to HTML and other formats. It is often used by content contributors who want a quick and easy way to write content without having to take their fingers off the keyboard and without having to learn numerous codes or shortcuts, and it can easily be shared interchangeably between virtually any types of contributor and system.

Oxygen XML Developer provides a built-in Markdown editor that allows you to convert Markdown syntax to HTML or DITA and it includes a preview panel to help you visualize the final output. Aside from the plain text syntax that is common among most Markdown applications, the editor in Oxygen XML Developer also integrates many other powerful features that content authors are accustomed to using for other types of documents. Some of these additional unique features include:

- Additional toolbar and contextual menu actions.
- Automatic validation to help keep the syntax valid.
- Dedicated syntax highlighting to make Markdown documents even easier to read and write.
- Unique features for creating Markdown documents directly in *DITA maps (on page 2268)* and converting Markdown documents to DITA topics.
- Specialized syntax rules to combine popular syntax features from several specifications.

Resources

For more information about editing Markdown documents in Oxygen XML Developer, see our webinar: [Oxygen Markdown Support](#).

Markdown Editor

Oxygen XML Developer provides an intuitive, dynamic, and easy-to-use Markdown editor. It is a split-screen editor with two panels that are synchronized in real time. The left side is a simple text editor that is specially designed for writing Markdown syntax. The right side is a WYSIWYG style preview of how changes will look in the output.

Markdown Text Editor Pane (Left Side)

The left pane is a simple text editor that is refined to accept Markdown syntax. At the same time, you still have many of the actions, options, and features that you are used to when editing any other type of document in Oxygen XML Developer.

The features of this special editor that are unique for Markdown documents include:

- **Unique Markdown Syntax Rules** - The Markdown editor in Oxygen XML Developer uses [an integration of rules \(on page 1055\)](#) that combine rules from common default Markdown syntax along with many of the rules used in the GitHub Flavored Markdown syntax.
- **Syntax Highlighting** - The Oxygen XML Developer syntax highlighting feature is integrated into the Markdown text editor to make it easier to read and write Markdown syntax. You can even [customize the colors and styles for the syntax highlighting \(on page 1054\)](#).
- **Automatic Spell Checking** - The Markdown editor supports the Oxygen XML Developer [automatic spell checking feature \(on page 419\)](#) that reports possible misspelled words as you type. You simply need to select the **Automatic spell check** option in the **Spell Check** preferences page [\(on page 198\)](#), then click the **Select editors** button and select **Markdown Editor**.
- **Helpful Toolbar and Contextual Menu Actions** - A [variety of unique actions \(on page 1047\)](#) are available from the toolbar to help you insert proper Markdown syntax. The contextual menu also includes some common editing actions, as well as unique actions to export (convert) Markdown documents to HTML or DITA.
- **Shortcut Keys** - Many of the [shortcut keys that are most commonly used \(on page 36\)](#) in Oxygen XML Developer also work in the Markdown editor.

Figure 366. Markdown Editor

Related information

[Markdown Editor Syntax Rules and Specifications \(on page 1055\)](#)

[Actions Available in the Markdown Editor \(on page 1047\)](#)

[Creating New Markdown Documents \(on page 1046\)](#)

Creating New Markdown Documents

To create a new Markdown document in Oxygen XML Developer, follow these steps:

1. Click the  **New** button on the toolbar or select **File > New**.
2. Select the  **Markdown** document template (in the **New Document** folder).
3. Click the **Create** button.

Result: A new Markdown document is created and it is opened in the specialized [Markdown Editor \(on page 1045\)](#).

Related Information:[Markdown Editor \(on page 1045\)](#)

Actions Available in the Markdown Editor

Aside from the actions that are available in Oxygen XML Developer for any type of document (such as the actions in the various menus and the common sections of the toolbar), a variety of unique actions are also available in the Markdown editor, from the toolbar and contextual menu.

Toolbar Actions

The following default actions are available on the Markdown toolbar when editing Markdown documents:

H₁ Header (1st Level)

Inserts an *atx-style first-level header* ([on page 1056](#)) at the cursor position.

H₂ Header (2st Level)

Inserts an *atx-style second-level header* ([on page 1056](#)) at the cursor position.

H₃ Header (3rd Level)

Inserts an *atx-style third-level header* ([on page 1056](#)) at the cursor position.

— Horizontal Rule

Inserts a *horizontal rule* ([on page 1056](#)) at the cursor position.

****B** Bold (Strong)**

Marks the selected text with *bold* ([on page 1057](#)).

***I* Italic (Emphasis)**

Marks the selected text with *italics* ([on page 1057](#)).

~~Ⓢ~~ Strikethrough

Marks the selected text with a *strikethrough* ([on page 1057](#)).

{ } Code Block

Inserts (or surrounds selected text in) a *codeblock* ([on page 1061](#)).

”” Blockquote

Inserts a *blockquote* ([on page 1060](#)) at the cursor position.

Insert Link

Opens the **Insert Link** dialog box that allows you to define a *link* ([on page 1058](#)) to insert at the cursor position.

Figure 367. Insert Link Dialog Box

Insert Image

Opens the **Insert Image** dialog box that allows you to define an *image (on page 1060)* to insert at the cursor position. You can type the URL of the image you want to insert or use browsing actions in the  **Browse** drop-down menu.

Figure 368. Insert Image Dialog Box

Insert Ordered List

Inserts an *ordered list (on page 1063)* at the cursor position. Three child list items are also automatically inserted by default. You can also use this action to convert selected content to an ordered list.

Insert Unordered List

Inserts an *unordered list (on page 1063)* at the cursor position. Three child list items are also automatically inserted by default. You can also use this action to convert selected content to an unordered list.

Insert Task List

Inserts a *task list (on page 1065)* at the cursor position. Three child list items are also automatically inserted by default. You can also use this action to convert selected content to a task list.

Insert Table

Inserts a *table (on page 1065)* at the cursor position.

Contextual Menu Actions

The following default actions are available in the contextual menu when editing Markdown documents:

 **Cut**,  **Copy**,  **Paste**

Use these actions to execute the typical editing actions on the currently selected content.

Source submenu

This submenu includes the following actions:

To Upper Case

Converts the content selection to upper case characters.

To Lower Case

Converts the content selection to lower case characters.

Capitalize Lines

It capitalizes the first letter found on every new line that is selected. Only the first letter is affected, the rest of the line remains the same. If the first character on the new line is not a letter then no changes are made.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + X (Command + Shift + X on macOS))

Converts a sequence of hexadecimal characters to the corresponding [Unicode character \(on page 422\)](#). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the `0x` or `0X` prefix. Examples of valid sequences and the characters they will be converted to:

- `0x0045` will be converted to `É`
- `0x0125` to `ĥ`
- `265` to `ı`
- `2190` to `←`

Note:

For more information about finding the hexadecimal value of a character, see [Finding the Decimal, Hexadecimal, or Character Entity Equivalent \(on page 425\)](#).

Base64 Encode/Decode submenu

This submenu includes the following actions for encoding or decoding **base 64** schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page (*on page 159*) will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page (*on page 273*).

Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page (*on page 159*) will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page (*on page 273*).

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Base32 Encode/Decode submenu

This submenu includes the following actions for encoding or decoding **base32** schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page (*on page 159*) will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page (*on page 273*).

Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page (*on page 159*) will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page (*on page 273*).

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Hex Encode/Decode submenu

This submenu includes the following actions for encoding or decoding **hex** schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page (*on page 159*) will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page (*on page 273*).

Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page (*on page 159*) will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page (*on page 273*).

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Join and Normalize Lines (**Ctrl + J** (**Command + J** on macOS))

For the current selection, this action joins the lines by replacing the *line separator* with a single space character. It also normalizes the whitespaces by replacing a sequence of such characters with a single space.

Insert new line after (Ctrl + Alt + Enter (Command + Option + Enter on macOS))

This action has the same result as moving the cursor to the end of the current line and pressing the *ENTER* key.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Open submenu

The following actions are available in this submenu:

Open File at Cursor

Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a **Create new file** button that starts the **New document** wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel. If the file is an image file, it will be opened in the **Image Preview pane** (*on page 428*).

Open File at Cursor in System Application

Opens the file (identified by its link) or web page (identified by a web link) found at the cursor position. The target is opened in the default system application associated with that file type.

Compare

Opens the current file in [the Compare Files tool](#) (*on page 433*).

Show/Hide Preview

A toggle action that shows or hides the *Preview* pane.

Export as DITA Topic

Converts the current Markdown document into a DITA topic.

Export as XDITA Topic

Converts the current Markdown document into a Lightweight DITA XML topic.

Export as HTML

Converts the current Markdown document into an XHTML document.

Print (Available in the *Preview* pane)

Opens a page setup dialog box that allows you to configure printing options for the current document.

Syntax Highlighting in the Markdown Editor

Oxygen XML Developer supports syntax highlighting in the Markdown editor to make it easier to read the semantics of the structured content by displaying each type of XML code in different colors and fonts.

**Note:**

For Markdown documents that contain code from other languages, those blocks are rendered with proper syntax highlights to make them more distinguishable. The languages that are rendered with syntax highlights within Markdown documents include JavaScript, JSON, YAML, XML, XSLT, XSD, Java, Python, and CSS.

To customize the colors or styles used for the syntax highlighting colors for Markdown documents, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114).
2. Go to **Editor > Syntax Highlight** (on page 193).
3. Select and expand the **Markdown** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

Related Information:[Syntax Highlight Preferences \(on page 193\)](#)[Markdown Editor \(on page 1045\)](#)

Automatic Validation in Markdown Documents

Markdown documents are validated automatically as you type. The conversion engine constantly tries to parse your changes to display the results in the *Preview* pane. If a change results in an error that prevents the parser from converting the syntax, an error message will be displayed in the **DITA** tab or in the **Results view** (on page 503) at the bottom of the editor.

Examples of the type of errors that will be reported include headers being in the wrong order or the syntax of a document begins with something other than a 1st level header.

Validating Markdown Documents with Schematron

It is possible to validate Markdown documents with Schematron rules. There are two ways to create an association between Markdown documents and Schematron files:

- You can configure an association using the [Markdown preferences page \(on page 241\)](#). You can specify a Schematron file to validate converted HTML content, as well as one to validate converted DITA content.
- You can create a Schematron association for Markdown documents by adding a [catalog mapping \(on page 593\)](#) for one of the following URIs:
 - <http://www.oxygenxml.com/schematron/validation/markdown-as-html> - The obtained Schematron will be applied over HTML conversions.
 - <http://www.oxygenxml.com/schematron/validation/markdown-as-dita> - The obtained Schematron will be applied over DITA conversions.

The catalog mapping is a fallback in case the Schematron validation is disabled in the [Markdown preferences page \(on page 241\)](#) or the path to the Schematron file is empty.

**Warning:**

If you are using a [custom version of DITA-OT \(on page 237\)](#), the mapping information might not be generated properly, causing issues with the Schematron validation. For example, error locations may not be accurate or synchronization may fail.

**Tip:**

Inside the samples folder, there is a `schematron-validation` folder with some files you can use to see how Schematron validation can be done with Markdown files. The path of the folder is:
`[OXYGEN_INSTALL_DIR]/samples/markdown/schematron-validation/`.

Markdown Editor Syntax Rules and Specifications

The Markdown editor in Oxygen XML Developer uses rules that were integrated from the most common set of [default Markdown syntax rules](#) along with many of the [GitHub Flavored Markdown rules](#).

This topic lists the Oxygen XML Developer implementation of the most commonly used syntax rules.

Headers

The Markdown editor supports two styles of headers, *Setext* and *Atx*.

- **Setext Style**

Setext-style headers are underlined using equal signs (for first-level headers) and dashes (for second-level headers). Any number of equal signs or dashes will result in the same output.

Example: Setext Style Headers

```

First-Level Header (H1)

=====

Second-Level Header (H2)

-----

```

- **Atx Style**

Atx-style headers use 1-6 hash characters at the start of the line, corresponding to header levels 1-6. Optionally, you may close atx-style headers. This is purely cosmetic and the closing hashes do not need to match the number of hashes used to open the header. It is the number of opening hashes that determines the header level.

Example: Atx Style Headers

```

# H1 text #
## H2 text
### H3 text #####
#### H4 text
##### H5 text ###
##### H6 text

```

Horizontal Rules (for HTML output only)

You can produce a horizontal rule tag (`<hr>`) by placing three or more hyphens, asterisks, or underscores on a line by themselves (they also need to be preceded and followed by a blank line). Optionally, they can be separated by spaces.

Example: Horizontal Rules

```

* * *

*****

-----

-----

```

Paragraphs and Line Breaks

A paragraph is simply one or more consecutive lines of text, separated by one or more blank lines. The text at the beginning of a paragraph should not be indented with spaces or tabs. To create a new paragraph, simply insert a blank line in between them.

**Important:**

When converting to HTML, if you break a paragraph on multiple lines (without a blank line in between them), it will create a break tag (`
`). When converting to DITA, the text is kept in a single paragraph in this case and a blank line is required to break a paragraph. This behavior differs slightly from the default Markdown rules.

Example: Paragraphs

```
This is a paragraph that contains  
two lines of text. (In HTML, a break tag is created in between the two lines)  
  
This is a new paragraph.
```

Styling Text

The Markdown editor supports some syntax rules for styling text (such as bold, italic, or strikethrough).

• Italic (Emphasis)

Text wrapped with one asterisk or underscore produces an italic (emphasis) tag.

```
*italic*  
_italic_
```

• Bold (Strong)

Text wrapped with two asterisks or underscores produces a bold (strong) tag.

```
**bold**  
__bold__
```

• Strikethrough

In HTML only, text wrapped with two tildes (~~) produces a strikethrough tag.

```
~~strikethrough~~
```

• Underline

Text wrapped with two plus signs (++) produces an underline tag.

```
++underline++
```

**Tip:**

You can also combine these styling rules. For example, `**BoldText _ItalicText_ BoldText**` would produce italicized text within bold text. Also, if you surround an asterisk or underscore with spaces, it will be treated as a literal asterisk or underscore. To produce a literal asterisk or underscore at a

position where it would otherwise be used as a styling delimiter, you can escape it with a backslash (for example, `*literal asterisks*`).

Links

The Markdown editor supports two types of links, *inline* and *reference*. In both cases, it begins with link text that is delimited by [square brackets].

• Inline Links

To create an inline link, use a set of regular parentheses immediately after the closing square bracket for the link text. Inside the parentheses, put the URL where you want the link to point, and optionally a title surrounded in quotes. Also, if you reference a local resource on the same server, you can use relative paths.

Examples: Inline Link

With a title:

```
Text with [example link text](http://www.example.com/path "Title") inline link and title.
```

Without a title:

```
Text with [example link text](http://www.example.com/path) inline link without a title.
```

Relative path:

```
Text with [example link text](/relative_path/) inline link with relative path.
```

• Reference Links

Reference-type links use a second set of square brackets that include a label (link identifier) to reference the target for the link (link identifier may consist of letters, numbers, spaces, and punctuation and it is not case-sensitive). You can optionally use a space to separate the sets of brackets. The labels (link identifiers) are only used for creating the links and do not appear in the output.

```
Text with [link text1][id 1] a reference-type link and [link text2][id_2] another one.
```

Then, somewhere in the document, you need to define your link label on a line by itself. The link identifier must be within square brackets followed by a colon, then after one or more spaces the URL for the link. Optionally this can be followed by a title enclosed in single quotes, double quotes, or parentheses. Also, the link may optionally be enclosed in angle brackets (< >).

```
[id 1]: http://example1.com/ "Optional Title"
[id_2]: <http://example2.com/> "Optional Title2"
```

Other notes about Reference Links:

- You can put the title on a second line and use extra spaces or tabs for padding. This is useful for aesthetics when the URL is long.

```
[id]: http://example.com/long/path/to/resource/here
    "Optional Title Here"
```

- The label (link identifier) can be missing, in which case the link text (in square brackets) is used as the name.

```
[My Link][ ]
```

and then defined as:

```
[My Link]: http://example.com/
```

Automatic Links

The Markdown editor supports a shortcut style for creating automatic links for URLs and email addresses. You simply surround the URL or email address with angle brackets.

Note:

These automatic links only work properly in HTML conversions. The *Preview* pane may display them properly in the DITA tab, but the DITA output will not properly recognize the format.

• URLs

By surrounding a URL with angle brackets, you can show the actual text of the URL while also making it clickable in the output.

```
<http://example.com/>
```

For example, in HTML it is converted to:

```
<a href="http://example.com/">http://example.com/</a>
```

• Email Addresses

Automatic links for email addresses work similarly, except that Markdown will also perform a bit of randomized decimal and hex entity-encoding to help obscure your address from address-harvesting *spambots*.

```
<address@example.com>
```

In HTML, it is converted to something like:

```
<a href="&#x6D;&#x61;i&#x6C;&#x74;&#x6F;:&#x61;&#x64;&#x72;&#x65;
&#115;&#115;&#64;&#101;&#120;&#x61;&#109;&#x70;&#x6C;e&#x2E;&#99;&#111;
&#109;">&#x61;&#x64;&#x64;&#x72;&#x65;&#115;&#115;&#64;&#101;&#120;&#x61;
&#109;&#x70;&#x6C;e&#x2E;&#99;&#111;&#109;</a>
```

Images

The Markdown editor uses an image syntax that is intended to resemble the syntax for two types of links (*inline* and *reference*). In both cases, the syntax for images begins with an exclamation mark, followed by `Alt` attribute text surrounded by square brackets, and then followed by a set of parentheses that contain the URL or path to the image.

- **Inline Images**

For inline images, use a set of regular parentheses immediately after the closing square bracket for the `Alt` attribute text. Inside the parentheses, put the URL or path of the image, and optionally a title surrounded in quotes.

Examples: Inline Images

With a title:

```
Text with ![Alt text](/path/to/img.jpg "Optional title") inline image and a title.
```

Without a title:

```
Text with ![Alt text](/path/to/img.jpg) inline link without a title.
```

- **Reference Images**

For reference-type images, use a second set of square brackets that include a label (image identifier) to identify the image (it may consist of letters, numbers, spaces, and punctuation and it is not case-sensitive). You can optionally use a space to separate the sets of brackets. The labels (image identifiers) do not appear in the output.

```
Text with ![Alt text][id] a reference-type image.
```

Then, somewhere in the document, you need to define your image label on a line by itself. The image identifier must be within square brackets followed by a colon, then after one or more spaces the URL or path of the image. Optionally this can be followed by a title enclosed in single quotes, double quotes, or parentheses.

```
[id]: url/to/image "Optional Title"
```

Blockquotes

The Markdown editor uses email-style greater than characters (>) for *blockquotes*. You only need to put the > before the first line of a hard-wrapped paragraph, but it looks better (and is clearer) if you put a > before every line.

- **Example: Blockquotes**

```
> This is a blockquote with two paragraphs. Lorem ipsum dolor sit amet,  
> consectetur adipiscing elit. Aliquam hendrerit mi posuere lectus.  
> Vestibulum enim wisi, viverra nec, fringilla in, laoreet vitae, risus.
```

```
>
> Donec sit amet nisl. Aliquam semper ipsum sit amet velit. Suspendisse
> id sem consectetuer libero luctus adipiscing.
```

- **Example: Nested Blockquotes**

Blockquotes can be nested by adding additional levels of > characters.

```
> This is the first level of quoting.
>
