> > This is nested blockquote.
>
> Back to the first level.
```

- **Example: Blockquotes with Other Markdown Elements**

Blockquotes can also contain other Markdown elements (such as headers, lists, and code blocks).

```
> ## This is a header.
>
> 1. This is the first list item.
> 2. This is the second list item.
>
> Here's some example code:
>
>     return shell_exec("echo $input | $markdown_script")
```

Quoting Code (Inline and Code Blocks)

The Markdown editor supports quoting code or commands inline within a sentence or in distinct blocks.

- **Inline**

You can quote or emphasize code within a sentence (inline) with single backticks (`). The text within the backticks will not be formatted.

- **Example: Inline Code Emphasis**

```
This is a normal sentence with a `code` in the middle.
```

- **Code Blocks**

You can format code or text into its own distinct block by inserting a blank line before and after the content and using at least 4 spaces (or 1 tab), or by using opening and closing triple backticks (```) on separate lines.

- **Example: Code Block**

```
This is a normal paragraph:
```

```
    This is a code block
```

```
This is a normal paragraph:
```

```
...
```

```
This is a code block
```

```
...
```

One level of indentation is removed from each line of a codeblock and it continues until it reaches a line that is not indented (or until the closing backticks).

Example: Code Block with Indentation

```
tell application "something"
    beep
end tell
```

For example, in HTML the result would look like this:

```
<pre><code>tell application "Foo"
    beep
end tell
</code></pre>
```

You can also add an optional language identifier to enable syntax highlighting in your code blocks. The Oxygen XML Developer Markdown editor syntax highlight supports the following languages: *Java*, *JavaScript*, *CSS*, and *Python*. When publishing Markdown content as part of a DITA project, more language values are supported and produce syntax highlights in the published WebHelp or PDF outputs: [How to Add Syntax Highlights for Codeblocks in the Output \(on page 1356\)](#).

Example: Syntax Highlighting in Code Block

```
```css
input[type="submit"] {
 color: white;
 font-weight: bold;
}
```
```

Inline XHTML (for HTML output only)

The Markdown editor supports writing inline XHTML. Since Markdown is just a writing format, it requires a conversion for publishing purposes. If you are using the HTML conversion, for any markup that is not covered by Markdown syntax, you can simply use XHTML syntax.

Example: Inline XHTML

This is a regular paragraph.

```
<table>
  <tr>
    <td>Col 1</td>
    <td>Col 2</td>
  </tr>
</table>
```

This is another regular paragraph.

Lists

The Markdown editor supports ordered and unordered lists. You can also insert *blockquotes* (on page 1060) and *code blocks* (on page 1061) inside list items. List markers typically start at the left margin, but may be indented by up to three spaces.

• Unordered Lists

For unordered lists, you can use asterisks (*), plus signs (+), and hyphens (-) interchangeably.

```
* List item 1
+ List item 2
- List item 3
```

• Ordered Lists

For ordered lists, use numbers followed by periods. The actual numbers you use have no effect on the output. It simply converts them to list items within an ordered list and the actual number of list items will determine the numbers in the output.

```
1. List item 1
8. List item 2
5. List item 3
```

• Nested Lists

You can create nested lists by indenting lines by three spaces.

```
1. Ordered list item 1
  1. Nested ordered list item 1
  2. Nested ordered list item 2
    * 2nd level nested unordered list item 1
    * 2nd level nested unordered list item 2
      * 3rd level nested unordered list item 1
  2. Ordered list item 2
```

• Paragraphs Inside Lists

If list items are separated by blank lines, Markdown will wrap the items in a paragraph in the output.

```
* List item 1

* List item 2
```

For both DITA and HTML output, this would result in:

```
<ul>
<li><p>List item 1</p></li>
<li><p>List item 2</p></li>
</ul>
```

• Multiple Paragraphs Inside Lists

List items may consist of multiple paragraphs. Each subsequent paragraph in a list item must be indented by either 4 spaces or one tab. Optionally, you can also indent each line of a paragraph to make it look nicer.

```
1. This is a list item with two paragraphs. Lorem ipsum dolor
   sit amet, consectetur adipiscing elit. Aliquam hendrerit
   mi posuere lectus.

   Vestibulum enim wisi, viverra nec, fringilla in, laoreet
   vitae, risus. Donec sit amet nisl. Aliquam semper ipsum
   sit amet velit.

2. Suspendisse id sem consectetur libero luctus adipiscing.
```

• Blockquotes Inside Lists

To put a *blockquote* within a list item, the blockquote delimiters (>) need to be indented so that they are under the first letter of the text after the list item marker.

```
* A list item with a blockquote:
  > This is a blockquote
  > inside a list item.
```

• Code Blocks Inside Lists

To put a code block within a list item, insert an empty line in between the list item and the code block, and the code block needs to be indented twice (with 8 spaces or 2 tabs), or if you are using the triple backticks method, the opening triple backtick needs to be indented with 4 spaces or 1 tab.

```
* A list item with a code block:

    This is a code block inside a list item
```

```

...
This is a code block inside a list item using the backticks method
...

```

Task Lists

You can create task lists by prefacing list items with a hyphen followed by a space followed by square brackets (- []). To mark a task as complete, use - [x].

Example: Task Lists

```

- [ ] Unfinished task 1
- [x] Finished task 2

```

Definition Lists

You can create definition lists by using a colon plus a space for each list item.

Example: Definition Lists

```

Term 1
: Definition A
: Definition B

```

Tables

You can create tables in the Markdown editor by using pipes (|) and hyphens (-).

• Creating a Table

Pipes are used to separate each column, while hyphens are used to create column headers. The pipes on either end of the table are optional. Cells can vary in width and do not need to be perfectly aligned within columns, but there must be at least three hyphens in each column of the header row.

```

| First Header | Second Header |
| ----- | ----- |
| Column 1 Row 1 Cell | Column 2 Row 1 Cell |
| Column 1 Row 2 Cell | Column 2 Row 2 Cell |

```

• Formatting Rules in Table Cells

You can use formatting rules inside the cells of the table (such as links, inline code blocks, and text styling).

```

| First Header | Second Header |
| --- | --- |
| `inline code` | Content with bold text inside cell |

```

• Aligning Text in Tables

You can align text to the left, right, or center of a column by including colons (:) to the left, right, or on both sides of the hyphens within the header row.

```
| Left-aligned | Center-aligned | Right-aligned |
| :---        |      :---:    |          ---:  |
| Content Cell | Content Cell  | Content Cell  |
```

• Joining Cells (Span a Cell Over Multiple Columns)

You can join cells horizontally (span a cell over multiple columns) by using multiple consecutive pipe characters (|) to the right of the particular cell. The number of consecutive pipes indicate the number of columns the cell will span (|| for two, ||| for three, and so on).

```
| First Header | Second Header | Third Header | Fourth Header |
| -----    | -----    | -----    | -----    |
| Content Cell | *Cell Span Over 3 Columns* |||
```

Emoji

You can add *emoji* in the Markdown editor by surrounding the EMOJICODE with colons (:EMOJICODE:).

Example: Emoji

```
:smile:
:laughing:
```

The resulting emoticons will appear in the output, but they are not displayed in the *Preview* pane.

For a full list of available emoji codes, see [Emoji Cheat Sheet](#).

Backslash Escapes

You can ignore Markdown formatting by using backslash escapes (\) to generate literal characters that would otherwise have special meaning in the Markdown syntax. For example, if you want to surround a word with literal asterisks (instead of an italic or emphasis tag), you can use backslashes to escape the asterisks.

```
\*literal asterisks\*
```

The Markdown editor provides backslash escapes for the following characters:

```
\  backslash
`  backtick
*  asterisk
_  underscore
{} curly braces
[] square brackets
() parentheses
#  hash mark
```

```
+ plus sign
- minus sign (hyphen)
. dot
! exclamation mark
```

Automatic Escaping for Special Characters

The Markdown editor includes support for automatically escaping special characters such as angle brackets (< >) and ampersands (&). If you want to use them as literal characters, you must escape them as entities, as in the table below. The exception to this is in HTML output, if the special characters for a valid tag (for example,), they are treated as literal characters and escaping is not necessary.

Literal Character	Escaping Code
<	<
>	>
&	&

Footnotes

The Markdown editor in Oxygen XML Developer supports normal and inline footnotes. The following examples show the required syntax.

- **Example: Normal Footnote**

```
Here is a footnote reference,[^1]

[^1]: Here is the footnote.
```

- **Example: Normal Footnote with Multiple Blocks**

```
Here is a footnote reference,[^longnote]

[^longnote]: Here is the footnote with multiple blocks.

    Subsequent paragraphs are indented with 4 spaces or 1 tab to show that they
    belong to the previous footnote.
```

- **Example: Inline Footnote**

```
Here is an inline note.^[Inlines notes are easier to write, since
you don't have to pick an identifier and move down to type the
note.]
```

Latex Mathematical Equations

Mathematical equations in Latex format [can be specified](#) either inline or as blocks.

Example of an inline equation:

```
 $E(x) = x^2$ 
```

Such equations are automatically preserved as `<foreign>` elements when converting the Markdown content to DITA XML and with the addition of [editing and publishing plugins](#), they can be rendered in the Markdown editor's **DITA** preview tab and when the Markdown content is published as part of a DITA map.

Other Supported Document Types

Along with the [fully supported built-in frameworks \(document types\) \(on page 1070\)](#), Oxygen XML Developer also provides limited support (including document templates) for editing a variety of other document types. All the specialized views, editors, actions, and options are dynamic according to the type of file that is opened or created. Other document types that are supported in Oxygen XML Developer include:

- [EPUB \(NCX, OCF, OPF 2.0, 3.0, & 3.1\) \(on page 1090\)](#) - A standard for e-book files.
- [OOXML \(on page 1744\)](#) - An XML-based file format for representing spreadsheets, charts, presentations, and word processing documents.
- [ODF \(on page 1744\)](#) - An free and open-source XML-based file format for electronic office documents, such as spreadsheets, charts, presentations, and word processing documents.
- [DocBook Targetset \(on page 1081\)](#) - For resolving cross-references when using *olinks*.
- XMLSpec - A markup language for W3C specifications and other technical reports.
- DITAVAL - DITA conditional processing profile to identify the values you want to conditionally process for a particular output, build, or other purpose.
- [Daisy XML](#) - A technical standard for digital audio books, periodicals, and computerized text. It is designed to be an audio substitute for print material.
- Maven Project & Settings - Project or settings file for Maven build automation tool that is primarily used for Java projects.
- [Oasis XML Catalog](#) - An [XML Catalog \(on page 2273\)](#) document that describes a mapping between external entity references and locally-cached equivalents.
- [Other Non-XML Files \(on page 360\)](#) - Oxygen XML Developer also includes a simple text editor and a variety of helpful features for creating and editing non-XML files.

External Document Types

Some document types are available to be manually installed from GitHub:

- StratML (Part 1 & 2) - Part 1 and 2 of the Strategy Markup Language specification. Available to be installed from [GitHub](#).
- EAD - Encoded Archival Description is an XML standard for encoding archival finding aids. Available to be installed from [GitHub](#).
- KML - Keyhole Markup Language is an XML notation for expressing geographic visualization in maps and browsers. Available to be installed from [GitHub](#).

9.

Built-in Frameworks (Document Types)

Oxygen XML Developer includes a variety of specialized editors, views, and features that are dynamic according to the type of document that you open or create. Oxygen XML Developer includes fully supported built-in *frameworks* (on page 2269) for popular XML document types (e.g. DITA, DocBook, TEI, XHTML, JATS), as well as other document types (e.g. JSON, YAML, OpenAPI, Markdown, HTML, CSS), each with a specialized set of *editing features for the particular document type* (on page 471).

The built-in *frameworks* (on page 2269) are defined according to a set of rules and a variety of settings that improve editing capabilities for its particular file type. These settings include:

- A default grammar used for validation and content completion in **Text** mode.
- Built-in transformation scenarios used for publishing XML documents.
- *XML Catalogs* (on page 2273) used for mapping resources.
- New document templates to make it easy to create XML documents.

DocBook 4 Document Type (Framework)

DocBook is a very popular set of tags for describing books, articles, and other prose documents, particularly technical documentation. DocBook provides a vast number of semantic element tags, divided into three broad categories: structural, *block-level*, and *inline*. DocBook content can then be published in a variety of formats, including HTML, PDF, and EPUB.

File Definition

A file is considered to be a *DocBook 4* document when one of the following conditions are true:

- The root element name is `<book>` or `<article>`.
- The PUBLIC ID of the document contains the string `-//OASIS//DTD DocBook XML`.

Default Document Templates

There are a variety of default *DocBook 4* templates available when creating *new documents from templates* (on page 330) and they can be found in: **Framework Templates > DocBook 4**.

The default templates for DocBook 4 documents are located in the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/Docbook 4` folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected in the DocBook 4 file is `docbookxi.dtd` and it is stored in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/4.5/dtd/`.

Default XML Catalog

The default *XML Catalog* (on page 2273), `catalog.xml`, is stored in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/`.

Transformation Scenarios

Oxygen XML Developer includes numerous built-in DocBook transformation scenarios that allow you to transform DocBook 4 documents to a variety of outputs, such as PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, and EPUB. All of them are listed in the **DocBook 4** section in the **Configure Transformation Scenario(s)** dialog box (on page 1240).

For more information, see the [DocBook Transformation Scenarios](#) (on page 1127) section.

[Editing XML Documents in Text Mode](#) (on page 471)

Inserting an Olink in DocBook Documents

The `<olink>` element is used for linking to resources outside the current DocBook document. The `@targetdoc` attribute is used for the document ID that contains the target element and the `@targetptr` attribute for the ID of the target element (the value of an `@id` or `@xml:id` attribute). The combination of those two attributes provides a unique identifier to locate cross references.

For example, a *Mail Administrator Guide* with the document ID `MailAdminGuide` might contain a chapter about user accounts, like this:

```
<chapter id="user_accounts">
<title>Administering User Accounts</title>
<para>blah blah</para>
```

You can form a cross reference to that chapter by adding an `<olink>`, as in the following example:

```
You may need to update your
<olink targetdoc="MailAdminGuide" targetptr="user_accounts">user accounts
</olink>
when you get a new machine.
```

To use an `<olink>` to create links between documents, follow these steps:

1. Decide which documents are to be included in the domain for cross referencing.

A unique ID must be assigned to each document that will be referenced with an `<olink>`. It is usually added as an `@id` (or `@xml:id` for DocBook5) attribute to the root element of the document.

2. Decide on your output hierarchy.

For creating links between documents, the relative locations of the output documents must be known. Before going further you must decide the names and locations of the output directories for all the documents from the domain. Each directory will be represented by an element: `<dir name="directory_name">`, in the target database document.

3. Create the target database document.

Each collection of documents has a main target database document that is used to resolve all *olinks* from that collection. The target database document is an XML file that is created once. It provides a means for pulling in the target data for each document. The database document is static and all the document data is pulled in dynamically.

Tip:

Oxygen XML Developer includes a built-in new document template called **DocBook Targetset Map** available in the **New document wizard** (*on page 330*) that will help you get started.

Example: The following is an example of a target database document. It structures a collection of documents in a `<sitemap>` element that provides the relative locations of the outputs (HTML in this example). Then it pulls in the individual target data using system entity references to target data files that will be created in the next step.

```
<?xml version="1.0" encoding="utf-8"?>
<!DOCTYPE targetset [
<!ENTITY ugtargets SYSTEM "file:///doc/userguide/target.db">
<!ENTITY agtargetes SYSTEM "file:///doc/adminguide/target.db">
<!ENTITY reftargets SYSTEM "file:///doc/man/target.db">
]>
<targetset>
  <targetsetinfo>
    Description of this target database document,
    which is for the examples in olink doc.
  </targetsetinfo>
  <!-- Site map for generating relative paths between documents -->
  <sitemap>
    <dir name="documentation">
      <dir name="guides">
        <dir name="mailuser">
          <document targetdoc="MailUserGuide"
            baseuri="userguide.html">
            &ugtargetes;
```

```

</document>

</dir>

<dir name="mailadmin">

  <document targetdoc="MailAdminGuide">

    &agttargets;

  </document>

</dir>

</dir>

<dir name="reference">

  <dir name="mailref">

    <document targetdoc="MailReference">

      &refrtargets;

    </document>

  </dir>

</dir>

</dir>

</sitemap>

</targetset>

```

4. Generate the target data files by executing a DocBook transformation scenario.

Before applying the transformation, you need to edit the transformation scenario, go to the **Parameters** tab, and make sure the value of the `collect.xref.targets` parameter is set to `yes`. The default name of a target data file is `target.db`, but it can be changed by setting an absolute file path in the `targets.filename` parameter.

Example: An example of a `target.db` file:

```

<div element="book" href="#MailAdminGuide" number="1" targetptr="user_accounts">
  <ttl>Administering User Accounts</ttl>
  <xrefext>How to administer user accounts</xrefext>
  <div element="part" href="#d5e4" number="I">
    <ttl>First Part</ttl>
    <xrefext>Part I, "First Part"</xrefext>
    <div element="chapter" href="#d5e6" number="1">
      <ttl>Chapter Title</ttl>
      <xrefext>Chapter 1, Chapter Title</xrefext>
      <div element="sect1" href="#src_chapter" number="1" targetptr="src_chapter">
        <ttl>Section1 Title</ttl>
        <xrefext>xreflabel_here</xrefext>
      </div>
    </div>
  </div>
</div>

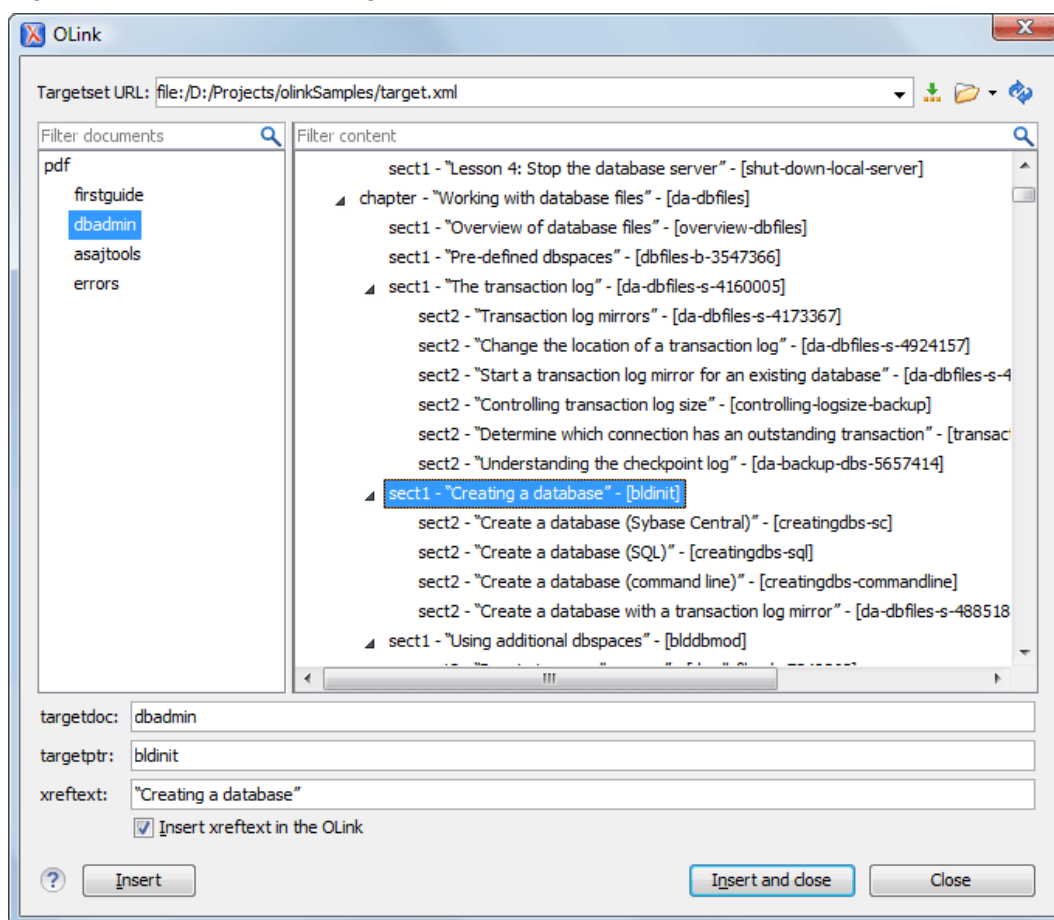

```

5. Insert `<olink>` elements in the DocBook documents.

When editing a DocBook XML document in **Author** mode, the **Insert OLink** action is available in the  **Link** drop-down menu from the toolbar. This action opens the **Insert OLink** dialog box that allows you to select the target of an `<olink>` from the list of all possible targets from a specified target database document (specified in the **Targetset URL** field). Once a **Targetset URL** is selected, the structure of the target documents is presented. For each target document (`@targetdoc`), its content is displayed, allowing you to easily identify the appropriate `@targetptr`. You can also use the search fields to quickly identify a target. If you already know the values for the `@targetdoc` and `@targetptr` attributes, you can insert them directly in the corresponding fields.

Example: In the following image, the target database document is called `target.xml`, `dbadmin` is selected for the target document (`@targetdoc`), and `bldinit` is selected as the value for the `@targetptr` attribute. Notice that you can also add XREF text into the `<olink>` by using the `xreftext` field.

Figure 369. Insert OLink Dialog Box

6. Process a DocBook transformation for each document to generate the output.
 - a. Edit the transformation scenario and set the value of the `target.database.document` parameter to be the URL of the target database document.
 - b. Apply the transformation scenario.

DocBook 5 Document Type (Framework)

DocBook is a very popular set of tags for describing books, articles, and other prose documents, particularly technical documentation. DocBook provides a vast number of semantic element tags, divided into three broad categories: structural, *block-level*, and *inline*. DocBook content can then be published in a variety of formats, including HTML, PDF, and EPUB.

File Definition

A file is considered to be a DocBook 5 document when the namespace is *http://docbook.org/ns/docbook*.

Default Document Templates

There are a variety of default *DocBook* 5 templates available when creating [new documents from templates \(on page 330\)](#) and they can be found in: **Framework Templates > DocBook 5 > DocBook 5.0** and **Framework Templates > DocBook 5 > DocBook 5.1**.

New document templates for both DocBook 5 documents are located in the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/Docbook5.0` folder.

New document templates for both DocBook 5.1 documents are located in the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/Docbook5.1` folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected is `docbookxi.rng` and it is stored in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/5.0/rng/` (or for DocBook 5.1 in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/5.1/rng/`). Other types of schemas for various DocBook versions are also located in various folders inside the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/` directory.

Transformation Scenarios

Oxygen XML Developer includes numerous built-in DocBook transformation scenarios that allow you to transform DocBook 5 documents to a variety of outputs, such as PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, and EPUB. Oxygen XML Developer also includes a DocBook 5.1 transformation scenario for [Assembly documents \(on page 1079\)](#). All of them are listed in the **DocBook 5** section in the **Configure Transformation Scenario(s)** dialog box [\(on page 1240\)](#).

For more information, see the [DocBook Transformation Scenarios \(on page 1127\)](#) section.

Related Information:[Editing XML Documents in Text Mode \(on page 471\)](#)[DocBook Assembly \(5.1 and Later\) \(on page 1079\)](#)[DocBook Topic \(5.1 and Later\) \(on page 1080\)](#)

Inserting an Olink in DocBook Documents

The `<olink>` element is used for linking to resources outside the current DocBook document. The `@targetdoc` attribute is used for the document ID that contains the target element and the `@targetptr` attribute for the ID of the target element (the value of an `@id` or `@xml:id` attribute). The combination of those two attributes provides a unique identifier to locate cross references.

For example, a *Mail Administrator Guide* with the document ID `MailAdminGuide` might contain a chapter about user accounts, like this:

```
<chapter id="user_accounts">
<title>Administering User Accounts</title>
<para>blah blah</para>
```

You can form a cross reference to that chapter by adding an `<olink>`, as in the following example:

```
You may need to update your
<olink targetdoc="MailAdminGuide" targetptr="user_accounts">user accounts
</olink>
when you get a new machine.
```

To use an `<olink>` to create links between documents, follow these steps:

1. Decide which documents are to be included in the domain for cross referencing.

A unique ID must be assigned to each document that will be referenced with an `<olink>`. It is usually added as an `@id` (or `@xml:id` for DocBook5) attribute to the root element of the document.
2. Decide on your output hierarchy.

For creating links between documents, the relative locations of the output documents must be known. Before going further you must decide the names and locations of the output directories for all the documents from the domain. Each directory will be represented by an element: `<dir name="directory_name">`, in the target database document.
3. Create the target database document.

Each collection of documents has a main target database document that is used to resolve all *olinks* from that collection. The target database document is an XML file that is created once. It provides a means for pulling in the target data for each document. The database document is static and all the document data is pulled in dynamically.

**Tip:**

Oxygen XML Developer includes a built-in new document template called **DocBook Targetset Map** available in the **New document wizard** (*on page 330*) that will help you get started.

Example: The following is an example of a target database document. It structures a collection of documents in a `<sitemap>` element that provides the relative locations of the outputs (HTML in this example). Then it pulls in the individual target data using system entity references to target data files that will be created in the next step.

```
<?xml version="1.0" encoding="utf-8"?>
<!DOCTYPE targetset [
<!ENTITY ugtargets SYSTEM "file:///doc/userguide/target.db">
<!ENTITY agtargetes SYSTEM "file:///doc/adminguide/target.db">
<!ENTITY reftargets SYSTEM "file:///doc/man/target.db">
]>
<targetset>
  <targetsetinfo>
    Description of this target database document,
    which is for the examples in olink doc.
  </targetsetinfo>

  <!-- Site map for generating relative paths between documents -->
  <sitemap>
    <dir name="documentation">
      <dir name="guides">
        <dir name="mailuser">
          <document targetdoc="MailUserGuide"
            baseuri="userguide.html">
            &ugtargetes;
          </document>
        </dir>
        <dir name="mailadmin">
          <document targetdoc="MailAdminGuide">
            &agtargetes;
          </document>
        </dir>
      </dir>
      <dir name="reference">
        <dir name="mailref">
          <document targetdoc="MailReference">
            &reftargets;
          </document>
        </dir>
      </dir>
    </sitemap>
  </targetset>
</targetset>
```

```

    </dir>

  </dir>

</dir>

</sitemap>

</targetset>

```

4. Generate the target data files by executing a DocBook transformation scenario.

Before applying the transformation, you need to edit the transformation scenario, go to the **Parameters** tab, and make sure the value of the `collect.xref.targets` parameter is set to `yes`. The default name of a target data file is `target.db`, but it can be changed by setting an absolute file path in the `targets.filename` parameter.

Example: An example of a `target.db` file:

```

<div element="book" href="#MailAdminGuide" number="1" targetptr="user_accounts">

  <ttl>Administering User Accounts</ttl>

  <xrefext>How to administer user accounts</xrefext>

  <div element="part" href="#d5e4" number="I">

    <ttl>First Part</ttl>

    <xrefext>Part I, "First Part"</xrefext>

    <div element="chapter" href="#d5e6" number="1">

      <ttl>Chapter Title</ttl>

      <xrefext>Chapter 1, Chapter Title</xrefext>

      <div element="sect1" href="#src_chapter" number="1" targetptr="src_chapter">

        <ttl>Section1 Title</ttl>

        <xrefext>xreflabel_here</xrefext>

      </div>

    </div>

  </div>

</div>

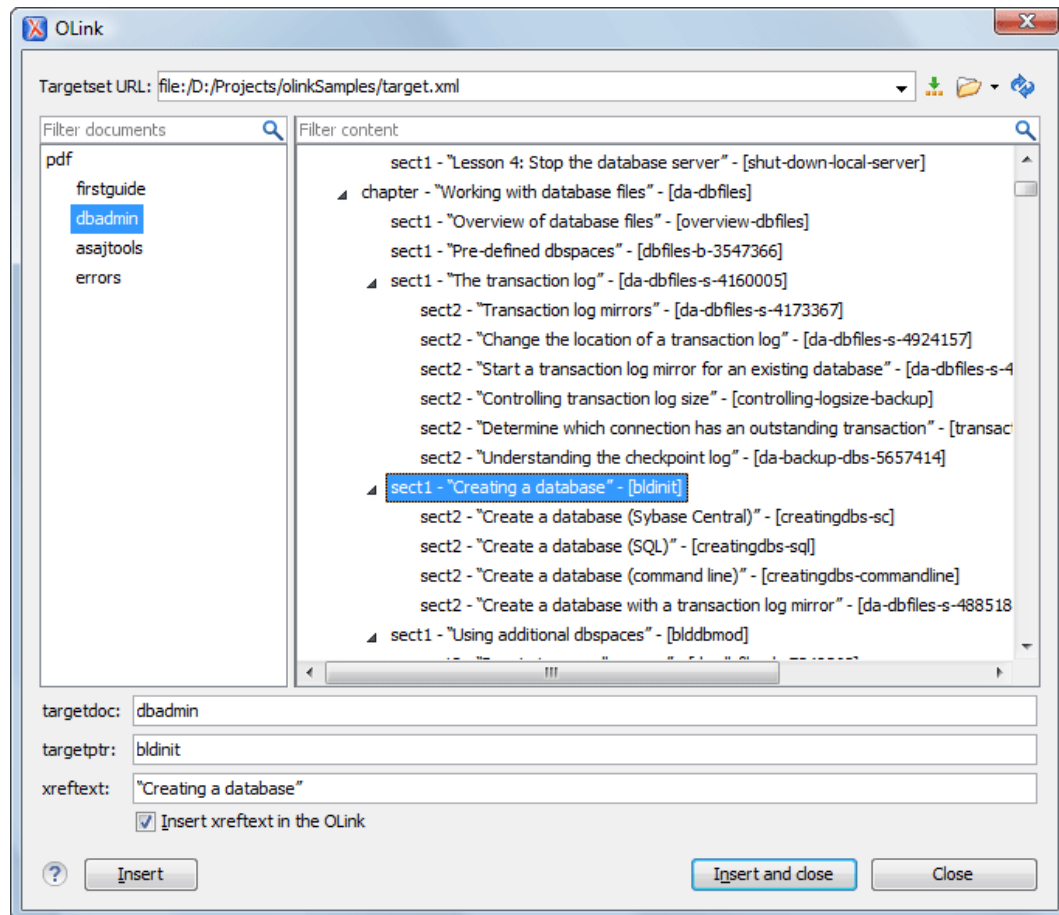

```

5. Insert `<olink>` elements in the DocBook documents.

When editing a DocBook XML document in **Author** mode, the **Insert OLink** action is available in the  **Link** drop-down menu from the toolbar. This action opens the **Insert OLink** dialog box that allows you to select the target of an `<olink>` from the list of all possible targets from a specified target database document (specified in the **Targetset URL** field). Once a **Targetset URL** is selected, the structure of the target documents is presented. For each target document (`@targetdoc`), its content is displayed, allowing you to easily identify the appropriate `@targetptr`. You can also use the search fields to quickly identify a target. If you already know the values for the `@targetdoc` and `@targetptr` attributes, you can insert them directly in the corresponding fields.

Example: In the following image, the target database document is called `target.xml`, `dbadmin` is selected for the target document (`@targetdoc`), and `blinit` is selected as the value for the `@targetptr` attribute. Notice that you can also add XREF text into the `<olink>` by using the `xrefext` field.

Figure 370. Insert OLink Dialog Box

6. Process a DocBook transformation for each document to generate the output.
 - a. Edit the transformation scenario and set the value of the `target.database.document` parameter to be the URL of the target database document.
 - b. Apply the transformation scenario.

DocBook Assembly (5.1 and Later)

The DocBook *Assembly* document type was introduced with DocBook 5.1 and it is used to define the hierarchy and relationships for a collection of resources. It is especially helpful for topic-oriented authoring scenarios since it assembles a set of resources (such as *DocBook 5.1 topics (on page 1080)*) to form a hierarchical structure for a larger publication.

An *Assembly* document usually has four major parts:

- **Resources** - Identifies a collection of resources (such as topics). An *Assembly* may identify one or more collections.
- **Structure** - Identifies an artifact to be assembled. A document in this case is the particular collection of resources (such as topics) that forms the documentation. Within the `<structure>` element, an `<output>` element can be used to identify the type of output to be generated and `<module>` elements can be used to identify the resources to be included. An *Assembly* may identify one or more *structures*.

- **Relationships** - Identifies relationships between resources. These relationships may be manifested in any number of *structures* during assembly. An *Assembly* may identify any number of relationships.
- **Transformations** - Identifies transformations that can be applied during assembly. An *Assembly* may identify any number of transformations.

For detailed information about the DocBook *Assembly* document type, see [The Definitive Guide - DocBook Assemblies](#).

File Definition

A file is considered to be an *Assembly* when the root name is `assembly`.

Default Document Templates

A default **Assembly** document template is available when creating [new documents from templates](#) (on page 330) and it can be found in: **Framework Templates > DocBook 5 > DocBook 5.1**.

The default template for DocBook Assembly documents is located in the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/Docbook5.1` folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected is `docbookxi.rng` and it is stored in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/5.1/rng/`.

Transformation Scenarios

Oxygen XML Developer includes a built-in transformation scenario that can be applied on an *Assembly* file to generate an *assembled* (merged) DocBook file. The scenario is called **DocBook Assembly** and is found in the **DocBook 5** section in the [Configure Transformation Scenario\(s\)](#) dialog box (on page 1240).

Resources

- [The Definitive Guide - DocBook Assemblies](#)
- [DocBook Specifications](#)
- Sample files: `[OXYGEN_INSTALL_DIR]/samples/docbook/v5/assembly/`

DocBook Topic (5.1 and Later)

The DocBook *Topic* document type was introduced with DocBook 5.1 and it is used as a modular unit of documentation. It is similar to the concept of the DITA *Topic* and can be used as modular resources in conjunction with [DocBook Assembly](#) (on page 1079) documents.

For detailed information about the DocBook *Topic* document type, see [The Definitive Guide - DocBook Topic](#).

File Definition

A DocBook file is considered to be a *Topic* when the root name is `topic`.

Default Document Templates

A default **Topic** document template is available when creating [new documents from templates \(on page 330\)](#) and it can be found in: **Framework Templates > DocBook 5 > DocBook 5.1**.

The default template for DocBook Assembly documents is located in the

`[OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/Docbook5.1` folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected is `docbookxi.rng` and it is stored in

`[OXYGEN_INSTALL_DIR]/frameworks/docbook/5.1/rng/`.

Transformation Scenarios

Since DocBook *Topics* are modular resources, they are *assembled* and transformed in the **DocBook Assembly transformation process (on page 1080)**. You can also use any of the built-in DocBook transformation scenarios to transform individual DocBook Topics to a variety of outputs, such as PDF, HTML, EPUB, and more. They are found in the **DocBook 5** section in the **Configure Transformation Scenario(s)** dialog box [\(on page 1240\)](#).

Resources

- [The Definitive Guide - DocBook Topic](#)
- [DocBook Specifications](#)
- Sample files: `[OXYGEN_INSTALL_DIR]/samples/docbook/v5/assembly/`

Related Information:

[DocBook Assembly \(5.1 and Later\) \(on page 1079\)](#)

DocBook Targetset Document Type (Framework)

DocBook *Targetset* documents are used to resolve cross references with the DocBook *Olink*.

File Definition

A file is considered to be a *Targetset* when the root name is `targetset`.

Default Document Templates

A default **DocBook Targetset Map** document template is available when creating [new documents from templates \(on page 330\)](#) and it can be found in: **Framework Templates > DocBook Targetset**.

The default template for DocBook Targetset documents is located in the

`[OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/Targetset` folder.

Default Schema for Validation and Content Completion

The default schema, `targetdatabase.dtd`, for this type of document is stored in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/common/`.

Related Information:

[DocBook Specifications](#)

DITA Topics Document Type (Framework)

The Darwin Information Typing Architecture (DITA) is an XML-based architecture for authoring, producing, and delivering technical information. It divides content into small, self-contained topics that you can reuse in various deliverables. The extensibility of DITA permits organizations to define specific information structures while still using standard tools to work with them. DITA content is created as topics, each an individual XML file. Typically, each topic has a defined primary objective and structure, and DITA also includes several specialized topic types (*task*, *concept*, *reference*, *glossary entry*).

File Definition

A file is considered to be a DITA topic document when one of the following conditions are true:

- The root element name is one of the following: `<concept>`, `<task>`, `<reference>`, `<dita>`, or `<topic>`.
- The PUBLIC ID of the document is a PUBLIC ID for the elements listed above.
- The root element of the file has a `@DITAArchVersion` attribute for the “`http://dita.oasis-open.org/architecture/2005/`” namespace. This enhanced case of matching is only applied when the **Enable DTD/XML Schema processing in document type detection** option (*on page 129*) is selected from the **Document Type Association** preferences page (*on page 128*).

Default Document Templates

There are a variety of default *DITA topic* templates available when creating [new documents from templates](#) (*on page 330*) and they can be found in various folders inside: **Framework Templates > DITA**.

The default templates for DITA topic documents are located in the `[OXYGEN_INSTALL_DIR]/frameworks/dita/templates/topic` folder.

Default Schema for Validation and Content Completion

Default schemas that are used if one is not detected in the DITA documents are stored in the various folders inside `DITA-OT-DIR/dtd/` or `DITA-OT-DIR/schema/`.

Default XML Catalogs

The default *XML Catalogs* (*on page 2273*) for the DITA topic document type are as follows:

- `DITA-OT-DIR/catalog-dita.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/dita/catalog.xml`

- `[OXYGEN_INSTALL_DIR]/frameworks/dita/plugin/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/dita/styleguide/catalog.xml`

Transformation Scenarios

Oxygen XML Developer includes built-in transformation scenarios for transforming individual DITA Topics to HTML5, XHTML, or PDF output. They can be found in the **DITA** section in the **Configure Transformation Scenario(s)** dialog box (*on page 1240*).

Resources

- [DITA Specifications](#)

- [Oxygen Video Tutorial: DITA Editing](#)

Related Information:

[Editing XML Documents in Text Mode \(on page 471\)](#)

DITA Map Document Type (Framework)

DITA maps (on page 2268) are documents that collect and organize references to DITA topics to indicate the relationships between the topics. They can be used as a container for topics used to transform a collection of content into a publication and they offer a sequence and structure to the topics. They can also serve as outlines or tables of contents for DITA deliverables and as build manifests for DITA projects. *DITA maps* allow scalable reuse of content across multiple contexts. Maps can reference topics or other maps, and can contain a variety of content types and metadata.

File Definition

A file is considered to be a *DITA map* document when one of the following conditions are true:

- The root element name is one of the following: `<map>`, `<bookmap>`.
- The public ID of the document is `-//OASIS//DTD DITA Map` or `-//OASIS//DTD DITA BookMap`.
- The root element of the file has a `@class` attribute that contains the value `map/map` and a `@DITAArchVersion` attribute from the `http://dita.oasis-open.org/architecture/2005/` namespace. This enhanced case of matching is only applied when the **Enable DTD/XML Schema processing in document type detection option (on page 129)** from the **Document Type Association preferences page (on page 128)** is selected.

Default Document Templates

There are a variety of default *DITA map* templates available when creating [new documents from templates \(on page 330\)](#) and they can be found in various folders inside: **Framework Templates > DITA Map**.

The default templates for *DITA map* documents are located in the `[OXYGEN_INSTALL_DIR]/frameworks/sita/templates/map` folder.

Default Schema for Validation and Content Completion

Default schemas that are used if one is not detected in the *DITA map* document are stored in the various folders inside `DITA-OT-DIR/dtd/` or `DITA-OT-DIR/schema/`.

Default XML Catalogs

The default *XML Catalogs* (on page 2273) for the *DITA map* document type are as follows:

- `[OXYGEN_INSTALL_DIR]/frameworks/dita/catalog.xml`
- `DITA-OT-DIR/catalog-dita.xml`

Transformation Scenarios

Oxygen XML Developer includes numerous built-in transformation scenarios that allow you to transform *DITA maps* to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, and CHM. All of them are listed in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box (on page 1240).

For more information, see the *DITA Map Transformation Scenarios* (on page) section.

[Editing XML Documents in Text Mode](#) (on page 471)

XHTML Document Type (Framework)

The Extensible HyperText Markup Language (XHTML), is a markup language that has the same depth of expression as HTML, but also conforms to XML syntax.

File Definition

A file is considered to be an XHTML document when the root element is `<html>`.

Default Document Templates

There are a variety of default *XHTML* templates available when creating [new documents from templates](#) (on page 330) and they can be found in: **Framework Templates > XHTML**.

The default templates for XHTML documents are located in the `[OXYGEN_INSTALL_DIR]/frameworks/xhtmll/templates/` folder.

Default Schema for Validation and Content Completion

Default schemas that are used if one is not detected in the XHTML file are stored in the following locations:

- XHTML 1.0 - `[OXYGEN_INSTALL_DIR]/frameworks/xhtmll/dtd/` or `[OXYGEN_INSTALL_DIR]/frameworks/xhtmll/nvdl/`.
- XHTML 1.1 - `[OXYGEN_INSTALL_DIR]/frameworks/xhtmll11/dtd/` or `[OXYGEN_INSTALL_DIR]/frameworks/xhtmll11/schema/`.
- XHTML 5 - `[OXYGEN_INSTALL_DIR]/frameworks/xhtmll/xhtmll5 (epub3)/`.

Default XML Catalogs

The default *XML Catalogs* (on page 2273) for the XHTML document type are as follows:

- `[OXYGEN_INSTALL_DIR]/frameworks/xhtmll/dtd/xhtmllcatalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/relaxng/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/nvdl/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/xhtmll11/dtd/xhtmllcatalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/xhtmll11/schema/xhtmllcatalog.xml`
- `[OXYGEN_INSTALL_DIR]/xhtml5 (epub3)/catalog-compat.xml`

Transformation Scenarios

Oxygen XML Developer includes built-in transformation scenarios that allow you to transform XHTML documents to several types of DITA document types (topic, task, concept, reference). They can be found in the **XHTML** section in the **Configure Transformation Scenario(s)** dialog box (on page 1240).

[XHTML Specifications](#)

XHTML Validation

XHTML documents can be validated in Oxygen XML Developer using the same validation features as with any other XML document. In addition, Oxygen XML Developer includes a built-in validator engine (**W3C XHTML Validator**) based upon the *W3C Nu HTML Checker* that can be used to validate HTML or XHTML documents.

To use the **W3C XHTML Validator** engine:

1. Create or edit a validation scenario (e.g. select the  **Configure Validation Scenario(s)** from the  **Validation** toolbar drop-down menu).
2. Change the **File type** column to *XML Document* and select *W3C XHTML Validator* in the **Validation engine** column.
3. Click **OK** and **Apply Associated** to run the validation.

TEI P5 Document Type (Framework)

The *TEI (Text Encoding Initiative)* document type is an international and interdisciplinary standard that enables libraries, museums, publishers, and individual scholars to represent a variety of literary and linguistic texts for online research, teaching, and preservation.

File Definition

A file is considered to be a TEI P5 document when one of the following conditions are true:

- The document namespace is *http://www.tei-c.org/ns/1.0*.
- The public ID of the document is *-//TEI P5*.

Default Document Templates

There are a variety of default *TEI P5* templates available when creating [new documents from templates \(on page 330\)](#) and they can be found in: **Framework Templates > TEI P5**.

The default templates for TEI P5 documents are located in the `[OXYGEN_INSTALL_DIR]/frameworks/tei/templates/TEI P5` folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected in the TEI P5 document is `tei_all.rng` and it is stored in `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/relaxng/`.

Default XML Catalogs

The default *XML Catalogs (on page 2273)* for the TEI P5 document type are as follows:

- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/schema/dtd/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/dtd/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/stylesheet/catalog.xml`

Transformation Scenarios

Oxygen XML Developer includes built-in transformation scenarios that allow you to transform TEI P5 documents to a variety of outputs, such as PDF, XHTML, EPUB, DOCX, and ODT. They can be found in the **TEI P5** section in the **Configure Transformation Scenario(s)** dialog box (*on page 1240*).

How to Install a TEI Framework with the Latest Schema and Stylesheets

The TEI framework that is bundled in Oxygen XML Developer has the TEI schema and stylesheets that were available at the time of its release. When the *TEI Consortium* releases a new TEI version (Schema and Stylesheets), they also release a new version of the Oxygen XML Developer TEI framework with them.

Warning:

TEI Consortium, who maintains these releases, chose to keep them compatible with Oxygen XML Developer version 18.1. This means that some features or improvements that were developed in later versions of Oxygen XML Developer might be missing from these frameworks.

The following procedure describes how to install a release of the TEI framework done by *TEI Consortium* that has a newer version of the TEI Schema and TEI XSL <https://github.com/TEIC/oxygen-tei/blob/master/oxygen-tei-plugin.md>

1. Go to **Help > Install new add-ons**.
2. Enter or paste <https://www.tei-c.org/release/oxygen/updateSite.oxygen> in the **Show add-ons from** field.
3. Choose the TEI framework that you want to install and click **Next**.
4. Read the end-user license agreement. Then select the **I accept all terms of the end-user license agreement** option and click **Finish**.
5. Restart the application.

TEI ODD Document Type (Framework)

The *TEI ODD* (*Text Encoding Initiative - One Document Does it all*) document type is a TEI XML-conformant specification format that allows you to create a custom TEI P5 schema in a literate programming fashion. A system of XSLT stylesheets called [Roma](#) was created by the TEI Consortium for manipulating the ODD files.

File Definition

A file is considered to be a TEI ODD document when the following conditions are true:

- The file extension is `.odd`.
- The document namespace is `http://www.tei-c.org/ns/1.0`.

Default Document Templates

There is a default *TEI ODD* document template available when creating [new documents from templates \(on page 330\)](#) and they can be found in: **Framework Templates > TEI ODD**.

The default template is located in the `[OXYGEN_INSTALL_DIR]/frameworks/tei/templates/TEI ODD` folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected in the TEI ODD document is `tei_odds.rng` and it is stored in `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/relaxng/`.

Default XML Catalogs

The default *XML Catalogs (on page 2273)* for the TEI ODD document type are as follows:

- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/schema/catalog.xml`

Transformation Scenarios

Oxygen XML Developer includes built-in transformation scenarios that allow you to transform TEI ODD documents to a variety of outputs, such as PDF, XHTML, EPUB, DOCX, ODT, RNG, DTD, and XML Schema. They can be found in the **TEI ODD** section in the **Configure Transformation Scenario(s)** dialog box [\(on page 1240\)](#).

Related Information:

[Editing XML Documents in Text Mode \(on page 471\)](#)

jTEI Document Type (Framework)

The *jTEI (Journal of the Text Encoding Initiative)* document type is a highly restrictive customization (only about 80 elements are included) of the TEI P5 *framework*.

File Definition

A file is considered to be a *jTEI* document when the root element is named *TEI*, it is in the namespace *http://www.tei-c.org/ns/1.0*, and the `@rend` attribute is set to "jTEI".

Default Document Templates

There is a default **jTEI Article** template available when creating [new documents from templates \(on page 330\)](#) and they can be found in: **Framework Templates > TEI JTEI**.

The default template is located in the `[OXYGEN_INSTALL_DIR]/frameworks/tei/templates/TEI jTEI` folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected is `tei_jtei.rng` and it is stored in `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/relaxng/`.

Default XML Catalogs

The default *XML Catalogs (on page 2273)* for *jTEI* are as follows:

- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/schema/dtd/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/dtd/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/stylesheet/catalog.xml`

Transformation Scenarios

Oxygen XML Developer includes built-in transformation scenarios that allow you to transform *jTEI* documents to PDF and ODT. They can be found in the **TEI JTEI** section in the **Configure Transformation Scenario(s)** dialog box [\(on page 1240\)](#).

Resources

- [jTEI Article Guidelines](#)

[Editing XML Documents in Text Mode \(on page 471\)](#)

JATS Document Type (Framework)

The *JATS (NISO Journal Article Tag Suite)* document type is a technical standard that defines an XML format for scientific literature.

File Definition

A file is considered to be a JATS document when the PUBLIC ID of the document contains the string `-//NLM//DTD.`

Default Document Templates

There are some default *JATS* templates available when creating [new documents from templates \(on page 330\)](#) and they can be found in: **Framework Templates > JATSKit - NISO JATS and NLM BITS**

The default templates for JATS documents are located in the `[OXYGEN_INSTALL_DIR]/frameworks/jats/templates/` folder.

Default Schema for Validation and Content Completion

Default schemas that are used if one is not detected in the JATS document are stored in `[OXYGEN_INSTALL_DIR]/frameworks/jats/lib/schemas/`.

Default XML Catalog

The default *XML Catalog (on page 2273)*, `jatskit-catalog.xml`, is stored in `[OXYGEN_INSTALL_DIR]/frameworks/jats/lib/schemas/`.

Transformation Scenarios

Oxygen XML Developer includes built-in transformation scenarios that allow you to transform JATS documents to a variety of outputs, such as PDF, HTML, and EPUB. They can be found in the **JATSKit** section in the **Configure Transformation Scenario(s)** dialog box [\(on page 1240\)](#).

Resources

Related Information:

[Editing XML Documents in Text Mode \(on page 471\)](#)

EPUB Document Type (Framework)

EPUB is an e-book file format that is a ZIP archive and can be downloaded and read on devices such as phones, tablets, computers, or e-readers. Oxygen XML Developer includes an **Archive Browser view (on page 1741)** that allows you to view the contents and structure of this type of file.

Three distinct *frameworks (on page 2269)* are supported for the EPUB document type:

- **NCX** - A declarative global navigation definition.
- **OCF** - The Open Container Format (OCF) defines a mechanism by which all components of an Open Publication Structure (OPS) can be combined into a single file system entity.
- **OPF** - The Open Packaging Format (OPF) defines the mechanism by which all components of a published work that conforms to the Open Publication Structure (OPS) standard (including metadata, reading order, and navigational information) are packaged in an OPS Publication.

**Note:**

Oxygen XML Developer supports OPF 2.0, OPF 3.0, and OPF 3.1.

File Definition

A file is considered to be an *EPUB* document if it has a file extension of `.epub`.

Default Document Templates

There are a variety of default *EPUB* templates available when creating [new documents from templates \(on page 330\)](#) and they can be found the following folders in **Framework Templates: NCX, OCF, OPF 2.0, OPF 3.0, and OPF 3.1**.

- The default templates for the **NCX** document types are located in the `[OXYGEN_INSTALL_DIR]/frameworks/ncx/templates` folder.
- The default templates for the **OCF** document types are located in the `[OXYGEN_INSTALL_DIR]/frameworks/ocf/templates` folder.
- The default template for the **OPF 2.0** document type is located in the `[OXYGEN_INSTALL_DIR]/frameworks/opf/templates/2.0` folder.
- The default template for the **OPF 3.0** document type is located in the `[OXYGEN_INSTALL_DIR]/frameworks/opf/templates/3.0` folder.
- The default template for the **OPF 3.1** document type is located in the `[OXYGEN_INSTALL_DIR]/frameworks/opf/templates/3.1` folder.

Default Schema

The default schema files for the various types of *EPUB* document types are located in the following directories:

- The default schema files for the **NCX** document types are located in the `[OXYGEN_INSTALL_DIR]/frameworks/ncx/schemas` folder.
- The default schema files for the **OCF** document types are located in the `[OXYGEN_INSTALL_DIR]/frameworks/ocf/schemas` folder.
- The default schema files for the **OPF 2.0** document type is located in the `[OXYGEN_INSTALL_DIR]/frameworks/opf/schemas/2.0` folder.

- The default schema files for the **OPF 3.0** document type is located in the `[OXYGEN_INSTALL_DIR]/frameworks/opf/schemas/3.0` folder.
- The default schema files for the **OPF 3.1** document type is located in the `[OXYGEN_INSTALL_DIR]/frameworks/opf/schemas/3.1` folder.

[Working with Archive Files \(on page 1744\)](#)

OpenAPI (Swagger) Document Type (Framework)

OpenAPI specification, previously known as Swagger specification, is a specification that defines a standard, programming language-agnostic interface description for HTTP APIs, which allows both humans and computers to discover and understand the capabilities of a service without requiring access to source code, additional documentation, or inspection of network traffic. Use cases for machine-readable API definition documents include interactive documentation, code generation for documentation, automation of test cases, and more. OpenAPI documents describe an API's services and are represented in either YAML or JSON format.

Oxygen XML Developer includes three OpenAPI frameworks:

- OpenAPI 2.0
- OpenAPI 3.0
- OpenAPI 3.1

Editing OpenAPI Documents

You can edit OpenAPI files in **Text** mode and you have access to all the usual text editing actions.

**Tip:**

There is an OpenAPI sample document named `petsore.json` located in `[OXYGEN-INSTALL-DIR]/samples/json/openapi` that you can use to see how these documents are rendered in Oxygen XML Developer.

Validation and Content Completion

Validation and content completion is supported in Oxygen XML Developer for OpenAPI documents (version 2.0, 3.0, 3.1). The validation and content completion in OpenAPI documents are driven by schemas according to the OpenAPI version in the document. Each of the three frameworks (OpenAPI 2.0, OpenAPI 3.0, and OpenAPI 3.1) have a unique schema specified for content completion and validation. When opening an OpenAPI document (in JSON or YAML format), Oxygen XML Developer automatically associates the corresponding schema based on the OpenAPI version of the document.

Resources

- Oxygen XML Developer includes a tool for generating documentation for OpenAPI components in HTML format: [Generating OpenAPI Documentation \(on page 2004\)](#).
- Oxygen XML Developer includes a testing tool for OpenAPI files: [OpenAPI Tester \(on page 1989\)](#).
- For more details about the *OpenAPI Specification*, along with example documents, go to <https://spec.openapis.org/oas/latest.html>.

- Webinar: [OpenAPI/AsyncAPI Support in Oxygen](#)

OpenAPI Test Scenario Document Type (Framework)

Oxygen XML Developer includes a specialized framework for working with OpenAPI test scenario files. It includes the usual text editing actions, a visual editing interface, content completion, and automatic validation.

Default Document Template

There is a default scenario file template available when creating [new documents from templates \(on page 330\)](#) and they can be found in the **Framework Templates > OpenAPI Test Scenario**.

Content Completion

Oxygen XML Developer helps you edit OpenAPI test scenario files through the [Content Completion Assistant \(on page 2267\)](#), offering proposals for properties and values that can be inserted at the cursor position. It can be manually activated with the **Ctrl + Space** shortcut.

Validation

Oxygen XML Developer includes built-in validation for OpenAPI test scenario documents to help you keep them well-formed. The documents are validated automatically as you type against the schema specified in the framework and problems are highlighted within the document.

OpenAPI Tools

The following additional OpenAPI tools are available as free add-ons:

- **OpenAPI Tester** - Provides the ability to inspect OpenAPI request responses and to ensure that they work as expected. It can be used for [OpenAPI 3.x](#) in JSON or YAML format. For details, see [OpenAPI Tester Add-on](#).
- **Run OpenAPI Test Scenario** - Provides the ability to run a test suite for an OpenAPI document in JSON format. It performs the requests based on the specified OpenAPI document and the data entered in the test file, and then checks if the server responses are as expected. For details, see [Run OpenAPI Test Scenario \(on page 1989\)](#).
- **OpenAPI Documentation Generator** - Provides the ability to generate documentation for *OpenAPI* components in HTML format, including annotations and cross references. The documentation displays

information about the servers, paths, components and tags defined in the [OpenAPI 3.0](#) documents and it is presented in a visual diagram style with various sections, hyperlinks, and filtering options. For details, see [OpenAPI Documentation Generator Add-on \(on page 2004\)](#).

Resources

- For more details about the *OpenAPI Specification*, along with example documents, go to <https://spec.openapis.org/oas/latest.html>.

- Webinar: [OpenAPI Editing, Testing, and Documenting](#)
- Webinar: [OpenAPI/AsyncAPI Support in Oxygen](#)

AsyncAPI Document Type (Framework)

Oxygen XML Developer includes a specialized framework for working with [AsyncAPI](#) files. The application supports the following AsyncAPI versions: 1.0.0, 1.1.0, 1.2.0, 2.0.0, 2.1.0, 2.2.0, 2.3.0, 2.4.0, 3.0.0.

Editing AsyncAPI Documents

You can edit AsyncAPI files in **Text** mode and you have access to all the usual text editing actions.

Default Document Templates

There are some default AsyncAPI templates available when creating [new documents from templates \(on page 330\)](#) and they can be found in the **Framework Templates > AsyncAPI 1.x** and **Framework Templates > AsyncAPI 2.x** folders. Each of those folders contain a default new document template for a JSON version and a YAML version. Some other useful examples can be found at [public AsyncAPI GitHub project](#).

Content Completion

Oxygen XML Developer helps you edit AsyncAPI files through the [Content Completion Assistant \(on page 2267\)](#), offering proposals for properties and values that can be inserted at the cursor position. It can be manually activated with the **Ctrl + Space** shortcut.

Validation

Oxygen XML Developer includes built-in validation for AsyncAPI documents to help you keep them well-formed. The documents are validated automatically as you type against the schema specified in the framework and problems are highlighted within the document.

Resources

- For details about the *AsyncAPI Specification*, go to <https://www.asyncapi.com/docs>.
- Webinar: [OpenAPI/AsyncAPI Support in Oxygen](#)

JSON-LD Document Type (Framework)

Oxygen XML Developer includes a specialized framework for working with **JSON-LD** files. *JSON-LD* (JavaScript Object Notation for Linked Data) consists of multi-dimensional arrays and is considered an easy-to-use lightweight *Linked Data* format.

Editing JSON-LD Documents

You can edit JSON-LD files in the [specialized JSON text mode editor \(on page 879\)](#) and you have access to its various features and actions.

Default Document Template

There are some default *JSON-LD* templates available when creating [new documents from templates \(on page 330\)](#) and they can be found in: **Framework Templates > JSON-LD**. Some other useful examples can be found at [public JSON-LD GitHub project](#).

Content Completion

Oxygen XML Developer includes an intelligent [Content Completion Assistant \(on page 2267\)](#) that offers proposals for inserting JSON structures that are valid at the current editing location. For more details, see [Content Completion Assistant in JSON \(on page 891\)](#).

Validation

Oxygen XML Developer includes built-in validation for JSON-LD documents to help you keep them well-formed. The documents are validated automatically as you type against the schema specified in the framework and problems are highlighted within the document. For more details, see [Validating JSON Documents \(on page 883\)](#).

10.

Additional XML Editing Frameworks (Document Types)

Oxygen XML Developer supports custom frameworks (document types) contributed by the XML community (for example, the [S1000D framework \(on page 1096\)](#)). They provide support for additional functionality and XML vocabularies.

Similar to the built-in [frameworks \(on page 2269\)](#), the additional frameworks may define:

- A default grammar used for validation and content completion in **Text** mode.
- Built-in transformation scenarios used for publishing XML documents.
- [XML Catalogs \(on page 2273\)](#) used for mapping resources.
- New document templates to make it easy to create XML documents.

S1000D Document Type (Framework)

S1000D is an international specification for the procurement and production of technical publications (mainly used in aerospace and aviation industries). It is an XML-based specification for preparing, managing, and using equipment maintenance and operations information.

S1000D is articulated based on three main notions:

- **Data Module** - It is an XML file that defines a standalone information unit.
- **Data Module Structure** - It defines how a *Data Module* is divided:
 - The *Identification* and *Status* part that identifies the *Data Module* within the CSDB structure.
 - The *Content* part that is the detailed information of the *Data Module*.
- **Common Source DataBase (CSDB)** - It defines how the *Data Modules* are arranged inside a publication.

Oxygen XML Developer does not have default built-in support for **S1000D**, but a company called Amplexor has developed a framework that can be installed in Oxygen XML Developer to add support for S1000D documents.

To install the framework in Oxygen XML Developer, follow these steps:

1. Download or clone the framework on [GitHub](#) and install it as an [additional framework](#) (*on page 129*).
2. Download the S1000D specifications package that contains samples and schemas at [S1000D Downloads](#).
3. Copy the XML Schema files from `[ZIP]\XML Schema Package\xml_schema_flat` into the corresponding version of the `xml_schema_flat` folder.

If you want more advanced **S1000D** editing features, you can ask some of [our partners](#).

11.

Publishing

XML documents can be transformed into a variety of user-friendly output formats that can be viewed by end-users. This process is known as a *transformation*.

Oxygen XML Developer includes numerous built-in transformation possibilities to publish XML content in various output formats (such as WebHelp, PDF, CHM, EPUB, JavaHelp, Eclipse Help, XHTML, etc.)

For transformations that are not included in your installed version of Oxygen XML Developer, simply install the tool chain required to perform the specific transformation and process the files in accordance with the processor instructions. A multitude of target formats are possible. The basic condition for a transformation to any format is that your source document is well-formed.

Transformation Scenarios

A transformation scenario is a set of complex operations and settings that gives you the possibility to obtain outputs of multiple types (XML, HTML, PDF, EPUB, etc.) from the same source of XML files and stylesheets.

Note:

You need to use the appropriate stylesheet according to the source definition and the desired output. For example, if you want to transform into an HTML format using a DocBook stylesheet, your source XML document should conform with the DocBook DTD.

Executing a transformation scenario implies multiple actions, such as:

- Validating the input file.
- Obtaining intermediate output files (for example, formatting objects for the XML to PDF transformation).
- Using transformation engines to produce the output.

Before transforming an XML document in Oxygen XML Developer, you need to define a transformation scenario to apply to that document. A scenario is a set of values for various parameters that define a transformation. It is not related to a particular document, but rather to a document type. Oxygen XML Developer includes [preconfigured built-in transformation scenarios \(on page 1099\)](#), but you can also [create new transformation scenarios \(on page 1129\)](#).

When creating new transformation scenarios, the types that are available include:

- **Scenarios that Apply to XML Files** - This type of scenario contains the location of an XSLT stylesheet that is applied on the edited XML document, as well as other transformation parameters. For more information, see [XML Transformation with XSLT \(on page 1130\)](#) and [XML Transformation with XQuery \(on page 1146\)](#).
- **Scenarios that Apply to XSLT Files** - This type of scenario contains the location of an XML document that the edited XSLT stylesheet is applied to, as well as other transform parameters. For more information, see [XSLT Transformation on XML \(on page 1188\)](#).
- **Scenarios that Apply to XQuery Files** - This type of scenario contains the location of an XML source, that the edited XQuery file is applied to, as well as other transform parameters. When the XML source is a native XML database, the XML source field of the scenario is empty because the XML data is read with XQuery-specific functions, such as `document ()`. When the XML source is a local XML file, the URL of the file is specified in the XML input field of the scenario. For more information, see [XQuery Transformation on XML \(on page 1220\)](#).
- **Scenarios that Apply to JSON Files** - This type of scenario contains the location of an XSLT stylesheet that is applied on the edited JSON document, as well as other transformation parameters. For more information, see [JSON Transformation with XSLT \(on page 1173\)](#) and [XSLT Transformation on JSON \(on page 1208\)](#).
- **Scenarios that Apply to SQL Files** - This type of scenario specifies a database connection for the database server that runs the SQL file that is associated with the scenario. The data processed by the SQL script is located in the database.
- **Scenarios that Apply to XProc Files** - This type of scenario contains the location of an XProc script, as well as other transform parameters. For more information, see [SQL Transformation \(on page 1236\)](#).
- **DITA-OT Scenarios** - This type of scenario provides the parameters for an Ant transformation that executes a DITA-OT build script. Oxygen XML Developer includes a built-in version of Ant and a built-in version of DITA-OT, although you can also set other versions in the scenario. For more information, see [DITA-OT Transformation \(on page 1156\)](#).
- **ANT Scenarios** - This type of scenario contains the location of an Ant build script, as well as other transform parameters. For more information, see [Ant Transformation \(on page 1169\)](#).

**Note:**

Status messages generated during the transformation process are displayed in the **Information view** ([on page 467](#)).

Built-in Transformation Scenarios

Oxygen XML Developer includes preconfigured built-in transformation scenarios that are used for common transformations. They can be found in the various sections in the **Configure Transformation Scenario(s)** dialog box ([on page 1240](#)) or **Transformation Scenarios view** ([on page 1246](#)). All the built-in *document types (frameworks)* ([on page 2269](#)) that are included in Oxygen XML Developer have various transformation scenarios in their specific sections, including the most popular *frameworks*, such as DITA, DocBook, TEI, XHTML, JATS, OOXML, and more.

To obtain the desired output, use one of the following actions from the toolbar or **Transform** submenu in the contextual menu of the **Project view** (*on page 365*):

-  **Apply Transformation Scenario(s) (Ctrl + Shift + T (Command + Shift + T on macOS))** - If you have associated transformation scenarios for the current document, this action will simply [apply the association](#) (*on page 1239*) and begin the transformation process. If an association is not detected, this action will open the **Configure Transformation Scenario(s)** dialog box (*on page 1240*) where you can choose the scenarios you want to apply.
-  **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on macOS))** - This action will open the **Configure Transformation Scenario(s)** dialog box (*on page 1240*) where you can choose the scenarios you want to apply.

**Note:**

- You can apply a transformation even if the current document is not associated with a transformation scenario.
- If the document contains an `xml-stylesheet` processing instruction that references an XSLT stylesheet (commonly used to display the document in web browsers), Oxygen XML Developer prompts you to associate the document with a built-in transformation scenario.
- The default transformation scenario is suggested based on the processing instruction from the edited document.

[Transformation Scenarios View](#) (*on page 1246*)

DITA Map Transformation Scenarios

Built-in transformation scenarios allow you to transform *DITA maps* (*on page 2268*) to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word. Oxygen XML Developer also includes a special **Integrate/Install DITA-OT Plugins** (*on page 1124*) that can be used to integrate a DITA-OT plugin and a **DITA Map Metrics Report** transformation that generates a statistics report for your DITA map. All of them are listed in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box (*on page 1240*).

A variety of transformations scenarios are available for *DITA maps* (*on page 2268*):

- Built-in transformation scenarios allow you to transform a *DITA map* to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Metrics Report, and MS Word.
- **Integrate/Install DITA-OT Plugins** ([on page 1124](#)) - Use this transformation scenario if you want to integrate a DITA-OT plugin. This scenario runs an Ant task that integrates all the plugins from the DITA-OT/plugins directory.

DITA Map WebHelp Responsive Transformation

DITA content can be transformed into several types of WebHelp Responsive systems (with or without a feedback section). The [WebHelp Responsive layout and features](#) ([on page 1251](#)) are designed to adapt to any device and screen size to provide an optimal viewing and interaction experience. Oxygen XML Developer also provides numerous possibilities for [customizing the WebHelp Responsive output](#) ([on page 1336](#)).

WebHelp Responsive Transformation Scenario

To publish a *DITA map* ([on page 2268](#)) as **WebHelp Responsive** output, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** action from the toolbar.
2. Select the **DITA Map WebHelp Responsive** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab** ([on page](#)) - This tab contains a set of built-in [publishing templates](#) ([on page 1297](#)) that you can use for the layout of your WebHelp system output. You can also [create your own publishing templates or edit existing ones](#) ([on page 1336](#)).
- **Parameters Tab** ([on page](#)) - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the [Parameters section](#) ([on page 1102](#)) below for details about the most commonly used parameters for WebHelp Responsive transformations.
- **Feedback Tab** ([on page](#)) - This tab is for those who want to add the **Oxygen Feedback** comments component at the bottom of each WebHelp page so that you can interact with your readers.
- **Filters Tab** ([on page](#)) - This tab allows you to filter certain content elements from the generated output.

- **Advanced Tab** (*on page*) - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab** (*on page*) - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to process the transformation.

Result: When the **DITA Map WebHelp Responsive** transformation is complete, the output is automatically opened in your default browser.

General Parameters for Customizing WebHelp Responsive Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

default.language

This parameter is used if the language is not detected in the *DITA map*. The default value is `en-us`.

clean.output

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

editlink.remote.ditamap.url

Use this parameter in conjunction with `editlink.web.author.url` to add an *Edit* link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the custom URL of the *main DITA map*. For example, a GitHub custom URL might look like this: `https://getFileContent/oxyengxml/userguide/master/UserGuide.ditamap`.

editlink.web.author.url

This parameter needs to be used in conjunction with `editlink.remote.ditamap.url` to add an *Edit* link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the URL of the Web Author installation. For example: `https://www.oxygenxml.com/oxygen-xml-web-author/`.

editlink.present.only.path.to.topic

When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the WebHelp Responsive output. Also, when this parameter is used, the `editlink.ditamap.edit.url`, `editlink.remote.ditamap.url`, and `editlink.web.author.url` parameters are ignored.

fix.external.refs.com.oxygenxml (Only supported when the DITA-OT transformation process is started from Oxygen XML Developer)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed *DITA map*. This parameter is used to specify whether

or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

force.unique

When set to `true` (default value), the transformation will be forced to create unique output files for each instance of a resource when a map contains multiple references to a single topic.

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

webhelp.csh.disable.topicID.fallback

Specifies whether or not topic ID *fallbacks* are enabled when computing the mapping of context sensitive help and `resourceid` information is not available. Possible values are **false** (default) and **true**.

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

webhelp.favicon

The file path that points to an image to be used as a *favicon* in the WebHelp output.

webhelp.reload.stylesheet

Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

webhelp.search.custom.excludes.file

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as `'*'` (matches zero or more characters) or `'?'` (matches one character). For more information about the patterns, see <https://ant.apache.org/manual/dirtasks.html#patterns>.

webhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the *Kuromoji* morphological engine for indexing Japanese content in the WebHelp pages. The encoding for the dictionary must be **UTF8**.

webhelp.search.enable.pagination

Specifies whether or not search results will be displayed on multiple pages. Allowed values are `yes` or `no`.

webhelp.search.index.elements.to.exclude

Specifies a list of HTML elements that will not be indexed by the search engine. The value of the `@class` attribute can be used to exclude specific HTML elements from indexing. For example, the **div.not-indexed** value will not index all `<div>` elements that have a `@class` attribute with the value of **not-indexed**. Use a comma separator to specify more than one element.

webhelp.search.page.numberOfItems

Specifies the number of search results items displayed on each page. This parameter is only used when the **webhelp.search.enable.pagination** parameter is enabled.

webhelp.search.ranking

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

webhelp.search.stop.words.include

Specifies a list of words that will be ignored by the search engine. Use a comma separator to specify more than one word.

webhelp.show.changes.and.comments

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is `no`.

webhelp.sitemap.base.url

Base URL for all the `<loc>` elements in the generated `sitemap.xml` file. If this parameter is specified, the `loc` element will contain the value of this parameter plus the relative path to the page. If this parameter is not specified, the `loc` element will only contain the relative path of the page (the relative file path from the `@href` attribute of a `<topicref>` element from the *DITA map*, appended to this base URL value).

webhelp.sitemap.change.frequency

The value of the `<changefreq>` element in the generated `sitemap.xml` file. The `<changefreq>` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `<changefreq>` element is not added in `sitemap.xml`. Allowed values: `<empty string>` (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

webhelp.sitemap.priority

The value of the `<priority>` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `<priority>` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `<priority>` element is not added in `sitemap.xml`.

Parameters Specific to Oxygen WebHelp Responsive

webhelp.fragment.feedback

You can integrate **Oxygen Feedback** with your WebHelp Responsive output to provide a comments area at the bottom of each page where readers can offer feedback. When you create

an **Oxygen Feedback site configuration**, an HTML fragment is generated during the final step of the creation process and that fragment should be set as the value for this parameter.

webhelp.default.collection.type.sequence

Specifies if the **sequence** value will be used by default when the `@collection-type` attribute is not specified. This option is helpful if you want to have *Next* and *Previous* navigational buttons generated for all HTML pages. Allowed values are **no** (default) and **yes**.

webhelp.enable.search.autocomplete

Specifies if the *Autocomplete* feature is enabled in the WebHelp search text field. The default value is `yes`.

webhelp.enable.html.fragments.cleanup

Enables or disables the automatic conversion of HTML fragments to well-formed XML. If set to **true** (default), the transformation automatically converts non-well-formed HTML content to a well-formed XML equivalent. If set to **false**, the transformation will fail if at least one HTML fragment is not well-formed.

webhelp.enable.scroll.to.search.term

Specifies whether or not the page should scroll to the first search term when opening the search results page. Possible values are **no** (default) and **true**.

webhelp.fragment.after.body

This parameter can be used to display a given XHTML fragment after the body in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.body.main.page

This parameter can be used to display a given XHTML fragment after the body in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.body.topic.page

This parameter can be used to display a given XHTML fragment after the body in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.body.search.page

This parameter can be used to display a given XHTML fragment after the body in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.body.terms.page

This parameter can be used to display a given XHTML fragment after the body in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.logo_and_title

This parameter can be used to display a given XHTML fragment after the logo and title in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.search.input

This parameter can be used to display a given XHTML fragment after the search field in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.main.page.search (deprecated)

This parameter is deprecated. Use `webhelp.fragment.after.search.input.main.page` instead.

webhelp.fragment.after.search.input.main.page

This parameter can be used to display a given XHTML fragment after the search field in all the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.search.input.topic.page

This parameter can be used to display a given XHTML fragment after the search field in all the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.search.input.search.page

This parameter can be used to display a given XHTML fragment after the search field in all the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.search.input.terms.page

This parameter can be used to display a given XHTML fragment after the search field in all the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.toc_or_tiles

This parameter can be used to display a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.top_menu

This parameter can be used to display a given XHTML fragment after the top menu in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.body

This parameter can be used to display a given XHTML fragment before the page body in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.body.main.page

This parameter can be used to display a given XHTML fragment before the page body in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.body.topic.page

This parameter can be used to display a given XHTML fragment before the page body in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.body.search.page

This parameter can be used to display a given XHTML fragment before the page body in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.body.terms.page

This parameter can be used to display a given XHTML fragment before the page body in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.logo_and_title

This parameter can be used to display a given XHTML fragment before the logo and title. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.search.input

This parameter can be used to display a given XHTML fragment before the search field in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.main.page.search (deprecated)

This parameter is deprecated. Use `webhelp.fragment.before.search.input.main.page` instead.

webhelp.fragment.before.search.input.main.page

This parameter can be used to display a given XHTML fragment before the search field in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.search.input.topic.page

This parameter can be used to display a given XHTML fragment before the search field in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.search.input.search.page

This parameter can be used to display a given XHTML fragment before the search field in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.search.input.terms.page

This parameter can be used to display a given XHTML fragment before the search field in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.toc_or_tiles

This parameter can be used to display a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.top_menu

This parameter can be used to display a given XHTML fragment before the top menu in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.footer

This parameter can be used to display a given XHTML fragment as the page footer in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

Important:

This parameter should only be used if you are using a valid, purchased license of Oxygen XML Developer (do not use it with a trial license).

webhelp.fragment.head

This parameter can be used to display a given XHTML fragment in the header section in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.head.main.page

This parameter can be used to display a given XHTML fragment in the header section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.head.topic.page

This parameter can be used to display a given XHTML fragment in the header section in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.head.search.page

This parameter can be used to display a given XHTML fragment in the header section in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.head.terms.page

This parameter can be used to display a given XHTML fragment in the header section in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.welcome

This parameter can be used to display a given XHTML fragment as a welcome message (or title). The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.header

This parameter can be used to display a given XHTML fragment after the header section in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.header.main.page

This parameter can be used to display a given XHTML fragment after the header section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.header.topic.page

This parameter can be used to display a given XHTML fragment after the header section in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.header.search.page

This parameter can be used to display a given XHTML fragment after the header section in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.header.terms.page

This parameter can be used to display a given XHTML fragment after the header section in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.search.input

This parameter can be used to display a given XHTML fragment before the search field in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.search.input

This parameter can be used to display a given XHTML fragment after the search field in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.main.content.area

This parameter can be used to display a given XHTML fragment before the main content section in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.main.content.area.main.page

This parameter can be used to display a given XHTML fragment before the main content section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.main.content.area.topic.page

This parameter can be used to display a given XHTML fragment before the main content section in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.main.content.area.search.page

This parameter can be used to display a given XHTML fragment before the main content section in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.main.content.area.terms.page

This parameter can be used to display a given XHTML fragment before the main content section in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.main.content.area

This parameter can be used to display a given XHTML fragment after the main content section in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.main.content.area.main.page

This parameter can be used to display a given XHTML fragment after the main content section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.main.content.area.topic.page

This parameter can be used to display a given XHTML fragment after the main content section in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.topic.toolbar

This parameter can be used to display a given XHTML fragment before the toolbar buttons above the topic content in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.topic.toolbar

This parameter can be used to display a given XHTML fragment after the toolbar buttons above the topic content in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.topic.breadcrumb

This parameter can be used to display a given XHTML fragment before the breadcrumb component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.topic.breadcrumb

This parameter can be used to display a given XHTML fragment after the breadcrumb component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.publication.toc

This parameter can be used to display a given XHTML fragment before the publication's table of contents component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.publication.toc

This parameter can be used to display a given XHTML fragment before the publication's table of contents component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.topic.content

This parameter can be used to display a given XHTML fragment before the topic's content in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.topic.content

This parameter can be used to display a given XHTML fragment after the topic's content in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.feedback

This parameter can be used to display a given XHTML fragment before the **Oxygen Feedback** commenting component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.feedback

This parameter can be used to display a given XHTML fragment after the **Oxygen Feedback** commenting component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.topic.toc

This parameter can be used to display a given XHTML fragment before the topic's table of contents component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.topic.toc

This parameter can be used to display a given XHTML fragment after the topic's table of contents component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.custom.search.engine.results

This parameter can be used to replace the search results area with custom XHTML content. The value of the parameter is the path to an XHTML file that contains your custom content.

webhelp.fragment.custom.search.engine.script

This parameter can be used to replace WebHelp's built-in search engine with your own custom search engine. The value of the parameter is the path to an XHTML file that contains the scripts required for your custom search engine to run.

webhelp.labels.generation.mode

Controls whether or not labels are generated in the output. These labels are useful because users can easily search for topics with the same label by simply clicking on the label presented in the output. Possible values are:

- **keywords-label** - Generates labels for each defined `<keyword>` element that has the `@outputclass` attribute value set to **label**.
- **keywords** - Generates labels for each defined `<keyword>` element. If the topic contains `<keyword>` elements with the `@outputclass` attribute value set to **label**, then only these elements will have labels generated for them in the output.
- **disable** - Disables the generation of labels in the Webhelp Responsive output.

webhelp.merge.nested.topics.related.links

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, *Related Tasks*, *Related References*, *Related Information*) are merged into a single group. The default value is `yes`.

webhelp.publication.toc.hide.chunked.topics

Specifies if the table of contents will contain links for *chunked* topics. The default value is `yes`.

webhelp.publication.toc.links

Specifies which links will be included in the table of contents. The possible values are:

- **chapter** (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor's siblings), and the parent chapter.
- **topic** - The TOC will only include links for the current topic and its direct children.
- **all** - The TOC will include all links.

webhelp.publication.toc.tooltip.position

By default, if a topic contains a `<shortdesc>` element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

- **left**
- **right** (default)
- **top**
- **bottom**
- **hidden** - The tooltip will not be displayed.

webhelp.search.default.operator

Makes it possible to change the default operator for the search engine. Possible values are `and`, `or` (default). If set to `and` while the search query is WORD1 WORD2, the search engine only returns results for topics that contain both WORD1 and WORD2. If set to `or` and the search query is WORD1 WORD2, the search engine returns results for topics that contain either WORD1 or WORD2.

webhelp.search.stop.words.exclude

Specifies a list of words that will be excluded from the default list of *stop words* that are filtered out before the search processing. Use comma separators to specify more than one word (for example: `if, for, is`).

webhelp.show.breadcrumb

Specifies if the breadcrumb component will be presented in the output. The default value is `yes`.

webhelp.show.child.links

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is `no`.

webhelp.show.indexterms.link

Specifies if an icon that links to the index terms page will be displayed in the output. The default value is `yes` (meaning the index terms icon is displayed). If set to `false`, the index terms icon is not displayed in the output and the index terms page is not generated.

webhelp.show.main.page.tiles

Specifies if the tiles component will be presented in the main page of the output. For a *tree* style layout, this parameter should be set to `no`.

webhelp.show.main.page.toc

Specifies if the table of contents will be presented in the main page of the output. The default value is `yes`.

webhelp.show.expand.collapse.sections

Specifies if links to collapse sections will be presented within each topic in the output. Collapsing sections will collapse all collapsible elements (nested topics with titles, sections with titles, or tables with titles). The default value is `yes`.

webhelp.show.navigation.links

Specifies if navigation links will be presented in the output. The default value is `yes`.

webhelp.show.print.link

Specifies if a print link or icon will be presented within each topic in the output. The default value is `yes`.

webhelp.show.related.links

Specifies if the related links component will be presented in the WebHelp Responsive output. The default value is `yes`. The `webhelp.merge.nested.topics.related.links` parameter can be used in conjunction with this one to merge the related links from nested topics into the links in the parent topic.

webhelp.show.publication.toc

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is `yes`.

webhelp.show.topic.toc

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each `<section>` within the current topic that contains an `@id` attribute and the section corresponding to the current scroll position is highlighted. The default value is `yes`.

webhelp.show.top.menu

Specifies if a menu will be presented at the topic of the main page in the output. The default value is `yes`.

webhelp.skip.main.page.generation

If set to `true`, the default main page is not generated in the output. The default value is `false`.

webhelp.top.menu.activated.on.click

When this parameter is activated (set to `yes`), clicking an item in the top menu will expand the submenu (if available). You can then click on a submenu item to open the item (topic). You can click outside the menu or press **ESC** to hide the menu. When set to `no` (default), hovering over a menu item displays the menu content.

webhelp.top.menu.depth

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is 3. A value of 0 means that the menu has unlimited depth.

webhelp.topic.collapsible.elements.initial.state

Specifies the initial state of collapsible elements (nested topics with titles, sections with titles, tables with titles or index term groups). The possible values are `collapsed` or `expanded` (default value).

Parameters for Adding a Link to PDF Documentation in WebHelp Responsive Output

The following transformation parameters can be used to generate a PDF link component in the WebHelp Responsive output (for example, it could link to the PDF equivalent of the documentation):

webhelp.pdf.link.url

Specifies the target URL for the PDF link component.

webhelp.pdf.link.text

Specifies the text for the PDF link component.

webhelp.pdf.link.icon.path

Specifies the path or URL of the image icon to be used for the PDF link component. If not specified, a default icon is used.

webhelp.show.pdf.link

Specifies whether or not the PDF link component is shown in the WebHelp Responsive output. Allowed values are: **yes** (default) and **no**.

webhelp.pdf.link.anchor.enabled

Specifies whether or not the current topic ID should be appended as the name destination at the end of the PDF link. Allowed values are: **yes** (default) and **no**.

DITA Map PDF - based on HTML5 & CSS Transformation

Oxygen XML Developer includes a built-in **DITA Map PDF - based on HTML5 & CSS** transformation scenario based on a *DITA-OT CSS-based PDF Publishing plugin* that converts DITA maps to PDF using a CSS-based processing engine and an HTML5 intermediate format. Oxygen XML Developer comes bundled with a built-in CSS-based PDF processing engine called **Oxygen PDF Chemistry**. Oxygen XML Developer also supports some third-party processors.

For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with *xsl:fo* customizations. This transformation also includes some

built-in publishing templates that you can use for the layout of your PDF output and you can create your own templates or edit existing ones.

The following CSS-based PDF processors can be used:

- **Oxygen PDF Chemistry** - A built-in processor that is bundled with Oxygen XML Developer. For more information, see the [Oxygen PDF Chemistry User Guide](#). This is the supported processor.
- **Prince Print with CSS** (not included in the Oxygen XML Developer installation kit) - A third-party component that needs to be purchased from <http://www.princexml.com>.
- **Antenna House Formatter** (not included in the Oxygen XML Developer installation kit) - A third-party component that needs to be purchased from <http://www.antennahouse.com/antenna1/formatter/>.

How to Create the Transformation Scenario

To create a **DITA Map PDF - based on HTML5 & CSS** transformation scenario, follow these steps:

1. Click the  **Configure Transformation Scenario(s)** button.
2. Select the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
3. If you want to configure the transformation, click the **Edit** button.

Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Templates** Tab (on page [1117](#)) - This tab contains a set of built-in publishing templates that you can use for the layout of your WebHelp system output. You can also create your own publishing templates by saving one from the gallery and changing it.

Figure 371. DITA Map to PDF Templates

- **Parameters** Tab (on page [1117](#)) - This tab includes numerous parameters that can be set to customize the transformation.
 - **Filters** Tab (on page [1117](#)) - This tab allows you to filter certain content elements from the generated output.
 - **Advanced** Tab (on page [1117](#)) - This tab allows you to specify some advanced options for the transformation scenario.
 - **Output** Tab (on page [1117](#)) - This tab allows you to configure options that are related to the location where the output is generated.
4. In the **Parameters** tab, configure any of the following parameters (if applicable):
- **args.css** - Specifies a path to a custom CSS to be used in addition to those specified in the publishing template
 - **css.processor.type** - This is where you choose the processor type. You can select between **Oxygen PDF Chemistry**, **Prince XML**, or **Antenna House**.
 - **css.processor.path.chemistry** (if you are using the **Oxygen PDF Chemistry** processor) - Specifies the path to the **Oxygen PDF Chemistry** executable file that will be run to generate the PDF. If this parameter is not set, the transformation will use the processor specified in the **CSS-based Processors** preferences page (on page [233](#)).

- **css.processor.path.prince** (if you are using the **Prince Print with CSS** processor) - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.
- **css.processor.path.antenna-house** (if you are using the **Antenna House Formatter** processor) - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.
- **show.changes.and.comments** - When set to `yes`, user comments, replies to comments, and *tracked changes* are published in the PDF output. The default value is `no`.
- **figure.title.placement** - Controls the position of the figure title relative to the image. Allowed values are "top" and "bottom", "top" is the default

5. Click **OK** and run the transformation scenario.

Customizing the Output

For information about customizing the output, see [CSS-based DITA to PDF Customization \(on page 1450\)](#).

DITA Map PDF - based on XSL-FO Transformation

Oxygen XML Developer comes bundled with the DITA Open Toolkit that provides a mechanism for converting *DITA maps* (on page 2268) to PDF output.

Creating a DITA Map PDF - based on XSL-FO Transformation Scenario

To create a *DITA Map PDF - based on XSL-FO* transformation scenario, follow these steps:

1. Click the  **Configure Transformation Scenario(s)** button.
2. Select **DITA Map PDF - based on XSL-FO** and click the **Edit** button (or use the **Duplicate** button if your *framework* (on page 2269) is read-only).
3. Use the various tabs to configure the transformation scenario. In the **Parameters** tab, you can use a variety of parameters to customize the output. For example, the following parameters are just a few of the most commonly used ones:
 - `show.changes.and.comments` - If set to `yes`, user comments, replies to comments, and *tracked changes* are published in the PDF output.
 - `customization.dir` - Specifies the path to a customization directory.
 - `editlink.present.only.path.to.topic` - When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the PDF output.
4. Click **OK** and then the **Apply Associated** button to run the transformation scenario.

Related Information:

[XSL FO-based DITA to PDF Customization \(on page 1719\)](#)

DITA Map MS Office Word Transformation

Oxygen XML Developer comes bundled with a transformation scenario that allows you to convert *DITA maps* (on page 2268) to Microsoft Office Word documents. It utilizes the **DITA to Word plugin** created by Jarno Elovirta. This *plugin* contains a Word document named **Normal.docx** (located in: `[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT/plugins/com.elovirta.ooxml/resources`) that is used by the transformation scenario as a template to generate the final Word document.

**Tip:**

You can make general modifications to the **Normal.docx** template file to alter the published output. The Word application used to edit the **Normal.docx** should be configured with English locale as the style names for each Word element must be in English.

Configuring the Transformation Scenario

To configure a **DITA Map to MS Office Word** transformation scenario, follow these steps:

1. Open the DITA map.
2. Click the  **Configure Transformation Scenario(s)** button.
3. Select **DITA Map MS Office Word**.
4. For advanced customizations, in the **Parameters** tab you can use any of the following parameters that are unique to this transformation scenario to specify paths to files that affect the output in various ways:
 - **dotx.file** - Specifies the path to a Word template file (`.docx`) that will be used in the transformation to generate the final Word document. Set this parameter if you want to use a different template file other than the **Normal.docx** file that is used by default.
 - **document.flat.xsl** - Specifies the path to a pre-process clean-up stylesheet.
 - **core.xsl** - Specifies the path to a core metadata stylesheet.
 - **custom.xsl** - Specifies the path to a custom metadata stylesheet.
 - **document.xsl** - Specifies the path to a main document stylesheet.
 - **comments.xsl** - Specifies the path to a comments stylesheet.
 - **numbering.xsl** - Specifies the path to a list and title numbering stylesheet.
 - **footnotes.xsl** - Specifies the path to a footnote stylesheet.
 - **document.xml.xsl** - Specifies the path to a document relations metadata stylesheet.
 - **inkscape.exec** - Specifies the path to an Inkscape (open-source vector graphics editor) executable file.
5. Click **OK** and run the transformation scenario.

Result: The result of the transformation will automatically be opened in your system's default word processing application (such as Microsoft Word).

Related Information:[Editing a Transformation Scenario \(on page 1237\)](#)[Configure Transformation Scenario\(s\) Dialog Box \(on page 1240\)](#)

DITA Map Markdown Transformation

Using the **Configure Transformation Scenarios** toolbar button, you can create a new transformation scenario of the type **DITA-OT transformation** and then choose one of the Markdown-specific output types:

- **GitHub-flavored Markdown**
- **Markdown**
- **GitBook**

More information about the Markdown output types is available in the DITA-OT documentation: <https://www.dita-ot.org/dev/topics/dita2markdown.html>.

The generated Markdown content can be used with a static web site generator (such as **MKDocs**) to build a web site: https://blog.oxygenxml.com/topics/publishing_dita_content_using_a_markdown_static_web_site_generator.html.

DITA Map CHM (Compiled HTML Help) Transformation

To perform a *Compiled HTML Help (CHM)* transformation, Oxygen XML Developer needs **Microsoft HTML Help Workshop** to be installed on your computer. Oxygen XML Developer automatically detects if **HTML Help Workshop** is installed and uses it.

**Note:**

HTML Help Workshop might fail if the files used for transformation contain accents in their names, due to different encodings used when writing the *.hhp* and *.hhc* files. If the transformation fails to produce the CHM output but the *.hhp* (HTML Help Project) file is already generated, you can manually try to build the CHM output using **HTML Help Workshop**.

Changing the Output Encoding

Oxygen XML Developer uses the `htmlhelp.locale` parameter to correctly display specific characters of different languages in the output of the *Compiled HTML Help (CHM)* transformation. By default, the **DITA Map CHM** transformation scenario that comes bundled with Oxygen XML Developer has the `htmlhelp.locale` parameter set to `en-US`.

To customize this parameter, follow this procedure:

1. Use the  **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on macOS))** action from the toolbar or the **Document > Transformation** menu.
2. Select the **DITA Map CHM** transformation scenario and click the **Edit** button.

- In the **Parameter** tab, search for the `htmlhelp.locale` parameter and change its value to the desired language tag.

**Note:**

The format of the `htmlhelp.locale` parameter is `LL-CC`, where `LL` represents the language code (`en`, for example) and `CC` represents the country code (`us`, for example). The language codes are contained in the `ISO 639-1` standard and the country codes are contained in the `ISO 3166-1` standard. For further details about language tags, go to <http://www.rfc-editor.org/rfc/rfc5646.txt>.

Customizing the CHM Output

There are several possibilities available for customizing the CHM output:

- You can use a custom CSS stylesheet to customize how the HTML content is rendered in the output:
 - Create the custom CSS.
 - Select the **DITA Map CHM** transformation scenario and click the **Edit** button.
 - In the **Parameter** tab, set the `args.css` parameter to point to the location of your custom CSS and make sure the `args.copy.css` parameter is set to **yes** to instruct the transformation to copy the custom CSS to the output folder.
 - Run the transformation.
- If you are familiar with XSLT, there are two XSLT stylesheets that are used in the transformation to compile various settings and components in the CHM output. They are found in the following directory: `OXYGEN_INSTALL_DIR/frameworks/dita/DITA-OT/plugins/org.dita.htmlhelp/xsl/map2htmlhelp`. The files are as follows:
 - `map2hhcimpl.xsl` - This file is used to compile the table of contents.
 - `map2hhpimpl.xsl` - This file contains information for compiling the CHM and various settings that are read by the *HTML Help Workshop* when creating the output.

DITA Map Metrics Report Transformation

A **DITA Map Metrics Report** action is available on the **DITA Maps Manager** toolbar and in the **DITA Maps** main menu. It generates an overview report that contains useful statistics for a DITA map.

As an alternate approach, to create a metrics report from a *DITA map (on page 2268)* using a transformation scenario, follow these steps:

- Select the  **Configure Transformation Scenario(s)** action from the toolbar.
- Select the **DITA Map Metrics Report** scenario from the **DITA Map** section.
- Run the transformation.

The generated HTML report contains information such as:

- The number of processed maps and topics.
- The number of `map/bookmap/topic/task/concept/reference` types in the DITA map.
- Content reuse percentage.
- Number of elements and attributes of different types used in the entire *DITA map* structure.
- Number of words and characters used in the entire *DITA map* structure.
- DITA conditional processing attributes used in the *DITA maps*.
- Processing instructions.
- External links.
- All `@outputclass` attribute values gathered from the DITA project.

Important:

If you have cross references that point to content outside the scope of the DITA map, that referenced content is not counted. For example, if you have links to topics that are not included in the DITA map hierarchy, the content in those topics is ignored when generating the statistics.

The metrics report can also be obtained in XML format, making it possible to construct a [metrics report evolution](#) between multiple versions of the same DITA project.

DITA Map Zendesk Publishing

Oxygen XML Developer includes a built-in transformation scenario that provides the ability to publish DITA topics to XHTML output and upload them directly as articles to the [Zendesk Help Center](#).

Attention:

This feature is only available in the **Enterprise** edition of Oxygen XML Developer.

To run the transformation, follow these steps:

1. Start Oxygen XML Developer and open a *DITA map*.
2. Click the  **Configure Transformation Scenario(s)** button.
3. Create a new **DITA-OT** transformation scenario and choose the **Zendesk Help Center** transformation type.
4. Go to **Parameters** tab and set the following parameters:

Host

The URL reference to the *Zendesk Help Center* (for example, `https://your-domain.zendesk.com`).

Username

The username (e-mail address) for the account used to upload the content.

API Token

An API token, generated in the *Zendesk* admin pages, necessary for authentication to the server: <https://support.zendesk.com/hc/en-us/articles/226022787-Generating-a-new-API-token>.

Article category

The name of the category where the articles are uploaded. The category needs to be created in the *Zendesk* admin pages: https://support.zendesk.com/hc/en-us/articles/218222877-Organizing-knowledge-base-content-in-categories-and-sections#topic_hjs_tl4_kk.

Article section

The name of the section (inside the parent category) where articles are uploaded. The section needs to be created in the *Zendesk* admin pages: https://support.zendesk.com/hc/en-us/articles/218222877-Organizing-knowledge-base-content-in-categories-and-sections#topic_ysj_wtt_zz.

Note:

When publishing to a subsection, a path of section names separated by '///' can be passed (for example: `Main section///Subsection 1///Subsection 1.1`).

Create article draft

This setting controls whether the articles should be published (if the value is `false`) or saved as drafts (if the value is `true`). The default value is `false`.

Visible to

The name of the user segment that can view the articles.

Permission group name

The name of the Zendesk permission group that controls who edits and publishes articles: <https://support.zendesk.com/hc/en-us/articles/203661966-Creating-managing-and-using-groups>.

Create table of contents

When the `zendesk.create.toc` parameter is set to `true` (default value), a table of contents is published as the first article in the Zendesk section and this initial article references all other articles. The title of the TOC article is the title of the DITA map.

Specify a prefix title for the table of contents

Set the `zendesk.toc.title.prefix` parameter to specify a prefix to use for the title of the table of contents article.

Specify a suffix title for the table of contents

Set the `zendesk.toc.title.suffix` parameter to specify a suffix to use for the title of the table of contents article.

5. Save the changes and run the transformation.

Important:

There may be cases when the publishing breaks, presenting an error related to **HTTPS** certificates, similar to this one:

```
Error: org.zendesk.client.v2.ZendeskException: java.net.ConnectException: PKIX path building failed:
sun.security.provider.certpath.SunCertPathBuilderException: unable to find valid certification path
to requested target
```

This usually occurs if an HTTPS proxy server is installed in your company's network. In this case, if running on Windows, you can edit the transformation scenario you are using to publish **DITA** to **Zendesk** and in the **Advanced** tab, go to the **JVM Arguments** field and set this value:

```
-Djavax.net.ssl.trustStoreType=Windows-ROOT -Djavax.net.ssl.trustStore=C:\\Windows\\win.ini
```

Resources

For more information about publishing content to the Zendesk Help Center, watch the following video demonstration:

https://www.youtube.com/embed/QZ_9Fk_L0k8

Integrate/Install DITA-OT Plugins Transformation

Oxygen XML Developer comes bundled with a transformation scenario designed to integrate DITA-OT [plugins \(on page 2271\)](#). These DITA-OT *plugins* are used for various customizations. It is called **Integrate/Install DITA-OT Plugins** and is found in the **DITA Map** section of the  **Configure Transformation Scenario(s)** dialog box [\(on page 1240\)](#).

Attention:

The integration will be performed on the DITA-OT version specified in the **DITA Open Toolkit** section of the **DITA preferences page (on page 237)**.

CAUTION:

Oxygen XML Developer support engineers do not officially offer support and troubleshooting assistance for custom DITA-OT distributions or custom installed DITA-OT plugins. If you discover any issues or inconsistent behavior while using a custom DITA-OT or a DITA-OT that contains custom DITA-OT plugins, you should revert to the default built-in DITA-OT.

Running the Transformation Scenario

To integrate a DITA-OT *plugin*, follow these steps:

1. If Oxygen XML Developer was installed in the default location, you may need to restart and run it as an administrator.
2. Select the  **Apply Transformation Scenario(s)** or  **Configure Transformation Scenario(s)** (on page 1240) action from the **DITA Maps Manager** toolbar (you could also use the same action on the main toolbar or open the **Transformation Scenarios** view (on page 1246)).
3. Select the **Integrate/Install DITA-OT Plugins** transformation scenario. If the *integrator* is not visible, select the **Show all scenarios** action that is available in the  **Settings** drop-down menu.
4. [Apply the scenario \(on page 1239\)](#).
5. Check the **Results** panel at the bottom of the application to make sure the build was successful.
6. Restart Oxygen XML Developer with your normal permissions.

Related Information:

[Configure Transformation Scenario\(s\) Dialog Box \(on page 1240\)](#)

Solving DITA Transformation Errors

If a DITA transformation results in errors or warnings, the information is displayed in the message panel at the bottom of the editor. The information includes the severity, description of the problem, the name of the resource, and the path of the resource.

To help prevent and solve DITA transformation problems, follow these steps:

1. Validate your DITA documents by using the  **Validate** action from the  **Validation** toolbar drop-down menu, the **Document > Validate** menu, or from the **Validate** menu when invoking the contextual menu in the **Project** view (on page 365).
2. If this action results in validation errors, solve them prior to executing the transformation. Also, you should pay attention to the warning messages because they may identify problems in the transformation.
3. [Run the DITA transformation scenario \(on page 1156\)](#).
4. If the transformation results in errors or warnings, they are displayed in the **Results** panel (on page 503) at the bottom of the editor. The following information is presented to help you troubleshoot the problems:
 - **Severity** - The first column displays the following icons that indicate the severity of the problem:
 - **Informational** - The transformation encountered a condition of which you should be aware.
 -  **Warning** - The transformation encountered a problem that should be corrected.
 -  **Error** - The transformation encountered a more severe problem, and the output is affected or cannot be generated.

- **Info** - Click the  **See More** icon to open a web page that contains more details about DITA-OT error messages.
 - **Description** - A description of the problem.
 - **Resource** - The name of the transformation resource.
 - **System ID** - The path of the transformation resource.
5. Use this information or other resources from the online DITA-OT community to solve the transformation problems before re-executing the transformation scenario.
 6. If you need to contact the *Oxygen* technical support team, they will need you to send the entire transformation scenario execution log. To obtain it:
 - a. Go to the **Options > Preferences > DITA** preferences page and set the **Show console output** option to **Always**.
 - b. Execute the transformation scenario again. The console output messages are displayed in the **DITA-OT** view.
 - c. Copy the entire log, save it in a text file, then send it to the *Oxygen* technical support team.
 - d. After your issue has been solved, go back to the **Options > Preferences > DITA** preferences page and set the **Show console output** option to **When build fails**.

DITA Topic Transformation Scenarios

Oxygen XML Developer includes built-in transformation scenarios for transforming individual DITA Topics to HTML5, XHTML, or PDF output. They can be found in the **DITA** section in the **Configure Transformation Scenario(s)** dialog box (*on page 1240*).

The available transformations scenarios for individual DITA topics include:

- **DITA HTML5** - This DITA-OT transformation scenario generates HTML5 output from a single DITA topic.
- **DITA XHTML** - This DITA-OT transformation scenario generates XHTML output from a single DITA topic. This was the first transformation scenario created for the DITA Open Toolkit and it originally served as the basis for all HTML-based transformations.
- **DITA PDF - based on HTML5 & CSS** - This transformation scenario converts individual DITA topics to PDF using a CSS-based processing engine and an HTML5 intermediate format. Oxygen XML Developer comes bundled with a built-in CSS-based PDF processing engine called **Oxygen PDF Chemistry**. Oxygen XML Developer also supports some third-party processors.

For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with *xsl:fo* customizations. Another advantage of this transformation scenario is that you can use the same *customization CSS* (*on page 1481*) or *publishing template* (*on page 1469*) that you use for converting entire DITA maps.

- **DITA PDF - based on XSL-FO** - This DITA-OT transformation scenario converts individual DITA topics to PDF using an *xsl:fo* processor.

Related Information:[Editing a Transformation Scenario \(on page 1237\)](#)[Configure Transformation Scenario\(s\) Dialog Box \(on page 1240\)](#)[Applying Associated Transformation Scenarios \(on page 1239\)](#)[DITA Map Transformation Scenarios \(on page \)](#)

DocBook Transformation Scenarios

Built-in transformation scenarios allow you to transform DocBook documents to a variety of outputs, such as PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, and EPUB. Oxygen XML Developer also includes a DocBook 5.1 transformation scenario for *Assembly* documents. All of them are listed in the **DocBook 4** and **DocBook 5** sections in the **Configure Transformation Scenario(s)** dialog box (on page 1240).

Related Information:[Editing a Transformation Scenario \(on page 1237\)](#)[Configure Transformation Scenario\(s\) Dialog Box \(on page 1240\)](#)[Applying Associated Transformation Scenarios \(on page 1239\)](#)

DocBook to DITA Transformation

Oxygen XML Developer includes a built-in transformation scenario that is designed to convert DocBook content to DITA. This transformation scenario is based upon a DITA Open Toolkit plugin that is available at sourceforge.net.

To convert a DocBook document to DITA, follow these steps:

1. Use one of the following two methods to begin the transformation process:
 - To apply the transformation scenario to a newly opened file, use the  **Apply Transformation Scenario(s) (Ctrl + Shift + T (Command + Shift + T on macOS))** action from the toolbar or the **Document > Transformation** menu.
 - To customize the transformation or change the scenario that is associated with the document, use the  **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on macOS))** action from the toolbar or the **Document > Transformation** menu.
2. Select the **DocBook to DITA** transformation scenario in the **DocBook 4** or **DocBook 5** section.
3. Click the **Apply associated** button to run the transformation.

Step Result: The transformation will convert as many of the DocBook elements into equivalent DITA elements as it can recognize in its mapping process. For elements that cannot be mapped, the transformation will insert XML comments so that you can see which elements could not be converted.

4. Adjust the resulting DITA composite to suit your needs. You may have to remove comments, fix validation errors, adjust certain attributes, or split the content into individual topics.

Related Information:[Editing a Transformation Scenario \(on page 1237\)](#)[Configure Transformation Scenario\(s\) Dialog Box \(on page 1240\)](#)

DocBook to PDF Transformation

Oxygen XML Developer includes a built-in transformation scenario that is designed to convert DocBook content to PDF.

To convert a DocBook document to PDF, follow these steps:

1. Use one of the following two methods to begin the transformation process:
 - To apply the transformation scenario to a newly opened file, use the  **Apply Transformation Scenario(s) (Ctrl + Shift + T (Command + Shift + T on macOS))** action from the toolbar or the **Document > Transformation** menu.
 - To customize the transformation or change the scenario that is associated with the document, use the  **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on macOS))** action from the toolbar or the **Document > Transformation** menu.
2. Select the **DocBook PDF** transformation scenario in the **DocBook 4** or **DocBook 5** section.
3. Click the **Apply associated** button to run the transformation.

For information about customizing the PDF output for DocBook content, see [DocBook to PDF Output Customization \(on page 1731\)](#).

Related Information:[Editing a Transformation Scenario \(on page 1237\)](#)[Configure Transformation Scenario\(s\) Dialog Box \(on page 1240\)](#)[DocBook to PDF Output Customization \(on page 1731\)](#)

DocBook to EPUB Transformation

Oxygen XML Developer includes a built-in transformation scenario that is designed to convert DocBook content to EPUB. The EPUB specification recommends the use of *OpenType* fonts (recognized by their `.otf` file extension) whenever possible. To use a specific font, follow these steps:

1. Declare it in your CSS file, as in the following example:

```
@font-face {
  font-family: "MyFont";
  font-weight: bold;
  font-style: normal;
  src: url(fonts/MyFont.otf);
}
```

- In the CSS, specify where this font is used. To set it as default for `<h1>` elements, use the `font-family` rule, as in the following example:

```
h1 {
  font-size: 20pt;
  margin-bottom: 20px;
  font-weight: bold;
  font-family: "MyFont";
  text-align: center;
}
```

- Open the **Configure Transformation Scenario(s)** dialog box (*on page 1240*), select the **DocBook EPUB** transformation scenario in the **DocBook 4** or **DocBook 5** section, and click **Edit**.
- In the **Parameters** tab, set the `epub.embedded.fonts` parameter to `fonts/MyFont.otf`. If you need to provide more files, use commas to separate their file paths.

**Note:**

The `html.stylesheet` parameter allows you to include a custom CSS in the output EPUB.

- Run the transformation scenario.

DocBook PDF (Show Change Tracking and Comments)

Oxygen XML Developer includes a built-in transformation scenario that is designed to show tracked changes and comment in DocBook to PDF output.

To include comments and *tracked changes* (stored within your DocBook 5 documents) in the PDF output, follow these steps:

- Click the  **Configure Transformation Scenario(s)** button.
- Select **DocBook PDF (Show Change Tracking and Comments)** in the **DocBook 5** section.
- If you need to configure the transformation, click the **Edit** (*on page 1237*) or **Duplicate** (*on page 1239*) button, make your changes to the scenario, and click **OK**.
- Click the **Apply Associated** button to run the transformation scenario.

Result: Comment threads and tracked changes will now appear in the PDF output. Details about each comment or change will be available in the footer section for each page.

Creating New Transformation Scenarios

Defining a transformation scenario is the first step in the process of transforming a document. This section includes information on the types of new scenarios that are available in Oxygen XML Developer and how to create each type of transformation.

XML Transformation with XSLT

This type of transformation specifies the transformation parameters and location of an XSLT stylesheet that is applied to the edited XML document. This scenario is useful when you develop an XML document and the XSLT document is in its final form.

To create an **XML transformation with XSLT** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on macOS))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XML transformation with XSLT**.
- Go to **Window > Show View** and select  **Transformation Scenarios** to display [this view \(on page 1246\)](#). Click the  **New Scenario** drop-down menu button and select **XML transformation with XSLT**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options** ([on page 2272](#)) - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** ([on page 2269](#)) - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XSLT Tab

When you [create a new transformation scenario \(on page 1129\)](#) or [edit an existing one \(on page 1237\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **XSLT** tab contains the following options:

XML URL

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** ([on page 289](#)) button, or the browsing actions in the  **Browse** drop-down list. You can also use the  **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

**Note:**

If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the [advanced Saxon preferences page \(on page 218\)](#), the XML input of the transformation is passed to that URI resolver. If the transformer engine is one of the built-in XSLT 2.0 / 3.0 engines and [the name of an initial template \(on page 1131\)](#) is specified in the scenario, the **XML URL** field can be empty. The **XML URL** field can also be empty if you use [external XSLT processors \(on page 1145\)](#). Otherwise, a value is mandatory in this field.

XSL URL

Specifies the source XSL file that the transformation will use. You can specify the path by using the text field, its history drop-down, the [Insert Editor Variables \(on page 289\)](#) button, or the browsing actions in the **Browse** drop-down list. You can also use the **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Use "xml-stylesheet" declaration

If selected, the scenario applies the stylesheet specified explicitly in the XML document with the `xml-stylesheet` processing instruction. By default, this option is deselected and the transformation applies the XSLT stylesheet that is specified in the **XSL URL** field.

Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Developer for performing a transformation. These include the built-in engines and [the external engines defined in the Custom Engines preferences page \(on page 228\)](#). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

Advanced options

Allows you to configure the [advanced options of the Saxon HE/PE/EE engine \(on page 1134\)](#) for the current transformation scenario. To configure the same options globally, go to the [Saxon-HE/PE/EE preferences page \(on page 215\)](#). For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

Parameters

Opens a **Configure parameters dialog box (on page 1132)** that allows you to configure the XSLT parameters used in the current transformation. In this dialog box, you can also configure the parameters for [additional XSLT stylesheets \(on page 1132\)](#). If the XSLT transformation engine is custom-defined, you cannot use this dialog box to configure the parameters sent to the custom engine. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XSLT engine to include the necessary parameters in the command line that starts the transformation process.

Extensions

Opens a [dialog box for configuring the XSLT extension JARS or classes \(on page 1133\)](#) that define extension Java functions or extension XSLT elements used in the transformation.

Additional XSLT stylesheets

Opens a [dialog box for adding XSLT stylesheets \(on page 1133\)](#) that are applied on the main stylesheet specified in the **XSL URL** field. This is useful when a chain of XSLT stylesheets must be applied to the input XML document.

XSLT Parameters

The global parameters of the XSLT stylesheet used in a transformation scenario can be configured by using the **Parameters** button in the **XSLT** tab of a new or edited transformation scenario dialog box.

The resulting dialog box includes a table that displays all the parameters of the current XSLT stylesheet, all imported and included stylesheets, and all [additional stylesheets \(on page 1133\)](#), along with their descriptions and current values. You can also add, edit, and remove parameters, and you can use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is selected, the parameter value is evaluated as an XPath expression before starting the XSLT transformation.

Example:

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@atr='val']
```

Note:

1. The **doc** function solves the argument relative to the XSL stylesheet location. You can use full paths or [editor variables \(on page 289\)](#) (such as **`\${cfdu}** [current file directory]) to specify other locations: `doc('${cfdu}/test.xml')//*`
2. You cannot use XSLT Functions. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An [editor variable \(on page 289\)](#) can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Edit

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An [editor variable \(on page 289\)](#) can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

Related Information:

[Editor Variables \(on page 289\)](#)

XSLT Extensions

The **Extensions** button opens a dialog box that allows you to specify the [JARS \(on page 2270\)](#) and classes that contain extension functions called from the XSLT file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

**Tip:**

You can specify the path to the resources using wildcards (for example, `${oxygenHome}/lib/*.jar`).

An extension function called from the XSLT file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and click the  **Move up** or  **Move down** buttons.

Additional XSLT Stylesheets

Use the **Additional XSLT Stylesheets** button in the **XSLT** tab to display a list of additional XSLT stylesheets to be used in the transformation and you can add files to the list or edit existing entries. The following actions are available:

Add

Adds a stylesheet in the **Additional XSLT stylesheets** list using a file browser dialog box. You can type an [editor variable \(on page 289\)](#) in the file name field of the browser dialog box. The name of the stylesheet will be added in the list after the current selection.

Remove

Deletes the selected stylesheet from the **Additional XSLT stylesheets** list.

Open

Opens the selected stylesheet in a separate view.

Up

Moves the selected stylesheet up in the list.

Down

Moves the selected stylesheet down in the list.

Advanced Saxon HE/PE/EE XSLT Transformation Options

The XSLT transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as [those in the Saxon HE/PE/EE preferences page \(on page 215\)](#) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the [global options \(on page 2269\)](#) defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 12.5 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Mode ("-im")

A Saxon-specific option that sets the initial mode for the transformation. If this value is also specified in a [configuration file \(on page 1134\)](#), the value in this option takes precedence.

Template ("-it")

A Saxon-specific option that sets the name of the initial XSLT template to be executed. If this value is also specified in a [configuration file \(on page 1134\)](#), the value in this option takes precedence.

Tip:

If your stylesheet includes `<xsl:template name="xsl:initial-template">`, Oxygen XML Developer will automatically detect and use it as the initial template, so this option is not needed in this case.

Use a configuration file ("-config")

Select this option if you want to use a Saxon 12.5 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration file by entering it in the **URL** field, or by using the  **Insert Editor Variables** button, or using the browsing actions in the  **Browse** drop-down list.

Attention:

Oxygen XML Developer does not support the `ALLOWED_PROTOCOLS` Saxon property (<http://saxon.sf.net/feature/allowedProtocols>). This feature is specific to Saxon and controls access by Saxon (but not by underlying software, such as the XML parser). For more information, see <https://www.saxonica.com/documentation12/index.html#!configuration/config-features>.

Debugger trace into XPath expressions (applies to debugging sessions)

Instructs the *XSLT Debugger* (on page 1851) to *step into* XPath expressions.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Line numbering ("-l")

Line numbers where errors occur are included in the output messages.

Expand attributes defaults ("-expand")

Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

DTD validation of the source ("-dtd")

Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

- **On** - Requests DTD validation of the source file and of any files read using the `document()` function.
- **Off** - (default setting) Suppresses DTD validation.
- **Recover** - Performs DTD validation but treats the errors as non-fatal.

Note:

Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

Strip whitespaces ("-strip")

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

Enable profiling ("-TP")

If selected, profiling of the execution time in a stylesheet is enabled. The corresponding text field is used to specify the path to the output file where the profiling information will be saved. As long as the option is selected, and the output file specified, it will gather timed tracing information and create a profile report to the specified file.

Saxon-PE/EE Options

The following advanced options are specific for Saxon 12.5 Professional Edition (PE) and Enterprise Edition (EE) only:

Register Saxon-JS extension functions and instructions

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 12.5 processors.

Note:

Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Developer only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about [executing such a stylesheet on Saxonica's website](#).

Allow calls on extension functions ("-ext")

If selected, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using `http://[URL]`). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

Enable assertions ("-ea")

In XSLT 3.0, you can use the `<xsl:assert>` element to make assertions in the form of XPath expressions, causing a dynamic error if the assertion turns out to be false. If this option is selected, XSLT 3.0 `<xsl:assert>` instructions are enabled. If it is not selected (default), the assertions are ignored.

Saxon-EE Options

The advanced options that are specific for Saxon 12.5 Enterprise Edition (EE) are as follows:

XML Schema version

Use this option to change the default XML Schema version for this transformation. To change the default XML Schema version globally, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **XML > XML Parser > XML Schema** and use the **Default XML Schema version** option [\(on page 207\)](#).

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable streaming mode

Selecting this option will allow an XSLT to run in streaming mode. It is not selected by default. However, in certain instances, the Saxon XSLT processor may auto detect and use streaming even if this option is not selected.

Other Options

Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via

a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

Using Saxon Integrated Extension Functions

Saxon, the transformation and validation engine used by Oxygen XML Developer, can be customized by adding custom functions (called [Integrated Extension Functions](#)) that can be called from XPath.

To define such a function, follow these steps:

1. Create a file with a Java class that extends `net.sf.saxon.lib.ExtensionFunctionDefinition`. Here is an example:

```
private static class ShiftLeft extends ExtensionFunctionDefinition {

    @Override

    public StructuredQName getFunctionQName() {

        return new StructuredQName("eg", "http://example.com/saxon-extension", "shift-left");

    }

    @Override

    public SequenceType[] getArgumentTypes() {

        return new SequenceType[] {SequenceType.SINGLE_INTEGER, SequenceType.SINGLE_INTEGER};

    }

    @Override

    public SequenceType getResultType(SequenceType[] suppliedArgumentTypes) {

        return SequenceType.SINGLE_INTEGER;

    }

    @Override

    public ExtensionFunctionCall makeCallExpression() {

        return new ExtensionFunctionCall() {

            public SequenceIterator call(SequenceIterator[] arguments, XPathContext context)

                throws XPathException {

                long v0 = ((IntegerValue)arguments[0].next()).longValue();

                long v1 = ((IntegerValue)arguments[1].next()).longValue();

                long result = v0<<v1;

                return Value.asIterator(Int64Value.makeIntegerValue(result));

            }

        };

    }

}
```

2. Compile the class and add it to a JAR file.

3. Add a file called **net.sf.saxon.lib.ExtensionFunctionDefinition** that contains the fully qualified name of the Java class in the `META-INF/services/` folder of the JAR file.

**Note:**

To add more function definitions in the same JAR file, you need to add their fully qualified names on different lines.

To enable Oxygen XML Developer to pick up your custom function definition, the JAR file should be added to the classpath of the transformer. Here are some possibilities:

- If you develop a framework, you just need to link the JAR file in the **Classpath** tab (*on page 134*).
- In a *validation scenario (on page 555)*, you can use the **Extensions** button to open a dialog box where you can add libraries.
- In a transformation scenario, you can use the **Extensions** button in the **XSLT** tab (*on page 1132*) to open a dialog box where you can add libraries.
- You can also create a plugin that *contributes such a JAR file in the classpath (on page 1863)*.

FO Processor Tab (XSLT Transformations)

When you *create a new transformation scenario (on page 1129)* or *edit an existing one (on page 1237)*, a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

Perform FO Processing

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

Input

Choose between the following options to specify which input file to use:

- **XSLT result as input** - The FO processor is applied to the result of the XSLT transformation that is defined in the **XSLT** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

Method

The output format of the FO processing. The available options depend on the selected processor type.

Processor

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an *external processor (on page 229)*.

Output Tab (XSLT Transformations)

When you create a new transformation scenario (on page 1129) or edit an existing one (on page 1237), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Prompt for file

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 289) button, or the  **Browse** button.

Open in Browser/System Application

If selected, Oxygen XML Developer automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

Note:

To set the web browser that is used for displaying HTML/XHTML pages, go to **Options > Preferences > Global**, and set it in the **Default Internet browser** field.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 289) button, or the  **Browse** button.

Open in editor

When this option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Developer displays the transformation result in an XML viewer panel at the bottom of the application window with [syntax highlighting \(on page 193\)](#).
- **SVG** - If this is selected, Oxygen XML Developer displays the transformation result in an [integrated SVG viewer in the Results panel \(on page 1037\)](#) at the bottom of the application window and renders the result as an SVG image.
- **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Developer displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

Important:

When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

- **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the  [Insert Editor Variables \(on page 289\)](#) button, or the  **Browse** button.

Attention:

If your input XSLT contains `<xsl:result-document>` elements, then the secondary results will be saved to the specified URIs while the principal result is specified in this **Output** tab. For more information, see: <https://www.w3.org/TR/xslt-30/#element-result-document>.

Configuring an XSLT Processor for Generating Output

This section explains how to configure an XSLT processor and extensions for such a processor in Oxygen XML Developer.

Supported XSLT Processors

Oxygen XML Developer includes the following XSLT processors:

- **Xalan 2.7.2** (Deprecated) - [Xalan-Java](#) is an XSLT processor for transforming XML documents into HTML, text, or other XML document types. It implements XSL Transformations (XSLT) Version 1.0 and XML Path Language (XPath) Version 1.0.
- **Saxon 6.5.5** - [Saxon 6.5.5](#) is an XSLT processor that implements the Version 1.0 XSLT and XPath with a number of powerful extensions. This version of Saxon also includes many of the new features that

were first defined in the XSLT 1.1 working draft, but for conformance and portability reasons these are not available if the stylesheet header specifies `version="1.0"`.

- **Saxon 12.5 Home Edition (HE), Professional Edition (PE) - Saxon-HE/PE** implements the basic conformance level for XSLT 2.0 / 3.0 and XQuery 1.0. The term *basic XSLT 2.0 / 3.0 processor* is defined in the draft XSLT 2.0 / 3.0 specifications. It is a conformance level that requires support for all features of the language other than those that involve schema processing. The HE product remains open source, but removes some of the more advanced features that are present in Saxon-PE.
- **Saxon 12.5 Enterprise Edition (EE) - Saxon EE** is the schema-aware edition of Saxon and it is one of the built-in processors included in Oxygen XML Developer. Saxon EE includes an XML Schema processor, and schema-aware XSLT, XQuery, and XPath processors.

The validation in schema aware transformations is done according to the XML Schema 1.0 or 1.1. This can be [configured in Preferences \(on page 207\)](#).

Note:

Oxygen XML Developer implements a Saxon *framework* that allows you to create Saxon configuration files. Two templates are available: **Saxon collection catalog** and **Saxon configuration**. Both of these templates support content completion, element annotation, and attribute annotation.

Note:

Saxon can use the *ICU-J localization library* (`saxon9-icu.jar`) to add support for sorting and date/number formatting in a wide variety of languages. This library is not included in the Oxygen XML Developer installation kit. However, Saxon will use the default collation and localization support available in the currently used JRE. To enable this capability, follow these steps:

1. Download Saxon 12.5 Professional Edition (PE) or Enterprise Edition (EE) from <http://www.saxonica.com>.
2. Unpack the downloaded archive.
3. Create a new XSLT transformation scenario (or edit an existing one). In the **XSLT** tab, click the **Extensions** button to open the list of additional libraries used by the transformation process.
4. Click **Add** and browse to the folder where you unpacked the downloaded archive and choose the `saxon9-icu.jar` file.

Note that the `saxon9-icu.jar` should NOT be added to the application library folder because it will conflict with another version of the ICU-J library that comes bundled with Oxygen XML Developer.

- **Saxon-CE (Client Edition)** is Saxonica's implementation of XSLT 2.0 for use on web browsers. Oxygen XML Developer provides support for editing stylesheets that contain Saxon-CE extension functions and instructions. This support improves the validation, content completion, and syntax highlighting.

**Note:**

Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Developer only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about [executing such a stylesheet on Saxonica's website](#).

**Note:**

A specific template, named **Saxon-CE stylesheet**, is available in the **New document wizard** (on [page 330](#)).

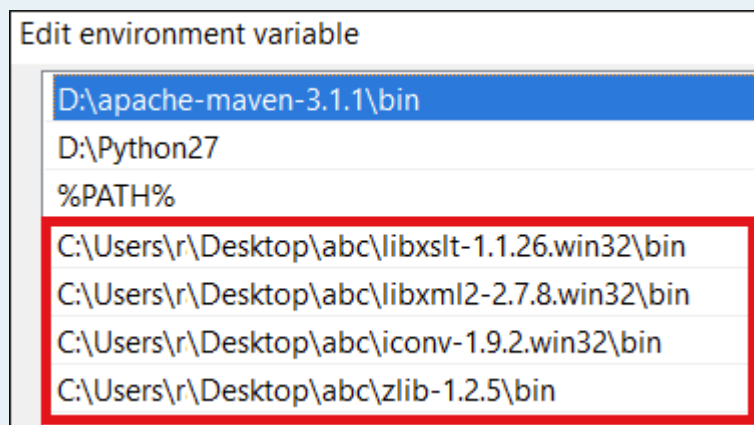

- **Xsltproc (libxslt)** (Deprecated) - **Libxslt** is the XSLT C library developed for the Gnome project. **Libxslt** is based on *libxml2*, the XML C library developed for the Gnome project. It also implements most of the EXSLT set of processor-portable extensions, functions, and some of Saxon's evaluate and expression extensions.

Oxygen XML Developer uses **Libxslt** through its command-line tool (*Xsltproc*). Depending on your operating system, you must download the Libxslt libraries on your machine from <http://xmlsoft.org/XSLT/downloads.html> and place them in a local folder. Then you need to update the `PATH` environmental variable to contain the parent folder where the `xsltproc` executable is located.

**Tip:**

As an example, a Windows installation of the Xsltproc engine would follow these steps:

1. Go to <http://ftp.zlatkovic.com/libxml.en.html> and download the following ZIP files: **iconv-1.9.2.win32.zip**, **libxml2-2.7.8.win32.zip**, **libxslt-1.1.26.win32.zip**, **zlib-1.2.5.win32.zip**.
2. Unzip all of them into the same folder of your choice.
3. Edit the `PATH` environment variable and add the `bin` folder for all four archives:

4. Restart Oxygen XML Developer.

Result: You can now use the **xsltproc** processor as an XSLT engine in the XSLT transformation scenario.

**Note:**

The Xsltproc processor can be configured from the **XSLTPROC** options page ([on page 218](#)).

**CAUTION:**

There is a known problem where file paths that contain spaces are not handled correctly in the LIBXML processor. For example, the built-in *XML Catalog* ([on page 2273](#)) files of the built-in document types (DocBook, TEI, DITA, etc.) are not handled properly by LIBXML if Oxygen XML Developer is installed in the default location on Windows (C:\Program Files). This is because the built-in *XML catalog* files are stored in the `[OXYGEN_INSTALL_DIR]/frameworks` subdirectory of the installation directory, and in this case it contains a space character.

- **MSXML 4.0 (Deprecated)** - MSXML 4.0 is available only on Windows platforms. It can be used for transformation ([on page 1129](#)) and validation of XSLT stylesheets ([on page 658](#)).

Oxygen XML Developer uses the Microsoft XML parser through its command-line tool `msxsl.exe`.

Since `msxsl.exe` is only a wrapper, Microsoft Core XML Services (MSXML) must be installed on the computer. Otherwise, you will get a corresponding warning. You can get the latest Microsoft XML parser from Microsoft web-site.

- **MSXML .NET (Deprecated)** - MSXML .NET is available only on Windows platforms. It can be used for transformation ([on page 1129](#)) and validation of XSLT stylesheets ([on page 658](#)).

Oxygen XML Developer performs XSLT transformations and validations using the .NET *Framework* XSLT implementation (`System.Xml.Xsl.XslTransform` class) through the **nxslt** command-line utility. The **nxslt** version included in Oxygen XML Developer is 1.6.

You should have the .NET *Framework* version 1.0 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128.`

- **.NET 1.0 (Deprecated)** - A transformer based on the **System.Xml** 1.0 library available in the .NET 1.0 and .NET 1.1 *frameworks* from Microsoft. It is available only on Windows.

You should have the .NET *Framework* version 1.0 or 1.1 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128.`

You can get the .NET *Framework* version 1.0 from the Microsoft website.

- **.NET 2.0 (Deprecated)** - A transformer based on the **System.Xml** 2.0 library available in the .NET 2.0 *Framework* from Microsoft. It is available only on Windows.

You should have the .NET *Framework* version 2.0 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 2.0 to be installed. Exit code: 128.`

You can get the .NET *Framework* version 2.0 from the Microsoft website.

For information about configuring the XSLT preferences, see the [XSLT options \(on page 214\)](#) section.

Configuring Custom XSLT Processors

Oxygen XML Developer allows you to configure custom processors to be used for running XSLT and XQuery transformations.

To add a new custom processor, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **XML > XSLT-XQuery > Custom Engines**.
2. Click the **New** button at the bottom of the dialog box.
3. Configure the [parameters for the custom engine \(on page 228\)](#).
4. Click **OK**.

Note:

The output messages of a custom processor are displayed in an output view at the bottom of the application window. If an output message follows [the format of an Oxygen XML Developer linked message \(on page 552\)](#), clicking it highlights the location of the message in an editor panel containing the file referenced in the message.

Related Information:

[Custom Engines Preferences \(on page 228\)](#)

Configuring the XSLT Processor Extensions Paths

The Saxon and Xalan processors support the use of extension elements and extension functions. Unlike a literal result element, which the stylesheet simply transfers to the result tree, an extension element performs an action. The extension is usually used because the XSLT stylesheet fails in providing adequate functions for accomplishing a more complex task.

For more information about how to use extensions, see the following links:

- **Xalan (Deprecated)** - <http://xml.apache.org/xalan-j/extensions.html>
- **Saxon 6.5.5** - <http://saxon.sourceforge.net/saxon6.5.5/extensions.html>
- **Saxon 12.5** - <http://www.saxonica.com/documentation9.5/index.html#!extensibility>

To set an XSLT processor extension (a directory or a `jar` file), use the **Extensions** button (*on page 1132*) in the **Edit scenario** dialog box.

XML Transformation with XQuery

This type of transformation specifies the transform parameters and location of an XQuery file that is applied to the edited XML document.

Use the **XML transformation with XQuery** scenario to apply a transformation to have an XQuery file query an XML file for the output results.

To create an **XML transformation with XQuery** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on macOS))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XML transformation with XQuery**.
- Go to **Window > Show View** and select  **Transformation Scenarios** to display *this view (on page 1246)*. Click the  **New Scenario** drop-down menu button and select **XML transformation with XQuery**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options** (*on page 2272*) - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** (*on page 2269*) - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XQuery Tab

When you *create a new transformation scenario (on page 1129)* or *edit an existing one (on page 1237)*, a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **XQuery** tab contains the following options:

XML URL

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** (*on page 289*) button, or the browsing actions in the  **Browse** drop-down list. You can also use the  **Open in editor** button to open the

specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

**Note:**

If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the [advanced Saxon preferences page \(on page 218\)](#), the XML input of the transformation is passed to that URI resolver.

XQuery URL

Specifies the source XQuery file to be used for the transformation. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables (on page 289)** button, or the browsing actions in the  **Browse** drop-down list. You can also use the  **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Developer for performing a transformation. These include the built-in engines and [the external engines defined in the Custom Engines preferences page \(on page 228\)](#). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

Advanced options

Allows you to configure the [advanced options of the Saxon HE/PE/EE engine \(on page 1149\)](#) for the current transformation scenario. To configure the same options globally, go to the [Saxon-HE/PE/EE preferences page \(on page 215\)](#). For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

Parameters

Opens the [Configure parameters dialog box \(on page 1148\)](#) for configuring the XQuery parameters. You can use the buttons in this dialog box to add, edit, or remove parameters. If the XQuery transformation engine is custom-defined, you can not use this dialog box to set parameters. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XQuery engine to include the necessary parameters in the command line that starts the transformation process.

Extensions

Opens a [dialog box for configuring the XQuery extension JARS or classes \(on page 1149\)](#) that define extension Java functions or extension XSLT elements used in the transformation.

XQuery Parameters

The global parameters of the XQuery file used in a transformation scenario can be configured by using the **Parameters** button in the **XQuery** tab.

The resulting dialog box includes a table that displays all the parameters of the current XQuery file, along with their descriptions and current values. You can also add, edit, and remove parameters, and use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is selected, the parameter value is evaluated as an XPath expression before starting the XQuery transformation.

Example:

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@atr='val']
```

Note:

1. The **doc** function solves the argument relative to the XQuery file location. You can use full paths or *editor variables* ([on page 289](#)) (such as **\${cfdu}** [current file directory]) to specify other locations: `doc('${cfdu}/test.xml')//*`
2. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An *editor variable* ([on page 289](#)) can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Edit

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An *editor variable* ([on page 289](#)) can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

Related Information:

[Editor Variables \(on page 289\)](#)

XQuery Extensions

The **Extensions** button is used to specify the [JAR \(on page 2270\)](#) and classes that contain extension functions called from the XQuery file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

An extension function called from the XQuery file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and click the **↑ Move up** or **↓ Move down** buttons.

Advanced Saxon HE/PE/EE XQuery Transformation Options

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the [Saxon HE/PE/EE preferences page \(on page 223\)](#) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the [global options \(on page 2269\)](#) defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 12.5 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Use a configuration file ("-config")

Sets a Saxon 12.5 configuration file that is used for XQuery transformation and validation scenarios.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Use linked tree model ("-tree:linked")

This option activates the linked tree model.

Strip whitespaces ("-strip")

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

Enable profiling ("-TP")

If selected, profiling of the execution time in a query is enabled. The corresponding text field is used to specify the path to the output file where the profiling information will be saved. As long as the option is selected, and the output file specified, it will gather timed tracing information and create a profile report to the specified file.

**Note:**

The profiling support works only if the **Present as a sequence** transformation option (*on page 1152*) is not set.

Saxon-PE/EE Options

The following advanced options are specific for Saxon 12.5 Professional Edition (PE) and Enterprise Edition (EE) only:

Allow calls on extension functions ("-ext")

If selected, calls on external functions are allowed. Selecting this option is not recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

Saxon-EE Options

The advanced options that are specific for Saxon 12.5 Enterprise Edition (EE) are as follows:

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable XQuery update ("-update:(on|off)")

This option controls whether or not XQuery update syntax is accepted. The default value is off.

Backup files updated by XQuery ("-backup:(on|off)")

If selected, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the **Enable XQuery update** option is selected.

Other Options

Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

FO Processor Tab (XQuery Transformations)

When you [create a new transformation scenario \(on page 1129\)](#) or [edit an existing one \(on page 1237\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

Perform FO Processing

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

Input

Choose between the following options to specify which input file to use:

- **XQuery result as input** - The FO processor is applied to the result of the XQuery transformation that is defined in the **XQuery** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

Method

The output format of the FO processing. The available options depend on the selected processor type.

Processor

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an [external processor \(on page 229\)](#).

Output Tab (XQuery Transformations)

When you [create a new transformation scenario \(on page 1129\)](#) or [edit an existing one \(on page 1237\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Present as a sequence

Selecting this option will reduce the time necessary to fetch the full results, as it will only fetch the first chunk of the results.

Prompt for file

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the  **Insert Editor Variables** [\(on page 289\)](#) button, or the  **Browse** button.

Open in Browser/System Application

If selected, Oxygen XML Developer automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

**Note:**

To set the web browser that is used for displaying HTML/XHTML pages, go to **Options > Preferences > Global**, and set it in the **Default Internet browser** field.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the  **Insert Editor Variables** (*on page 289*) button, or the  **Browse** button.

Open in editor

When this option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Developer displays the transformation result in an XML viewer panel at the bottom of the application window with [syntax highlighting \(on page 193\)](#).
- **SVG** - If this is selected, Oxygen XML Developer displays the transformation result in an [integrated SVG viewer in the Results panel \(on page 1037\)](#) at the bottom of the application window and renders the result as an SVG image.
- **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Developer displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

**Important:**

When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

- **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 289) button, or the  **Browse** button.

XML to PDF Transformation with CSS

This type of transformation uses the **Oxygen PDF Chemistry** processing engine to obtain PDF output by applying CSS styling to the edited XML document. This scenario is useful for those who are familiar with CSS and want to obtain PDF output as its final form.

To create an **XML to PDF transformation with CSS** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s)** (**Ctrl + Shift + C** (**Command + Shift + C** on macOS)) action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XML to PDF transformation with CSS**.
- Go to **Window > Show View** and select  **Transformation Scenarios** to display [this view](#) (on page 1246). Click the  **New Scenario** drop-down menu button and select **XML to PDF transformation with CSS**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options** (on page 2272) - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** (on page 2269) - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

For more information about the **Oxygen PDF Chemistry** processing engine and numerous tips for customizing the output, see the [Oxygen Chemistry User Guide](#).

CSS Tab (XML to PDF Transformation with CSS)

When you [create a new transformation scenario](#) (on page 1129) or [edit an existing one](#) (on page 1237), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **CSS** tab contains the following options:

XML URL

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** ([on page 289](#)) button, or the browsing actions in the  **Browse** drop-down list. You can also use the  **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

CSS URL

Optionally, you can use this option to specify the location of a custom CSS file to be applied to the transformation. If this option is left blank, only the CSS referenced directly from the document will be applied. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** ([on page 289](#)) button, or the browsing actions in the  **Browse** drop-down list. You can also use the  **Open in editor** button to open the specified file in the editor panel.

Apply CSS stylesheets set in the current framework

If selected, CSS stylesheets that are specified in the framework (in the [Document Type configuration CSS subtab](#) ([on page 136](#))) are applied to the transformation in addition to any CSS referenced directly in the document or specified in the [CSS URL field](#) ([on page 1155](#)).

Note:

If CSS files are specified in multiple ways, the transformation applies the CSS in the following order (from lowest priority to highest):

- CSS files that are specified in the framework (in the [Document Type configuration CSS subtab](#) ([on page 136](#))).
- CSS files referenced directly in the document.
- CSS files specified in the [CSS URL field](#) ([on page 1155](#)).

Processor options link

Opens the [CSS-based Processors preferences page](#) ([on page 233](#)) where you can configure some options for generating PDF output.

Output Tab (XML to PDF Transformation with CSS)

When you [create a new transformation scenario](#) ([on page 1129](#)) or [edit an existing one](#) ([on page 1237](#)), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Output File section

Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 289) button, or the  **Browse** button.

Open in Browser/System Application

If selected, Oxygen XML Developer automatically opens the result of the transformation in a system application associated with the PDF file type (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

Debugging section

Dump the intermediate annotated XML

Select this option to include (dump) the intermediate, annotated XML file in the same location as the output file. This can be used for debugging purposes.

Dump the FO file

Select this option to include (dump) the FO file (before it is converted to PDF) in the same location as the output file. This can be used for debugging purposes.

Console options link

Opens the **CSS-based Processors preferences page** (on page 233) where you can configure some options for generating PDF output.

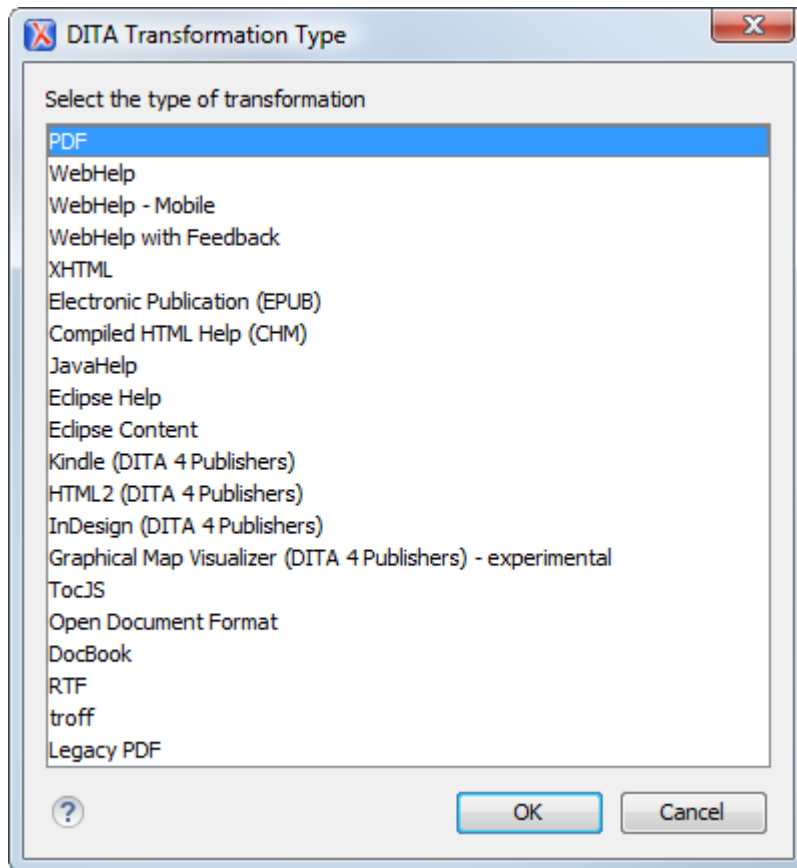

DITA-OT Transformation

This type of transformation specifies the parameters for an Ant transformation that executes a DITA-OT build script. Oxygen XML Developer includes a built-in version of Ant and a built-in version of DITA-OT, but other versions can be set in the scenario.

To create a **DITA-OT Transformation** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s)** (**Ctrl + Shift + C** (**Command + Shift + C** on macOS)) action from the **DITA Maps Manager** toolbar, main toolbar, or the **Document > Transformation** menu. Then click the **New** button and select **DITA-OT Transformation**.
- Go to **Window > Show View** and select  **Transformation Scenarios** to display [this view](#) (on page 1246). Click the  **New Scenario** drop-down menu button and select **DITA-OT Transformation**.

Both methods open the **DITA Transformation Type** dialog box that presents the list of possible outputs.

Figure 372. DITA Transformation Type Dialog Box

Select the desired type of output and click **OK**. This opens the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options** (*on page 2272*) - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** (*on page 2269*) - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

Templates Tab (DITA-OT Transformations)

When you create a new transformation scenario (*on page 1129*) or edit an existing one (*on page 1237*), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Templates** tab is available for DITA-OT transformations with **WebHelp Responsive** or **PDF - based on HTML5 & CSS** output types and it provides a set of built-in *publishing templates* (*on page 1297*). You can use one of them to publish your documentation or as a starting point for a new publishing template.

Figure 373. Templates Tab

Filtering and Previewing Templates

You can click on the tags at the top of the pane to filter the templates and narrow your search. Each built-in template also includes an  **Online preview** icon in the bottom-right corner that opens a webpage in your default browser providing a sample of how the main page will look when that particular template is used to generate the output.

Built-in Templates Locations

Oxygen XML Developer scans the following locations to find the built-in templates to display in the dialog box:

- **WebHelp Responsive Templates** - All built-in WebHelp Responsive publishing templates are stored in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`.
- **PDF - based on HTML5 & CSS** - All built-in PDF publishing templates are stored in the following directories:
 - `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/templates`
 - `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`

Custom Templates Locations

Oxygen XML Developer scans the locations specified in the [DITA > Publishing preferences page \(on page 240\)](#) to find custom templates to display in the dialog box. You can access that preferences page directly from the **Template** tab by clicking on the **Configure Publishing Templates Gallery** link.

Selecting Custom Templates

Once you are finished configuring your template, you can click the **Choose Custom Publishing Template** link to select your template.

You can also [add your custom templates \(on page 1340\)](#) to the list of templates displayed in the **Templates** tab. To do this, store them in a directory, then click the **Configure Publishing Templates Gallery** link to open the **DITA > Publishing preferences page (on page 240)** where you can add that directory to the list. All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

Save Template As Button

You can use the **Save template as** button (at the bottom-left of the transformation dialog box) to export the currently selected template into a new template package that can be used as a starting point to [create your own custom template \(on page 1476\)](#). Clicking this button will open a template package configuration dialog box (on page) that contains some options and displays the parameters that will be exported to your template package.

Template Errors

When the **Templates** tab is opened, all templates (built-in and custom) are loaded and validated. Specifically, certain elements in the template descriptor file are checked for validity. If errors are encountered that prevents the template from loading, the following message will be displayed toward the bottom of the dialog box:

Some templates could not be loaded. [More details](#)

If you click the **More details** link, a window will open with more information about the encountered error. For example, it might offer a hint that the element is missing from the expected descriptor file structure.

Also, if a template could be loaded, but certain elements could not be found in the descriptor file, a warning icon (⚠) will be displayed on the template's image (in the **Templates** tab of the transformation dialog box). For example, this happens if a valid preview-image element cannot be found.

Sharing Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder.
2. Go to **Options > Preferences > DITA > Publishing (on page 240)** and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to **Project Options**.
4. Share your project file (.xpr).

Resources

For more information about customizing publishing templates, watch our video demonstration:

<https://www.youtube.com/embed/zNmXfKWXwO8>

Related Information:

[Publishing Templates \(on page 1297\)](#)

[Publishing Template Package Contents for PDF Customizations \(on page 1470\)](#)

[Publishing Template Package Contents for WebHelp Responsive Customizations \(on page 1300\)](#)

Template Package Configuration Dialog Box

The **Save template as** button (at the bottom-left of the transformation dialog box for **WebHelp Responsive** or **PDF - based on HTML5 & CSS** transformations) can be used to export the currently selected template into a new template package that can be used as a starting point to [create your own custom template \(on page 1476\)](#). The result will be a ZIP archive that contains a template descriptor file and other resources (such as CSS files) that were attached to the selected template.

Clicking the **Save template as** button opens a template package configuration dialog box contains the following options and components:

Name

Required field used to specify the name for the new template. This will become the text value of the `<name>` element in the template descriptor file. This information is displayed as the name of the template in the transformation scenario dialog box.

Description

Optional field used to specify a template description. This will become the text value of the `<description>` element in the template descriptor file. This information is displayed when the user hovers over the template in the transformation scenario dialog box.

Parameter Table

This table displays the parameters that will be exported. Only certain relevant parameters are exported. The parameters and their values will be inserted in the `<parameters>` section of the template descriptor file. If any of the parameter values point to a file path that references a template resource (such as CSS files, custom HTML fragments, images), those resources will automatically be copied to the new template package and their references will be changed accordingly.

**Note:**

Additional resources that are referenced in CSS files or other resources will not be copied to the new template package, so you will need to copy them manually and update their references in the template descriptor file.

Include WebHelp Customization

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations ([DITA Map](#)

WebHelp Responsive (on page 1101) or **DITA Map to PDF - based on HTML5 & CSS** (on page 1115)). This option specifies that the custom template will include a WebHelp Responsive customization.

Include HTML Page Layout Files

For **WebHelp Responsive** customizations, select this option if you want to copy the default *HTML Page Layout Files* (on page 1316) into your template package. They are helpful if you want to change the structure of the generated HTML pages.

Include PDF Customization

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (**DITA Map WebHelp Responsive** (on page 1101) or **DITA Map to PDF - based on HTML5 & CSS** (on page 1115)). This option specifies that the custom template will include a PDF customization.

Save as

Use this field to specify the name and path of the ZIP file where the template will be saved.

Figure 374. Template Package Configuration Dialog Box

Save Template As

Name:

Description:

The following parameters will be set in the new template package: i

Name	Value
force-unique	true

Include WebHelp customization i

Include HTML Page Layout files

FO Processor Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1129) or edit an existing one (on page 1237), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab is available for DITA-OT transformations with a **PDF** output type.

This tab allows you to select an FO Processor to be used for the transformation.

Figure 375. FO Processor Configuration Tab

You can choose one of the following processors:

Apache FOP

The default processor that comes bundled with Oxygen XML Developer.

XEP

The **RenderX** XEP processor. If XEP is already installed, Oxygen XML Developer displays the detected installation path under the drop-down menu. XEP is considered installed if it was detected in one of the following sources:

- XEP was configured as an external FO Processor in the **FO Processors** option page (on page 229).
- The system property `com.oxygenxml.xep.location` was set to point to the XEP executable file for the platform (for example: `xep.bat` on Windows).
- XEP was installed in the `DITA-OT-DIR/plugins/org.dita.pdf2/lib` directory of the Oxygen XML Developer installation directory.

Antenna House

The [Antenna House](#) (AH Formatter) processor. If Antenna House is already installed, Oxygen XML Developer displays the detected installation path under the drop-down menu. Antenna House is considered installed if it was detected in one of the following sources:

- Environment variable set by Antenna House installation (the newest installation version will be used).
- Antenna House was added as an external FO Processor in the Oxygen XML Developer preferences pages.

To further customize the PDF output obtained from the Antenna House processor, follow these steps:

1. **Edit** the transformation scenario.
2. Open the **Parameters** tab (*on page 229*).
3. Add the `env.AXF_OPT` parameter and point to the Antenna House configuration file.

Related information

[FO Processors Preferences](#) (*on page 229*)

[XSL-FO \(Apache FOP\) Processor for Generating PDF Output](#) (*on page 1204*)

Parameters Tab (DITA-OT Transformations)

When you [create a new transformation scenario](#) (*on page 1129*) or [edit an existing one](#) (*on page 1237*), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Parameters** tab allows you to configure the parameters sent to the DITA-OT build file.

The table in this tab displays all the parameters that the DITA-OT documentation specifies as available for each chosen type of transformation (for example, XHTML or PDF), along with their description and current values. You can find more information about each parameter in the [DITA-OT Documentation](#). You can also add, edit, and remove parameters, and you can use the text box to filter or search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
- A file chooser and an [editor variable](#) (*on page 289*) selector to simplify setting a file path as the value of a parameter.

Note:

To input parameter values at runtime, use the [ask editor variable](#) (*on page 290*) in the **Value** column.

Below the table, the following actions are available for managing parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. You can specify the **Value** of the parameter by using the  **Insert Editor Variables** (*on page 289*) button or the  **Browse** button. You can also use the  **Open in editor** button to open the specified file in the editor panel.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Edit

Opens the **Edit Parameter** dialog box that allows you to change the value of the selected parameter or its description.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

Parameters Contributed by an Oxygen Publishing Template

Transformation parameters that are defined in an *Oxygen Publishing Template* (*on page 1469*) descriptor file are displayed in italics. After [creating a publishing template](#) (*on page 1476*) and [adding it to the templates gallery](#) (*on page 1340*), when you select the template in the **Templates** tab (*on page*), the **Parameters** tab will automatically be updated to include the parameters defined in the template descriptor file.

Related Information:

[DITA Open Toolkit Documentation](#)

Feedback Tab (DITA-OT Transformations)

When you [create a new transformation scenario](#) (*on page 1129*) or [edit an existing one](#) (*on page 1237*), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Feedback** tab is for those who want to provide a way for users to offer feedback and ask questions in the published output and it is available for the **DITA Map WebHelp Responsive** transformation type. To add a comments component in the output, you need to use **Oxygen Feedback** to create a site configuration for the website where your WebHelp output is published and use this **Feedback** tab to instruct the transformation to install the comments component at the bottom of each WebHelp page.

When you create a site configuration in the **Oxygen Feedback administration interface**, an HTML fragment is generated during the final step of the creation process. You need to click the **Edit** button at the bottom-right of this tab to open a dialog box where you will paste the generated HTML fragment. The HTML fragment

can also be set in an **Oxygen Publishing Template** (on page 1469), either as an **HTML fragment extension point** (on page 1307) or as a **transformation parameter** (on page 1305) (the `webhelp.fragment.feedback` parameter). If the fragment is specified in multiple places, the order of precedence (from highest to lowest) is:

- The fragment specified directly in the **Feedback** tab.
- The fragment specified in a publishing template as an HTML fragment extension point.
- The fragment specified in a publishing template as a transformation parameter.

Filters Tab (DITA Transformations)

When you [create a new transformation scenario](#) (on page 1129) or [edit an existing one](#) (on page 1237), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Filters** tab allows you to add filters to remove certain content elements from the generated output.

You can choose one of the following options to define filters:

Use DITAVAL file

If you already have a *DITAVAL* file associated with the *DITA map* (on page 2268), you can specify the file to be used when filtering content. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** (on page 289) button, or the browsing actions in the  **Browse** drop-down list. You can find out more about constructing a *DITAVAL* file in the [DITA Documentation](#).

Note:

If a filter file is specified in the `args.filter` parameter (in the **Parameters** tab (on page)), the filters are combined (neither file takes precedence over the other).

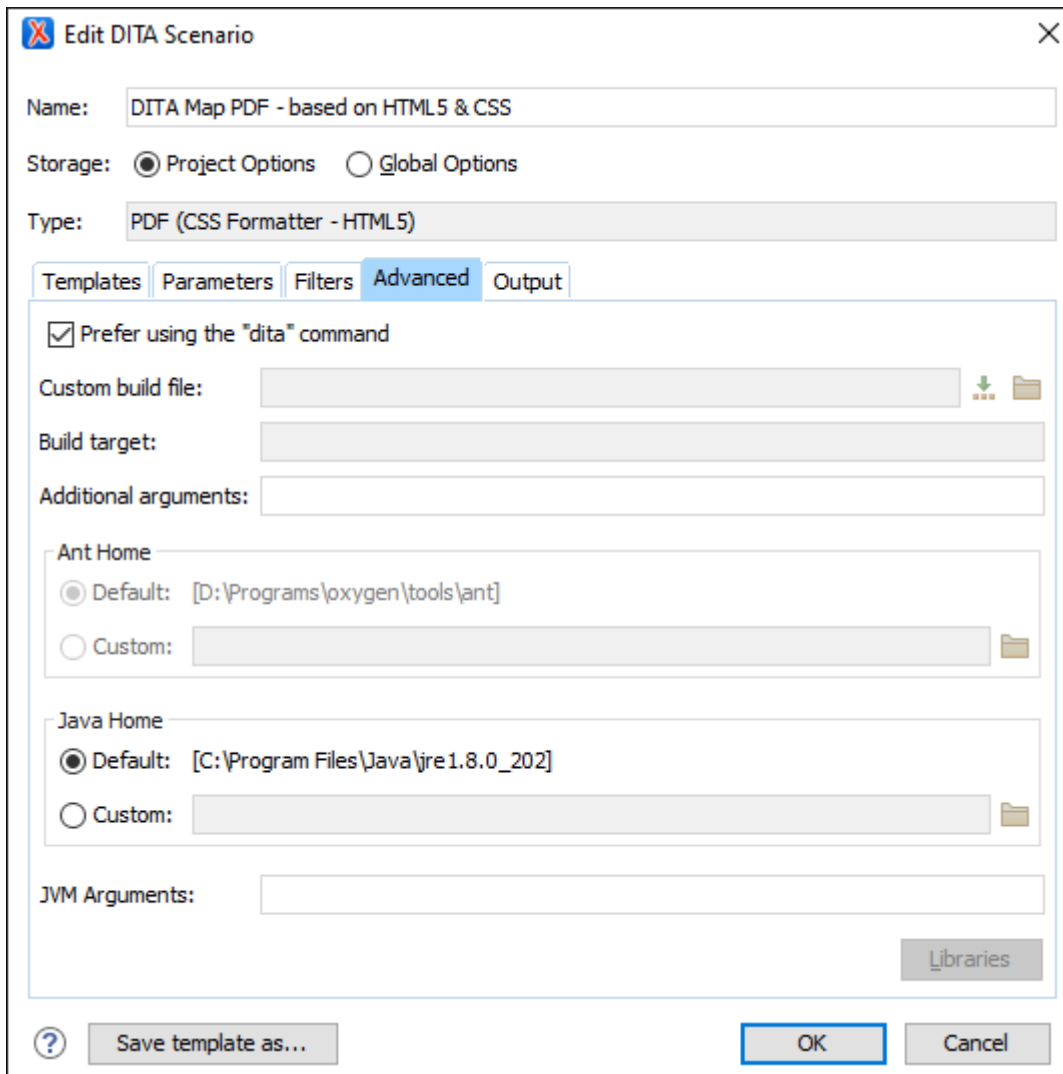

Exclude from output all elements with any of the following attributes

By using the  **New**,  **Edit**, or  **Delete** buttons at the bottom of the pane, you can configure a list of attributes (name and value) to exclude all elements that contain any of these attributes from the output.

Advanced Tab (DITA-OT Transformations)

When you [create a new transformation scenario](#) (on page 1129) or [edit an existing one](#) (on page 1237), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Advanced** tab allows you to specify advanced options for the transformation scenario.

Figure 376. Advanced Settings Tab

You can specify the following options:

Prefer using the "dita" command

When selected, Oxygen XML Developer will attempt to use the `dita.bat` executable script (`dita.sh` for macOS and Linux) that is bundled with DITA-OT to run the transformation. If not selected, the transformation will run as an ANT process. Also, when this option is selected, other options (**Custom build file**, **Build target**, **Ant Home**) become unavailable. This setting is checked by default in newly created DITA-OT transformation scenario.

Note:

Even when this option is selected, the `dita.bat` (`dita` for macOS and Linux) executable cannot be used in some cases. For example, if the DITA Map is published from a remote location or if the `fix.external.refs` parameter is enabled in the **Parameters** tab, the transformation is started as an ANT process instead of using the executable.

Custom build file

If you use a custom DITA-OT build file, you can specify the path to the customized build file. If empty, the `build.xml` file from the `dita.dir` parameter that is configured in the **Parameters** tab (on page) is used. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 289) button, or the  **Browse** button.

Build target

Optionally, you can specify a build target for the build file. If no target is specified, the default `init` target is used.

Additional Ant arguments

You can specify additional **Ant-specific** command-line arguments (such as `-diagnostics`).

Ant Home

You can choose between the default or custom Ant installation to run the transformation. The default path can be configured in the [Ant preferences page](#) (on page 234).

Java Home

You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Developer.

Note:

It may be possible that the used Java version is incompatible with the DITA Open Toolkit engine. If you encounter related errors running the transformation, consider installing a Java VM that is supported by the DITA-OT publishing engine and using it in the **Java Home** text field.

JVM Arguments

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid *Out of Memory* error messages (**OutOfMemoryError**). For example, if it is set to `-Xmx2g`, the transformation process is allowed to use a maximum 2 gigabytes of memory. If you do not specify an `-Xmx` value in this field, by default, the application will use a maximum of about a quarter of the total memory available on the machine.

Libraries

By default, Oxygen XML Developer adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (*JAR* (on page 2270) files or additional class paths) to be used by the transformer.

Tip:

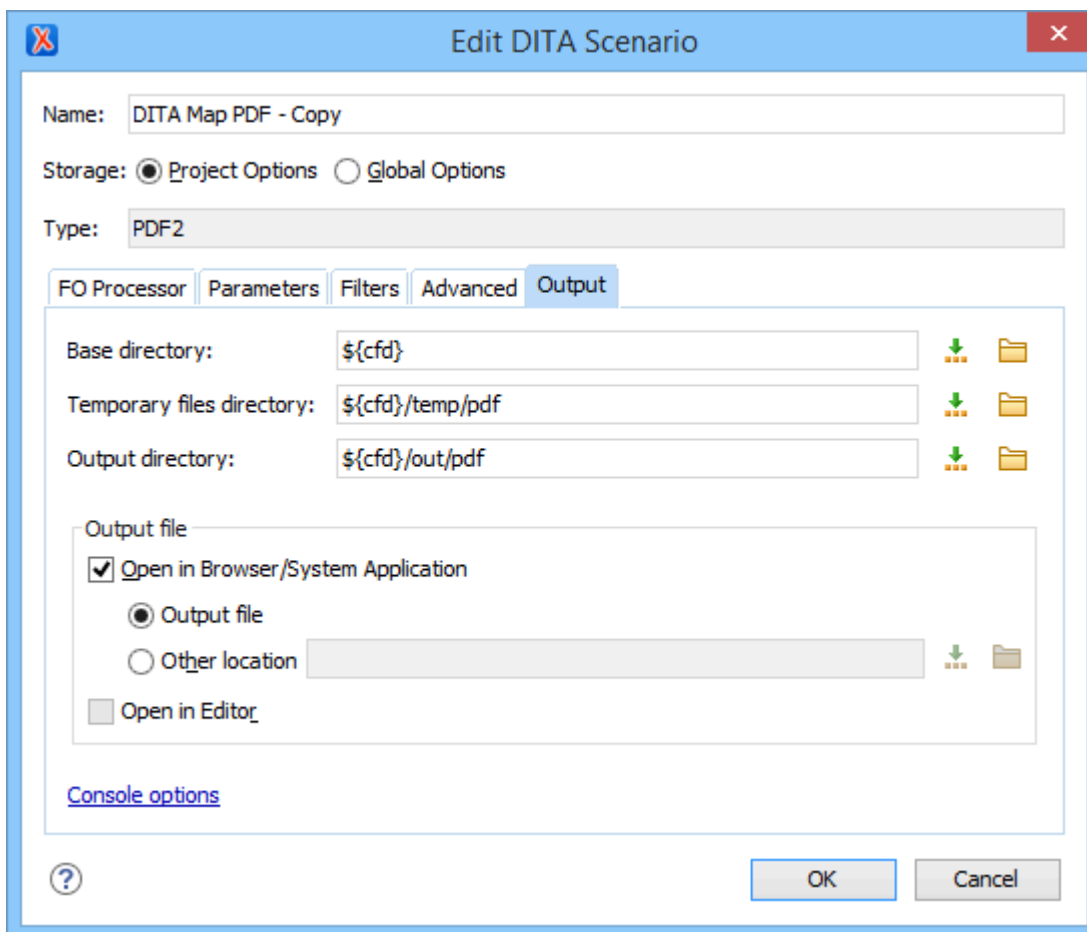

You can specify the path to the additional libraries using wildcards (for example, `${oxygenHome}/lib/*.jar`).

Output Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1129) or edit an existing one (on page 1237), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab allows you to configure options that are related to the location where the output is generated.

Figure 377. Output Settings Tab

You can specify the following parameters:

Base directory

All the relative paths that appear as values in parameters are considered relative to the base directory. The default value is the directory where the transformed map is located. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 289) button, or the  **Browse** button.

Temporary files directory

This directory is used to store pre-processed temporary files until the final output is obtained. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 289) button, or the  **Browse** button.

Output directory

The folder where the content of the final output is stored. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 289) button, or the  **Browse** button.

Note:

If the *DITA map* (on page 2268) or topic is opened from a remote location or a ZIP file, the parameters must specify absolute paths.

Open in Browser/System Application

If selected, Oxygen XML Developer automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

Note:

To set the web browser that is used for displaying HTML/XHTML pages, go to **Options > Preferences > Global**, and set it in the **Default Internet browser** field.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 289) button, or the  **Browse** button.

Open in editor

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Ant Transformation

This type of transformation allows you to configure the options and parameters of an Ant build script.

An Ant transformation scenario is usually associated with an Ant build script. Oxygen XML Developer runs an Ant transformation scenario as an external process that executes the Ant build script with the built-in Ant distribution (*Apache Ant* (on page 2267) version 1.9.8) that is included with the application, or optionally with a custom Ant distribution configured in the scenario.

**Tip:**

Certain Ant tasks require additional JAR libraries (for example, Ant *mail* tasks). The additional libraries can be added by editing the Ant transformation scenario, and in the **Output** tab, click the **Libraries** button (on page 1170) in the bottom right corner. This opens a dialog box where you can add JAR libraries. For a list of library dependencies, see <https://ant.apache.org/manual/install.html#librarydependencies>.

To create an Ant transformation scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s)** (**Ctrl + Shift + C** (**Command + Shift + C** on macOS)) action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **ANT transformation**.
- Go to **Window > Show View** and select **Transformation Scenarios** to display [this view](#) (on page 1246). Click the **New Scenario** drop-down menu button and select **ANT transformation**.

Both methods open the transformation configuration dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options** (on page 2272) - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** (on page 2269) - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

Since **Ant** transformation scenarios are run as separate processes, to instruct Oxygen XML Developer to open certain resources created by the separate process, you can use `<echo>` elements in your build files with the following syntax:

```
<echo>Finished publishing: "absolute/path/to/file.ext"</echo>
```

Related Information:

[Transforming Ant Build Files](#) (on page 705)

Options Tab (Ant Transformations)

When you [create a new transformation scenario](#) (on page 1129) or [edit an existing one](#) (on page 1237), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Options** tab allows you to specify the following options:

Working directory

The path of the current directory of the Ant external process. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 289) button, or the  **Browse** button.

Build file

The Ant script file that is the input of the Ant external process. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 289) button, or the  **Browse** button.

Build target

Optionally, you can specify a build target for the Ant script file. If no target is specified, the Ant target that is specified as the default in the Ant script file is used.

Additional Ant arguments

You can specify additional **Ant-specific** command-line arguments (such as `-diagnostics`).

Ant Home

You can choose between the default or custom Ant installation to run the transformation. The default path can be configured in the [Ant preferences page](#) (on page 234).

Java Home

You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Developer.

JVM Arguments

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid *Out of Memory* error messages (**OutOfMemoryError**). For example, if it is set to **-Xmx2g**, the transformation process is allowed to use a maximum 2 gigabytes of memory. If you do not specify an **-Xmx** value in this field, by default, the application will use a maximum of about a quarter of the total memory available on the machine.

Libraries

By default, Oxygen XML Developer adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (*JAR* (on page 2270) files or additional class paths) to be used by the transformer.

Tip:

You can specify the path to the additional libraries using wildcards (for example, `${oxygenHome}/lib/*.jar`).

Parameters Tab (Ant Transformations)

When you [create a new transformation scenario \(on page 1129\)](#) or [edit an existing one \(on page 1237\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Parameters** tab allows you to configure the parameters that are accessible as Ant properties in the Ant build script.

The table displays all the parameters that are available in the Ant build script, along with their description and current values. You can also add, edit, and remove parameters, and use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
- A file chooser and an [editor variable \(on page 289\)](#) selector to simplify setting a file path as the value of a parameter.

**Note:**

To input parameter values at runtime, use the [ask editor variable \(on page 290\)](#) in the **Value** column.

Below the table, the following actions are available for managing parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. You can specify the **Value** of the parameter by using the  **Insert Editor Variables (on page 289)** button or the  **Browse** button. You can also use the  **Open in editor** button to open the specified file in the editor panel.

Edit

Opens the **Edit Parameter** dialog box that allows you to change the value of the selected parameter or its description.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

These parameters are also available for the built-in validation processor and the [Content Completion Assistant \(on page 2267\)](#).

Related Information:

[Content Completion in Ant Build Files \(on page 706\)](#)

Output Tab (Ant Transformations)

When you create a new transformation scenario (on page 1129) or edit an existing one (on page 1237), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Open

Allows you to specify the file to open automatically when the transformation is finished. This is usually the output file of the Ant process. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 289) button, or the  **Browse** button.

- **In System Application** - The file specified in the **Open** text box is opened in the system application that is set in the operating system as the default application for that type of file (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).
- **In Editor** - The file specified in the **Open** text box is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor).

Show console output

Allows you to specify when to display the console output log in the message panel at the bottom of the editor. The following options are available:

- **When build fails** - Displays the console output log only if the build fails.
- **Always** - Displays the console output log, regardless of whether or not the build fails.

JSON Transformation with XSLT

This type of transformation specifies the transformation parameters and location of an XSLT stylesheet that is applied to the edited JSON document. This scenario is useful when you develop a JSON document and the XSLT document is in its final form.

To create a **JSON transformation with XSLT** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s)** (**Ctrl + Shift + C** (**Command + Shift + C** on macOS)) action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **JSON transformation with XSLT**.
- Go to **Window > Show View** and select  **Transformation Scenarios** to display [this view](#) (on page 1246). Click the  **New Scenario** drop-down menu button and select **JSON transformation with XSLT**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options** ([on page 2272](#)) - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** ([on page 2269](#)) - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XSLT Tab (JSON Transformations)

When you [create a new transformation scenario \(on page 1129\)](#) or [edit an existing one \(on page 1237\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **XSLT** tab contains the following options:

JSON URL

Specifies the source JSON file. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** ([on page 289](#)) button, or the browsing actions in the  **Browse** drop-down list. You can also use the  **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

XSL URL

Specifies the source XSL file that the transformation will use. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** ([on page 289](#)) button, or the browsing actions in the  **Browse** drop-down list. You can also use the  **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Developer for performing a transformation. The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

Advanced options

Allows you to configure the [advanced options of the Saxon HE/PE/EE engine \(on page 1134\)](#) for the current transformation scenario. To configure the same options globally, go to the [Saxon-](#)

[HE/PE/EE preferences page \(on page 215\)](#). For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

Parameters

Opens a **Configure parameters dialog box (on page 1132)** that allows you to configure the XSLT parameters used in the current transformation. In this dialog box, you can also configure the parameters for [additional XSLT stylesheets \(on page 1175\)](#). If the XSLT transformation engine is custom-defined, you cannot use this dialog box to configure the parameters sent to the custom engine. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XSLT engine to include the necessary parameters in the command line that starts the transformation process.

Extensions

Opens a **dialog box for configuring the XSLT extension JARS or classes (on page 1133)** that define extension Java functions or extension XSLT elements used in the transformation.

Additional XSLT stylesheets

Opens a **dialog box for adding XSLT stylesheets (on page 1133)** that are applied on the main stylesheet specified in the **XSL URL** field. This is useful when a chain of XSLT stylesheets must be applied to the input XML document.

XSLT Parameters

The global parameters of the XSLT stylesheet used in a transformation scenario can be configured by using the **Parameters** button in the **XSLT** tab of a new or edited transformation scenario dialog box.

The resulting dialog box includes a table that displays all the parameters of the current XSLT stylesheet, all imported and included stylesheets, and all [additional stylesheets \(on page 1133\)](#), along with their descriptions and current values. You can also add, edit, and remove parameters, and you can use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is selected, the parameter value is evaluated as an XPath expression before starting the XSLT transformation.

Example:

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@atr='val']
```

**Note:**

1. The **doc** function solves the argument relative to the XSL stylesheet location. You can use full paths or **editor variables** (*on page 289*) (such as **#{cfdu}** [current file directory]) to specify other locations: `doc('#{cfdu}/test.xml')//*`
2. You cannot use XSLT Functions. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An **editor variable** (*on page 289*) can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Edit

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An **editor variable** (*on page 289*) can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

Related Information:

[Editor Variables](#) (*on page 289*)

XSLT Extensions

The **Extensions** button opens a dialog box that allows you to specify the *JARS* (*on page 2270*) and classes that contain extension functions called from the XSLT file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

**Tip:**

You can specify the path to the resources using wildcards (for example, `${oxygenHome}/lib/*.jar`).

An extension function called from the XSLT file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and click the **↑ Move up** or **↓ Move down** buttons.

Additional XSLT Stylesheets

Use the **Additional XSLT Stylesheets** button in the **XSLT** tab to display a list of additional XSLT stylesheets to be used in the transformation and you can add files to the list or edit existing entries. The following actions are available:

Add

Adds a stylesheet in the **Additional XSLT stylesheets** list using a file browser dialog box. You can type an [editor variable \(on page 289\)](#) in the file name field of the browser dialog box. The name of the stylesheet will be added in the list after the current selection.

Remove

Deletes the selected stylesheet from the **Additional XSLT stylesheets** list.

Open

Opens the selected stylesheet in a separate view.

Up

Moves the selected stylesheet up in the list.

Down

Moves the selected stylesheet down in the list.

FO Processor Tab (JSON Transformations)

When you [create a new transformation scenario \(on page 1129\)](#) or [edit an existing one \(on page 1237\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

Perform FO Processing

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

Input

Choose between the following options to specify which input file to use:

- **XSLT result as input** - The FO processor is applied to the result of the XSLT transformation that is defined in the **XSLT** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

Method

The output format of the FO processing. The available options depend on the selected processor type.

Processor

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an [external processor \(on page 229\)](#).

Output Tab (JSON Transformations)

When you [create a new transformation scenario \(on page 1129\)](#) or [edit an existing one \(on page 1237\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Prompt for file

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the  [Insert Editor Variables \(on page 289\)](#) button, or the  **Browse** button.

Open in Browser/System Application

If selected, Oxygen XML Developer automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

Note:

To set the web browser that is used for displaying HTML/XHTML pages, go to **Options > Preferences > Global**, and set it in the **Default Internet browser** field.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 289) button, or the  **Browse** button.

Open in editor

When this option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Developer displays the transformation result in an XML viewer panel at the bottom of the application window with [syntax highlighting \(on page 193\)](#).
- **SVG** - If this is selected, Oxygen XML Developer displays the transformation result in an [integrated SVG viewer in the Results panel \(on page 1037\)](#) at the bottom of the application window and renders the result as an SVG image.
- **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Developer displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

Important:

When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

- **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 289) button, or the  **Browse** button.

**Attention:**

If your input XSLT contains `<xsl:result-document>` elements, then the secondary results will be saved to the specified URIs while the principal result is specified in this **Output** tab. For more information, see: <https://www.w3.org/TR/xslt-30/#element-result-document>.

JSON Transformation with XQuery

This type of transformation specifies the transformation parameters and location of an XQuery file that is applied to the edited JSON document. This scenario is useful when you develop a JSON document and the XQuery file is in its final form.

To create a **JSON transformation with XQuery** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on macOS))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **JSON transformation with XQuery**.
- Go to **Window > Show View** and select  **Transformation Scenarios** to display [this view \(on page 1246\)](#). Click the  **New Scenario** drop-down menu button and select **JSON transformation with XQuery**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options** [\(on page 2272\)](#) - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** [\(on page 2269\)](#) - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XQuery Tab (JSON Transformations)

When you [create a new transformation scenario \(on page 1129\)](#) or [edit an existing one \(on page 1237\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **XQuery** tab contains the following options:

JSON URL

Specifies the source JSON file. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** [\(on page 289\)](#) button, or the browsing actions in

the  **Browse** drop-down list. You can also use the  **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

XQuery URL

Specifies the source XQuery file to be used for the transformation. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** ([on page 289](#)) button, or the browsing actions in the  **Browse** drop-down list. You can also use the  **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Developer for performing a transformation. These include the built-in engines and [the external engines defined in the Custom Engines preferences page \(on page 228\)](#). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

Advanced options

Allows you to configure the [advanced options of the Saxon HE/PE/EE engine \(on page 1149\)](#) for the current transformation scenario. To configure the same options globally, go to the [Saxon-HE/PE/EE preferences page \(on page 215\)](#). For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

Parameters

Opens the [Configure parameters dialog box \(on page 1148\)](#) for configuring the XQuery parameters. You can use the buttons in this dialog box to add, edit, or remove parameters. If the XQuery transformation engine is custom-defined, you can not use this dialog box to set parameters. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XQuery engine to include the necessary parameters in the command line that starts the transformation process.

Extensions

Opens a [dialog box for configuring the XQuery extension JARS or classes \(on page 1149\)](#) that define extension Java functions or extension XSLT elements used in the transformation.

XQuery Parameters

The global parameters of the XQuery file used in a transformation scenario can be configured by using the **Parameters** button in the **XQuery** tab.

The resulting dialog box includes a table that displays all the parameters of the current XQuery file, along with their descriptions and current values. You can also add, edit, and remove parameters, and use the **Filter** text

box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is selected, the parameter value is evaluated as an XPath expression before starting the XQuery transformation.

Example:

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@atr='val']
```

Note:

1. The **doc** function solves the argument relative to the XQuery file location. You can use full paths or [editor variables \(on page 289\)](#) (such as `#{cfdu}` [current file directory]) to specify other locations: `doc('#{cfdu}/test.xml')//*`
2. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An [editor variable \(on page 289\)](#) can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Edit

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An [editor variable \(on page 289\)](#) can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

Related Information:

[Editor Variables \(on page 289\)](#)

XQuery Extensions

The **Extensions** button is used to specify the *JAR (on page 2270)* and classes that contain extension functions called from the XQuery file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

An extension function called from the XQuery file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and click the **↑ Move up** or **↓ Move down** buttons.

Advanced Saxon HE/PE/EE XQuery Transformation Options

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the [Saxon HE/PE/EE preferences page \(on page 223\)](#) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the [global options \(on page 2269\)](#) defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 12.5 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Use a configuration file ("-config")

Sets a Saxon 12.5 configuration file that is used for XQuery transformation and validation scenarios.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Use linked tree model ("-tree:linked")

This option activates the linked tree model.

Strip whitespaces ("-strip")

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

Enable profiling ("-TP")

If selected, profiling of the execution time in a query is enabled. The corresponding text field is used to specify the path to the output file where the profiling information will be saved. As long as the option is selected, and the output file specified, it will gather timed tracing information and create a profile report to the specified file.

Note:

The profiling support works only if the **Present as a sequence** transformation option ([on page 1152](#)) is not set.

Saxon-PE/EE Options

The following advanced options are specific for Saxon 12.5 Professional Edition (PE) and Enterprise Edition (EE) only:

Allow calls on extension functions ("-ext")

If selected, calls on external functions are allowed. Selecting this option is not recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

Saxon-EE Options

The advanced options that are specific for Saxon 12.5 Enterprise Edition (EE) are as follows:

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable XQuery update ("-update:(on|off)")

This option controls whether or not XQuery update syntax is accepted. The default value is off.

Backup files updated by XQuery ("-backup:(on|off)")

If selected, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the **Enable XQuery update** option is selected.

Other Options

Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

FO Processor Tab (XQuery Transformations)

When you [create a new transformation scenario \(on page 1129\)](#) or [edit an existing one \(on page 1237\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

Perform FO Processing

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

Input

Choose between the following options to specify which input file to use:

- **XQuery result as input** - The FO processor is applied to the result of the XQuery transformation that is defined in the **XQuery** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

Method

The output format of the FO processing. The available options depend on the selected processor type.

Processor

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an [external processor \(on page 229\)](#).

Output Tab (XQuery Transformations)

When you [create a new transformation scenario \(on page 1129\)](#) or [edit an existing one \(on page 1237\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Present as a sequence

Selecting this option will reduce the time necessary to fetch the full results, as it will only fetch the first chunk of the results.

Prompt for file

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the  **Insert Editor Variables** [\(on page 289\)](#) button, or the  **Browse** button.

Open in Browser/System Application

If selected, Oxygen XML Developer automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

**Note:**

To set the web browser that is used for displaying HTML/XHTML pages, go to **Options > Preferences > Global**, and set it in the **Default Internet browser** field.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the  **Insert Editor Variables** (*on page 289*) button, or the  **Browse** button.

Open in editor

When this option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Developer displays the transformation result in an XML viewer panel at the bottom of the application window with [syntax highlighting](#) (*on page 193*).
- **SVG** - If this is selected, Oxygen XML Developer displays the transformation result in an [integrated SVG viewer in the Results panel](#) (*on page 1037*) at the bottom of the application window and renders the result as an SVG image.
- **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Developer displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

**Important:**

When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

- **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 289) button, or the  **Browse** button.

XSLT Transformation on XML

This type of transformation specifies the parameters and location of an XML document that the edited XSLT stylesheet is applied on. This scenario is useful when you develop an XSLT document and the XML document is in its final form.

To create an **XSLT transformation on XML** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s)** (**Ctrl + Shift + C** (**Command + Shift + C** on macOS)) action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XSLT transformation on XML**.
- Go to **Window > Show View** and select  **Transformation Scenarios** to display [this view](#) (on page 1246). Click the  **New Scenario** drop-down menu button and select **XSLT transformation on XML**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options** (on page 2272) - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** (on page 2269) - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XSLT Tab

When you [create a new transformation scenario](#) (on page 1129) or [edit an existing one](#) (on page 1237), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **XSLT** tab contains the following options:

XML URL

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** (on page 289) button, or the browsing actions in the  **Browse** drop-down list. You can also use the  **Open in editor** button to open the

specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

Note:

If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the [advanced Saxon preferences page \(on page 218\)](#), the XML input of the transformation is passed to that URI resolver. If the transformer engine is one of the built-in XSLT 2.0 / 3.0 engines and [the name of an initial template \(on page 1189\)](#) is specified in the scenario, the **XML URL** field can be empty. The **XML URL** field can also be empty if you use [external XSLT processors \(on page 1145\)](#). Otherwise, a value is mandatory in this field.

XSL URL

Specifies the source XSL file that the transformation will use. You can specify the path by using the text field, its history drop-down, the  [Insert Editor Variables \(on page 289\)](#) button, or the browsing actions in the  **Browse** drop-down list. You can also use the  **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Use "xml-stylesheet" declaration

If selected, the scenario applies the stylesheet specified explicitly in the XML document with the `xml-stylesheet` processing instruction. By default, this option is deselected and the transformation applies the XSLT stylesheet that is specified in the **XSL URL** field.

Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Developer for performing a transformation. These include the built-in engines and [the external engines defined in the Custom Engines preferences page \(on page 228\)](#). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

Advanced options

Allows you to configure the [advanced options of the Saxon HE/PE/EE engine \(on page 1134\)](#) for the current transformation scenario. To configure the same options globally, go to the [Saxon-HE/PE/EE preferences page \(on page 215\)](#). For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

Parameters

Opens a **Configure parameters** dialog box [\(on page 1132\)](#) that allows you to configure the XSLT parameters used in the current transformation. In this dialog box, you can also configure the parameters for [additional XSLT stylesheets \(on page 1190\)](#). If the XSLT transformation engine is custom-defined, you cannot use this dialog box to configure the parameters sent to the custom

engine. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XSLT engine to include the necessary parameters in the command line that starts the transformation process.

Extensions

Opens a [dialog box for configuring the XSLT extension JARS or classes \(on page 1133\)](#) that define extension Java functions or extension XSLT elements used in the transformation.

Additional XSLT stylesheets

Opens a [dialog box for adding XSLT stylesheets \(on page 1133\)](#) that are applied on the main stylesheet specified in the **XSL URL** field. This is useful when a chain of XSLT stylesheets must be applied to the input XML document.

XSLT Parameters

The global parameters of the XSLT stylesheet used in a transformation scenario can be configured by using the **Parameters** button in the **XSLT** tab of a new or edited transformation scenario dialog box.

The resulting dialog box includes a table that displays all the parameters of the current XSLT stylesheet, all imported and included stylesheets, and all [additional stylesheets \(on page 1133\)](#), along with their descriptions and current values. You can also add, edit, and remove parameters, and you can use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is selected, the parameter value is evaluated as an XPath expression before starting the XSLT transformation.

Example:

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@atr='val']
```

Note:

1. The **doc** function solves the argument relative to the XSL stylesheet location. You can use full paths or [editor variables \(on page 289\)](#) (such as **\$(cfdu)** [current file directory]) to specify other locations: `doc('$(cfdu)/test.xml')//*`
2. You cannot use XSLT Functions. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An [editor variable \(on page 289\)](#) can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Edit

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An [editor variable \(on page 289\)](#) can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

Related Information:

[Editor Variables \(on page 289\)](#)

XSLT Extensions

The **Extensions** button opens a dialog box that allows you to specify the [JARS \(on page 2270\)](#) and classes that contain extension functions called from the XSLT file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

Tip:

You can specify the path to the resources using wildcards (for example, `${oxygenHome}/lib/*.jar`).

An extension function called from the XSLT file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and click the  **Move up** or  **Move down** buttons.

Additional XSLT Stylesheets

Use the **Additional XSLT Stylesheets** button in the **XSLT** tab to display a list of additional XSLT stylesheets to be used in the transformation and you can add files to the list or edit existing entries. The following actions are available:

Add

Adds a stylesheet in the **Additional XSLT stylesheets** list using a file browser dialog box. You can type an [editor variable \(on page 289\)](#) in the file name field of the browser dialog box. The name of the stylesheet will be added in the list after the current selection.

Remove

Deletes the selected stylesheet from the **Additional XSLT stylesheets** list.

Open

Opens the selected stylesheet in a separate view.

Up

Moves the selected stylesheet up in the list.

Down

Moves the selected stylesheet down in the list.

Advanced Saxon HE/PE/EE XSLT Transformation Options

The XSLT transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the [Saxon HE/PE/EE preferences page \(on page 215\)](#) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the [global options \(on page 2269\)](#) defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 12.5 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Mode ("-im")

A Saxon-specific option that sets the initial mode for the transformation. If this value is also specified in a [configuration file \(on page 1193\)](#), the value in this option takes precedence.

Template ("-it")

A Saxon-specific option that sets the name of the initial XSLT template to be executed. If this value is also specified in a [configuration file \(on page 1193\)](#), the value in this option takes precedence.

**Tip:**

If your stylesheet includes `<xsl:template name="xsl:initial-template">`, Oxygen XML Developer will automatically detect and use it as the initial template, so this option is not needed in this case.

Use a configuration file ("-config")

Select this option if you want to use a Saxon 12.5 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration file by entering it in the **URL** field, or by using the  **Insert Editor Variables** button, or using the browsing actions in the  **Browse** drop-down list.

**Attention:**

Oxygen XML Developer does not support the `ALLOWED_PROTOCOLS` Saxon property (<http://saxon.sf.net/feature/allowedProtocols>). This feature is specific to Saxon and controls access by Saxon (but not by underlying software, such as the XML parser). For more information, see <https://www.saxonica.com/documentation12/index.html#!configuration/config-features>.

Debugger trace into XPath expressions (applies to debugging sessions)

Instructs the *XSLT Debugger* ([on page 1851](#)) to *step into* XPath expressions.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Line numbering ("-l")

Line numbers where errors occur are included in the output messages.

Expand attributes defaults ("-expand")

Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

DTD validation of the source ("-dtd")

Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

- **On** - Requests DTD validation of the source file and of any files read using the `document()` function.
- **Off** - (default setting) Suppresses DTD validation.

- **Recover** - Performs DTD validation but treats the errors as non-fatal.

**Note:**

Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

Strip whitespaces ("-strip")

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

Enable profiling ("-TP")

If selected, profiling of the execution time in a stylesheet is enabled. The corresponding text field is used to specify the path to the output file where the profiling information will be saved. As long as the option is selected, and the output file specified, it will gather timed tracing information and create a profile report to the specified file.

Saxon-PE/EE Options

The following advanced options are specific for Saxon 12.5 Professional Edition (PE) and Enterprise Edition (EE) only:

Register Saxon-JS extension functions and instructions

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 12.5 processors.

**Note:**

Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Developer only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about [executing such a stylesheet on Saxonica's website](#).

Allow calls on extension functions ("-ext")

If selected, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using `http://[URL]`).

It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

Enable assertions ("-ea")

In XSLT 3.0, you can use the `<xsl:assert>` element to make assertions in the form of XPath expressions, causing a dynamic error if the assertion turns out to be false. If this option is selected, XSLT 3.0 `<xsl:assert>` instructions are enabled. If it is not selected (default), the assertions are ignored.

Saxon-EE Options

The advanced options that are specific for Saxon 12.5 Enterprise Edition (EE) are as follows:

XML Schema version

Use this option to change the default XML Schema version for this transformation. To change the default XML Schema version globally, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **XML > XML Parser > XML Schema** and use the **Default XML Schema version option (on page 207)**.

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable streaming mode

Selecting this option will allow an XSLT to run in streaming mode. It is not selected by default. However, in certain instances, the Saxon XSLT processor may auto detect and use streaming even if this option is not selected.

Other Options

Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

Using Saxon Integrated Extension Functions

Saxon, the transformation and validation engine used by Oxygen XML Developer, can be customized by adding custom functions (called [Integrated Extension Functions](#)) that can be called from XPath.

To define such a function, follow these steps:

1. Create a file with a Java class that extends `net.sf.saxon.lib.ExtensionFunctionDefinition`. Here is an example:

```
private static class ShiftLeft extends ExtensionFunctionDefinition {

    @Override

    public StructuredQName getFunctionQName() {

        return new StructuredQName("eg", "http://example.com/saxon-extension", "shift-left");

    }

    @Override

    public SequenceType[] getArgumentTypes() {

        return new SequenceType[] {SequenceType.SINGLE_INTEGER, SequenceType.SINGLE_INTEGER};

    }

    @Override

    public SequenceType getResultType(SequenceType[] suppliedArgumentTypes) {

        return SequenceType.SINGLE_INTEGER;

    }

    @Override

    public ExtensionFunctionCall makeCallExpression() {

        return new ExtensionFunctionCall() {

            public SequenceIterator call(SequenceIterator[] arguments, XPathContext context)

                throws XPathException {

                long v0 = ((IntegerValue)arguments[0].next()).longValue();

                long v1 = ((IntegerValue)arguments[1].next()).longValue();
```

```

    long result = v0<<v1;

    return Value.asIterator(Int64Value.makeIntegerValue(result));
}
};
}
}

```

2. Compile the class and add it to a JAR file.
3. Add a file called **net.sf.saxon.lib.ExtensionFunctionDefinition** that contains the fully qualified name of the Java class in the `META-INF/services/` folder of the JAR file.

Note:

To add more function definitions in the same JAR file, you need to add their fully qualified names on different lines.

To enable Oxygen XML Developer to pick up your custom function definition, the JAR file should be added to the classpath of the transformer. Here are some possibilities:

- If you develop a framework, you just need to link the JAR file in the **Classpath** tab (*on page 134*).
- In a *validation scenario* (*on page 555*), you can use the **Extensions** button to open a dialog box where you can add libraries.
- In a transformation scenario, you can use the **Extensions** button in the **XSLT** tab (*on page 1132*) to open a dialog box where you can add libraries.
- You can also create a plugin that *contributes such a JAR file in the classpath* (*on page 1863*).

FO Processor Tab (XSLT Transformations)

When you *create a new transformation scenario* (*on page 1129*) or *edit an existing one* (*on page 1237*), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

Perform FO Processing

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

Input

Choose between the following options to specify which input file to use:

- **XSLT result as input** - The FO processor is applied to the result of the XSLT transformation that is defined in the **XSLT** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

Method

The output format of the FO processing. The available options depend on the selected processor type.

Processor

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an [external processor \(on page 229\)](#).

Output Tab (XSLT Transformations)

When you [create a new transformation scenario \(on page 1129\)](#) or [edit an existing one \(on page 1237\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Prompt for file

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the  [Insert Editor Variables \(on page 289\)](#) button, or the  **Browse** button.

Open in Browser/System Application

If selected, Oxygen XML Developer automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

Note:

To set the web browser that is used for displaying HTML/XHTML pages, go to **Options > Preferences > Global**, and set it in the **Default Internet browser** field.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the  [Insert Editor Variables \(on page 289\)](#) button, or the  **Browse** button.

Open in editor

When this option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Developer displays the transformation result in an XML viewer panel at the bottom of the application window with [syntax highlighting \(on page 193\)](#).
- **SVG** - If this is selected, Oxygen XML Developer displays the transformation result in an [integrated SVG viewer in the Results panel \(on page 1037\)](#) at the bottom of the application window and renders the result as an SVG image.
- **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Developer displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

Important:

When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

- **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the  [Insert Editor Variables \(on page 289\)](#) button, or the  **Browse** button.

Attention:

If your input XSLT contains `<xsl:result-document>` elements, then the secondary results will be saved to the specified URIs while the principal result is specified in this **Output** tab. For more information, see: <https://www.w3.org/TR/xslt-30/#element-result-document>.

Configuring an XSLT Processor for Generating Output

This section explains how to configure an XSLT processor and extensions for such a processor in Oxygen XML Developer.

Supported XSLT Processors

Oxygen XML Developer includes the following XSLT processors:

- **Xalan 2.7.2** (Deprecated) - [Xalan-Java](#) is an XSLT processor for transforming XML documents into HTML, text, or other XML document types. It implements XSL Transformations (XSLT) Version 1.0 and XML Path Language (XPath) Version 1.0.
- **Saxon 6.5.5** - [Saxon 6.5.5](#) is an XSLT processor that implements the Version 1.0 XSLT and XPath with a number of powerful extensions. This version of Saxon also includes many of the new features that were first defined in the XSLT 1.1 working draft, but for conformance and portability reasons these are not available if the stylesheet header specifies `version="1.0"`.
- **Saxon 12.5 Home Edition (HE), Professional Edition (PE)** - [Saxon-HE/PE](#) implements the basic conformance level for XSLT 2.0 / 3.0 and XQuery 1.0. The term *basic XSLT 2.0 / 3.0 processor* is defined in the draft XSLT 2.0 / 3.0 specifications. It is a conformance level that requires support for all features of the language other than those that involve schema processing. The HE product remains open source, but removes some of the more advanced features that are present in Saxon-PE.
- **Saxon 12.5 Enterprise Edition (EE)** - [Saxon EE](#) is the schema-aware edition of Saxon and it is one of the built-in processors included in Oxygen XML Developer. Saxon EE includes an XML Schema processor, and schema-aware XSLT, XQuery, and XPath processors.

The validation in schema aware transformations is done according to the XML Schema 1.0 or 1.1. This can be [configured in Preferences \(on page 207\)](#).

Note:

Oxygen XML Developer implements a Saxon *framework* that allows you to create Saxon configuration files. Two templates are available: **Saxon collection catalog** and **Saxon configuration**. Both of these templates support content completion, element annotation, and attribute annotation.

Note:

Saxon can use the *ICU-J localization library* ([saxon9-icu.jar](#)) to add support for sorting and date/number formatting in a wide variety of languages. This library is not included in the Oxygen XML Developer installation kit. However, Saxon will use the default collation and localization support available in the currently used JRE. To enable this capability, follow these steps:

1. Download Saxon 12.5 Professional Edition (PE) or Enterprise Edition (EE) from <http://www.saxonica.com>.
2. Unpack the downloaded archive.

3. Create a new XSLT transformation scenario (or edit an existing one). In the **XSLT** tab, click the **Extensions** button to open the list of additional libraries used by the transformation process.
4. Click **Add** and browse to the folder where you unpacked the downloaded archive and choose the `saxon9-icu.jar` file.

Note that the `saxon9-icu.jar` should NOT be added to the application library folder because it will conflict with another version of the ICU-J library that comes bundled with Oxygen XML Developer.

- **Saxon-CE (Client Edition)** is Saxonica's implementation of XSLT 2.0 for use on web browsers. Oxygen XML Developer provides support for editing stylesheets that contain Saxon-CE extension functions and instructions. This support improves the validation, content completion, and syntax highlighting.

**Note:**

Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Developer only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about [executing such a stylesheet on Saxonica's website](#).

**Note:**

A specific template, named **Saxon-CE stylesheet**, is available in the **New document wizard** (on [page 330](#)).

- **Xsltproc (libxslt)** (Deprecated) - **Libxslt** is the XSLT C library developed for the Gnome project. **Libxslt** is based on *libxml2*, the XML C library developed for the Gnome project. It also implements most of the EXSLT set of processor-portable extensions, functions, and some of Saxon's evaluate and expression extensions.

Oxygen XML Developer uses **Libxslt** through its command-line tool (*Xsltproc*). Depending on your operating system, you must download the Libxslt libraries on your machine from <http://xmlsoft.org/XSLT/downloads.html> and place them in a local folder. Then you need to update the `PATH` environmental variable to contain the parent folder where the `xsltproc` executable is located.

**Tip:**

As an example, a Windows installation of the Xsltproc engine would follow these steps:

1. Go to <http://ftp.zlatkovic.com/libxml.en.html> and download the following ZIP files: **iconv-1.9.2.win32.zip**, **libxml2-2.7.8.win32.zip**, **libxslt-1.1.26.win32.zip**, **zlib-1.2.5.win32.zip**.
2. Unzip all of them into the same folder of your choice.
3. Edit the `PATH` environment variable and add the `bin` folder for all four archives:

Edit environment variable

```
D:\apache-maven-3.1.1\bin
D:\Python27
%PATH%
C:\Users\r\Desktop\abc\libxslt-1.1.26.win32\bin
C:\Users\r\Desktop\abc\libxml2-2.7.8.win32\bin
C:\Users\r\Desktop\abc\iconv-1.9.2.win32\bin
C:\Users\r\Desktop\abc\zlib-1.2.5\bin
```

4. Restart Oxygen XML Developer.

Result: You can now use the **xsltproc** processor as an XSLT engine in the XSLT transformation scenario.

**Note:**

The Xsltproc processor can be configured from the **XSLTPROC** options page ([on page 218](#)).

**CAUTION:**

There is a known problem where file paths that contain spaces are not handled correctly in the LIBXML processor. For example, the built-in *XML Catalog* ([on page 2273](#)) files of the built-in document types (DocBook, TEI, DITA, etc.) are not handled properly by LIBXML if Oxygen XML Developer is installed in the default location on Windows (C:\Program Files). This is because the built-in *XML catalog* files are stored in the `[OXYGEN_INSTALL_DIR]/frameworks` subdirectory of the installation directory, and in this case it contains a space character.

- **MSXML 4.0 (Deprecated)** - MSXML 4.0 is available only on Windows platforms. It can be used for [transformation \(on page 1129\)](#) and [validation of XSLT stylesheets \(on page 658\)](#).

Oxygen XML Developer uses the Microsoft XML parser through its command-line tool `msxsl.exe`.

Since `msxsl.exe` is only a wrapper, Microsoft Core XML Services (MSXML) must be installed on the computer. Otherwise, you will get a corresponding warning. You can get the latest Microsoft XML parser from Microsoft web-site.

- **MSXML .NET (Deprecated)** - MSXML .NET is available only on Windows platforms. It can be used for [transformation \(on page 1129\)](#) and [validation of XSLT stylesheets \(on page 658\)](#).

Oxygen XML Developer performs XSLT transformations and validations using the .NET *Framework* XSLT implementation (`System.Xml.Xsl.XsltTransform` class) through the **nxslt** command-line utility. The **nxslt** version included in Oxygen XML Developer is 1.6.

You should have the *.NET Framework* version 1.0 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128.`

- **.NET 1.0 (Deprecated)** - A transformer based on the **System.Xml** 1.0 library available in the .NET 1.0 and .NET 1.1 *frameworks* from Microsoft. It is available only on Windows.

You should have the *.NET Framework* version 1.0 or 1.1 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128.`

You can get the *.NET Framework* version 1.0 from the Microsoft website.

- **.NET 2.0 (Deprecated)** - A transformer based on the **System.Xml** 2.0 library available in the *.NET 2.0 Framework* from Microsoft. It is available only on Windows.

You should have the *.NET Framework* version 2.0 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 2.0 to be installed. Exit code: 128.`

You can get the *.NET Framework* version 2.0 from the Microsoft website.

For information about configuring the XSLT preferences, see the [XSLT options \(on page 214\)](#) section.

Configuring Custom XSLT Processors

Oxygen XML Developer allows you to configure custom processors to be used for running XSLT and XQuery transformations.

To add a new custom processor, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **XML > XSLT-XQuery > Custom Engines**.
2. Click the **New** button at the bottom of the dialog box.
3. Configure the [parameters for the custom engine \(on page 228\)](#).
4. Click **OK**.

Note:

The output messages of a custom processor are displayed in an output view at the bottom of the application window. If an output message follows [the format of an Oxygen XML Developer linked message \(on page 552\)](#), clicking it highlights the location of the message in an editor panel containing the file referenced in the message.

Related Information:[Custom Engines Preferences \(on page 228\)](#)

Configuring the XSLT Processor Extensions Paths

The Saxon and Xalan processors support the use of extension elements and extension functions. Unlike a literal result element, which the stylesheet simply transfers to the result tree, an extension element performs an action. The extension is usually used because the XSLT stylesheet fails in providing adequate functions for accomplishing a more complex task.

For more information about how to use extensions, see the following links:

- **Xalan (Deprecated)** - <http://xml.apache.org/xalan-j/extensions.html>
- **Saxon 6.5.5** - <http://saxon.sourceforge.net/saxon6.5.5/extensions.html>
- **Saxon 12.5** - <http://www.saxonica.com/documentation9.5/index.html#!extensibility>

To set an XSLT processor extension (a directory or a `jar` file), use the **Extensions** button (on page 1132) in the **Edit scenario** dialog box.

XSL-FO (Apache FOP) Processor for Generating PDF Output

The Oxygen XML Developer installation package is distributed with the [Apache FOP](#) that is a Formatting Objects processor for transforming your XML documents to PDF. *FOP* is a print and output independent formatter driven by XSL Formatting Objects. *FOP* is implemented as a Java application that reads a formatting object tree and renders the resulting pages to a specified output.

To see the version of the built-in XSL-FO processor for your installation, go to **Help > About > Libraries** and search for *Apache FOP*.

Other FO processors can be configured in the [FO Processors preferences page \(on page 229\)](#).

Add a Font to the Built-in FO Processor - Simple Version

If the font that must be set to Apache FOP is one of the fonts that are installed in the operating system you should follow the next steps for creating and setting a FOP configuration file that looks for the font that it needs in the system fonts. It is a simplified version of [the procedure for setting a custom font in Apache FOP \(on page 1205\)](#).

1. Register the font in FOP configuration. (This is not necessary for DITA PDF transformations, skip to the next step)
 - a. Create a FOP configuration file that specifies that FOP should look for fonts in the installed fonts of the operating system.

```
<fop version="1.0">  
<renderers>
```

```

<renderer mime="application/pdf">

  <font>

    <auto-detect/>

  </font>

</renderer>

</renderers>

</fop>

```

- b. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114), go to **XML > PDF Output > FO Processors**, and enter the path of the FOP configuration file in the **Configuration file** text field.

2. Set the font on the document content.

This is done usually with XSLT stylesheet parameters and depends on the document type processed by the stylesheet.

- For DocBook documents you can start with the built-in scenario called **DocBook PDF**, [edit the XSLT parameters \(on page 1130\)](#) and set the font name (for example, **Arial Unicode MS**) to the `body.font.family` and `title.font.family` parameters.
- For TEI documents you can start with the built-in scenario called **TEI PDF**, [edit the XSLT parameters \(on page 1130\)](#) and set the font name (for example, **Arial Unicode MS**) to the `bodyFont` and `sansFont` parameters.
- For DITA transformations to PDF using DITA-OT you should modify the following two files:
 - `DITA-OT-DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml` - The `<font-face>` element included in each `<physical-font>` element that has the `charset="default"` attribute must contain the name of the font (for example, **Arial Unicode MS**)
 - `DITA-OT-DIR/plugins/org.dita.pdf2.fop/fop/conf/fop.xconf` - An `<auto-detect>` element must be inserted in the `` element, which is inside the `<renderer>` element that has the `mime="application/pdf"` attribute:

```

<renderer mime="application/pdf">
  . . .
  <font>
    <auto-detect/>
  </font>
  . . .
</renderer>

```

Add a Font to the Built-in FO Processor - Advanced Version

If an XML document is transformed to PDF using the built-in Apache FOP processor but it contains some Unicode characters that cannot be rendered by the default PDF fonts, then a special font that is capable to render these characters must be configured and embedded in the PDF result.

**Important:**

On Windows, fonts are located into the `C:\Windows\Fonts` directory. On macOS, they are placed in `/Library/Fonts`. To install a new font on your system, it is enough to copy it in the `Fonts` directory. If a special font is installed in the operating system, there is a simple way of telling FOP to look for it. See the [simplified procedure for adding a font to FOP \(on page 1204\)](#).

1. Locate the font.

First, find out the name of a font that has the glyphs for the special characters you used. One font that covers most characters, including Japanese, Cyrillic, and Greek, is Arial Unicode MS.

2. Register the font in the FOP configuration.

**Note:**

DITA PDF transformations have their own `fop.xconf` (`DITA-OT-DIR/plugins/org.dita.pdf2.fop/fop/conf/fop.xconf`). If the font is not installed in the system, it needs to be referenced in the `fop.xconf`.

- a. For information about registering the font in the FOP Configuration, see: <https://xmlgraphics.apache.org/fop/2.3/fonts.html>.
- b. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114), go to **XML > PDF Output > FO Processors**, and enter the path of the FOP configuration file in the **Configuration file** text field.

3. Set the font on the document content.

This is usually done with XSLT stylesheet parameters and depends on the document type processed by the stylesheet.

DocBook Example: For DocBook documents, you can start with the built-in scenario called **DocBook PDF, edit the XSLT parameters (on page 1130)**, and set the font name (for example, *Arialuni*) to the `body.font.family` and `title.font.family` parameters.

TEI Example: For TEI documents, you can start with the built-in scenario called **TEI PDF, edit the XSLT parameters (on page 1130)**, and set the font name (for example, *Arialuni*) to the `bodyFont` and `sansFont` parameters.

DITA Example: For DITA to PDF transformations using DITA-OT modify the following two files:

- `DITA-OT-DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml` - The `<font-face>` element included in each `<physical-font>` element that has the `char-set="default"` attribute must contain the name of the font.
- `DITA-OT-DIR/plugins/org.dita.pdf2/fop/conf/fop.xconf` - A `` element must be inserted in the `<fonts>` element, which is inside the `<renderer>` element that has the `mime="application/pdf"` attribute.

For more information, see: <https://xmlgraphics.apache.org/fop/2.1/fonts.html>.

Adding Libraries to the Built-in FO Processor (XML with XSLT and FO)

Starting with Oxygen XML Developer version 20.0, both hyphenation and PDF image support are enabled by default in the built-in Apache FO processor. For older version of Oxygen XML Developer, use the following procedures to enable such support.

Adding Hyphenation Support for XML with XSLT Transformation Scenarios

If you want to add newer hyphenation libraries or you are using an older version of Oxygen XML Developer, follow this procedure:

1. Create a folder called `fop` in the `[OXYGEN_INSTALL_DIR]/lib` folder.
2. Download the compiled *JAR (on page 2270)* from OFFO.
3. Copy the `fop-hyph.jar` file into the `[OXYGEN_INSTALL_DIR]/lib/fop` folder.
4. Restart Oxygen XML Developer.

Adding Support for PDF Images

To add support for PDF images in an older version of Oxygen XML Developer, follow these steps:

1. Create a folder called `fop` in the `[OXYGEN_INSTALL_DIR]/lib` folder.
2. Download the *fop-pdf-images* JAR libraries.
3. Copy the libraries into the `[OXYGEN_INSTALL_DIR]/lib/fop` folder.
4. Restart Oxygen XML Developer.

How to Enable Debugging for FO Processor Transformations

If you encounter errors when running PDF transformations that use an FO processor, it is possible to enable debugging/logging to help you identify the problem. To enable debugging/logging for FO processing, follow this procedure:

1. Locate and edit the following configuration file: `[OXYGEN_INSTALL_DIR]/tools/config/logback.xml`.

**Note:**

You need write access to this folder, so if you do not have administrator permissions, you might first need to copy the file to another location where you have write access.

2. Edit the `<root>` element (inside the `<configuration>` element), change its level to **debug**, and save the file.
3. Restart Oxygen XML Developer and re-run the transformation.

**Tip:**

To make it easier to analyze the data in the logs, it is recommended that you use a small input file when trying to reproduce the problem.

4. Once you are finished with the debugging session, remember to edit the `logback.xml` file and change the `<root>` element back to its original value. Otherwise, performance could be affected.

XSLT Transformation on JSON

This type of transformation specifies the parameters and location of a JSON document that the edited XSLT stylesheet is applied on. This scenario is useful when you develop an XSLT document and the JSON document is in its final form.

To create an **XSLT transformation on JSON** scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on macOS))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XSLT transformation on JSON**.
- Go to **Window > Show View** and select **Transformation Scenarios** to display [this view \(on page 1246\)](#). Click the **New Scenario** drop-down menu button and select **XSLT transformation on JSON**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options** ([on page 2272](#)) - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** ([on page 2269](#)) - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XSLT Tab (JSON Transformations)

When you [create a new transformation scenario \(on page 1129\)](#) or [edit an existing one \(on page 1237\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **XSLT** tab contains the following options:

JSON URL

Specifies the source JSON file. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** ([on page 289](#)) button, or the browsing actions in the  **Browse** drop-down list. You can also use the  **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

XSL URL

Specifies the source XSL file that the transformation will use. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** ([on page 289](#)) button, or the browsing actions in the  **Browse** drop-down list. You can also use the  **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Developer for performing a transformation. The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

Advanced options

Allows you to configure the [advanced options of the Saxon HE/PE/EE engine \(on page 1134\)](#) for the current transformation scenario. To configure the same options globally, go to the [Saxon-HE/PE/EE preferences page \(on page 215\)](#). For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

Parameters

Opens a **Configure parameters dialog box** ([on page 1132](#)) that allows you to configure the XSLT parameters used in the current transformation. In this dialog box, you can also configure the parameters for [additional XSLT stylesheets \(on page 1209\)](#). If the XSLT transformation engine is custom-defined, you cannot use this dialog box to configure the parameters sent to the custom engine. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XSLT engine to include the necessary parameters in the command line that starts the transformation process.

Extensions

Opens a **dialog box for configuring the XSLT extension JARS or classes** ([on page 1133](#)) that define extension Java functions or extension XSLT elements used in the transformation.

Additional XSLT stylesheets

Opens a **dialog box for adding XSLT stylesheets** ([on page 1133](#)) that are applied on the main stylesheet specified in the **XSL URL** field. This is useful when a chain of XSLT stylesheets must be applied to the input XML document.

XSLT Parameters

The global parameters of the XSLT stylesheet used in a transformation scenario can be configured by using the **Parameters** button in the **XSLT** tab of a new or edited transformation scenario dialog box.

The resulting dialog box includes a table that displays all the parameters of the current XSLT stylesheet, all imported and included stylesheets, and all [additional stylesheets \(on page 1133\)](#), along with their descriptions and current values. You can also add, edit, and remove parameters, and you can use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is selected, the parameter value is evaluated as an XPath expression before starting the XSLT transformation.

Example:

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@atr='val']
```

Note:

1. The **doc** function solves the argument relative to the XSL stylesheet location. You can use full paths or [editor variables \(on page 289\)](#) (such as **\${cfdu}** [current file directory]) to specify other locations: `doc('${cfdu}/test.xml')//*`
2. You cannot use XSLT Functions. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An [editor variable \(on page 289\)](#) can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Edit

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An [editor variable \(on page 289\)](#) can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

Related Information:

[Editor Variables \(on page 289\)](#)

XSLT Extensions

The **Extensions** button opens a dialog box that allows you to specify the *JARS (on page 2270)* and classes that contain extension functions called from the XSLT file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

**Tip:**

You can specify the path to the resources using wildcards (for example, `${oxygenHome}/lib/*.jar`).

An extension function called from the XSLT file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and click the **↑ Move up** or **↓ Move down** buttons.

Additional XSLT Stylesheets

Use the **Additional XSLT Stylesheets** button in the **XSLT** tab to display a list of additional XSLT stylesheets to be used in the transformation and you can add files to the list or edit existing entries. The following actions are available:

Add

Adds a stylesheet in the **Additional XSLT stylesheets** list using a file browser dialog box. You can type an *editor variable (on page 289)* in the file name field of the browser dialog box. The name of the stylesheet will be added in the list after the current selection.

Remove

Deletes the selected stylesheet from the **Additional XSLT stylesheets** list.

Open

Opens the selected stylesheet in a separate view.

Up

Moves the selected stylesheet up in the list.

Down

Moves the selected stylesheet down in the list.

FO Processor Tab (JSON Transformations)

When you [create a new transformation scenario \(on page 1129\)](#) or [edit an existing one \(on page 1237\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

Perform FO Processing

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

Input

Choose between the following options to specify which input file to use:

- **XSLT result as input** - The FO processor is applied to the result of the XSLT transformation that is defined in the **XSLT** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

Method

The output format of the FO processing. The available options depend on the selected processor type.

Processor

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an [external processor \(on page 229\)](#).

Output Tab (JSON Transformations)

When you [create a new transformation scenario \(on page 1129\)](#) or [edit an existing one \(on page 1237\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Prompt for file

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 289) button, or the  **Browse** button.

Open in Browser/System Application

If selected, Oxygen XML Developer automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

Note:

To set the web browser that is used for displaying HTML/XHTML pages, go to **Options > Preferences > Global**, and set it in the **Default Internet browser** field.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 289) button, or the  **Browse** button.

Open in editor

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Developer displays the transformation result in an XML viewer panel at the bottom of the application window with [syntax highlighting \(on page 193\)](#).
- **SVG** - If this is selected, Oxygen XML Developer displays the transformation result in an [integrated SVG viewer in the Results panel \(on page 1037\)](#) at the bottom of the application window and renders the result as an SVG image.
- **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Developer displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

**Important:**

When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

- **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 289) button, or the  **Browse** button.

**Attention:**

If your input XSLT contains `<xsl:result-document>` elements, then the secondary results will be saved to the specified URIs while the principal result is specified in this **Output** tab. For more information, see: <https://www.w3.org/TR/xslt-30/#element-result-document>.

XProc Transformation

This type of transformation specifies the parameters and location of an XProc script.

A sequence of transformations described by an XProc script can be executed with an XProc transformation scenario. To create an **XProc transformation** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on macOS))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XProc transformation**.
- Go to **Window > Show View** and select  **Transformation Scenarios** to display [this view \(on page 1246\)](#). Click the  **New Scenario** drop-down menu button and select **XProc transformation**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options** (on page 2272) - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** (on page 2269) - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

Related Information:

[Integrating an External XProc Engine \(on page 1218\)](#)

[Editing XProc Scripts \(on page 974\)](#)

XProc Tab

When you [create a new transformation scenario \(on page 1129\)](#) or [edit an existing one \(on page 1237\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **XProc** tab contains the following options:

XProc URL

Specify the source XProc file to be used by the transformation. You can specify the path by using the text field, its history drop-down, the  [Insert Editor Variables \(on page 289\)](#) button, or the browsing actions in the  **Browse** drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Processor

Allows you to select the XProc engine to be used for the transformation. You can select the *Add-on for Calabash XProc engine* or a custom engine that is [configured in the XProc Preferences page \(on page 212\)](#).

Inputs Tab (XProc Transformations)

When you [create a new transformation scenario \(on page 1129\)](#) or [edit an existing one \(on page 1237\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Inputs** tab contains a list with the ports that the XProc script uses to read input data. Use the **Filter** text box to search for a specific term in the entire ports collection.

Each input port has an assigned name in the XProc script. The XProc engine reads data from the URL specified in the **URL** column.

The following actions are available for managing the input ports:

New

Opens an **Edit** dialog box that allows you to add a new port and its URL. The [built-in editor variables \(on page 289\)](#) and [custom editor variables \(on page 297\)](#) can be used to specify the URL.

Edit

Opens an **Edit** dialog box that allows you to modify the selected port and its URL. The [built-in editor variables \(on page 289\)](#) and [custom editor variables \(on page 297\)](#) can be used to specify the URL.

Delete

Removes the selected port from the list. It is available only for new ports that have been added to the list.

Parameters Tab (XProc Transformations)

When you [create a new transformation scenario \(on page 1129\)](#) or [edit an existing one \(on page 1237\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Parameters** tab presents a list of ports and parameters collected from the XProc script. The tab is divided into three sections:

List of Ports

In this section, you can use the **New** and **Delete** buttons to add or remove ports.

List of Parameters

This section presents a list of parameters for each port and includes columns for the parameter name, namespace URI, and its value. Use the **Filter** text box to search for a specific term in the entire parameters collection. You can use the **New** and **Delete** buttons to add or remove parameters. You can edit the value of each cell in this table by double-clicking the cell. You can also sort the parameters by clicking the column headers.

Editor Variable Information

The [built-in editor variables \(on page 289\)](#) and [custom editor variables \(on page 297\)](#) can be used for specifying the URI. The message pane at the bottom of the dialog box provides more information about the editor variables that can be used.

Outputs Tab (XProc Transformations)

When you [create a new transformation scenario \(on page 1129\)](#) or [edit an existing one \(on page 1237\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Outputs** tab displays a list of output ports (along with the URL) collected from the XProc script. Use the **Filter** text box to search for a specific term in the entire ports collection. You can also sort the columns by clicking the column headers.

The following actions are available for managing the output ports:

New

Opens an **Edit** dialog box that allows you to add a new output port and its URL. An [editor variable \(on page 289\)](#) can be inserted for the URL by using the  **Insert Editor Variables** button. There

is also a **Show in transformation results view** option that allows you to select whether or not the results will be displayed in the output **Results view** (on page 503).

Edit

Opens an **Edit** dialog box that allows you to edit an existing output port and its URL. An [editor variable](#) (on page 289) can be inserted for the URL by using the  **Insert Editor Variables** button. There is also a **Show in transformation results view** option that allows you to select whether or not the results will be displayed in the output **Results view** (on page 503).

Delete

Removes the selected output port from the list. It is available only for new ports that have been added to the list.

Additional options that are available at the bottom of this tab include:

Open in Editor

If this option is selected, the XProc transformation result is automatically opened in an editor panel.

Open in Browser/System Application

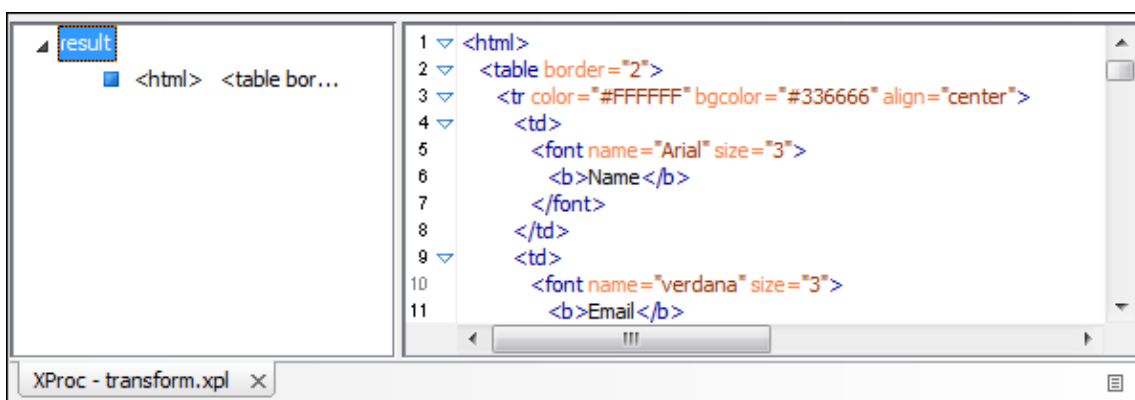

If this option is selected, you can specify a file to be opened at the end of the XProc transformation in the browser or system application that is associated with the file type. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** (on page 289) button, or the browsing actions in the  **Browse** drop-down list.

Results

The result of the XProc transformation can be displayed as a sequence in an output view with two sections:

- A list with the output ports on the left side.
- The content that correspond to the selected output port on the right side.

Figure 378. XProc Transformation Results View

Options Tab (XProc Transformations)

When you [create a new transformation scenario \(on page 1129\)](#) or edit an existing one [\(on page 1237\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Options** tab displays a list of the options collected from the XProc script. The tab is divided into two sections:

List of Options

This section presents a list of options and includes columns for the option name, namespace URI, and its value. Use the **Filter** text box to search for a specific term in the entire options collection. You can use the **New** and **Delete** buttons to add or remove options. You can edit the value of each cell in this table by double-clicking the cell. You can also sort the parameters by clicking the column headers. The names of edited options are displayed in bold.

Editor Variable Information

The [built-in editor variables \(on page 289\)](#) and [custom editor variables \(on page 297\)](#) can be used for specifying the URI. This section provides more information about the editor variables that can be used.

Calabash XProc Processor for Generating PDF Output

To generate PDF output from your XProc pipeline (when using the Calabash XProc processor), follow these steps:

1. Open the `[OXYGEN_INSTALL_DIR]/lib/xproc/calabash/engine.xml` file.
2. Uncomment the `<system-property name="com.xmlcalabash.fo-processor" value="com.xmlcalabash.util.FoXEP"/>` system property.
3. Uncomment the `<system-property name="com.renderx.xep.CONFIG" file="../../tools/xep/xep.xml"/>` system property. Edit the `@file` attribute to point to the configuration file that is usually located in the XEP installation folder.
4. Uncomment the references to the XEP libraries. Edit them to point to the matching library names from the XEP installation directory.
5. Restart Oxygen XML Developer.

Integrating an External XProc Engine

Oxygen XML Developer includes a bundled version of the *Calabash* XProc engine that can be used for XProc transformations and validation, but you can also integrate other external XProc engines. When you edit an XProc transformation scenario, there is a **Processor** drop-down menu where you can select the XProc engine to be used for the transformation.

If you do not need the external XProc engine to be used for automatic validation or pass parameters/ports and it is not Java-based, you can simply add the external engine by using the [XProc preferences page \(on page](#)

212). Otherwise, if the external engine is Java-based, or it has validation support, or it can receive parameters or ports passed from the transformation, you need to integrate it using the plugin extension procedure below.

For example, there is a public project on GitHub that is an implementation for integrating *Morgana XProc* with Oxygen XML Developer: <https://github.com/xml-project/support-for-xmleditor>. Also, the Javadoc documentation of the XProc API is available for download from the application website as a zip file: [xprocAPI.zip](#).

To create an XProc integration project, follow these steps:

1. Move the `oxygen.jar` file from `[OXYGEN_INSTALL_DIR]/lib` to the `lib` folder of your project.
2. Implement the `ro.sync.xml.transformer.xproc.api.XProcTransformerInterface` interface.
3. Create a *Java archive (JAR)* (on page 2270) from the classes you created.
4. Create an `engine.xml` file according to the `engine.dtd` file. The attributes of the `<engine>` element are as follows:
 - a. **name** - The name of the XProc engine.
 - b. **description** - A short description of the XProc engine.
 - c. **class** - The complete name of the class that implements `ro.sync.xml.transformer.xproc.api.XProcTransformerInterface`.
 - d. **version** - The version of the integration.
 - e. **engineVersion** - The version of the integrated engine.
 - f. **vendor** - The name of the vendor / implementer.
 - g. **supportsValidation** - **true** if the engine supports validation (otherwise, **false**).

The `<engine>` element has only one child, `<runtime>`. The `<runtime>` element contains several `<library>` elements with the `@name` attribute containing the relative or absolute location of the libraries necessary to run this integration.

5. Create a new folder (for example, named `MyXprocEngine`) and place the `engine.xml` and all the libraries necessary to run the new integration in that folder.
6. Place that new folder (e.g. `MyXprocEngine`) inside a new plugin folder. This new plugin folder should also contain a `plugin.xml` file that points to the new engine folder (e.g. `MyXprocEngine`).

The `plugin.xml` file would look like this (it is based on the [AdditionalXProcEngine](#) extension (on page 1875)):

```
<plugin
  id="morgana.xproc.addon"
  name="Contribute Morgana XProc"
  description="Contribute Morgana XProc"
  version="1.0"
  vendor="Syncro Soft"
  class="ro.sync.exml.plugin.Plugin"
  classLoaderType="preferReferencedResources">
  <extension type="AdditionalXProcEngine" path="MyXprocEngine/"></extension>
</plugin>
```

Related Information:[Editing XProc Scripts \(on page 974\)](#)[Creating an XProc Transformation Scenario \(on page 1214\)](#)[Additional XProc Engine Plugin Extension \(on page 1875\)](#)

XQuery Transformation on XML

This type of transformation specifies the parameters and location of an XML source that the edited XQuery file is applied on.

**Note:**

When the XML source is a native XML database, the source field of the scenario is empty because the XML data is read with XQuery-specific functions, such as `document()`. When the XML source is a local XML file, the URL of the file is specified in the input field of the scenario.

To create an **XQuery transformation on XML** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on macOS))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XQuery transformation on XML**.
- Go to **Window > Show View** and select  **Transformation Scenarios** to display [this view \(on page 1246\)](#). Click the  **New Scenario** drop-down menu button and select **XQuery transformation on XML**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options (on page 2272)** - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options (on page 2269)** - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XQuery Tab

When you [create a new transformation scenario \(on page 1129\)](#) or [edit an existing one \(on page 1237\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **XQuery** tab contains the following options:

XML URL

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** ([on page 289](#)) button, or the browsing actions in the  **Browse** drop-down list. You can also use the  **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

Note:

If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the [advanced Saxon preferences page](#) ([on page 218](#)), the XML input of the transformation is passed to that URI resolver.

XQuery URL

Specifies the source XQuery file to be used for the transformation. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** ([on page 289](#)) button, or the browsing actions in the  **Browse** drop-down list. You can also use the  **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Developer for performing a transformation. These include the built-in engines and [the external engines defined in the Custom Engines preferences page](#) ([on page 228](#)). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

Advanced options

Allows you to configure the [advanced options of the Saxon HE/PE/EE engine](#) ([on page 1149](#)) for the current transformation scenario. To configure the same options globally, go to the [Saxon-HE/PE/EE preferences page](#) ([on page 215](#)). For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

Parameters

Opens the **Configure parameters** dialog box ([on page 1148](#)) for configuring the XQuery parameters. You can use the buttons in this dialog box to add, edit, or remove parameters. If the XQuery transformation engine is custom-defined, you can not use this dialog box to set parameters. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XQuery engine to include the necessary parameters in the command line that starts the transformation process.

Extensions

Opens a [dialog box for configuring the XQuery extension JARS or classes \(on page 1149\)](#) that define extension Java functions or extension XSLT elements used in the transformation.

XQuery Parameters

The global parameters of the XQuery file used in a transformation scenario can be configured by using the **Parameters** button in the **XQuery** tab.

The resulting dialog box includes a table that displays all the parameters of the current XQuery file, along with their descriptions and current values. You can also add, edit, and remove parameters, and use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is selected, the parameter value is evaluated as an XPath expression before starting the XQuery transformation.

Example:

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@atr='val']
```

Note:

1. The **doc** function solves the argument relative to the XQuery file location. You can use full paths or [editor variables \(on page 289\)](#) (such as **\${cfdu}** [current file directory]) to specify other locations: `doc('${cfdu}/test.xml')//*`
2. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An [editor variable \(on page 289\)](#) can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Edit

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An [editor variable \(on page 289\)](#) can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

Related Information:

[Editor Variables \(on page 289\)](#)

XQuery Extensions

The **Extensions** button is used to specify the *JAR (on page 2270)* and classes that contain extension functions called from the XQuery file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

An extension function called from the XQuery file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and click the **↑ Move up** or **↓ Move down** buttons.

Advanced Saxon HE/PE/EE XQuery Transformation Options

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the [Saxon HE/PE/EE preferences page \(on page 223\)](#) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the [global options \(on page 2269\)](#) defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 12.5 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Use a configuration file ("-config")

Sets a Saxon 12.5 configuration file that is used for XQuery transformation and validation scenarios.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Use linked tree model ("**-tree:linked**")

This option activates the linked tree model.

Strip whitespaces ("**-strip**")

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

Enable profiling ("**-TP**")

If selected, profiling of the execution time in a query is enabled. The corresponding text field is used to specify the path to the output file where the profiling information will be saved. As long as the option is selected, and the output file specified, it will gather timed tracing information and create a profile report to the specified file.

Note:

The profiling support works only if the **Present as a sequence transformation option** ([on page 1152](#)) is not set.

Saxon-PE/EE Options

The following advanced options are specific for Saxon 12.5 Professional Edition (PE) and Enterprise Edition (EE) only:

Allow calls on extension functions ("**-ext**")

If selected, calls on external functions are allowed. Selecting this option is not recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

Saxon-EE Options

The advanced options that are specific for Saxon 12.5 Enterprise Edition (EE) are as follows:

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable XQuery update ("-update:(on|off)")

This option controls whether or not XQuery update syntax is accepted. The default value is off.

Backup files updated by XQuery ("-backup:(on|off)")

If selected, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the **Enable XQuery update** option is selected.

Other Options

Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

FO Processor Tab (XQuery Transformations)

When you [create a new transformation scenario \(on page 1129\)](#) or [edit an existing one \(on page 1237\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

Perform FO Processing

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

Input

Choose between the following options to specify which input file to use:

- **XQuery result as input** - The FO processor is applied to the result of the XQuery transformation that is defined in the **XQuery** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

Method

The output format of the FO processing. The available options depend on the selected processor type.

Processor

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an [external processor \(on page 229\)](#).

Output Tab (XQuery Transformations)

When you [create a new transformation scenario \(on page 1129\)](#) or [edit an existing one \(on page 1237\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Present as a sequence

Selecting this option will reduce the time necessary to fetch the full results, as it will only fetch the first chunk of the results.

Prompt for file

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the  **Insert Editor Variables** [\(on page 289\)](#) button, or the  **Browse** button.

Open in Browser/System Application

If selected, Oxygen XML Developer automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

**Note:**

To set the web browser that is used for displaying HTML/XHTML pages, go to **Options > Preferences > Global**, and set it in the **Default Internet browser** field.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the  **Insert Editor Variables** (*on page 289*) button, or the  **Browse** button.

Open in editor

When this option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Developer displays the transformation result in an XML viewer panel at the bottom of the application window with [syntax highlighting \(on page 193\)](#).
- **SVG** - If this is selected, Oxygen XML Developer displays the transformation result in an [integrated SVG viewer in the Results panel \(on page 1037\)](#) at the bottom of the application window and renders the result as an SVG image.
- **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Developer displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

**Important:**

When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

- **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the  **Insert Editor Variables** ([on page 289](#)) button, or the  **Browse** button.

XQuery Transformation on JSON

This type of transformation specifies the parameters and location of a JSON document that the edited XQuery file is applied on. This scenario is useful when you develop an XQuery file and the JSON document is in its final form.

To create an **XQuery transformation on JSON** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s)** (**Ctrl + Shift + C** (**Command + Shift + C on macOS**)) action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XQuery transformation on JSON**.
- Go to **Window > Show View** and select  **Transformation Scenarios** to display [this view \(on page 1246\)](#). Click the  **New Scenario** drop-down menu button and select **XQuery transformation on JSON**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options** ([on page 2272](#)) - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** ([on page 2269](#)) - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XQuery Tab (JSON Transformations)

When you [create a new transformation scenario \(on page 1129\)](#) or [edit an existing one \(on page 1237\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **XQuery** tab contains the following options:

JSON URL

Specifies the source JSON file. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** ([on page 289](#)) button, or the browsing actions in

the  **Browse** drop-down list. You can also use the  **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

XQuery URL

Specifies the source XQuery file to be used for the transformation. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** ([on page 289](#)) button, or the browsing actions in the  **Browse** drop-down list. You can also use the  **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Developer for performing a transformation. These include the built-in engines and [the external engines defined in the Custom Engines preferences page \(on page 228\)](#). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

Advanced options

Allows you to configure the [advanced options of the Saxon HE/PE/EE engine \(on page 1149\)](#) for the current transformation scenario. To configure the same options globally, go to the [Saxon-HE/PE/EE preferences page \(on page 215\)](#). For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

Parameters

Opens the [Configure parameters dialog box \(on page 1148\)](#) for configuring the XQuery parameters. You can use the buttons in this dialog box to add, edit, or remove parameters. If the XQuery transformation engine is custom-defined, you can not use this dialog box to set parameters. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XQuery engine to include the necessary parameters in the command line that starts the transformation process.

Extensions

Opens a [dialog box for configuring the XQuery extension JARS or classes \(on page 1149\)](#) that define extension Java functions or extension XSLT elements used in the transformation.

XQuery Parameters

The global parameters of the XQuery file used in a transformation scenario can be configured by using the **Parameters** button in the **XQuery** tab.

The resulting dialog box includes a table that displays all the parameters of the current XQuery file, along with their descriptions and current values. You can also add, edit, and remove parameters, and use the **Filter** text

box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is selected, the parameter value is evaluated as an XPath expression before starting the XQuery transformation.

Example:

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@atr='val']
```

Note:

1. The **doc** function solves the argument relative to the XQuery file location. You can use full paths or [editor variables \(on page 289\)](#) (such as **#{cfdu}** [current file directory]) to specify other locations: `doc('${cfdu}/test.xml')//*`
2. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An [editor variable \(on page 289\)](#) can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Edit

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An [editor variable \(on page 289\)](#) can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

Related Information:

[Editor Variables \(on page 289\)](#)

XQuery Extensions

The **Extensions** button is used to specify the *JAR (on page 2270)* and classes that contain extension functions called from the XQuery file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

An extension function called from the XQuery file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and click the **↑ Move up** or **↓ Move down** buttons.

Advanced Saxon HE/PE/EE XQuery Transformation Options

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the [Saxon HE/PE/EE preferences page \(on page 223\)](#) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the [global options \(on page 2269\)](#) defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 12.5 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Use a configuration file ("-config")

Sets a Saxon 12.5 configuration file that is used for XQuery transformation and validation scenarios.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Use linked tree model ("-tree:linked")

This option activates the linked tree model.

Strip whitespaces ("-strip")

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

Enable profiling ("-TP")

If selected, profiling of the execution time in a query is enabled. The corresponding text field is used to specify the path to the output file where the profiling information will be saved. As long as the option is selected, and the output file specified, it will gather timed tracing information and create a profile report to the specified file.

Note:

The profiling support works only if the **Present as a sequence** transformation option ([on page 1152](#)) is not set.

Saxon-PE/EE Options

The following advanced options are specific for Saxon 12.5 Professional Edition (PE) and Enterprise Edition (EE) only:

Allow calls on extension functions ("-ext")

If selected, calls on external functions are allowed. Selecting this option is not recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

Saxon-EE Options

The advanced options that are specific for Saxon 12.5 Enterprise Edition (EE) are as follows:

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable XQuery update ("-update:(on|off)")

This option controls whether or not XQuery update syntax is accepted. The default value is off.

Backup files updated by XQuery ("-backup:(on|off)")

If selected, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the **Enable XQuery update** option is selected.

Other Options

Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

FO Processor Tab (XQuery Transformations)

When you [create a new transformation scenario \(on page 1129\)](#) or [edit an existing one \(on page 1237\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

Perform FO Processing

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

Input

Choose between the following options to specify which input file to use:

- **XQuery result as input** - The FO processor is applied to the result of the XQuery transformation that is defined in the **XQuery** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

Method

The output format of the FO processing. The available options depend on the selected processor type.

Processor

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an [external processor \(on page 229\)](#).

Output Tab (XQuery Transformations)

When you [create a new transformation scenario \(on page 1129\)](#) or [edit an existing one \(on page 1237\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Present as a sequence

Selecting this option will reduce the time necessary to fetch the full results, as it will only fetch the first chunk of the results.

Prompt for file

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the  **Insert Editor Variables** [\(on page 289\)](#) button, or the  **Browse** button.

Open in Browser/System Application

If selected, Oxygen XML Developer automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

**Note:**

To set the web browser that is used for displaying HTML/XHTML pages, go to **Options > Preferences > Global**, and set it in the **Default Internet browser** field.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the  **Insert Editor Variables** (*on page 289*) button, or the  **Browse** button.

Open in editor

When this option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Developer displays the transformation result in an XML viewer panel at the bottom of the application window with [syntax highlighting](#) (*on page 193*).
- **SVG** - If this is selected, Oxygen XML Developer displays the transformation result in an [integrated SVG viewer in the Results panel](#) (*on page 1037*) at the bottom of the application window and renders the result as an SVG image.
- **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Developer displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

**Important:**

When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

- **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 289) button, or the  **Browse** button.

SQL Transformation

This type of transformation specifies a database connection for the database server that runs the SQL file associated with the scenario. The data processed by the SQL script is located in the database.

To create an **SQL transformation** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on macOS))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **SQL transformation**.
- Go to **Window > Show View** and select  **Transformation Scenarios** to display [this view \(on page 1246\)](#). Click the  **New Scenario** drop-down menu button and select **SQL transformation**.

Both methods open the **New Scenario** dialog box. This dialog box allows you to configure the following options that control the transformation:

Name

The unique name of the SQL transformation scenario.

Storage

Allows you to select one of the following storage options:

- **Project Options** (on page 2272) - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** (on page 2269) - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

SQL URL

Allows you to specify the URL of the SQL script. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** (on page 289) button, or the browsing actions in the  **Browse** drop-down list. You can also use the  **Open in editor** button to open the specified file in the editor panel.

Connection

Allows you to select a connection from a drop-down list. To configure a connection, use the  **Advanced options** button to open the **Data Source preferences page** (on page 242).

Parameters

Allows you to add or configure parameters for the transformation.

Editing a Transformation Scenario

Editing a transformation scenario is useful if you need to configure some of its parameters.

Note:

Since transformation scenarios that are associated with built-in *frameworks* (on page 2269) are read-only, to edit one of these scenarios you will need to [duplicate it and edit the duplicated scenario](#) (on page 1239).

To configure an existing transformation scenario, follow these steps:

1. Select the **Configure Transformation Scenario(s)** (**Ctrl + Shift + C** (**Command + Shift + C** on **macOS**)) action from the toolbar or the **Document > Transformation** menu.

Step Result: The **Configure Transformation Scenario(s)** dialog box (on page 1240) is opened.

2. Select the particular transformation scenario and click the **Edit** button at the bottom of the dialog box or from the contextual menu.

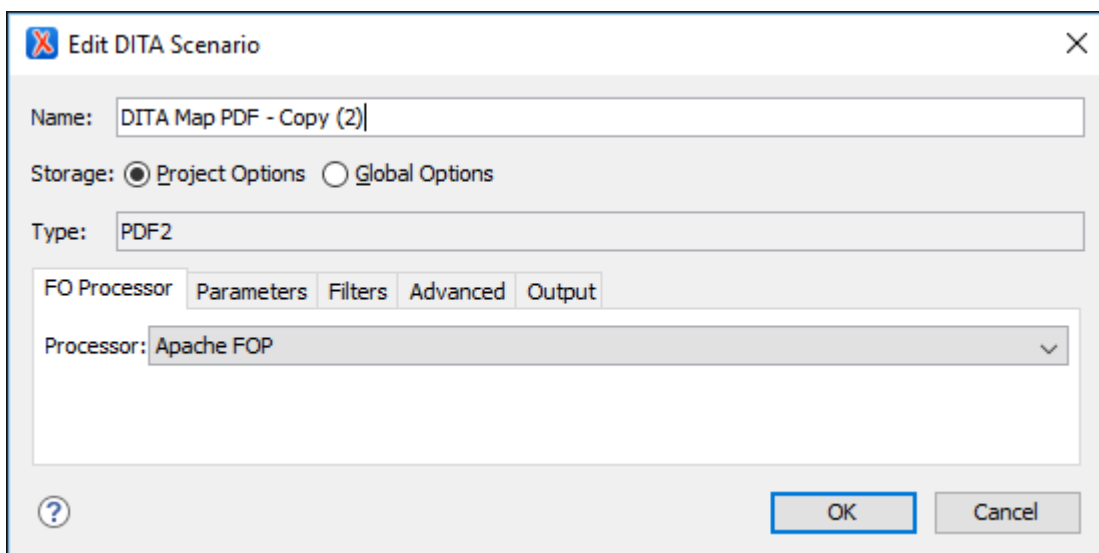

Tip:

You could also select the scenario and the **Edit** button in the **Transformation Scenarios** view (on page 1246) to achieve the same result.

Result: This will open an **Edit scenario** configuration dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected.

Figure 379. Edit Scenarios Configuration Dialog Box

Transformation Types

The **Configure Transformation Scenario(s)** dialog box (*on page 1240*) contains a **Type** column that shows you the transformation type for each of the listed scenarios. Each type of transformation contains some tabs with various configuration options.

The following is a list of the transformation types and their particular tabs (click the name of each tab below to see details about all the options that are available):

- **DITA-OT** - This type of transformation includes configurable options in the following tabs:
 - Templates Tab (*on page*)
 - FO Processor Tab (*on page*) (Available for PDF output)
 - Parameters Tab (*on page*)
 - Filters Tab (*on page*)
 - Advanced Tab (*on page*)
 - Output Tab (*on page*)
- **ANT** - This type of transformation includes configurable options in the following tabs:
 - Options Tab (*on page 1170*)
 - Parameters Tab (*on page 1172*)
 - Output Tab (*on page 1173*)
- **XSLT** - This type of transformation includes configurable options in the following tabs:
 - XSLT Tab (*on page 1130*)
 - FO Processor Tab (*on page 1139*)
 - Output Tab (*on page 1140*)
- **XProc** - This type of transformation includes configurable options in the following tabs:
 - XProc Tab (*on page 1215*)
 - Inputs Tab (*on page 1215*)
 - Parameters Tab (*on page 1216*)
 - Outputs Tab (*on page 1216*)
 - Options Tab (*on page 1218*)
- **XQuery** - This type of transformation includes configurable options in the following tabs:
 - XQuery Tab (*on page 1146*)
 - FO Processor Tab (*on page 1151*)
 - Output Tab (*on page 1152*)

Related Information:

[Creating New Transformation Scenarios \(*on page 1129*\)](#)

[Duplicating a Transformation Scenario \(*on page 1239*\)](#)

[Configure Transformation Scenario\(s\) Dialog Box \(*on page 1240*\)](#)

[Applying Associated Transformation Scenarios \(*on page 1239*\)](#)

Duplicating a Transformation Scenario

Duplicating a transformation scenario is useful for creating a scenario that is similar to an existing one or to edit a built-in transformation scenario.

To configure an existing transformation scenario, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** (**Ctrl + Shift + C** (**Command + Shift + C on macOS**)) action from the toolbar or the **Document > Transformation** menu.

Step Result: The **Configure Transformation Scenario(s)** dialog box (*on page 1240*) is opened.

2. Select the particular transformation scenario and click the **Duplicate** button at the bottom of the dialog box or from the contextual menu.

Tip:

You could also select the scenario and the  **Duplicate** button in the **Transformation Scenarios** view (*on page 1246*) to achieve the same result.

Result: This will open an **Edit scenario** configuration dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected. For information about all the specific options in the various tabs, see the [Transformation Types section](#) (*on page 1238*).

Related Information:

[Creating New Transformation Scenarios](#) (*on page 1129*)

[Editing a Transformation Scenario](#) (*on page 1237*)

Applying Associated Transformation Scenarios

If you have associated transformation scenarios for the current document (in the **Configure Transformation Scenario(s)** dialog box (*on page 1240*) or **Transformation Scenarios** view (*on page 1246*)), Oxygen XML Developer included an  **Apply Transformation Scenario(s)** action that allows you to quickly apply the associated transformation scenarios on the current document. Note that if an association is not detected, this action will open the **Configure Transformation Scenario(s)** dialog box (*on page 1240*) where you can choose the scenarios you want to apply.

The  **Apply Transformation Scenario(s)** action can be initiated from any of the following methods:

- Use the **Ctrl + Shift + T** (**Command + Shift + T on macOS**) keyboard shortcut.
- Click the  **Apply Transformation Scenario(s)** button on the main toolbar.
- Click the  **Apply Transformation Scenario(s)** button on the toolbar in the **Transformation Scenarios** view (*on page 1246*).

- Right-click a file in the **Project view** (on page 365) and select **Transform > Apply Transformation Scenario(s)**.
- Use the **Apply Associated** button in the **Configure Transformation Scenario(s)** dialog box (on page 1240).

Related Information:

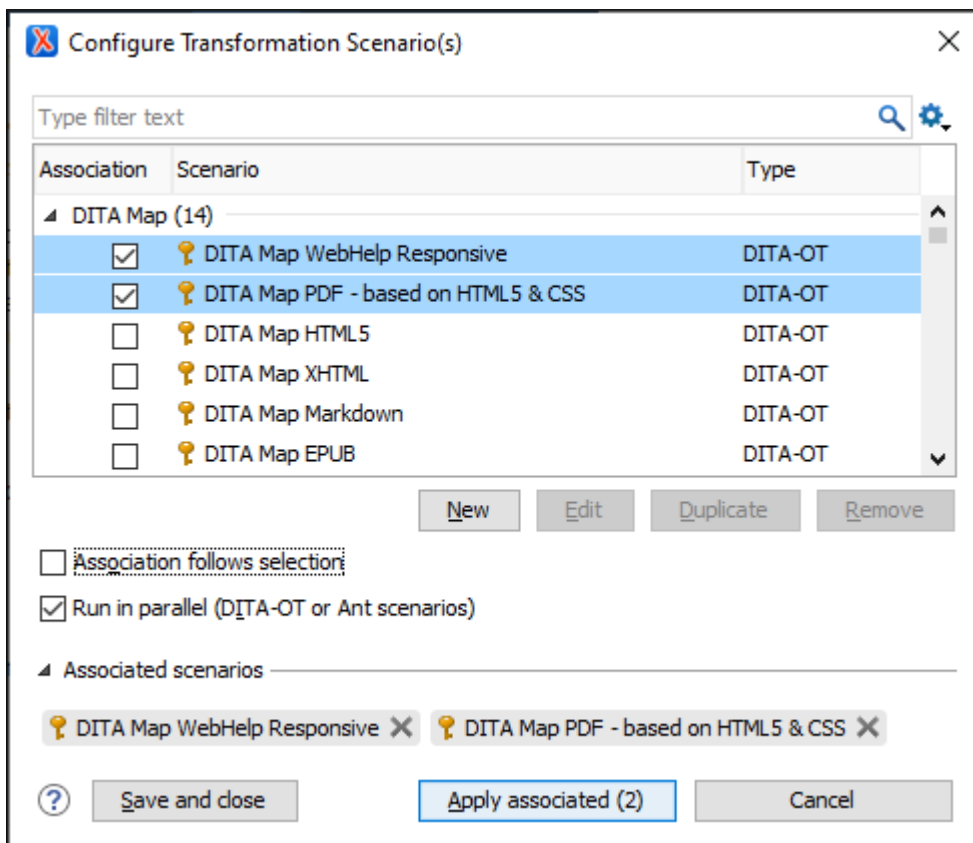

- [Creating New Transformation Scenarios \(on page 1129\)](#)
- [Editing a Transformation Scenario \(on page 1237\)](#)
- [Configure Transformation Scenario\(s\) Dialog Box \(on page 1240\)](#)
- [Transformation Scenarios View \(on page 1246\)](#)

Configure Transformation Scenario(s) Dialog Box

You can use the **Configure Transformation Scenarios(s)** dialog box for editing existing transformation scenarios (on page 1237) or creating new ones (on page 1129).

To open this dialog box, use the **Configure Transformation Scenario(s)** (Ctrl + Shift + C (Command + Shift + C on macOS)) action from the toolbar or the **Document > Transformation** menu.

Figure 380. Configure Transformation Scenario(s) Dialog Box

The dialog box includes the following options and features:

Search Filter Field

You can begin typing text in the search field at the top of the dialog box to filter the scenarios shown in the table below this field.

Settings

Use this drop-down to access the following options:

Show all scenarios

Select this option to display all the available scenarios, regardless of the document they are associated with.

Show only the scenarios available for the editor

Select this option to only display the scenarios that Oxygen XML Developer can apply for the current document type.

Show associated scenarios

Select this option to only display the scenarios associated with the document you are editing.

Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the `scenarios` file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Developer ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

Note:

When you keep both scenarios, Oxygen XML Developer adds `imported` to the name of the imported scenario.

Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Developer creates a `scenarios` file that contains the exported scenarios. This is useful if you want to share scenarios with others or export them to another computer.

Scenarios Table Section

The middle section of the dialog box is a table that displays the scenarios that you can apply to the current document. You can view both the scenarios associated with the current document type and the scenarios defined at [project level \(on page 2272\)](#). The table includes following sortable columns:

- **Association** - The checkboxes in this column mark whether or not a transformation scenario is associated with the current document.
- **Scenario** - This column presents the names of the transformation scenarios.
- **Type** - If the **Show Type** contextual menu option is selected, this column displays the type of the transformation scenario. For further details about the types of transformation scenarios that are available in Oxygen XML Developer, see the [Transformation Types section \(on page 1238\)](#).

If you right-click in the header area, the following options are accessible:

Show Type

Use this option to display the transformation type of each scenario.

Show Storage

Use this option to display the storage location of the scenarios.

Group by Association

Select this option to group the scenarios depending on whether or not they are associated with the current document.

Group by Type

Select this option to group the scenarios by their type.

Group by Storage

Select this option to group the scenarios by their storage location.

Ungroup all

Select this option to ungroup all the scenarios.

Reset Layout

Select this option to restore the default settings of the layout.

If you right-click any particular transformation scenario, the following actions are accessible:

Edit

This button opens the **Edit Scenario configuration dialog box (on page 1237)** that allows you to configure the options of the transformations scenario.

Duplicate

Use this button to create a **duplicate transformation scenario (on page 1239)**.

Remove

Use this button to remove custom transformation scenarios.

Change storage

Allows you to change the storage location of a transformation scenario to **Project Options** (*on page 2272*) or **Global Options** (*on page 2269*). You are also able to keep the original storage location and make a copy of the selected scenario in the new storage location.

Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the **scenarios** file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Developer ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

Note:

When you keep both scenarios, Oxygen XML Developer adds **imported** to the name of the imported scenario.

Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Developer creates a **scenarios** file that contains the exported scenarios. This is useful if you want to share scenarios with others or export them to another computer.

Bottom Section

The bottom section of the dialog box contains the following actions and options:

New

This button allows you to [create a new transformation scenario \(on page 1129\)](#).

Edit

This button opens the **Edit Scenario** dialog box that allows you to configure the options of the transformations scenario. For information about all the specific options in the various tabs, see the [Transformation Types section \(on page 1238\)](#).

Note:

If you try to edit a transformation scenario associated with a defined document type, Oxygen XML Developer displays a warning message to inform you that this is not possible and gives you the option to create a [duplicate transformation scenario \(on page 1239\)](#) to edit instead.

Duplicate

Use this button to create a [duplicate transformation scenario \(on page 1239\)](#).

Remove

Use this button to remove transformation scenarios.

Note:

Removing scenarios associated with a defined document type is not allowed.

Association follows selection

Select this checkbox to automatically associate selected transformation scenarios with the current document. This option can also be used for multiple selections.

Note:

When this option is selected, the **Association** column is hidden.

Run in parallel (DITA-OT or Ant scenarios)

This option is available if you select multiple DITA-OT or Ant type scenarios. Selecting this option results in the transformations being done in parallel, instead of sequentially. It should help to reduce the amount of time it takes for the publishing to finish when transforming large projects.

Attention:

If multiple selected DITA-OT scenarios have the same output or temporary files folder, this option is not available since the process would need to read and write content to the same folder in this case.

Associated scenarios section

Displays the scenarios that are associated with the current document. Selecting a checkbox in the **Association** column in the list of scenarios will add that scenario to this section. To remove a scenario from being associated with the current document, simply click the remove icon () to the right of the scenario name.

Save and close

Saves the current configuration and closes the dialog box.

Apply associated

Use this button to apply the associated scenarios and run the transformation on the current document.

Cancel

Cancels any changes made in the dialog box and reverts to the previously saved association.

**Tip:**

Your selections in the **Configure Transformation Scenario(s)** dialog box are persistent so the configured associations for the current document will be remembered after the dialog box is closed.

Related Information:

[Editing a Transformation Scenario \(on page 1237\)](#)

[Duplicating a Transformation Scenario \(on page 1239\)](#)

[Sharing Transformation Scenarios \(on page 1246\)](#)

Batch Transformations

A transformation action can be applied on a batch of selected files [from the contextual menu of the Project view \(on page 371\)](#) without having to open the files involved in the transformation. You can apply the same scenario to a batch of files or multiple scenarios to a single file or batch of files.

1. (Optional, but recommended) Organize the files you want to transform in logical folders.
 - a. Create a logical folder in the [Project view \(on page 365\)](#) by using the **New > Logical Folder** action from the contextual menu of the root file.
 - b. Add the files you want to transform to the logical folder by using the  **Add Files** or  **Add Edited File** actions from the contextual menu of the logical folder.

**Note:**

You can skip this step if the files are already in a dedicated folder that does not include any additional files or folders. You can also manually select the individual files in the [Project view \(on page 365\)](#) each time you want to transform them, but this can be tedious.

2. Select the files you want to transform (or the newly created logical folder) and from the contextual menu, select **Transform >  Configure Transformation Scenario(s)** to choose one or more transformation scenarios to be applied on all the files in the logical folder.
3. Use Oxygen XML Developer [editor variables \(on page 289\)](#) to specify the input and output files. This ensures that each file from the selected set of resources is processed and that the output is not overwritten by the subsequent processing.
 - a. Edit the transformation scenario to make sure the appropriate [editor variable \(on page 289\)](#) is assigned for the input file. For example, for a *DocBook PDF transformation*, make sure the **XML URL** input box is set to the ``${currentFileURL}` editor variable [\(on page 295\)](#). For a *DITA PDF transformation*, make sure the `args.input` parameter is set to the ``${cf}` editor variable [\(on page 294\)](#).

- b. Edit the transformation scenario to make sure the appropriate editor variable is assigned for the output file. For example, for an **XML transformation with XSLT**, switch to the **Output** tab and set the path of the output file using a construct of **editor variables** ([on page 289](#)), such as `${cfd}/`
`${cfn}.html`.
4. Now that the logical folder has been associated with one or more transformation scenarios, whenever you want to apply the same batch transformation, you can select **Transform** >  **Transform with** from the contextual menu and the same previously associated scenario(s) will be applied.
5. If you want a different type of transformation to be applied to each file inside the logical folder, associate individual scenarios for each file and select **Transform** >  **Apply Transformation Scenario(s)** from the contextual menu of the logical folder.

Related Information:[Editor Variables](#) ([on page 289](#))

Sharing Transformation Scenarios

The transformation scenarios and their settings can be shared with other users by saving them at [project level](#) ([on page 2272](#)) or by [exporting them to a specialized scenarios file](#) ([on page 288](#)) that can then be imported. When you create a new transformation scenario or edit an existing one, there is a **Storage** option to control whether the scenarios are stored in **Project Options** ([on page 2272](#)) or **Global Options** ([on page 2269](#)).

Storage: Project Options Global Options

Selecting **Project Options** ([on page 2272](#)) stores the scenario in the project file and can be shared with other users that have access to the project. If your project is saved on a source versioning system (CVS, SVN, Source Safe, etc.) then your team will have access to the scenarios that you define. When you create a scenario at the project level, the URLs from the scenario become relative to the project URL.

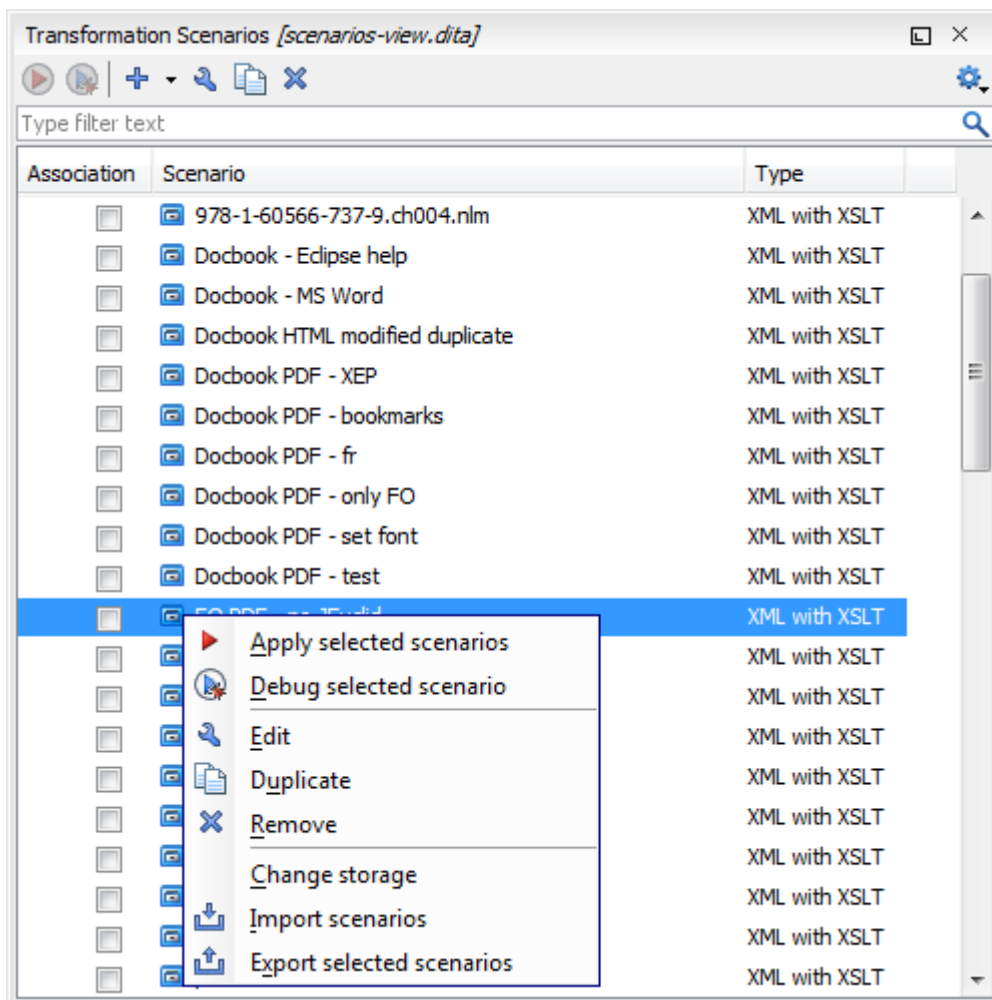

Selecting **Global Options** ([on page 2269](#)) stores the scenario in the global options that are stored in the user home directory.

You can also change the storage options on existing transformation scenarios by using the **Change storage action** ([on page 1240](#)) from the contextual menu of the list of scenarios.

Related Information:[Sharing Application Settings](#) ([on page 278](#))

Transformation Scenarios View

You can manage the transformation scenarios by using the **Transformation Scenarios** view. To open this view, select **Window** > **Show View** > **Transformation Scenarios**.

Figure 381. Transformation Scenarios view

Oxygen XML Developer supports multiple scenarios association. To associate multiple scenarios with a document, select the checkboxes in front of each scenario. You can also associate multiple scenarios with a document from the **Configure Transformation Scenario(s)** dialog box (on page 1240).

The **Transformation Scenarios** view presents both global and *project-level* (on page 2272) scenarios. By default, Oxygen XML Developer presents the items in the following order:

1. Scenarios that match the current *framework* (on page 2269).
2. Scenarios that match the current project.
3. Scenarios that match other *frameworks*.

Toolbar/Contextual Menu Actions and Options

The following actions and options are available on the toolbar or in the contextual menu:

Apply selected scenarios

Select this option to run the current transformation scenario.

Debug selected scenario

Select this option to switch to the **Debugger perspective** ([on page 2271](#)) and initialize it with the parameters from the scenario (the XML, XSLT, or XQuery input, the transformation engine, the XSLT parameters).

New

This drop-down menu contains a list of the [scenarios that you can create](#) ([on page 1129](#)).

Oxygen XML Developer determines the most appropriate scenarios for the current type of file and displays them at the beginning of the list, followed by the rest of the scenarios.

Duplicate

Adds a new scenario to the list that is a duplicate of the current scenario. It is useful for creating a scenario that is similar to an existing one.

Edit

Opens the dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected. For information about all the specific options in the various tabs, see the [Transformation Types section](#) ([on page 1238](#)).

Remove

Removes the current scenario from the list. This action is also available by using the **Delete** key.

Change storage

Use this option to change the storage location of the selected scenario. You are also able to keep the original storage location and make a copy of the selected scenario in the target storage location.

Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the `scenarios` file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Developer ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

Note:

When you keep both scenarios, Oxygen XML Developer adds `imported` to the name of the imported scenario.

Export selected scenarios

Use this option to export transformation and validation scenarios individually. Oxygen XML Developer creates a `scenarios` file that contains the scenarios that you export.

Settings

This drop-down menu allows you to configure the following options (many of these options are also available if you right-click the name of a column):

Show all scenarios

Select this option to display all the available scenarios, regardless of the document they are associated with.

Show only the scenarios available for the editor

Select this option to only display the scenarios that Oxygen XML Developer can apply for the current document type.

Show associated scenarios

Select this option to only display the scenarios associated with the document you are editing.

Change storage

Use this option to change the storage location of the selected scenario to **Project Options** (*on page 2272*) or **Global Options** (*on page 2269*). You are also able to keep the original storage location and make a copy of the selected scenario in the new storage location.

Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the `scenarios` file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Developer ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

Note:

When you keep both scenarios, Oxygen XML Developer adds `imported` to the name of the imported scenario.

Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Developer creates a `scenarios` file that contains the exported scenarios. This is useful if you want to share scenarios with others or export them to another computer.

Show Type

Use this option to display the transformation type of each scenario.

Show Storage

Use this option to display the storage location of the scenarios.

Group by Association

Select this option to group the scenarios depending on whether or not they are associated with the current document.

Group by Type

Select this option to group the scenarios by their type.

Group by Storage

Select this option to group the scenarios by their storage location.

Ungroup all

Select this option to ungroup all the scenarios.

Reset Layout

Select this option to restore the default settings of the layout.

Your selections in the **Transformation Scenarios** view are persistent so the configured associations for the current document will be remembered whenever the document is opened.

WebHelp Responsive Output for DITA

WebHelp Responsive features a very flexible layout, is designed to adapt to any screen size to provide an optimal viewing and interaction experience. It is based upon the *Bootstrap* responsive front-end framework and is available for DITA document types.

WebHelp Responsive output can be generated by using the [DITA Map WebHelp Responsive \(on page 1101\)](#) transformation scenario.

For an in-depth look at WebHelp Responsive features and the publishing process, watch our Webinar: [DITA Publishing and Feedback with Oxygen Tools](#).

Layout and Features

This section contains information about the layout and features of the WebHelp Responsive output.

Layout of the Responsive Page Types

You can select from several different styles of layouts (for example, by default, you can select either a *tiles* or *tree* style of layout). Furthermore, each layout includes a collection of skins that you can choose from, or you can customize your own.

Figure 382. WebHelp Responsive Output on a Normal Screen

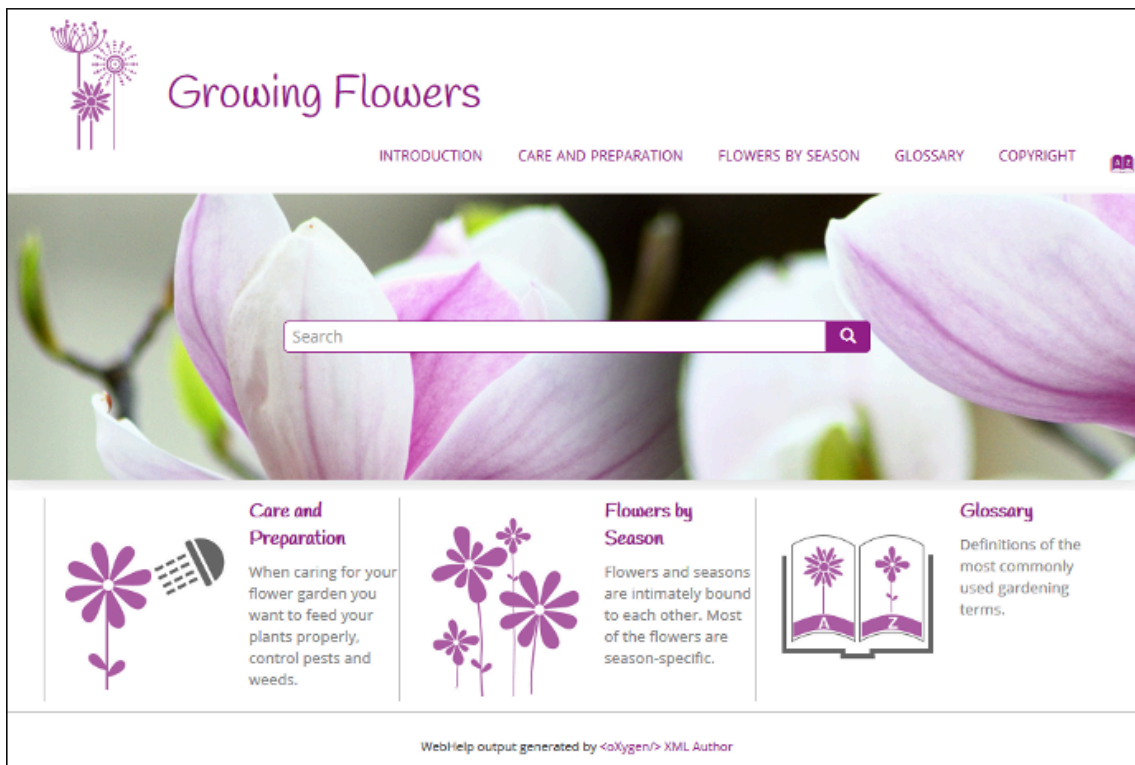

Figure 383. WebHelp Responsive Output on a Narrow Screen

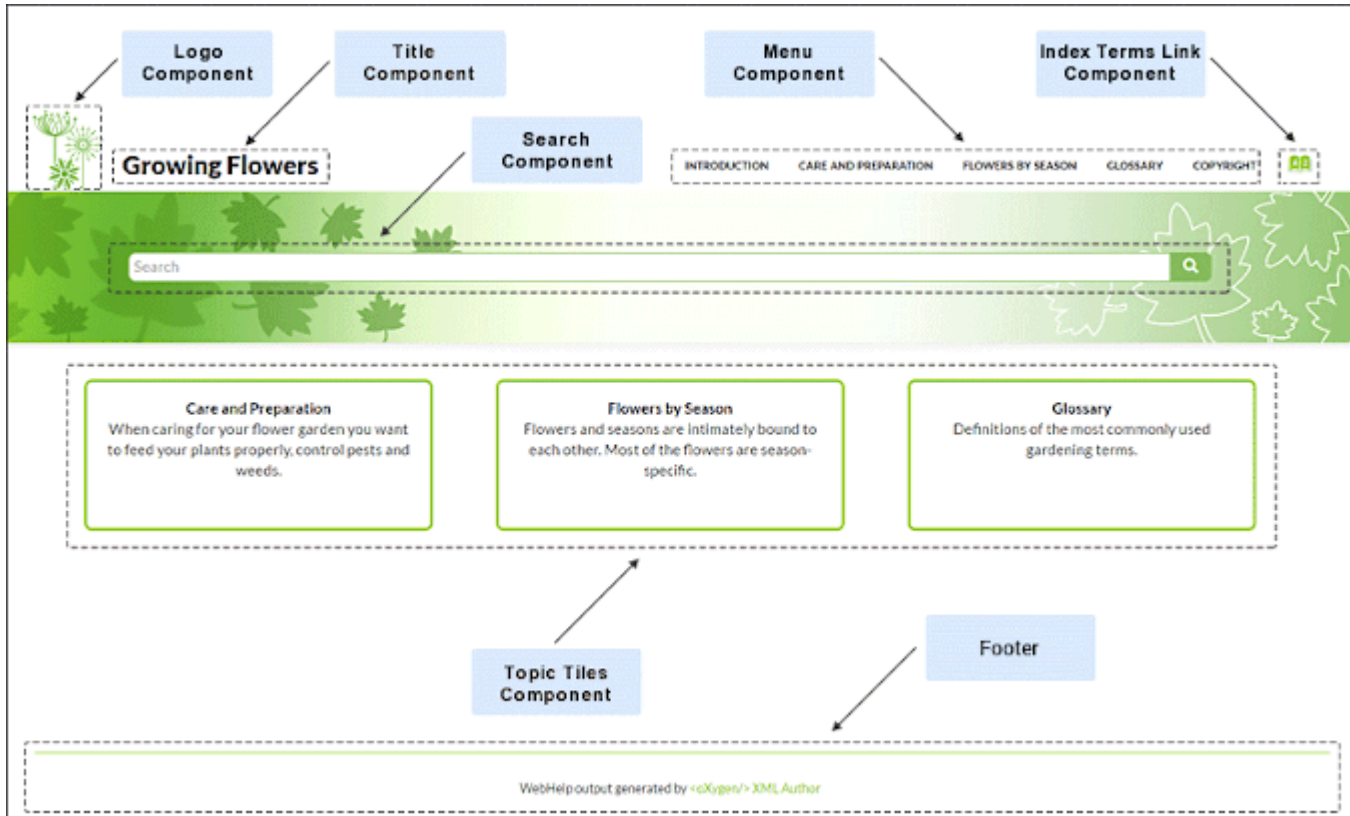

Main Page

The *Main Page* is the home page generated in the WebHelp Responsive output. The main function of the home page is to display top-level information and provide links that help you easily navigate to any of the top-level topics of the publication. These links can be rendered in either a *Tiles* or *Tree* style of layout. The main page also consists of various other components, such as a logo, title, menu, search field, or index link.

Main Page - Tiles Layout

In the *tiles* presentation mode, a tile component is created for each chapter (first-level topic) in the publication. The tile presents a link to the topic and its short description.

Figure 384. Main Page - Tiles Layout

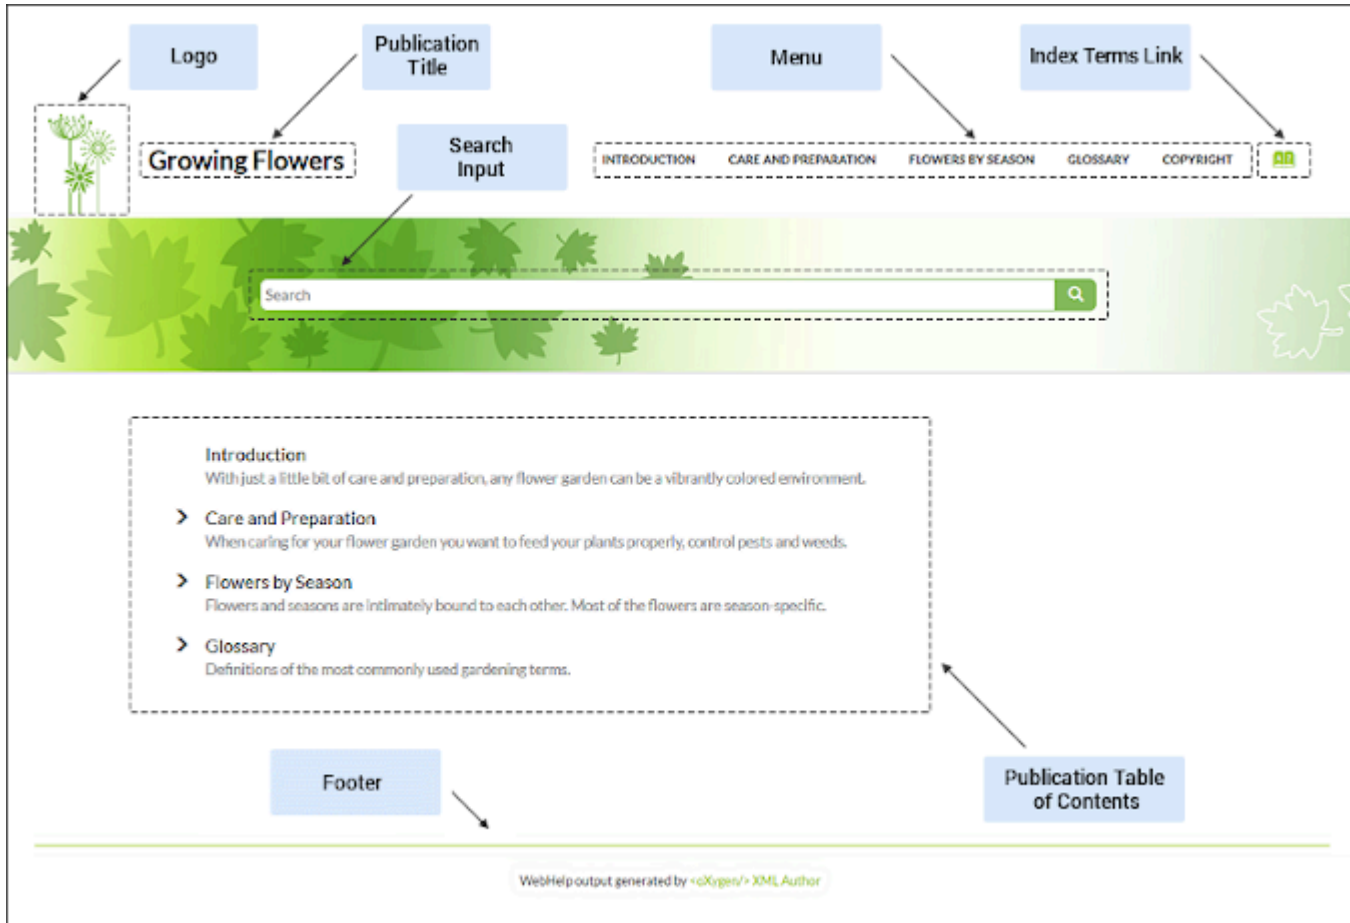

1. Logo Component (on page 1254)
2. Title Component (on page 1254)
3. Search Input Component (on page 1255)
4. Menu Component (on page 1255)
5. Index Terms Link Component (on page 1255)
6. Topic Tiles Component (on page 1255)
7. Footer Component (on page 1255)

Main Page - Tree Layout

In the *tree* presentation mode, links to the first and second level topics in the publication are displayed using a tree-like component.

Figure 385. Main Page - Tree Layout

1. Logo Component (on page 1254)
2. Title Component (on page 1254)
3. Search Input Component (on page 1255)
4. Menu Component (on page 1255)
5. Index Terms Link Component (on page 1255)
6. Table of Contents Component (on page 1255)
7. Footer Component (on page 1255)

Main Page Components

The layout components displayed in the main page are:

Publication Title

The title of the publication. It is usually taken from the DITA map title.

Logo

Displays a logo associated with the publication. Additionally, you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the [webhelp.logo.image](#) transformation parameter ([on page 1434](#)). For the target URL, use the [webhelp.logo.image.target.url](#) parameter ([on page 1434](#)).

Menu

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see [How to Customize the Menu](#) ([on page 1358](#)) topic.

Index Terms Link

Presents a link to the index terms page. You can control if this component is displayed by using the [webhelp.show.indexterms.link](#) parameter ([on page 1443](#)).

Search Input

An input text field where you can enter search queries.

Topic Tiles

A tile associated with a main topic. Each topic tile has three sections that correspond to the topic title, short description, and image.

Topic Tile Title

Presents the navigation title of the associated topic.

Topic Tile Short Description

Presents the [short description](#) of the topic. It may be collected either from the topic or from the DITA map topic meta.

Topic Tile Image

Presents an image associated with the topic. The [image association](#) ([on page 1358](#)) is done in the DITA map.

Tree Table of Contents

An area that contains first and second-level topic titles from your publication.

Page Footer

WebHelp Responsive output footer.

Topic Page

The *Topic Page* is the page generated for each DITA topic in the WebHelp Responsive output. The HTML pages produced for each topic consist of the topic content along with various other additional components, such as a title, menu, navigation breadcrumb, print icon, or side table of contents.

Figure 386. Topic Page

1. Logo Component (on page 1257)
2. Title Component (on page 1256)
3. Search Input Component (on page 1257)
4. Menu Component (on page 1257)
5. Index Terms Link Component (on page 1257)
6. Expand/Collapse All Sections Component (on page 1257)
7. Navigation Links Component (on page 1257)
8. Print Link Component (on page 1257)
9. Breadcrumb Component (on page 1257)
10. Publication Table of Contents Component (on page 1258)
11. Topic Content Component (on page 1257)
12. Topic Table of Contents Component (on page 1258)

Topic Page Components

The layout components displayed in this page are:

Publication Title

The title of the publication. It is usually taken from the DITA map title.

Logo

Displays a logo associated with the publication. Additionally, you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the `webhelp.logo.image` transformation parameter (on page 1434). For the target URL, use the `webhelp.logo.image.target.url` parameter (on page 1434).

Menu

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see [How to Customize the Menu \(on page 1358\)](#) topic.

Index Terms Link

Presents a link to the index terms page. You can control if this component is displayed by using the `webhelp.show.indexterms.link` parameter (on page 1443).

Search Input

An input text field where you can enter search queries.

Navigation Links

The navigation links ([← Previous](#) / [Next →](#) arrows) can be used to navigate to the previous or next topic. These navigation links are controlled by the `collection-type` attribute. For example, if you set `collection-type="sequence"` on a parent topic reference, navigation links will be generated in the output for that topic and all of its child topics. You can also use the `webhelp.default.collection.type.sequence` parameter and set its value to `yes` to generate navigation links for all topics, regardless of whether or not the `collection-type` attribute is present.

Tip:

To hide the navigation links, you can edit the transformation scenario and set the value of the `webhelp.show.navigation.links` parameter to `no`.

Expand/Collapse Sections Button

Icon that expands or collapses sections listed in the side table of contents within a topic.

Print Link

A print icon that opens the print dialog box for your particular browser.

Breadcrumb

Presents the path of the current displayed DITA topic.

Topic Content

Presents the content of the associated DITA topic.

Publication Table of Contents

A Table of Content for the publication displayed in the left side of the screen. You can use the  button to collapse the table of contents (or the  button to expand it).

Topic Table of Contents (*On this page* links)

A table of contents for the topic displayed on the right side with a heading named **On this page** and it contains links to each section within the current topic and the section corresponding to the current scroll position is highlighted. This component is generated for any topic that contains at least two `<section>` elements and each `<section>` must have an `@id` attribute. You can use the  button to collapse the table of contents (or the  button to expand it).

Page Footer

WebHelp Responsive output footer.

Search Results Page

The *Search Page* presents search results in the WebHelp Responsive output. The HTML page consists of a search results component along with various other additional components, such as a title, menu, or index link.

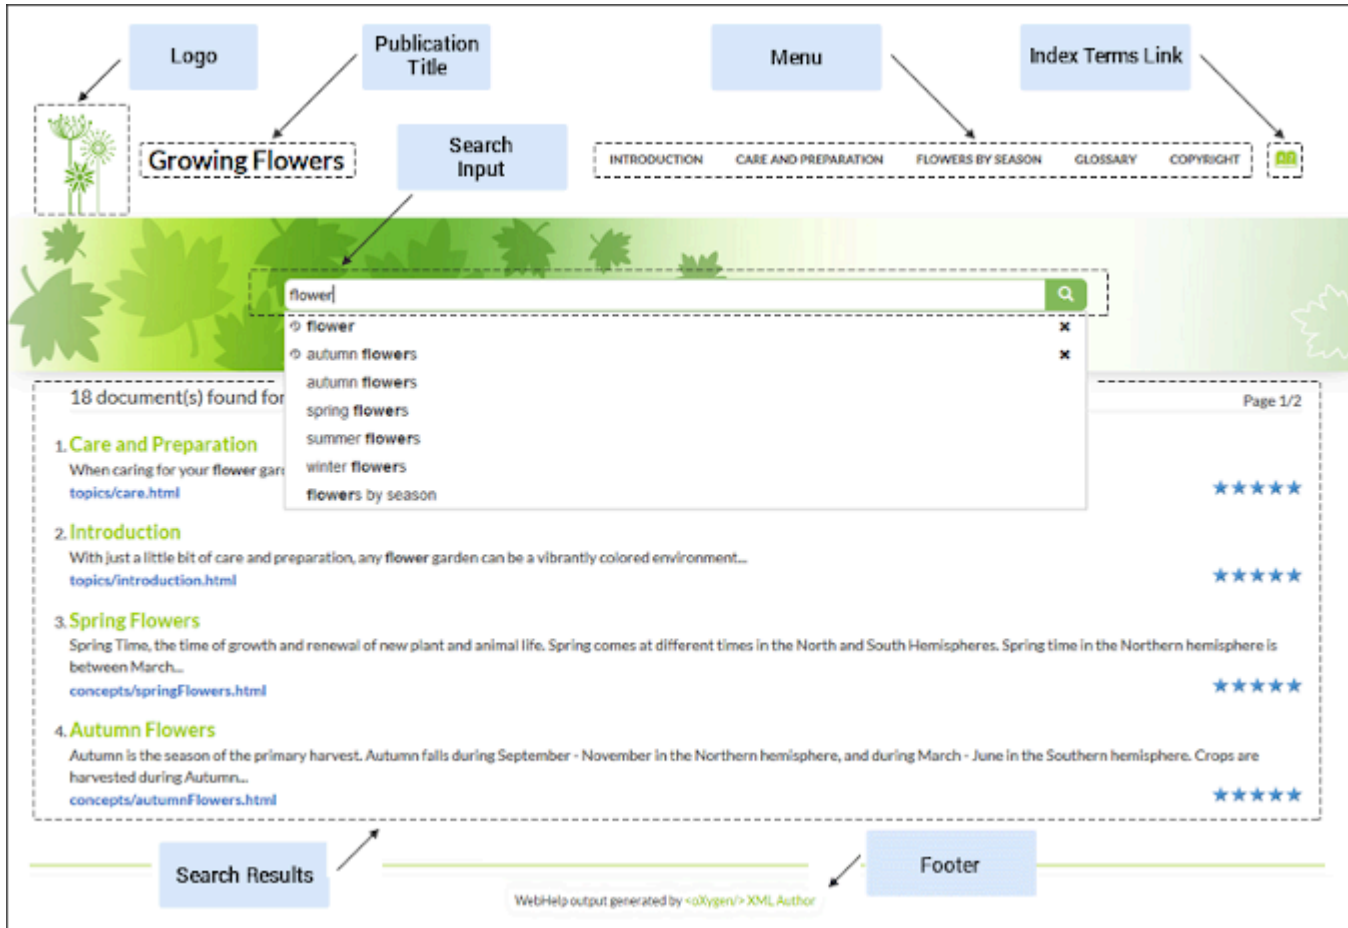

When you enter search terms in the **Search** field, the results are displayed in a results page. When you click on a result, the topic is opened in the main pane and the search results are highlighted. If you want to remove the colored highlights, click the  **Toggle Highlights** button at the top-right side of the page. The **Search** field also includes an *autocomplete* feature.

Figure 387. Search Results Page

1. Logo Component (on page 1259)
2. Title Component (on page 1259)
3. Search Input Component (on page 1260)
4. Menu Component (on page 1260)
5. Index Terms Link Component (on page 1260)
6. Search Results Component (on page 1260)
7. Footer Component (on page 1260)

Search Results Page Components

The layout components displayed in the search page are:

Publication Title

The title of the publication. It is usually taken from the DITA map title.

Logo

Displays a logo associated with the publication. Additionally, you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the `webhelp.logo.image` transformation parameter (*on page 1434*). For the target URL, use the `webhelp.logo.image.target.url` parameter (*on page 1434*).

Menu

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see [How to Customize the Menu](#) (*on page 1358*) topic.

Index Terms Link

Presents a link to the index terms page. You can control if this component is displayed by using the `webhelp.show.indexterms.link` parameter (*on page 1443*).

Search Input

An input text field where you can enter search queries.

Search Results

Each result includes the topic title that can be clicked to open that page. Under the title, a breadcrumb is displayed that shows the path of the topic and you can click any of the topics in the breadcrumb to open that particular page.

Page Footer

WebHelp Responsive output footer.

Auto-complete Suggestions in the Search Input Field

When you are typing in the search input field, proposals are presented to help you to compute the search query. The information proposed when you are typing is collected from:

- The search queries from the history of the previous searches.
- The titles collected from your documentation.
- Documentation index terms and keywords. For example, in a DITA topic, the keywords and index terms are specified in the topic prolog section like this:

```
<prolog>
  <metadata>
    <keywords><indexterm>databases</indexterm></keywords>
    <keyword>installing</keyword>
    <keyword>uninstalling</keyword>
    <keyword>prerequisites</keyword>
  </metadata>
</prolog>
```

Missing Terms

If you enter multiple search terms (other than *stop words*), for any result that the search engine found at least one term but not one or more of the other terms, the **Missing** terms will be listed below each result.

Related information

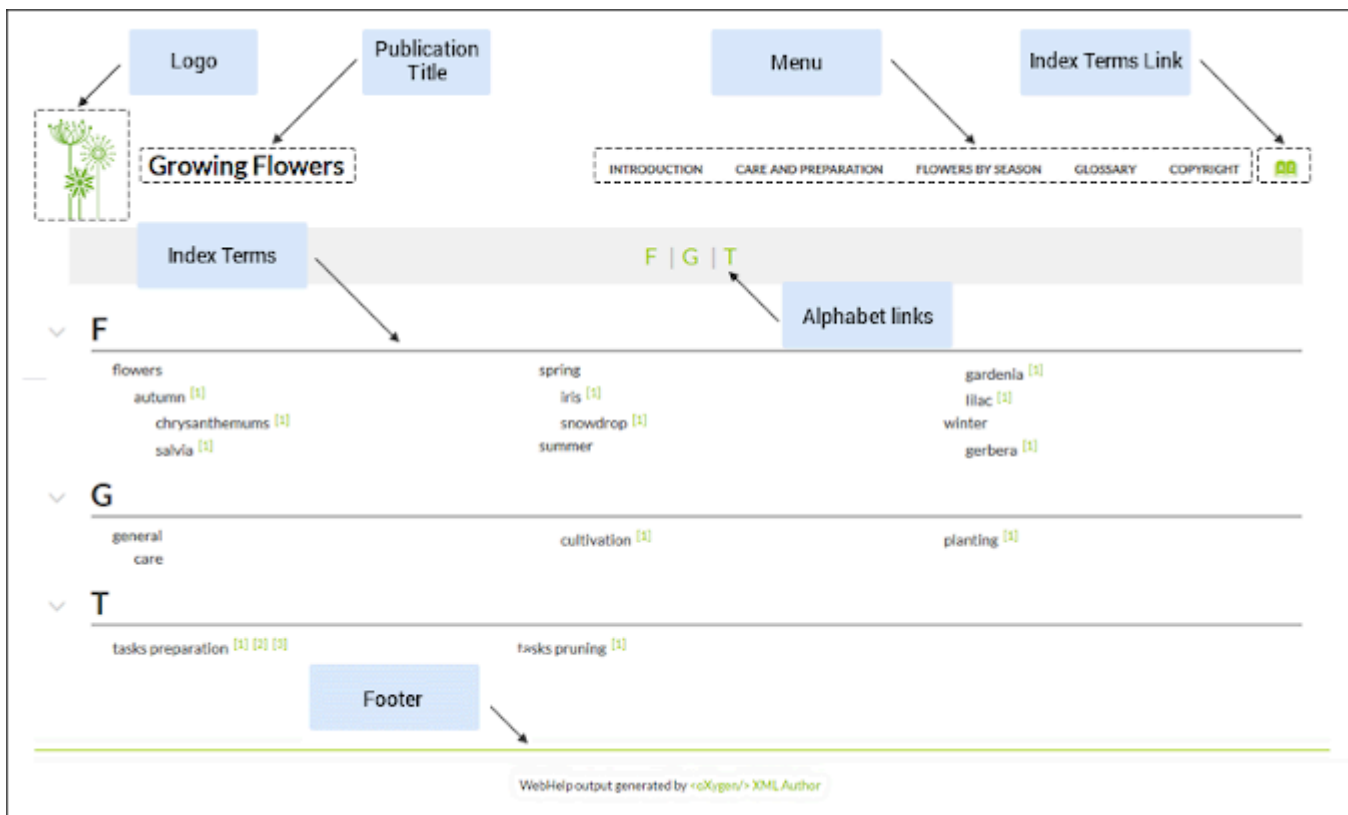

[WebHelp Responsive Search Engine \(on page 1262\)](#)

Index Terms Page

The *Index Terms Page* page consists of an index terms section along with various other additional components, such as a title, menu, or search field.

An alphabet that contains the first letter of the documentation index terms is generated at the top of the index page. Each letter represents a link to a specific indices section. The indexes are presented in multiple columns to make it easier to read this page.

Figure 388. Index Terms Page

1. Logo Component (on page 1262)
2. Title Component (on page 1262)
3. Menu Component (on page 1262)
4. Index Terms Link Component (on page 1262)
5. Index Terms Component (on page 1262)

6. [Alphabet Links Component \(on page 1262\)](#)

7. [Footer Component \(on page 1262\)](#)

Index Terms Page Components

The layout components displayed in this page are:

Publication Title

The title of the publication. It is usually taken from the DITA map title.

Logo

Displays a logo associated with the publication. Additionally, you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the [webhelp.logo.image transformation parameter \(on page 1434\)](#). For the target URL, use the [webhelp.logo.image.target.url parameter \(on page 1434\)](#).

Menu

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see [How to Customize the Menu \(on page 1358\)](#) topic.

Index Terms Link

Presents a link to the index terms page. You can control if this component is displayed by using the [webhelp.show.indexterms.link parameter \(on page 1443\)](#).

Index Terms Alphabet

An alphabet that contains the first letter of index terms. Each letter represents a link to a specific indices section.

Index Terms

The first letter of the index along with the list of index terms.

Page Footer

WebHelp Responsive output footer.

Built-in JavaScript-based Search Engine

The client-side JavaScript-based search engine comes preconfigured in the WebHelp responsive plugin. It is enabled by default when you run the WebHelp Responsive transformation.

Search Index

The search index is created when you publish your documentation to WebHelp by traverses all HTML pages (for DITA topics) from output folder to gather information.

Search interface

This component is an interface between the user and the *search index*. It helps the user to search through the *search index* and displays results in the search page.

Search Field and Results Page

When you enter search terms in the **Search** field, the results are displayed in a results page. When you click on a result, the topic is opened in the main pane and the search results are highlighted. If you want to remove the colored highlights, click the  **Toggle Highlights** button at the top-right side of the page. The **Search** field also includes an *autocomplete* feature.

Each result includes the topic title that can be clicked to open that page. Under the title, a breadcrumb is displayed that shows the path of the topic and you can click any of the topics in the breadcrumb to open that particular page.

If you enter multiple search terms (other than *stop words*), for any result that the search engine found at least one term but not one or more of the other terms, the **Missing** terms will be listed below each result.

Tip:

You can use the `searchQuery` URL parameter to perform a search operation when WebHelp is loaded. This opens the Search Results page with the specified search query processed. The URL should look something like this:

```
http://localhost/webhelp/search.html?searchQuery=deploying%20feedback
```

5-Star Rating Mechanism and Sorting

The **Search** feature is also enhanced with a rating mechanism that computes scores for every result that matches the search criteria. These scores are then translated into a 5-star rating scheme and the stars are displayed to the right of each result. The search results are sorted depending on the following:

- Search entries that satisfy the phrase search criterion are presented first.
- The number of keywords found in a single page (the higher the number, the better).
- The context (for example, a word found in a title, scores better than a word found in unformatted text).

The search ranking order, sorted by relevance is as follows:

- The search term is included in a meta keyword.
- The search term is in the title of the page.
- The search term is in bold text in a paragraph.
- The search term is in normal text in a paragraph.

Tag Element Scoring Values

HTML tag elements are also assigned a scoring value and these values are evaluated for the search results. For information about editing these values, see [How to Change Element Scoring in Search Results \(on page 1369\)](#).

Search Rules

Rules that are applied during a search include:

- You can use quotes to perform an exact search for multiple word phrases (for example, "grow flowers" will only return results if both words are found consecutively and exactly as they are typed in the search field). This type of search is known as a *phrase search*.
- *Boolean Search* is supported using the following operators: *and*, *or*, *not*. When there are two adjacent search terms without an operator, *or* is used as the default search operator (for example, *grow flowers* is the same as *grow or flowers*).
- The space character separates keywords (an expression such as *grow flowers* counts as two separate keywords).
- Words composed by merging two or more words with colon (":"), minus ("-"), underline ("_"), or dot (".") characters count as a single word.
- Your search terms should contain two or more characters (note that stop words will be ignored). This rule does not apply to CJK (Chinese, Japanese, Korean) languages.
- When searching for multiple words in CJK (Chinese, Japanese, Korean) languages that often have them appear in strings without a space separator, you may need to add a space to separate the words. Otherwise, WebHelp will not find results. For example, Chinese uses a specialized character for space separators, but the current WebHelp implementation cannot detect such specialized characters, so to search for 开始之前 (it translates as "before you begin" or "before start"), you have to enter 开始 之前 (notice the space between the second and third symbols) in the search field.

Note:

Phrase searches (two or more consecutive words in an exact order) do not work for CJK (Chinese, Japanese, Korean) languages.

Tip:

The `<indexterm>` and `<keywords>` DITA elements are an effective way to increase the ranking of a page (for example, content inside a *keywords* element weighs more than an *H1* HTML element).

Excluded Terms

To improve performance, the **Search** feature excludes certain *stop words*. For example, the English version of the *stop words* includes: *a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with*.

[WebHelp Responsive HTML5 Pages: Search Page \(on page 1258\)](#)

Context-Sensitive Help System

Context-sensitive help systems assist users by providing specific informational topics for certain components of a user interface, such as a button or window. This mechanism works based on mappings between a unique ID defined in the topic and a corresponding HTML page.

Generating Context-Sensitive Help

When WebHelp Responsive output is generated, the transformation process produces an XML mapping file called `context-help-map.xml` and copies it to the output folder of the transformation. This XML file maps an ID to a corresponding HTML page through an `<appContext>` element, as in the following example:

```
<map productID="oxy-webhelp" productVersion="1.1">
  <appContext helpID="myapp-functionid1" path="tasks/app-help1.html"/>
  <appContext helpID="myapp-functionid2" path="tasks/app-help1.html"/>
  .
  .
  .
</map>
```

The possible attributes are as follows:

helpID

A Unique ID provided by a topic from two possible sources (`<resourceid>` element or `@id` attribute):

resourceid

The `<resourceid>` element is mapped into the `<appContext>` element and can be specified in either the `<topicref>` within a *DITA map* or in a `<prolog>` within a DITA topic. The `<resourceid>` element accepts the following attributes:

- **appname** - A name for the external application that references the topic. If this attribute is not specified, its value is considered to be empty (" ").
- **appid** - An ID used by an application to identify the topic.
- **id** - Specifies a value that is used by a specific application to identify the topic, but this attribute is ignored if an `@appid` attribute is used.

Note:

Multiple `@appid` values can be associated with a single `appname` value (and multiple `@appname` values can be associated with a single `@appid` value), but the values for both attributes work in combination to specify a specific ID for a specific application, and therefore each combination of values for the `@appid` and `@appname` attributes should be unique within the context of a single *root map* (on page 2273). For example, suppose that you need two different functions of an application to both open the same WebHelp page.

Example: The `<resourceid>` Element Specified in a DITA Map

The `<resourceid>` element can be specified in a `<topicmeta>` element within a `<topicref>`.

```
<map title="App Help">
  <topicref href="app-help1.dita" type="task">
    <topicmeta>
      <resourceid appname="myapp" appid="functionid1"/>
      <resourceid appname="myapp" appid="functionid2"/>
    </topicmeta>
  </topicref>
</map>
```

Example: The `<resourceid>` Element Specified in a DITA Topic

The `<resourceid>` element can be specified in a `<prolog>` element within a DITA topic.

```
<task id="app-help1">
  <title>My App Help</title>
  <prolog>
    <resourceid appname="myapp" appid="functionid1"/>
    <resourceid appname="myapp" appid="functionid2"/>
  </prolog>
  ...
</task>
```

For more information about the `<resourceid>` element, see [DITA Specifications: `<resourceid>`](#).

id

If a `<resourceid>` element is not declared in the *DITA map* or DITA topic (as described above), the `@id` attribute that is set on the topic root element is mapped into the `<appContext>` element.

**Important:**

You should ensure that these defined IDs are unique in the context of the entire DITA project. If the IDs are not unique, the transformation scenario will display warning messages in the transformation console output and the help system will not work properly.

path

The path to a corresponding WebHelp page. This path is relative to the location of the `context-help-map.xml` mapping file.

There are two ways of implementing context-sensitive help in your system:

- The XML mapping file can be loaded by a PHP script on the server side. The script receives the `contextId` value and will look it up in the XML file.
- Invoke the `cshelp.html` WebHelp system file and pass the `contextId` parameter with a specific value. The WebHelp system will automatically open the help page associated with the value of the `contextId` parameter.

```
cshelp.html?contextId=myDITATopic
```

**Note:**

The `contextId` parameter is not case-sensitive.

**Attention:**

Prior to version 24.1, the method was to invoke the `index.html` file. The system still works using this method but it has been deprecated and its functionality will be removed in a future version.

Context-Sensitive Queries

You can use the URL field in your browser to search for topics in a context-sensitive WebHelp system with the assistance of the following parameters:

contextId

The WebHelp JavaScript engine will look for this value in the `context-help-map.xml` mapping file and load the corresponding help page.

**Note:**

You can use an *anchor* (on page 2267) in the `contextId` parameter to jump to a specific section in a document. For example, `contextId=topicID#anchor`.

appname

You can use this parameter in conjunction with `contextId` to search for this value in the corresponding `appname` attribute value in the mapping file.

```
http://localhost/webhelp/cshelp.html?contextId=topicID&appname=myApplication
```

**Tip:**

The `webhelp.csh.disable.topicID.fallback` parameter (on page 1434) can be set *true* to use a topic ID fallback when `resourceid` information is not available when computing the mapping for context sensitive help.

Accessibility

Oxygen XML WebHelp Responsive output is compliant with the Section 508 accessibility standard, making the output accessible for people with visual impairment and other disabilities. Documentation and interface components are considered accessible when they have support in place that allows those with disabilities to use assistive technologies to understand the content.

Generally speaking, the WebHelp Responsive output has two major parts: topic content and WebHelp Responsive-related components (publication TOC, breadcrumb, menu). While the WebHelp Responsive components are designed to comply with the accessibility rules, it is important to adhere to some rules when you write DITA topics so that the content is also accessible.

Related Information:

[DITA-OT Day 2017 Presentation: Accessibility in DITA-OT](#)

Writing Guidelines for Accessible Documentation

To create accessible content, good authoring practices involve following guidelines, such as marking table headers, using semantic elements where available, and using alternative text for images.

Accessible Images

Images must have text alternatives that describe the information or function represented by them.

Short Text Equivalents for Images

When using the `<image>` element, specify a short alternative text with the `<alt>` element.

```
<image href="puffin.jpg">
  <alt>Puffin figure</alt>
</image>
```

Long Descriptions of Images

For complex images, when a short text equivalent does not suffice to adequately convey the function or role of an image, provide additional information in a file designated by the `<longdescref>` element.

```
<image href="puffin.jpg">
  <alt>Puffin figure</alt>
  <longdescref href="http://www.example.org/birds/puffin.html"
    scope="external"
    format="html"/>
</image>
```

Related Information:

[Darwin Information Typing Architecture \(DITA\) Specification <image> element](#)
[Web Accessibility Tutorials: Alt Decision Tree](#)

Accessible Image Maps

For image maps, text alternatives are needed on both the `<image>` element itself (to describe the informative context) and on each of the `<area>` elements (to convey the link destination or the action that will be initiated if the link is followed). The `<xref>` content within the `<area>` element contains the intended alternative text or hover text for that image map area.

```
<imagemap id="gear_pump_map">
  <image href="../../../images/Gear_pump_exploded.png" id="gear_pump_exploded">
    <alt>Gear Pump</alt>
  </image>
  <area>
    <shape>circle</shape>
    <coords>172, 265, 14</coords>
    <xref href="parts/bushings.dita#bushings_topic/bushings"
          format="dita">Bushings</xref>
  </area>
  <area>
    <shape>circle</shape>
    <coords>324, 210, 14</coords>
    <xref href="parts/ports.dita#ports_topic/suction_port" format="dita"
          >Suction Port</xref>
  </area>
</imagemap>
```

Related Information:

[Darwin Information Typing Architecture \(DITA\) Specification <imagemap> element](#)

Accessible Tables

Accessible HTML tables need markup that indicates header cells and data cells and defines their relationship. Header cells must be marked with `<th>`, and data cells with `<td>`, to make tables accessible. For more complex tables, explicit associations may be needed using `@scope`, `@id`, and `@headers` attributes.

When you implement the table, it is best to use the `<table>` element (CALs table or OASIS Table Exchange Model). The `<table>` element includes all that you need to make a fully accessible table.

Related Information:

[Darwin Information Typing Architecture \(DITA\) Specification <table> element](#)

Table with Header Cells in the Top Row Only

For this type of table, you have to embed the table rows in the `<thead>` element.

Table 35. Example: Oxygen Events

Event	Date	Location
Evolution of TC 2018	May 31 - June 1, 2018	Sofia, Bulgaria
Markup UK	June 9 - 10, 2018	London, United Kingdom
Balisage 2018 - The Markup Conference	July 31 - August 3, 2018	Rockville, Maryland, USA

```

<table colsep="1" rowsep="1" frame="all">
  <title>
    <b>Oxygen Events</b>
  </title>
  <tgroup cols="3">
    <colspec colname="COLSPEC0" colwidth="1*" />
    <colspec colname="COLSPEC1" colwidth="1.1*" />
    <colspec colname="newCol3" colwidth="1*" />
    <thead>
      <row>
        <entry colname="COLSPEC0" valign="top">Event</entry>
        <entry colname="COLSPEC1" valign="top">Date</entry>
        <entry>Location</entry>
      </row>
    </thead>
    <tbody>
      <row>

Table with Header Cells in the Top Row and First Column

For this type of table, you can use `<thead>` to identify header rows and `@rowheader` to identify a header column.

Table 37. Example: Bus Timetable

	Mon- day	Tues- day	Wednes- day	Thurs- day	Friday
09:00 - 11:00	Closed	Open	Open	Closed	Closed
11:00 - 13:00	Open	Open	Closed	Closed	Closed
13:00 - 15:00	Open	Open	Open	Closed	Closed
15:00 - 17:00	Closed	Closed	Closed	Open	Open

```
<table id="table_dqk_n24_vdb" rowheader="firstcol" colsep="1" rowsep="1" frame="all">

WebHelp Responsive VPAT Accessibility Conformance Report

International Edition

VPAT® Version 2.5 – November 2023

Product Name/Version

Oxygen XML WebHelp Responsive

Product Description

Oxygen XML WebHelp Responsive enables you to publish DITA content on the web and present it in a user-friendly interface that is easy to navigate. You can design your WebHelp Responsive output to be available on desktop systems or various mobile devices. With **Oxygen XML WebHelp Responsive**, your published content is accessible, interactive, and convenient.

Date

February 2025

Contact Information

support@oxygenxml.com

Notes

Oxygen XML WebHelp Responsive has been designed and enhanced to adhere to the [U.S. Government Section 508 accessibility standards](#) and the [Web Content Accessibility Guidelines \(WCAG\)](#). For details, see [WebHelp Responsive Accessibility \(on page 1268\)](#).

Evaluation Methods Used:

The following applications were used for testing **Oxygen XML WebHelp Responsive**:

- Desktop browsers: Chrome, Firefox, Safari, Edge.
- Assistive technologies: NVDA, VoiceOver, JAWS, Microsoft Narrator.

Applicable Standards/Guidelines

This report covers the degree of conformance for the following accessibility standards/guidelines:

Standard/Guideline	Included In Report
Web Content Accessibility Guidelines 2.0	Level A - Yes Level AA - Yes Level AAA - No
Web Content Accessibility Guidelines 2.1	Level A - Yes Level AA - Yes Level AAA - No
Web Content Accessibility Guidelines 2.2	Level A - Yes Level AA - Yes Level AAA - No
Revised Section 508 standards published January 18, 2017 and corrected January 22, 2018	Yes
EN 301 549 Accessibility requirements for ICT products and services - V3.1.1 (2019-11) AND EN 301 549 Accessibility requirements for ICT products and services - V3.2.1 (2021-03)	No

Terms

The terms used in the Conformance Level information are defined as follows:

- **Supports:** The functionality of the product has at least one method that meets the criterion without known defects or meets with equivalent facilitation.
- **Partially Supports:** Some functionality of the product does not meet the criterion.
- **Does Not Support:** The majority of product functionality does not meet the criterion.
- **Not Applicable:** The criterion is not relevant to the product.
- **Not Evaluated:** The product has not been evaluated against the criterion. This can only be used in WCAG Level AAA criteria.

WCAG 2.x Report

Tables 1 and 2 also document conformance with:

- Revised Section 508: Chapter 5 – 501.1 Scope, 504.2 Content Creation or Editing, and Chapter 6 – 602.3 Electronic Support Documentation.

Note:

When reporting on conformance with the WCAG 2.x Success Criteria, they are scoped for full pages, complete processes, and accessibility-supported ways of using technology as documented in the [WCAG 2.0 Conformance Requirements](#).

Table 1: Success Criteria, Level A

Criteria	Conformance Level	Remarks and Explanations
<p>1.1.1 Non-text Content (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Partially Supports	Text alternatives are provided for many instances of non-text content, with exceptions that include perma-links for subtopics and sections.
<p>1.2.1 Audio-only and Video-only (Pre-recorded) (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p>	Supports	The authors of the input DITA document are responsible for providing a transcript of the media content in the document.

Criteria	Conformance Level	Remarks and Explanations
<ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 		
<p><u>1.2.2 Captions (Prerecorded)</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	The product does not provide prerecorded media that requires captions.
<p><u>1.2.3 Audio Description or Media Alternative (Prerecorded)</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	<p>The authors of the input DITA document are responsible for providing an alternative for time-based media or audio description of the prerecorded video content in the document.</p> <p>See: G58: Placing a link to the alternative for time-based media immediately next to the non-text content</p>
<p><u>1.3.1 Info and Relationships</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Partially Supports	<p>Information, structure, and relationships conveyed through presentation can be programmatically determined or are available in text, with exceptions that include:</p> <ul style="list-style-type: none"> • Some landmarks are not marked with the corresponding role or do not have an associated label. • Some link groups are not structured using lists or are not marked as navigation regions. <p>The authors of the input DITA document are responsible for:</p>

Criteria	Conformance Level	Remarks and Explanations
		<ul style="list-style-type: none"> • Using semantic elements to mark up structure. • Using semantic markup to mark emphasized or special text. • Using caption elements to associate data table captions with data tables.
<p><u>1.3.2 Meaningful Sequence</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	<p>The product presents content in a meaningful sequence.</p> <p>Authors should use Unicode right-to-left mark (RLM) or left-to-right mark (LRM) to mix text direction inline.</p>
<p><u>1.3.3 Sensory Characteristics</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	<p>Authors should ensure that items are referenced in the content in ways that do not depend on sensory perception.</p>
<p><u>1.4.1 Use of Color</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	<p>(Cobalt template) Color is not used as the only visual means of conveying information, indicating an action, prompting a response, or distinguishing a visual element.</p>
<p><u>1.4.2 Audio Control</u> (Level A)</p> <p>Also applies to:</p>	Supports	<p>There is no sound that plays automatically.</p>

Criteria	Conformance Level	Remarks and Explanations
Revised Section 508 <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 		
<p><u>2.1.1 Keyboard</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Partially Supports	<p>Most of the content is operable through a keyboard interface, with exceptions that include:</p> <ul style="list-style-type: none"> • The top-level links in the main page accordion cannot be accessed. • The facets component does not have full keyboard support.
<p><u>2.1.2 No Keyboard Trap</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	The product does not contain content that traps the keyboard focus.
<p><u>2.1.4 Character Key Shortcuts</u> (Level A 2.1 only)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Supports	The product does not include character key shortcuts.
<p><u>2.2.1 Timing Adjustable</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p>	Supports	The product does not include time limits.

Criteria	Conformance Level	Remarks and Explanations
<ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 		
<p><u>2.2.2 Pause, Stop, Hide</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	The product does not include elements that move, blink, scroll, or auto-update.
<p><u>2.3.1 Three Flashes or Below Threshold</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	The product does not contain flashing content.
<p><u>2.4.1 Bypass Blocks</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) – Does not apply to non-web software • 504.2 (Authoring Tool) • 602.3 (Support Docs) – Does not apply to non-web docs 	Supports	Each page contains a link at the top that goes directly to the main content area. Each page contains <i>ARIA</i> landmarks that identify the available regions.
<p><u>2.4.2 Page Titled</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p>	Supports	Each page contains a non-empty <code><title></code> element in the <code><head></code> section.

Criteria	Conformance Level	Remarks and Explanations
<ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 		
<p><u>2.4.3 Focus Order</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	Focusable components receive focus in an order that preserves meaning and operability.
<p><u>2.4.4 Link Purpose (In Context)</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	<p>The purpose of each link can be determined from the link text alone or from the link text together with its programmatically-determined link context.</p> <p>The authors can create hypertext links using text that describes the purpose of the hypertext.</p> <p>There is no control that allows the user to choose between short or long link text (G189 / SCR30).</p>
<p><u>2.5.1 Pointer Gestures</u> (Level A 2.1 only)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Supports	The WebHelp Responsive output does not rely on path-based or multipoint gestures and does not provide controls that require complex gestures.
<p><u>2.5.2 Pointer Cancellation</u> (Level A 2.1 only)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Supports	The product has operations that are activated on the pointer up event.
<p><u>2.5.3 Label in Name</u> (Level A 2.1 only)</p>	Supports	The names of the user interface components contain the text that is presented visually.

Criteria	Conformance Level	Remarks and Explanations
<p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>		
<p>2.5.4 Motion Actuation (Level A 2.1 only)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Supports	The product does not contain functionality that can be operated by device or user motion.
<p>3.1.1 Language of Page (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	The web pages indicate the language of the content when the content language has been specified by authors.
<p>3.2.1 On Focus (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	No changes of context occur when any component receives focus.
<p>3.2.2 On Input (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	Changing the setting of any user interface component does not automatically cause a change of context.
<p>3.3.1 Error Identification (Level A)</p> <p>Also applies to:</p>	Partially Supports	If a search operation is performed leaving the search input empty, an error message is automatically dis-

Criteria	Conformance Level	Remarks and Explanations
Revised Section 508 <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 		played to the user, but no <i>aria-invalid</i> information is provided.
<u>3.3.2 Labels or Instructions</u> (Level A) Also applies to: Revised Section 508 <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Partially Supports	The search input does not have a visible label specified using a label element.
<u>4.1.1 Parsing</u> (Level A) Also applies to: Revised Section 508 <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Partially Supports	Several HTML validation errors are reported by the W3C validator.
<u>4.1.2 Name, Role, Value</u> (Level A) Also applies to: Revised Section 508 <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Partially Supports	The <i>Home</i> link from the breadcrumb does not have an associated <i>aria-label</i> .

Table 2: Success Criteria, Level AA

Criteria	Conformance Level	Remarks and Explanations
<u>1.2.4 Captions (Live)</u> (Level AA)	Supports	No live audio content is used.

Criteria	Conformance Level	Remarks and Explanations
<p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 		
<p><u>1.2.5 Audio Description (Prerecorded)</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	The authors of the input DITA document can ensure that the output document meets this criterion.
<p><u>1.3.4 Orientation</u> (Level AA 2.1 and 2.2)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Supports	Content does not restrict its view and operation to a single display orientation.
<p><u>1.3.5 Identify Input Purpose</u> (Level AA 2.1 and 2.2)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Supports	The content does not contain input fields that collect information about the user.
<p><u>1.4.3 Contrast (Minimum)</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Partially Supports	The missing words element from the search results page does not have the contrast ratio 4.5:1.

Criteria	Conformance Level	Remarks and Explanations
<p><u>1.4.4 Resize text</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Partially Supports	<p>Text can be resized up to 200 percent without loss of content or functionality and without using assistive technology.</p> <p>Some text content has dimensions specified in pixels rather than em units.</p>
<p><u>1.4.5 Images of Text</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	<p>The output does not contain images of text. The authors of the input DITA content can ensure that this criterion is met.</p>
<p><u>1.4.10 Reflow</u> (Level AA 2.1 and 2.2)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Partially Supports	<p>The majority of the content can be presented without loss of information or functionality, and without requiring scrolling in two dimensions.</p> <p>Long URLs determine the page to display the horizontal scroll bar.</p>
<p><u>1.4.11 Non-text Contrast</u> (Level AA 2.1 and 2.2)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Supports	<p>(Cobalt template) There is no contrast issue regarding user interface components or graphical objects.</p>
<p><u>1.4.12 Text Spacing</u> (Level AA 2.1 and 2.2)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Supports	<p>There is no loss of content or functionality that occurs by setting line height (line spacing), spacing following paragraphs, letter spacing, and word spacing.</p>

Criteria	Conformance Level	Remarks and Explanations
<p><u>1.4.13 Content on Hover or Focus</u> (Level AA 2.1 and 2.2)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Partially Supports	<p>Tooltips and submenus are not dismissible.</p> <p>Also, the tooltips are not hoverable.</p>
<p><u>2.4.5 Multiple Ways</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) – Does not apply to non-web software • 504.2 (Authoring Tool) • 602.3 (Support Docs) – Does not apply to non-web docs 	Supports	<p>There is a search form provided that will go to a page that contains the search term and links to the corresponding page. Also, a table of contents is provided.</p> <p>The authors of the input DITA document are responsible for providing links to all pages from the home page or providing links to navigate to related pages from the current page.</p>
<p><u>2.4.6 Headings and Labels</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	<p>Headings and labels describe the topic or purpose.</p> <p>DITA authors can ensure that this criterion is met.</p>
<p><u>2.4.7 Focus Visible</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Partially Supports	Placing focus on a focusable element using the mouse doesn't render a visible focus indicator. Also, the search button does not have a visible focus indicator.
<p><u>2.4.11 Focus Not Obscured (Minimum)</u> (Level AA 2.2 only)</p>	Supports	Focused items are always visible even if the page contains sticky elements.

Criteria	Conformance Level	Remarks and Explanations
Revised Section 508 – Does not apply		
<p><u>2.5.7 Dragging Movements</u> (Level AA 2.2 only)</p> <p>Revised Section 508 – Does not apply</p>	Supports	No user action relies on dragging.
<p><u>2.5.8 Target Size (Minimum)</u> (Level AA 2.2 only)</p> <p>Revised Section 508 – Does not apply</p>	Does Not Support	<p>Links in the breadcrumb, publication TOC, and topic TOC do not match the 24x24px minimum size.</p> <p>Navigation buttons, print button, and link to PDF button do not match the 24x24px minimum size.</p>
<p><u>3.1.2 Language of Parts</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	DITA authors can ensure that this criterion is met.
<p><u>3.2.3 Consistent Navigation</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) – Does not apply to non-web software • 504.2 (Authoring Tool) • 602.3 (Support Docs) – Does not apply to non-web docs 	Supports	Repeated components appear in the same relative in each page.
<p><u>3.2.4 Consistent Identification</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p>	Partially Supports	The output uses labels, names, and text alternatives consistently for items that have the same functionality.

Criteria	Conformance Level	Remarks and Explanations
<ul style="list-style-type: none"> • 501 (Web)(Software) – Does not apply to non-web software • 504.2 (Authoring Tool) • 602.3 (Support Docs) – Does not apply to non-web docs 		<p>Text alternatives are provided for many instances of non-text content, with exceptions that include:</p> <ul style="list-style-type: none"> • Permalinks for subtopics and sections. • Enlarge images action. <p>The <i>Home</i> link from the breadcrumb does not have an associated <i>aria-label</i>.</p>
<p><u>3.3.3 Error Suggestion</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Does Not Support	<p>The Search input does not have the <i>aria-required</i> information set and does not contain a text description specifying that it is a required field.</p>
<p><u>3.3.4 Error Prevention (Legal, Financial, Data)</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	<p>The Web pages do not cause legal commitments or financial transactions for the user to occur, that modify or delete user-controllable data in data storage systems, or that submit user test responses.</p>
<p><u>3.3.8 Accessible Authentication (Minimum)</u> (Level AA 2.2 only)</p> <p>Revised Section 508 – Does not apply</p>	Not Applicable	
<p><u>4.1.3 Status Messages</u>(Level AA 2.1 and 2.2)</p> <p>Also applies to:</p>	Supports	<p>The pages do not contain status messages as defined by this criterion.</p>

Criteria	Conformance Level	Remarks and Explanations
Revised Section 508 – Does not apply		

Table 3: Success Criteria, Level AAA

Criteria	Conformance Level	Remarks and Explanations
<p><u>1.2.6 Sign Language (Prerecorded)</u> (Level AAA)</p> <p>Revised Section 508 – Does not apply</p>	Not Evaluated	
<p><u>1.2.7 Extended Audio Description (Prerecorded)</u> (Level AAA)</p> <p>Revised Section 508 – Does not apply</p>	Not Evaluated	
<p><u>1.2.8 Media Alternative (Prerecorded)</u> (Level AAA)</p> <p>Revised Section 508 – Does not apply</p>	Not Evaluated	
<p><u>1.2.9 Audio-only (Live)</u> (Level AAA)</p> <p>Revised Section 508 – Does not apply</p>	Not Evaluated	
<p><u>1.3.6 Identify Purpose</u> (Level AAA 2.1 and 2.2)</p> <p>Revised Section 508 – Does not apply</p>	Not Evaluated

Chapter 3: Functional Performance Criteria (FPC)

Criteria	Conformance Level	Remarks and Explanations
302.1 Without Vision	Partially Supports	<p>Most of the content is accessible without vision with exceptions that include:</p> <ul style="list-style-type: none"> • Some components do not have text alternatives or labels. • Some landmarks are not marked with the corresponding role or do not have an associated label. • Some link groups are not structured using lists or are not marked as navigation regions.
302.2 With Limited Vision	Partially Supports	<p>Most of the content is accessible with limited vision with exceptions that include:</p>

Criteria	Conformance Level	Remarks and Explanations
		<ul style="list-style-type: none"> • Some components do not have text alternatives or labels. • Some landmarks are not marked with the corresponding role or do not have an associated label. • Some link groups are not structured using lists or are not marked as navigation regions.
302.3 Without Perception of Color	Supports	(Cobalt template) Color is not used as the only visual means of conveying information, indicating an action, prompting a response, or distinguishing a visual element.
302.4 Without Hearing	Supports	The authors can create content that does not require hearing abilities for use.
302.5 With Limited Hearing	Supports	The authors can create content that does not require hearing abilities for use.
302.6 Without Speech	Supports	The output does not require speech for use.
302.7 With Limited Manipulation	Supports	The WebHelp Responsive output does not rely on path-based or multipoint gestures and does not provide controls that require complex gestures.
302.8 With Limited Reach and Strength	Supports	The WebHelp Responsive output does not rely on path-based or multipoint gestures and does not provide controls that require complex gestures.
302.9 With Limited Language, Cognitive, and Learning Abilities	Supports	The authors can create content that can be used by users with limited language, cognitive, and learning abilities.

Chapter 4: Hardware

Notes: Not Applicable - **Oxygen XML WebHelp Responsive** is not a hardware product.

Chapter 5: Software

Notes: **Oxygen XML WebHelp Responsive** is a web application, not a software product. However, the web application includes authoring functionality, hence Chapter 5: Software 504 Authoring Tools applies to this product.

501 General

Criteria	Conformance Level	Remarks and Explanations
501.1 Scope – Incorporation of WCAG 2.0 AA	See WCAG 2.x section (on page 1275)	See information in WCAG section

502 Interoperability with Assistive Technology

Criteria	Conformance Level	Remarks and Explanations
502.2.1 User Control of Accessibility Features	Not Applicable	The product is not platform software.
502.2.2 No Disruption of Accessibility Features	Supports	The product does not disrupt platform features that are defined in the platform documentation as accessibility features.

502.3 Accessibility Services

Criteria	Conformance Level	Remarks and Explanations
502.3.1 Object Information	Partially Supports	The majority of object roles, state(s), properties, boundary, name, and description are programmatically determinable. The <i>Home</i> link from the breadcrumb does not have an associated <i>aria-label</i> .
502.3.2 Modification of Object Information	Supports	States and properties that can be set by the user can be set programmatically.
502.3.3 Row, Column, and Headers	Supports	The headers associated with the rows or columns of a table can be programmatically determined.

Criteria	Conformance Level	Remarks and Explanations
502.3.4 Values	Supports	The current values of an object can be programmatically determined.
502.3.5 Modification of Values	Supports	Values that can be set by the user are capable of being set programmatically.
502.3.6 Label Relationships	Partially Supports	<p>Information, structure, and relationships conveyed through presentation can be programmatically determined or are available in text.</p> <p>See WCAG 1.3.1 (on page 1276).</p>
502.3.7 Hierarchical Relationships	Supports	The content is hierarchically structured using language-specific elements and their relationships can be programmatically determined.
502.3.8 Text	Supports	The content of text objects, text attributes, and the boundary of text rendered to the screen shall be programmatically determinable.
502.3.9 Modification of Text	Supports	The editable text (search input) can be set programmatically.
502.3.10 List of Actions	Not Applicable	There are no custom actions available that can be executed on the content.
502.3.11 Actions on Objects	Not Applicable	There are no custom actions available that can be executed on the content.
502.3.12 Focus Cursor	Not Applicable	The product is a web application and is isolated from the underlying platform software (web browser).
502.3.13 Modification of Focus Cursor	Not Applicable	The product is a web application and is isolated from the underlying platform software (web browser).
502.3.14 Event Notification	Not Applicable	There are no automatic focus changes, caret movement, selection

Criteria	Conformance Level	Remarks and Explanations
		changes, or added components in the content.
502.4 Platform Accessibility Features	Not Applicable	This product is not platform software.

503 Applications

Criteria	Conformance Level	Remarks and Explanations
503.2 User Preferences	Not Applicable	This section does not apply to web applications.
503.3 Alternative User Interfaces	Not Applicable	The application does not provide an alternative user interface that functions as assistive technology.

503.4 User Controls for Captions and Audio Description

Criteria	Conformance Level	Remarks and Explanations
503.4.1 Caption Controls	Not Applicable	The product does not provide controls for volume adjustment.
503.4.2 Audio Description Controls	Not Applicable	The product does not provide controls for program selection.

504 Authoring Tools

Criteria	Conformance Level	Remarks and Explanations
504.2 Content Creation or Editing (if not authoring tool, enter "not applicable")	Not Applicable See the WCAG 2.x section (on page 1275)	The product is not an authoring tool. See information in WCAG section
504.2.1 Preservation of Information Provided for Accessibility in Format Conversion	Not Applicable	The product is not an authoring tool.
504.2.2 PDF Export	Not Applicable	The product is not an authoring tool.
504.3 Prompts	Not Applicable	The product is not an authoring tool.

Criteria	Conformance Level	Remarks and Explanations
504.4 Templates	Not Applicable	The product is not an authoring tool.

Chapter 6: Support Documentation and Services

601.1 Scope

602 Support Documentation

Criteria	Conformance Level	Remarks and Explanations
602.2 Accessibility and Compatibility Features	Partially Supports	The product documentation is distributed in the WebHelp Responsive format. See the Chapter 3 (on page 1291) and Chapter 5 (on page 1293) sections.
602.3 Electronic Support Documentation	See the WCAG 2.x section (on page 1275)	See information in the WCAG section.
602.4 Alternate Formats for Non-Electronic Support Documentation	Not Applicable	Documentation is not provided in non-electronic formats.

603 Support Services

Criteria	Conformance Level	Remarks and Explanations
603.2 Information on Accessibility and Compatibility Features	Supports	The support services cover the accessibility features.
603.3 Accommodation of Communication Needs	Supports	Support services are available by phone or e-mail.

Publishing Templates

An *Oxygen Publishing Template* defines all aspects of the layout and styles for output obtained from the following transformation scenarios:

- **WebHelp Responsive**
- **DITA Map PDF - based on HTML5 & CSS**

It is a self-contained customization package stored as a ZIP archive or folder that can easily be shared with others. It provides the primary method for customizing the output.

Tip:

You can start creating publishing templates by using the **Oxygen Styles Basket**. <https://styles.oxygenxml.com>

Some possible customization methods include:

- Add additional template resources to customize the output (such as logos, *Favicons*, or CSS files).
- Extend the default processing by specifying one or more XSLT extension points.
- Specify one or more transformation parameters to customize the output.
- Customize various aspects of the output through simple CSS styling.
- For **WebHelp Responsive** output, change the layout of the main page or topic pages by customizing which components will be displayed and where they will be positioned in the page.

The following graphics are possible sample structures for *Oxygen Publishing Template* packages:

Figure 389. Oxygen Publishing Template Package (WebHelp Responsive)

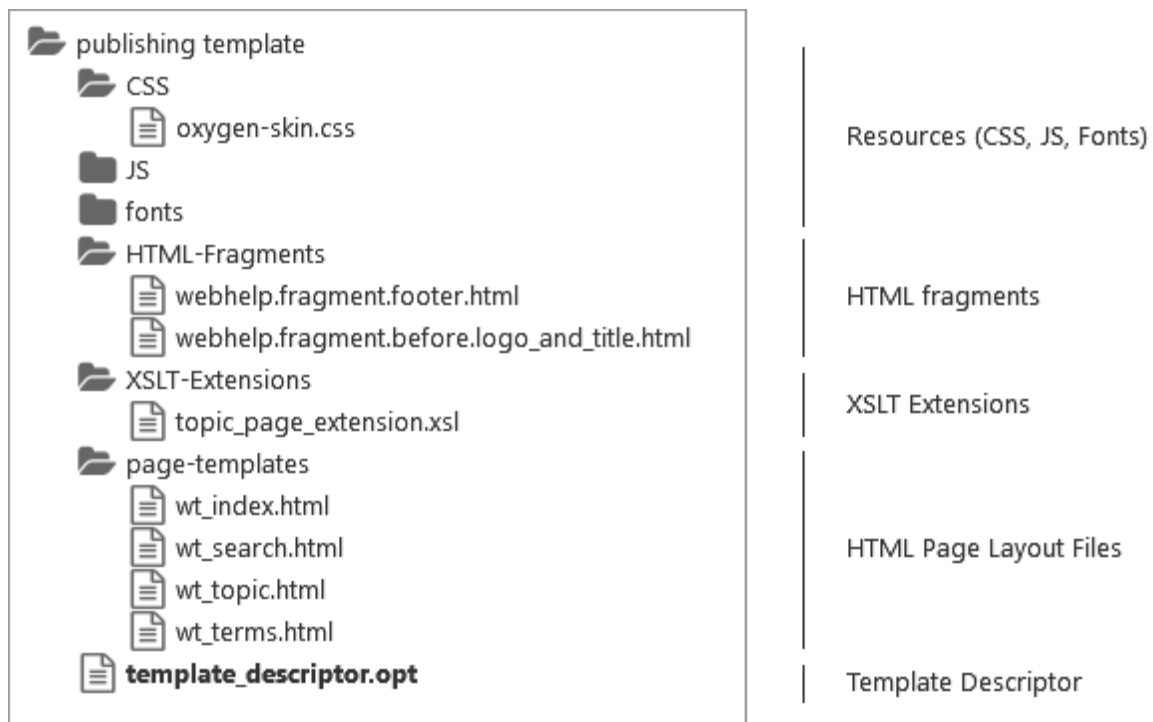

Figure 390. Oxygen Publishing Template Package (PDF)

For information about creating and customizing publishing templates, and how to adjust the WebHelp and PDF output through CSS styling and other customization methods, watch our Webinar: [Creating Custom Publishing Templates for WebHelp and PDF Output](#). The Webinar slides and sample project are also available from that webpage.

[How to Share a Publishing Template \(on page 1481\)](#)

Publishing Templates Gallery

Oxygen XML Developer comes bundled with a variety of built-in templates. You can use one of them to publish your documentation or as a starting point for a new publishing template.

Built-in Templates

There are two categories of templates, *Tiles* and *Tree*. You can see the built-in templates in the **Templates** tab when editing a WebHelp Responsive transformation scenario in **Oxygen XML Editor/Author**. Each one also includes an  **Online preview** icon in the bottom-right corner that opens a webpage in your default browser that provides a sample of how the main page will look when that particular template is used to generate the output.

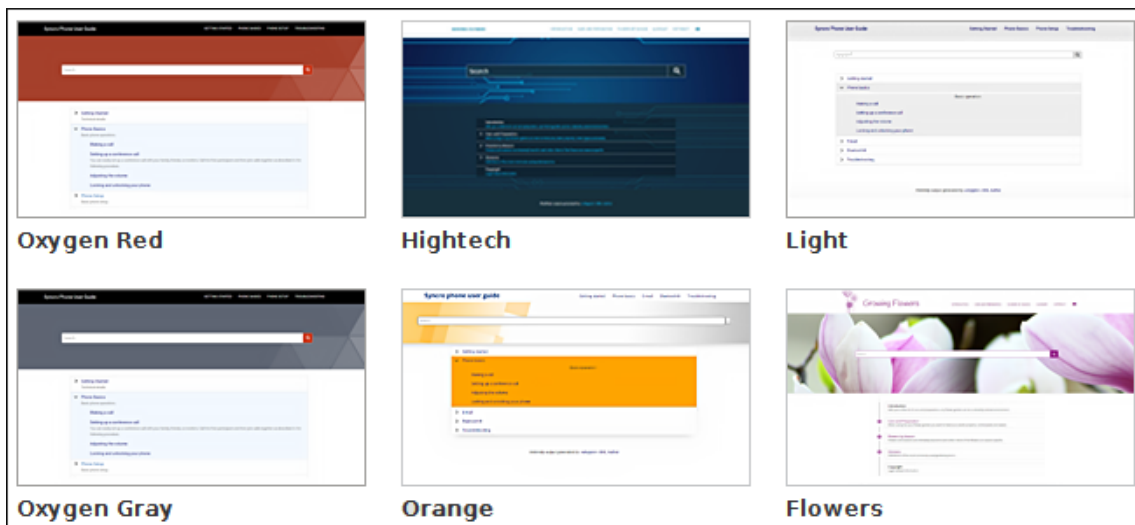

Tiles Templates

The main page in the WebHelp output presents a tile for each main topic (chapter) of the documentation.

Tree Templates

The main page in the WebHelp output presents a tree-like table of contents.

Built-in Templates Location

All built-in templates are stored in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`.

Custom Templates

You can use a built-in template as a starting point for [creating your own custom template \(on page 1476\)](#).

You can store all of your custom templates in a particular directory. Then, go to **Options > Preferences > DITA > Publishing** and add your directory to the list, and all the templates stored in that directory will be displayed in the preview pane in the transformation scenario's **Template** tab along with all the built-in templates.

Sharing Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder.
2. Go to **Options > Preferences > DITA > Publishing** and add that new folder to the list.
3. Switch the option at the bottom of that preferences page to **Project Options**.
4. Share your project file (`.xpr`).

Publishing Template Package Contents for WebHelp Responsive Customizations

An *Oxygen Publishing Template* package for WebHelp output must contain a template descriptor file and at least one CSS file, and may contain other resources (such as graphics, XHTML files, XSLT files, etc.). All the template resources can be stored in either a ZIP archive or in a folder. It is recommended to use a ZIP archive because it is easier to share with others.

Template Descriptor File

Each publishing template includes a descriptor file that defines the meta-data associated with the template. It is an XML file that defines all the resources included in a template (such as CSS files, images, JS files, and transformation parameters).

The template descriptor file must have the `.opt` file extension and must be located in the template's root folder.

A template descriptor might look like this:

```
<publishing-template>
  <name>Flowers</name>

  <webhelp>
    <tags>
      <tag>tree</tag>
      <tag>light</tag>
    </tags>
    <preview-image file="flowers-tree.png"/>

    <!-- Resources (CSS, favicon, logo and others) -->
    <resources>
      <!-- Main CSS file -->
      <css file="flowers.css"/>

      <!-- Resources to copy to the output folder -->
      <fileset>
        <include name="resources/**/*"/>
        <exclude name="resources/**/*.svn"/>
        <exclude name="resources/**/*.git"/>
      </fileset>
    </resources>
  </webhelp>
</publishing-template>
```

```

</resources>

<parameters>
  <parameter name="webhelp.show.main.page.tiles" value="no"/>
  <parameter name="webhelp.show.main.page.toc" value="yes"/>
  <parameter name="webhelp.top.menu.depth" value="3"/>
</parameters>
</webhelp>
</publishing-template>

```

Tip:

It is recommended to edit the template descriptor in **Oxygen XML Editor/Author** because it provides content completion and validation support.

Template Name and Description

Each template descriptor file requires a `<name>` element. This information is displayed as the name of the template in the transformation scenario dialog box.

Optionally, you can include a `<description>` and it displayed when the user hovers over the template in the transformation scenario dialog box.

```

<publishing-template>
  <name>Lorem Ipsum</name>
  <description>Lorem ipsum dolor sit amet, consectetur adipiscing elit</description>
  ...

```

Template Author

Optionally, you can include author information in the descriptor file and it displayed when the user hovers over the template in the transformation scenario dialog box. This information might be useful if users run into an issue or have questions about a certain template.

If you include the `<author>` element, a `<name>` is required and optionally you can include `<email>`, `<organization>`, and `<organizationUrl>` information.

```

<publishing-template>
  ...
  <author>
    <name>John Doe</name>
    <email>jdoe@example.com</email>
    <organization>ACME</organization>
    <organizationUrl>http://www.example.com/jdoe</organizationUrl>
  </author>

```

```
</author>
```

```
...
```

Webhelp Element

The `<webhelp>` element contains various details that define the WebHelp Responsive output. It is a required element if you intend on using a WebHelp Responsive transformation scenario. The elements that are allowed in this `<webhelp>` section specify the [template tags \(on page 1302\)](#), [template preview image \(on page 1303\)](#), [resources \(on page 1303\)](#) (such as CSS, JS, fonts, logos), [transformation parameters \(on page 1305\)](#), [HTML fragment extensions \(on page 1307\)](#) (used to add fragments to placeholders), [XSLT extensions \(on page 1306\)](#), or [HTML page layout files \(on page 1316\)](#).

```
<webhelp>
  <tags>
    ...
  </tags>
  <preview-image file="MyPreview.png"/>

  <resources>
    ...
  </resources>

  <html-page-layouts>
    ...
  </html-page-layouts>

  <parameters>
    ...
  </parameters>
</webhelp>
```

Template Tags

The `<tags>` section provides meta information about the template (such as layout type or color theme). Each *tag* is displayed at the top of the **Templates** tab window in the transformation scenario dialog box and they help the user filter and find particular templates.

```
<publishing-template>
  ...
  <webhelp>
    <tags>
      <tag>tree</tag>
      <tag>dark</tag>
    </tags>
```

Template Preview Image

The `<preview-image>` element is used to specify an image that will be displayed in the transformation scenario dialog box. It provides a visual representation of the template to help the user select the right template. The image dimensions should be 200 x 115 pixels and the supported image formats are: JPEG, PNG, or GIF.

You can also include an `<online-preview-url>` element to specify the URL of a published sample of your template. This will display an  **Online preview** icon in the bottom-right corner the image in the transformation scenario dialog box and if the user clicks that icon, it will open the specified URL in their default browser.

```
<publishing-template>
...
<webhelp>
...
<preview-image file="ashes/ashes-tree.png"/>
<online-preview-url>https://www.example.com/samples/tiles/ashes</online-preview-url>
```

Template Resources

The `<resources>` section of the descriptor file specifies a set of resources (CSS, JS, fonts, logos, graphics, etc.) that are used to customize various components in the generated output. These resources will be copied to the output folder during the transformation process. At least one CSS file must be included, while the other types of resources are optional.

Warning:

All paths set in the `@file` attribute must be relative.

This section is defined using the `<resources>` element and the types of resources that can be specified include:

- **CSS files** - One or more CSS files that will define the styles of all generated HTML pages. They are referenced using the `<css>` element.
- **Favicon** - You can specify the path to an image for the *favicon* associated with your website. It is referenced using the `<favicon>` element.
- **Logo** - You can specify the path to a logo image that will be displayed in the left side of the output header. It is referenced using the `<logo>` element. Optionally, you can also specify:
 - `@target-url` - Redirects the user to the specified URL if they click the logo in the output.
 - `@new-tab` - Opens the target URL in a new browser tab.
 - `@alt` - Provides an alternate text for the logo image.
- **Additional Resources (graphics, JS, fonts, folders)** - For other resources (such as images referenced in CSS, JavaScript, fonts, entire folders, etc.) that need to be included in the output, you need to instruct the transformation to include them in the output folder. You can specify one or more sets of additional resources to be copied to the output folder by using the `<fileset>` element and you can use one or more `<include>` and `<exclude>` elements. This semantic is similar to the [ANT FileSet](#).

```

<publishing-template>
  ...
  <webhelp>
    ...
    <resources>
      <css file="css/custom_styles.css"/>
      <css file="css/custom_fonts.css"/>

      <favicon file="images/favicon.png"/>

      <logo
        file="images/logo.png"
        target-url="http://www.example.com"
        alt="Alternate text for the logo image"
        new-tab="true"/>

      <js-amd-module file="js/template-main.js"/>

      <fileset>
        <include name="common/**/*"/>
        <include name="JS/**/*"/>
        <exclude name="**/*.svn"/>
        <exclude name="**/*.git"/>
      </fileset>
    </resources>
  </webhelp>
</publishing-template>

```

**Note:**

All relative paths specified in the descriptor file are relative to the template root folder.

The resources specified in the template descriptor are copied to the following output folder:

`[WebHelp_OUTPUT_DIR]/oxygen-webhelp/template`. The following graphic illustrates the mapping between the template resources and the location where they will be copied to the output folder:

Figure 391. Template Resources Mapping**Related Information:**

[How to Add a Favicon in WebHelp Systems \(on page 1366\)](#)

Transformation Parameters

You can also set one or more WebHelp transformation parameters in the descriptor file.

```
<publishing-template>
...
<webhelp>
...
<parameters>
  <parameter
    name="webhelp.show.main.page.toc"
    value="yes" />
  <parameter
    name="webhelp.top.menu.depth"
    value="3" />
  <parameter
    name="webhelp.fragment.welcome"
    value="html-fragment/webhelp.fragment.welcome.html"
    type="filePath" />
</parameters>
</webhelp>
```

The following information can be specified in the `<parameter>` element:

Parameter name

The name of the parameter. It may be one of the [WebHelp Responsive transformation parameters \(on page 1433\)](#) or a DITA-OT HTML-based output parameter.

**Note:**

It is not recommended to specify an input/output parameter in the descriptor file (such as the input Map, DITAVAL file, or temporary directory).

**Attention:**

JVM arguments like `-Xmx` cannot be specified as a transformation parameter.

Parameter Value

The value of the parameter. It should be a relative path to the template root folder for file paths parameters.

Parameter Type

The type of the parameter: `string` or `filepath`. The `string` value is default.

After [creating a publishing template \(on page 1476\)](#) and adding it to the [templates gallery \(on page 1340\)](#), when you select the template in the transformation scenario dialog box, the **Parameters** tab will automatically be updated to include the parameters defined in the descriptor file. These parameters are displayed in italics.

XSLT Extension Points

The publishing templates can include one or more [supported XSLT extension points \(on page 1447\)](#). They are helpful when you want to change the structure of the HTML pages that are primarily generated from XSLT processing. They can be specified using the `<xslt>` element in the descriptor file using the following structure:

```
<publishing-template>
...
<webhelp>
...
<xslt>
  <extension
    id="com.oxygenxml.webhelp.xsl.dita2webhelp"
    file="xsl/customDita2webhelp.xsl"/>
  <extension
    id="com.oxygenxml.webhelp.xsl.createMainPage"
    file="xsl/customMainPage.xsl"/>
</xslt>
```

For a full list of the supported extension points, see: [XSLT-Import and XSLT-Parameter Extension Points \(on page 1447\)](#).

**Note:**

You can read the value of a WebHelp transformation parameter from your XSLT extension stylesheets by using the `getParameter(param.name)` function from the <http://www.oxygenxml.com/functions> namespace.

HTML Fragment Placeholders

The HTML pages contain component placeholders that can be used to insert custom HTML fragments either by specifying a **well-formed** XHTML fragment or referencing a path to a file that contains a **well-formed** XHTML fragment (for details on how the file or fragment needs to be constructed, see [How to Insert Custom HTML Content \(on page 1349\)](#)).

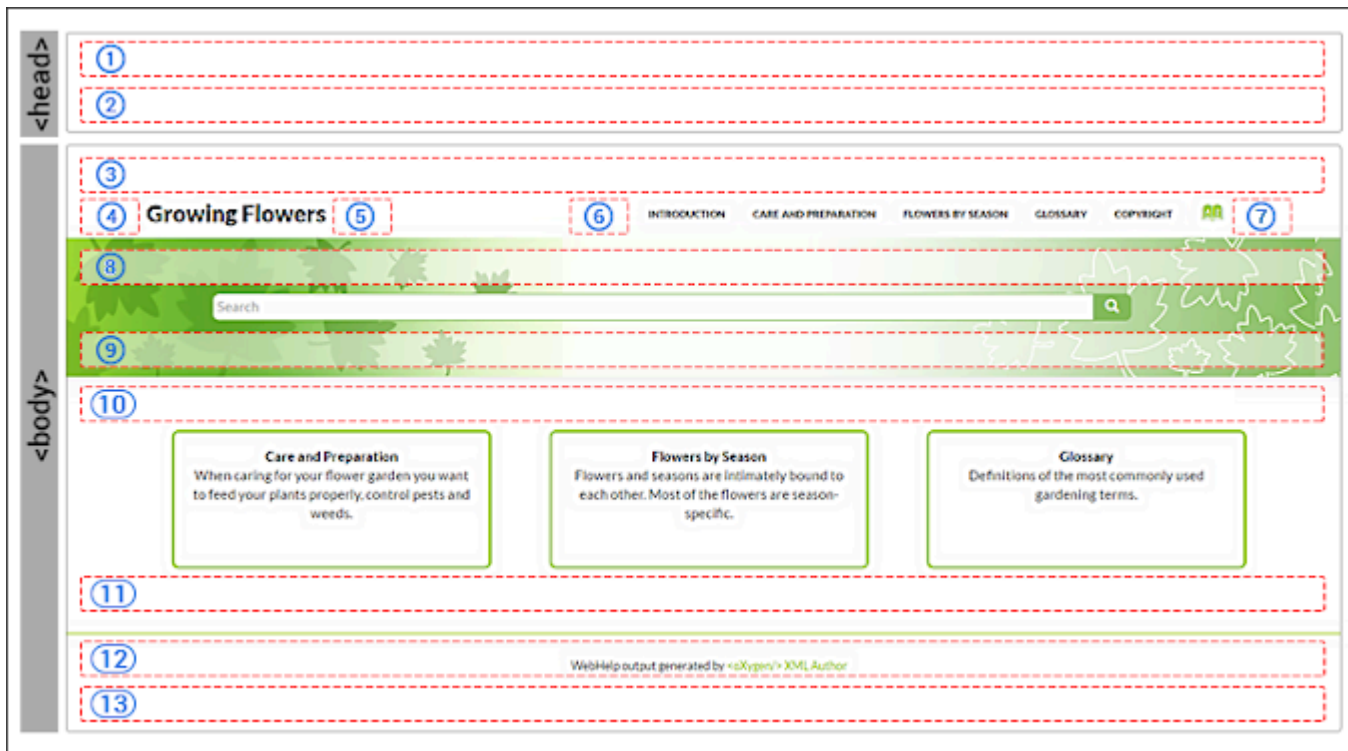

These fragments and their placeholder location are defined in the descriptor file using a `<fragment>` element inside the `<html-fragments>` section. You can specify one or more HTML fragment extension points in the descriptor file using the following structure:

```
<publishing-template>
...
<webhelp>
...
<html-fragments>
  <fragment
    file="html-fragments/webhelp_fragment_welcome.html"
    placeholder="webhelp.fragment.welcome"/>
  <fragment
    file="html-fragments/webhelp_fragment_footer.html"
    placeholder="webhelp.fragment.footer"/>
</html-fragments>
```

Some of these placeholders are left empty in the default output configurations, but you can use them to insert custom content.

Each placeholder has an associated parameter value in the transformation. Some of the placeholder parameters are global and can be used in all type of pages (*main page, topic page, search results page, index terms page*), while others are applicable for certain type of pages. The following diagram illustrates the predefined placeholders that are global (can be used in any of the types of pages).

Figure 392. Global Predefined Placeholders Diagram

1. Header (on page 1308)
2. After Header (on page 1308)
3. Before Body (on page 1308)

9. After Search Input (on page 1309)
10. Before Main Content (on page 1309)
11. After Main Content (on page 1309)
12. Footer (on page 1309)
13. After Body (on page 1309)

Global Placeholder Parameters

The following placeholder parameters can be used in any of the type of pages (*main page, topic page, search results page, index terms page*). The parameter values can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment:

- **1 = webhelp.fragment.header** - Displays the specified XHTML fragment in the header section.
- **2 = webhelp.fragment.after.header** - Displays the specified XHTML fragment after the header section.
- **3 = webhelp.fragment.before.body** - Displays the specified XHTML fragment before the body.

- **4 = webhelp.fragment.before.logo_and_title** - Displays the specified XHTML fragment before the logo and title.
- **5 = webhelp.fragment.after.logo_and_title** - Displays the specified XHTML fragment after the logo and title.
- **6 = webhelp.fragment.before.top_menu** - Displays the specified XHTML fragment before the top menu.
- **7 = webhelp.fragment.after.top_menu** - Displays the specified XHTML fragment after the top menu.
- **8 = webhelp.fragment.before.search.input** - Displays the specified XHTML fragment before the search input component.
- **9 = webhelp.fragment.after.search.input** - Displays the specified XHTML fragment after the search input component.
- **10 = webhelp.fragment.before.main.content.area** - Displays the specified XHTML fragment before the main content area
- **11 = webhelp.fragment.after.main.content.area** - Displays the specified XHTML fragment after the main content area.
- **12 = webhelp.fragment.footer** - Displays the specified XHTML fragment in the footer section.
- **13 = webhelp.fragment.after.body** - Displays the specified XHTML fragment after the body.

Main Page Placeholder Parameters

The following placeholder parameters can be used in the *main page*. The parameter values can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment:

- **webhelp.fragment.header.main.page** - Displays the specified XHTML fragment in the header section.
- **webhelp.fragment.after.header.main.page** - Displays the specified XHTML fragment after the header section.
- **webhelp.fragment.before.body.main.page** - Displays the specified XHTML fragment before the body.
- **webhelp.fragment.before.search.input.main.page** - Displays the specified XHTML fragment before the search input component.
- **webhelp.fragment.after.search.input.main.page** - Displays the specified XHTML fragment after the search input component.
- **webhelp.fragment.before.main.content.area.main.page** - Displays the specified XHTML fragment before the main content area
- **webhelp.fragment.after.main.content.area.main.page** - Displays the specified XHTML fragment after the main content area.
- **webhelp.fragment.after.body.main.page** - Displays the specified XHTML fragment after the body.
- **webhelp.fragment.before.toc_or_tiles** - Displays the specified XHTML fragment before the main table of contents or tiles component on the main page.
- **webhelp.fragment.after.toc_or_tiles** - Displays the specified XHTML fragment after the main table of contents or tiles component on the main page.

Topic Page Placeholder Parameters

The following placeholder parameters can be used in the *topic page*. The parameter values can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment:

- **webhelp.fragment.header.topic.page** - Displays the specified XHTML fragment in the header section.
- **webhelp.fragment.after.header.topic.page** - Displays the specified XHTML fragment after the header section.
- **webhelp.fragment.before.body.topic.page** - Displays the specified XHTML fragment before the body.
- **webhelp.fragment.before.search.input.topic.page** - Displays the specified XHTML fragment before the search input component.
- **webhelp.fragment.after.search.input.topic.page** - Displays the specified XHTML fragment after the search input component.
- **webhelp.fragment.before.main.content.area.topic.page** - Displays the specified XHTML fragment before the main content area
- **webhelp.fragment.after.main.content.area.topic.page** - Displays the specified XHTML fragment after the main content area.
- **webhelp.fragment.after.body.topic.page** - Displays the specified XHTML fragment after the body.
- **webhelp.fragment.before.topic.toolbar** - Displays the specified XHTML fragment before the toolbar buttons above the topic content in the topic page.
- **webhelp.fragment.after.topic.toolbar** - Displays the specified XHTML fragment after the toolbar buttons above the topic content in the topic page.
- **webhelp.fragment.before.topic.breadcrumb** - Displays the specified XHTML fragment before the breadcrumb component in the topic page.
- **webhelp.fragment.after.topic.breadcrumb** - Displays the specified XHTML fragment after the breadcrumb component in the topic page.
- **webhelp.fragment.before.publication.toc** - Displays the specified XHTML fragment before the publication's table of contents component in the topic page.
- **webhelp.fragment.after.publication.toc** - Displays the specified XHTML fragment after the publication's table of contents component in the topic page.
- **webhelp.fragment.before.topic.content** - Displays the specified XHTML fragment before the topic's main content in the topic page.
- **webhelp.fragment.after.topic.content** - Displays the specified XHTML fragment after the topic's main content in the topic page.
- **webhelp.fragment.before.feedback** - Displays the specified XHTML fragment before the **Oxygen Feedback** commenting component in the topic page.
- **webhelp.fragment.after.feedback** - Displays the specified XHTML fragment after the **Oxygen Feedback** commenting component in the topic page.
- **webhelp.fragment.before.topic.toc** - Displays the specified XHTML fragment before the topic's table of contents component in the topic page.
- **webhelp.fragment.after.topic.toc** - Displays the specified XHTML fragment after the topic's table of contents component in the topic page.

Search Results Page Placeholder Parameters

The following placeholder parameters can be used in the *search results page*. The parameter values can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment:

- **webhelp.fragment.header.search.page** - Displays the specified XHTML fragment in the header section.
- **webhelp.fragment.after.header.search.page** - Displays the specified XHTML fragment after the header section.
- **webhelp.fragment.before.body.search.page** - Displays the specified XHTML fragment before the body.
- **webhelp.fragment.before.search.input.search.page** - Displays the specified XHTML fragment before the search input component.
- **webhelp.fragment.after.search.input.search.page** - Displays the specified XHTML fragment after the search input component.
- **webhelp.fragment.before.main.content.area.search.page** - Displays the specified XHTML fragment before the main content area
- **webhelp.fragment.after.main.content.area.search.page** - Displays the specified XHTML fragment after the main content area.
- **webhelp.fragment.after.body.search.page** - Displays the specified XHTML fragment after the body.
- **webhelp.google.search.script** - Replaces the search input component with a Google search component.

Index Terms Page Placeholder Parameters

The following placeholder parameters can be used in the *search results page*. The parameter values can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment:

- **webhelp.fragment.header.terms.page** - Displays the specified XHTML fragment in the header section.
- **webhelp.fragment.after.header.terms.page** - Displays the specified XHTML fragment after the header section.
- **webhelp.fragment.before.body.terms.page** - Displays the specified XHTML fragment before the body.
- **webhelp.fragment.before.search.input.terms.page** - Displays the specified XHTML fragment before the search input component.
- **webhelp.fragment.after.search.input.terms.page** - Displays the specified XHTML fragment after the search input component.
- **webhelp.fragment.before.main.content.area.terms.page** - Displays the specified XHTML fragment before the main content area
- **webhelp.fragment.after.main.content.area.terms.page** - Displays the specified XHTML fragment after the main content area.
- **webhelp.fragment.after.body.terms.page** - Displays the specified XHTML fragment after the body.

Using String Values in Placeholder Parameter Values

If you use strings for values of HTML fragment placeholder parameter values, the string values are written to files in the transformation's temporary directory. The values of the associated parameters reference the paths of the temporary files. This means that the HTML fragments will have a uniform processing in the *WebHelp's XSLT Module*.

Example:

Suppose the placeholder parameter has the following string value:

```
# String value
webhelp.fragment.welcome = <p>This is an HTML paragraph.</p>
```

A new file that contains the parameter's value is created:

```
[temp-dir]/whr-html-fragments/webhelp_fragment_welcome.xml
```

```
<p>This is an HTML paragraph.</p>
```

The parameter's value then becomes:

```
# Absolute file path as value
webhelp.fragment.welcome= [temp-dir]/whr-html-fragments/webhelp_fragment_welcome.xml
```

Related Information:

[How to Insert Custom HTML Content \(on page 1349\)](#)

WebHelp Responsive Macros

You can use the `whc:macro` layout component to specify a macro value (a variable that will be expanded when the output files are generated).

A macro has the following syntax:

```
${macro-name}
```

or

```
${macro-name(macro-parameter)}
```

A macro name can accept any alphanumeric characters, as well as the following characters: `-` (minus), `_` (underscore), `.` (dot), `:` (colon). The value of a parameter may contain any character except the `}` (close curly bracket) character.

Implementations

The following *macros* are supported:

i18n

For localizing a string.

```
${i18n(string.id)}
```

param

Returns the value of a transformation parameter.

```
${param(webhelp.show.main.page.tiles)}
```

env

Returns the value of an environment variable.

```
${env(JAVA_HOME)}
```

system-property

Returns the value of a system property.

```
${system-property(os.name)}
```

timestamp

Can be used to format the current date and time. Accepts a string (as a parameter) that determines how the date and time will be formatted (format string or *picture string* as it is known in the XSLT specification). The format string must comply with the [rules of the XSLT format-dateTime function specification](#).

```
${timestamp([h1]:[m01] [P] [M01]/[D01]/[Y0001])}
```

path

Returns the path associated with the specified path ID. The following paths IDs are supported:

- **oxygen-webhelp-output-dir** - The path to the output directory. The path is relative to the current HTML file.
- **oxygen-webhelp-assets-dir** - The path to the *oxygen-webhelp* subdirectory from the output directory. The path is relative to the current HTML file.
- **oxygen-webhelp-template-dir** - The path to the template directory. The path is relative to the current HTML file.

```
${path(oxygen-webhelp-template-dir)}
```

Note:

New paths IDs can be added by overriding the `wh-macro-custom-path` template from `com.oxygenxml.webhelp.responsive\xsl\template\macroExpander.xsl`:

```
<!-- Extension template for expanding a custom path macro. -->
<xsl:template name="wh-macro-custom-path">
  <xsl:param name="pathId"/>
  <xsl:value-of select="$pathId"/>
</xsl:template>
```

map-xpath

Can be used to execute an XPath expression over the DITA map file from the temporary directory.

Tip:

Available in all template layout HTML pages.

```
${map-xpath(/map/title)}
```

topic-xpath

Can be used to execute an XPath expression over the current topic.

**Tip:**

Available only in the topic HTML page template (`wt_topic.html`).

```
${topic-xpath(string-join(//shortdesc//text(), ' '))}
```

oxygen-webhelp-build-number

Returns the current WebHelp distribution ID (build number).

```
${oxygen-webhelp-build-number}
```

Extensibility

To add new *macros*, you can add an XSLT extension to overwrite the `wh-macro-extension` template from the `com.oxygenxml.webhelp.responsive\xsl\template\macroExpander.xml` file.

```

<!-- Extension template for expanding custom macro constructs -->
<xsl:template name="wh-macro-extension">
  <xsl:param name="name"/>
  <xsl:param name="params"/>
  <xsl:param name="contextNode"/>
  <xsl:param name="matchedString"/>

  <xsl:choose>
    <xsl:when test="$contextNode instance of attribute()">
      <xsl:value-of select="$matchedString"/>
    </xsl:when>
    <xsl:otherwise>
      <xsl:message>Cannot expand macro:
        [ <xsl:value-of select="$matchedString"/> ] </xsl:message>
      <xsl:copy-of select="$contextNode" />
    </xsl:otherwise>
  </xsl:choose>
</xsl:template>

```

The `wh-macro-extension` template has the following parameters:

- **name** - The name of the current *macro*.
- **params** - List of parameters of the current *macro* as a `string` sequence. The current *macros* parsing mechanism only allows *macros* with a maximum of one parameter. Consequently, this list will contain at most one element.
- **contextNode** - The current element or attribute where the *macro* was declared.
- **matchedString** - The entire value of the matched *macro* as specified in the HTML template page.

Combining WebHelp Responsive and PDF Customizations in a Template Package

An *Oxygen Publishing Template* package can contain both a WebHelp Responsive and PDF customization in the same template package and you can use that same template in both types of transformations. The template descriptor file can define the customization for both types by including both a `<webhelp>` and `<pdf>` element and some of the resources can be reused. Resources referenced in elements in the `<webhelp>` element will only be used for WebHelp transformations, and resources referenced in the elements in the `<pdf>` element will only be used in PDF transformations.

```
<publishing-template>

  <name>Flowers</name>

  <description>Flowers themed light-colored template</description>

  <webhelp>

    <tags>

      <tag>purple</tag>

      <tag>light</tag>

    </tags>

    <preview-image file="flowers-preview.png"/>

    <resources>

      <css file="flowers-wh.css"/>

      <css file="flowers-page-styling.css"/>

    </resources>

    <parameters>

      <parameter name="webhelp.show.main.page.tiles" value="no"/>

      <parameter name="webhelp.show.main.page.toc" value="yes"/>

    </parameters>

  </webhelp>

  <pdf>

    <tags>

      <tag>purple</tag>

      <tag>light</tag>

    </tags>

    <preview-image file="flowers-preview.png"/>

    <resources>

      <css file="flowers-pdf.css"/>

      <css file="flowers-page-styling.css"/>

    </resources>

    <parameters>

      <parameter name="show.changes.and.comments" value="yes"/>

    </parameters>

</publishing-template>
```

```
<pdf>
```

```
</publishing-template>
```

[Publishing Template Package Contents for PDF Customizations \(on page 1470\)](#)

HTML Page Layout Files

The HTML page layout files define the default layout of the generated pages in the output for the built-in template. There are four types of pages (*main*, *search*, *topic*, *index*) and each type of page is a simple HTML file. Each page type has various components that appear by default and each component has a corresponding element and when that element is included in the HTML file, the corresponding components will appear in the output.

Warning:

It is no longer recommended for you to customize these files because if you upgrade to a newer version of **Oxygen**, those files may no longer produce the desired results and if new components have been added, you won't have access to them. Instead, use any of the other methods described in [Publishing Template Package Contents for WebHelp Responsive Customizations \(on page 1300\)](#).

If you do choose to customize these HTML files, each type of page is defined inside an `<html-page-layout-files>` element in the descriptor file.

```
<publishing-template>
...
<webhelp>
...
<!-- HTML page layout files -->
<html-page-layout-files>
  <page-layout-file page="main" file="page-templates/wt_index.html"/>
  <page-layout-file page="search" file="page-templates/wt_search.html"/>
  <page-layout-file page="topic" file="page-templates/wt_topic.html"/>
  <page-layout-file page="index-terms" file="page-templates/wt_terms.html"/>
</html-page-layout-files>
```

If you do use the **html-page-layout-files** element, you must specify all four types of pages (*main*, *search*, *topic*, *index*). When not specified, the files from the `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates` folder will be used to define the layout of each type of page.

HTML Page Components

Each type of page contains various components that control the layout of that page. The rendering of each component depends on the context where it is placed and its content depends on the transformed *DITA map* (on page 2268).

Some of the components can be used in all four types of pages, while some are only available for certain pages. For instance, the *Publication Title* component can be used in all pages, but the *Navigation Breadcrumb* component can only be used in the **Topic Page**.

To include a component in the output of a particular type of page, you have to reference a specific element in that particular HTML file. All the elements associated with a component should belong to the `http://www.oxygenxml.com/webhelp/components` namespace.

Every component can contain custom content or reference another component. To specify where the component content will be located in the output, you can use the `<whc:component_content>` element as a descendant of the component element. It can specify the location as before, after, or it can wrap the component content. The following snippet contains an example of each:

```
<whc:webhelp_search_input class="navbar-form wh_main_page_search"
  role="form" >
  <div class="custom-content-before">Enter search terms here:</div>
  <div class="custom-wrapper">
    <whc:component_content/>
  </div>
  <div class="custom-content-after">Results will be displayed in a new window.</div>
</whc:webhelp_search_input>
```

Main Page

The *Main Page* is the home page generated in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_index.html` and it is located in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates`.

The main function of the home page is to display top-level information and provide links that help you easily navigate to any of the top-level topics of the publication. These links can be rendered in either a *Tiles* or *Tree* style of layout. The HTML page produced for the home page also consists of various other components, such as a logo, title, menu, search field, or index link.

Figure 393. Examples of Main Page Components for a Tiles Style of Layout

1. Publication Logo (on page 1319)
2. Publication Title (on page 1319)
3. Search Input (on page 1320)
4. Main Menu (on page 1320)
5. Index Terms Link (on page 1321)
6. Topic Tiles (on page 1320)
7. Print Link (on page 1320)

Figure 394. Examples of Main Page Components for a Tree Style of Layout

1. Publication Logo (on page 1319)
2. Publication Title (on page 1319)
3. Search Input (on page 1320)
4. Main Menu (on page 1320)
5. Index Terms Link (on page 1321)
6. Table of Contents (on page 1321)
7. Print Link (on page 1320)

The following components can be referenced in the *Main Page* (`wt_index.html`) file:

Publication Title (`webhelp_publication_title`)

This component generates the publication title in the output. To generate this component, the `<whc:webhelp_publication_title>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_publication_title
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_publication_title`.

Publication Logo (`webhelp_logo`)

This component generates a logo image in the output. To generate this component, the `<whc:webhelp_logo>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_logo
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the **Parameters** tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

Search Input (`webhelp_search_input`)

This component is used to generate the input widget associated with search function in the output. To generate this component, the `<whc:webhelp_search_input>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_search_input
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_search_input`.

Print Link (`webhelp_print_link`)

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `<whc:webhelp_print_link>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_print_link
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_print_link`.

Main Menu (`webhelp_top_menu`)

This component generates a menu with all the documentation topics. To generate this component, the `<whc:webhelp_top_menu>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_top_menu
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_top_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the **Parameters** tab of the transformation scenario).

For information about customizing the menu, see [How to Customize the Menu \(on page 1358\)](#).

Main Page Topic Tiles (`webhelp_tiles`)

This component generates the tiles section in the main page. This section will contain a tile for each root topic of the published documentation. Each topic tile has three sections that correspond to the topic title, short description, and image. To generate this component, the `<whc:webhelp_tiles>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_tiles
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_tiles`.

If you want to control the HTML structure that is generated for a WebHelp tile you can also specify the template for a tile by using the `<whc:webhelp_tile>` component, as in the following example:

```
<whc:webhelp_tile class="col-md-4">
  <!-- Place holder for tile's image -->
  <whc:webhelp_tile_image/>

  <div class="wh_tile_text">
    <!-- Place holder for tile's title -->
    <whc:webhelp_tile_title/>

    <!-- Place holder for tile's shordesc -->
    <whc:webhelp_tile_shortcode/>
  </div>
</whc:webhelp_tile>
```

For information about customizing the tiles, see [How to Configure the Tiles on the WebHelp Responsive Main Page \(on page 1363\)](#).

Main Page Table of Contents (`webhelp_main_page_toc`)

This component generates a simplified Table of Contents. It is simplified because it contains only two levels from the documentation hierarchy. To generate this component, the `<whc:webhelp_main_page_toc>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_main_page_toc
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_main_page_toc`.

Index Terms Link (`webhelp_indexterms_link`)

This component can be used to generate a link to the index terms page (`indexterms.html`). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the `<whc:webhelp_indexterms_link>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_indexterms_link  
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_indexterms_link`. This component will contain a link to the `indexterms.html` page.

Link to Skins Resources (`webhelp_skin_resources`)

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `<whc:webhelp_skin_resources>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_skin_resources/>
```

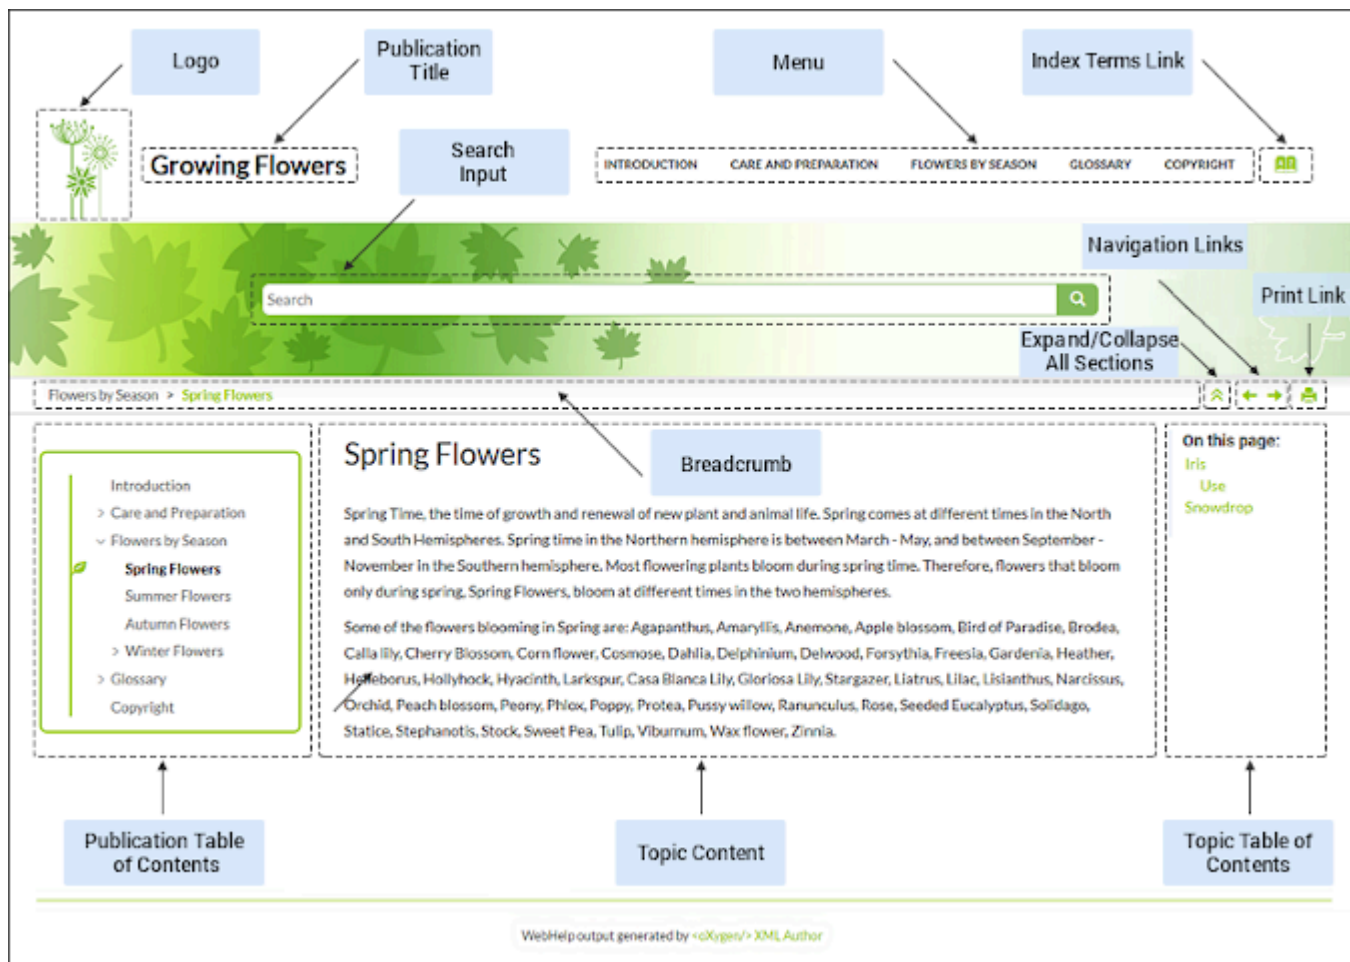

In the output, you will find a link to the skin resources.

Topic Page

The *Topic Page* is the page generated for each DITA topic in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_topic.html` and it is located in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates`.

The HTML pages produced for each topic consist of the topic content along with various other additional components, such as a title, menu, navigation breadcrumb, print icon, or side table of contents.

Figure 395. Examples of Topic Page Components

1. Publication Logo (on page 1324)
2. Publication Title (on page 1323)
3. Search Input (on page 1324)
4. Main Menu (on page 1326)
5. Index Terms Link (on page 1326)
6. Expand/Collapse All Sections (on page 1326)
7. Navigation Links (on page 1324)
8. Print Link (on page 1325)
9. Breadcrumb (on page 1324)
10. Publication Table of Contents (on page 1325)
11. Topic Content (on page 1325)
12. Topic Table of Contents (on page 1325)

The following components can be referenced in the *Topic Page* (`wt_topic.html`) file:

Publication Title (`webhelp_publication_title`)

This component generates the publication title in the output. To generate this component, the `<whc:webhelp_publication_title>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_publication_title
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_publication_title`.

Publication Logo (`webhelp_logo`)

This component generates a logo image in the output. To generate this component, the `<whc:webhelp_logo>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_logo
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the **Parameters** tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

Search Input (`webhelp_search_input`)

This component is used to generate the input widget associated with search function in the output. To generate this component, the `<whc:webhelp_search_input>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_search_input
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_search_input`.

Topic Breadcrumb (`webhelp_breadcrumb`)

This component generates a breadcrumb that displays the path of the current topic. To generate this component, the `<whc:webhelp_breadcrumb>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_breadcrumb
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_breadcrumb`. This component will contain a list with items that correspond to the topics in the path. The first item in the list has a link to the main page with the `home` class. The last item in the list corresponds to the current topic and has the `active` class set.

Navigation Links (`webhelp_navigation_links`)

This component generates navigation links to the next and previous topics. To generate this component, the `<whc:webhelp_navigation_links>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_navigation_links
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_navigation_links`. This component will contain the links to the next and previous topics.

Print Link (`webhelp_print_link`)

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `<whc:webhelp_print_link>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_print_link
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_print_link`.

Topic Content (`webhelp_topic_content`)

This component generates the content of a topic and it represent the content of the HTML files as they are produced by the DITA-OT processor. To generate this component, the `<whc:webhelp_topic_content>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_topic_content
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_topic_content`.

Publication TOC (`webhelp_publication_toc`)

This component generates a mini table of contents for the current topic (on the left side). It will contain links to the children of the current topic, its siblings, and all of its ancestors. To generate this component, the `<whc:webhelp_publication_toc>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_publication_toc
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_publication_toc`. This component will contain links to the topics referenced in the DITA map. It also includes an expand/collapse button (either `<` to collapse or the `>` to expand).

Topic TOC (`webhelp_topic_toc`)

This component generates a topic table of contents for the current topic (on the right side) with a heading named **On this page**. It contains links to each section within the current topic and

the section corresponding to the current scroll position is highlighted. The topic must contain at least two `<section>` elements and each `<section>` must have an `@id` attribute. To generate this component, the `<whc:webhelp_topic_toc>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_topic_toc
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_topic_toc`. This component will contain links to the sections within the current topic. It also includes an expand/collapse button (either `>` to collapse or the `<` to expand).

Expand/Collapse Sections (`webhelp_expand_collapse_sections`)

This component is used to generate an icon that expands or collapses sections listed in the side table of contents within a topic. To generate this component, the `<whc:webhelp_expand_collapse_sections>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_expand_collapse_sections
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `webhelp_expand_collapse_sections`.

Topic Feedback (`webhelp_feedback`)

This component generates a placeholder for where the comments section will be presented. To generate this component, the `<whc:webhelp_feedback>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_feedback
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

Main Menu (`webhelp_top_menu`)

This component generates a menu with all the documentation topics. To generate this component, the `<whc:webhelp_top_menu>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_top_menu
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_top_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the **Parameters** tab of the transformation scenario).

For information about customizing the menu, see [How to Customize the Menu \(on page 1358\)](#).

Index Terms Link (`webhelp_indexterms_link`)

This component can be used to generate a link to the index terms page (`indexterms.html`). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the `<whc:webhelp_indexterms_link>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_indexterms_link
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_indexterms_link`. This component will contain a link to the `indexterms.html` page.

Child Links (`webhelp_child_links`)

For all topics with subtopics (child topics), this component generates a list of links to each child topic. To generate this component, the `<whc:webhelp_child_links>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_child_links
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

Related Links (`webhelp_related_links`)

For all topics that contain related links, this component generates a list of related links that will appear in the output. To generate this component, the `<whc:webhelp_related_links>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_related_links
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

Link to Skins Resources (`webhelp_skin_resources`)

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `<whc:webhelp_skin_resources>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

Search Results Page

The *Search Results Page* is the page generated that presents search results in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_search.html` and it is located in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates`.

The HTML page that is produced consists of a search results component along with various other additional components, such as a title, menu, or index link.

Figure 396. Examples of Search Results Page Components

1. Publication Logo (on page 1328)
2. Publication Title (on page 1328)
3. Search Input (on page 1329)
4. Main Menu (on page 1329)
5. Index Terms Link (on page 1330)
6. Search Results (on page 1329)
7. Print Link (on page 1329)

The following components can be referenced in the *Search Results Page* (`wt_search.html`) file:

Publication Title (`webhelp_publication_title`)

This component generates the publication title in the output. To generate this component, the `<whc:webhelp_publication_title>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_publication_title
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_publication_title`.

Publication Logo (`webhelp_logo`)

This component generates a logo image in the output. To generate this component, the `<whc:webhelp_logo>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_logo
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the **Parameters** tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

Search Input (`webhelp_search_input`)

This component is used to generate the input widget associated with search function in the output. To generate this component, the `<whc:webhelp_search_input>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_search_input
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_search_input`.

Search Results (`webhelp_search_results`)

This component is used to generate a placeholder to signal where the search results will be presented in the output. To generate this component, the `<whc:webhelp_search_results>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_search_results
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_search_results`.

Print Link (`webhelp_print_link`)

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `<whc:webhelp_print_link>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_print_link
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_print_link`.

Main Menu (`webhelp_top_menu`)

This component generates a menu with all the documentation topics. To generate this component, the `<whc:webhelp_top_menu>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_top_menu
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_top_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the **Parameters** tab of the transformation scenario).

For information about customizing the menu, see [How to Customize the Menu \(on page 1358\)](#).

Index Terms Link (`webhelp_indexterms_link`)

This component can be used to generate a link to the index terms page (`indexterms.html`). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the `<whc:webhelp_indexterms_link>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_indexterms_link
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_indexterms_link`. This component will contain a link to the `indexterms.html` page.

Link to Skins Resources (`webhelp_skin_resources`)

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `<whc:webhelp_skin_resources>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

Index Terms Page

The *Index Terms Page* is the page generated that presents index terms in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_terms.html` and it is located in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates`.

The HTML page that is produced consists of an index terms section along with various other additional components, such as a title, menu, or search field.

An alphabet that contains the first letter of the documentation index terms is generated at the top of the index page. Each letter represents a link to a specific indices section.

Figure 397. Example of Index Terms Page Components

1. Publication Logo (on page 1331)
2. Publication Title (on page 1331)
3. Search Input (on page 1332)
4. Main Menu (on page 1332)
5. Index Terms Link (webhelp_indexterms_link) (on page 1332)
6. Print Link (on page 1332)

The following components can be referenced in the *Index Terms Page* (`wt_terms.html`) file:

Publication Title (webhelp_publication_title)

This component generates the publication title in the output. To generate this component, the `<whc:webhelp_publication_title>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_publication_title
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_publication_title`.

Publication Logo (webhelp_logo)

This component generates a logo image in the output. To generate this component, the `<whc:webhelp_logo>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_logo
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the **Parameters** tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

Search Input (`webhelp_search_input`)

This component is used to generate the input widget associated with search function in the output. To generate this component, the `<whc:webhelp_search_input>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_search_input
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_search_input`.

Print Link (`webhelp_print_link`)

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `<whc:webhelp_print_link>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_print_link
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_print_link`.

Main Menu (`webhelp_top_menu`)

This component generates a menu with all the documentation topics. To generate this component, the `<whc:webhelp_top_menu>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_top_menu
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_top_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the **Parameters** tab of the transformation scenario).

For information about customizing the menu, see [How to Customize the Menu \(on page 1358\)](#).

Index Terms Link (`webhelp_indexterms_link`)

This component can be used to generate a link to the index terms page (`indexterms.html`). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the `<whc:webhelp_indexterms_link>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_indexterms_link
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_indexterms_link`. This component will contain a link to the `indexterms.html` page.

Link to Skins Resources (`webhelp_skin_resources`)

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `<whc:webhelp_skin_resources>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

Generating WebHelp Responsive Output

The publishing process can be initiated from a transformation scenario within **Oxygen XML Editor/Author**, from a command line outside **Oxygen XML Editor/Author**, or from an integration server.

Running WebHelp Responsive from Oxygen XML Editor/Author

To publish a *DITA map* (on page 2268) as **WebHelp Responsive** output, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** action from the toolbar.
2. Select the **DITA Map WebHelp Responsive** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab** - This tab contains a set of built-in skins that you can use for the layout of your WebHelp system output.
- **Parameters Tab** - This tab includes numerous transformation parameters that can be set to customize your WebHelp system output.
- **Feedback Tab** - This tab is for those who want to add the **Oxygen Feedback comments component** at the bottom of each WebHelp page so that you can interact with your readers.
- **Filters Tab** - This tab allows you to filter certain content elements from the generated output.

- **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to process the transformation.

Result: When the **DITA Map WebHelp Responsive** transformation is complete, the output is automatically opened in your default browser.

Automating the WebHelp Responsive Output for DITA

DITA-based WebHelp output can be generated from an automated publishing process [using a command line outside of Oxygen XML Editor/Author](#) or an automatic publishing system, such as *Jenkins* or *Travis*. **However, to do this, you must purchase an additional Oxygen XML WebHelp license.**

Adding Oxygen Feedback to WebHelp Responsive Documentation

You can add Oxygen Feedback in WebHelp Responsive for DITA output to benefit from a modern commenting system, advanced ready-to-use search engine, administrative interface, and **Oxygen XML Editor/Author** integration.

Comments Component

A comments component is presented in your WebHelp Responsive output to provide a simple and efficient way for your community to interact and offer feedback. The comments component is contributed by **Oxygen Feedback**, a modern comment management system that can be integrated with your WebHelp Responsive output to provide a comments area at the bottom of each WebHelp page where readers can add new comments or reply to existing ones.

External Search Engine

Oxygen Feedback can be [configured as an external search engine](#) for the **Oxygen WebHelp Responsive** output. This function can be enabled from the *Content Indexing and Search* section that is available in the *Version Settings* page.

Administration Interface

Oxygen Feedback includes a modern, user-friendly administration interface where you can moderate comments, manage users, view statistics, and configure settings. It is very easy to integrate and there are no requirements for installing additional software. You simply need to create an [Oxygen Feedback site configuration in the administration interface](#), copy the HTML installation fragment that is generated at the end of the creation process, and paste the generated fragment in the **Feedback** tab in the WebHelp Responsive transformation scenario dialog box (*on page* [Feedback](#)).

Oxygen XML Editor/Author Integration

An add-on is available that contributes a **Feedback Comments Manager view** in *Oxygen XML Editor/Author* where the documentation team can see all the comments added in your WebHelp

output. This means they can react to user feedback by making corrections and updating the source content without leaving the application.

Deploying the Oxygen Feedback Comments Component

Prerequisite

To install and manage **Oxygen Feedback**, you will need to obtain a license for the product. This requires that you choose a subscription plan during the installation procedure. To see the subscription plans prior to installing the product, go to: https://www.oxygenxml.com/oxygen_feedback/buy_feedback.html.

Installation Procedure

1. Log in to your Feedback account from the *administration login page* (<https://feedback.oxygenxml.com/login>). You can click on **Log in with Google** or **Log in with Facebook** to create an account using your Google or Facebook credentials, or click the **Sign Up** tab to create an account using your name and email address.
2. Click the **Add site** button to create a site configuration. If you have not already selected a subscription plan, you will be directed to a page where you can choose from several options.
3. In the **Settings** page, enter a **Name** and **Description** for the site configuration. There are some optional settings that can be adjusted according to your needs. For more details, see the [Site Settings topic](#). Click **Continue**.
4. In the **Initial version** page, enter the **Base URL** for your website (you can add additional URLs by clicking the  **Add** button). You can also specify an **Initial version** if you want it to be something other than *1.0*. If you do not plan to have multiple versions, leave the version as *1.0*. For more details, see the [Initial Version topic](#).
5. [Optional] To configure Oxygen Feedback as an external search engine check the **Enable content indexing** option.
6. Click **Continue**.
7. In the **Installation** page, choose a site generation option:
 - a. If you will generate the documentation using a transformation scenario in *Oxygen XML Editor/Author*, select the **Oxygen XML Editor** option and continue with these steps:
 - i. Copy the generated HTML fragment and click **Finish**.
 - ii. In *Oxygen XML Editor/Author*, open the **Configure Transformation Scenario(s)** dialog box.
 - iii. Select and duplicate the **DITA Map WebHelp Responsive** scenario.
 - iv. Go to the **Feedback** tab.
 - v. Click the **Edit** button and paste the generated installation fragment.
 - b. If you will generate the documentation using a command-line script, select the **Oxygen XML WebHelp** option and continue with these steps:
 - i. Copy the generated HTML fragment and click **Finish**.
 - ii. Create an XML file (for example, `feedback-install.xml`) with the generated installation fragment.

- iii. Use the `webhelp.fragment.feedback` parameter in your command-line script to specify the path to the file you just created. For example:

```
dita.bat -Dwebhelp.fragment.feedback=c:\path\to\feedback-install.xml
```

8. [Optional] If you want the **Oxygen Feedback** comments component to fill the entire page width, contribute a custom CSS file (use the `args.css` parameter to reference it) that contains the following style rule:

```
div.footer {
    float: none;
}
```

For more details about **Oxygen Feedback**, how to configure settings, moderate comments, view statistics, and much more, see the [Oxygen Feedback user guide](#).

Also, to see a demonstration of **Oxygen Feedback** being integrated into WebHelp Responsive output, watch our Webinar: [DITA Publishing and Feedback with Oxygen Tools](#).

Customizing WebHelp Responsive Output

Oxygen XML Developer provides support for customizing the **WebHelp Responsive** output to suit your specific needs. The **WebHelp Responsive** output is based upon the *Bootstrap* responsive front-end framework and is available for DITA document types.

To change the overall appearance of your **WebHelp Responsive** output, you can use several different customization methods or a combination of methods. If you are familiar with CSS and coding, you can style your WebHelp output through your own custom stylesheets. You can also customize your output by modifying existing templates, create your own layout pages, or by configuring certain options and parameters in the transformation scenario.

This section includes topics that explain various ways to customize your WebHelp Responsive system output, such as how to configure the tiles on the main page, add logos in the title area, integrate with social media, localizing the interface, and much more.

For an in-depth look at WebHelp Responsive features and some customization tips, watch our Webinar: [DITA Publishing and Feedback with Oxygen Tools](#).

Working with Publishing Templates

An *Oxygen Publishing Template (on page 2270)* defines all aspects of the layout and styles of the **WebHelp Responsive** output. It is a self-contained customization package stored as a ZIP archive or folder that can easily be shared with others. It provides the primary method for customizing the output. The recommended method for customizing the *WebHelp Responsive* output is to use a custom publishing template.

This section contains topics about how to create, edit, publish, and share publishing templates.

[Publishing Template Package Contents for WebHelp Responsive Customizations \(on page 1300\)](#)

How to Create a Publishing Template

To create a customization, you can start from scratch or from an existing template, and then adapt it according to your needs.

Creating a Publishing Template Starting from Scratch

To create a new *Oxygen Publishing Template (on page 2270)*, follow these steps:

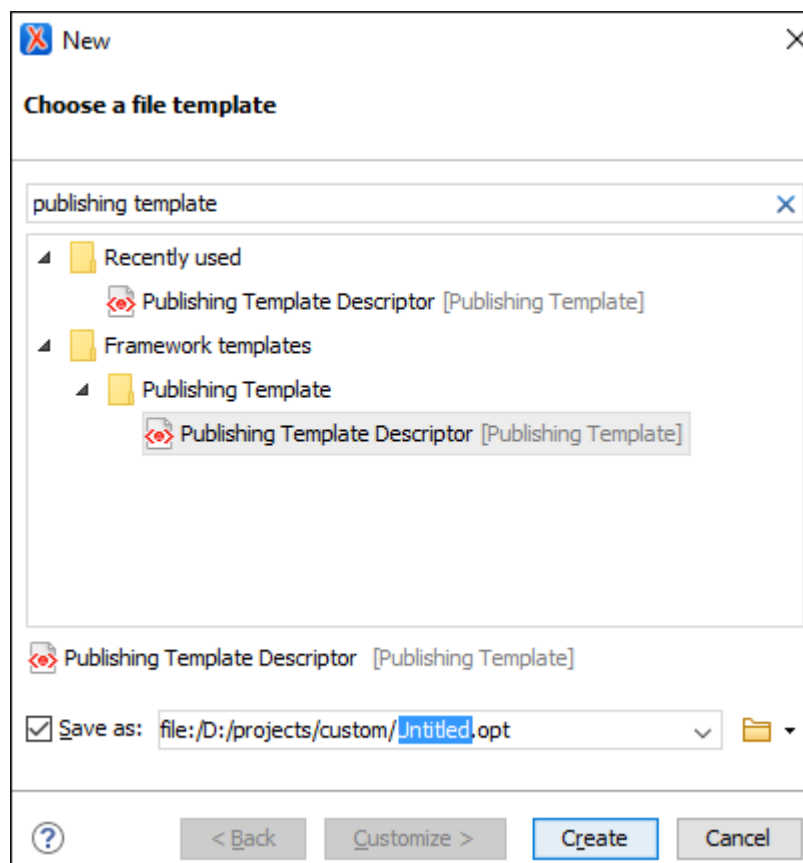

1. Create a folder that will contain all the template files.
2. In **Oxygen XML Editor/Author**, open the new document wizard (use **File > New** or the  **New** toolbar button), then choose the **Publishing Template Descriptor** template.

Figure 398. Choosing the Publishing Template Descriptor Document Template

3. Save the `.opt` file into your customization directory.
4. Open the `.opt` file in the editor and customize it to suit your needs.

Creating a Publishing Template Starting from an Existing Template

If you are using a **DITA Map WebHelp Responsive** or **DITA Map PDF - based on HTML5 & CSS** transformation, the easiest way to create a new *Oxygen Publishing Template (on page 2270)* is to select an existing template

in the transformation scenario dialog box and use the **Save template as** button to save that template into a new template package that can be used as a starting point.

To create a new *Oxygen Publishing Template*, follow these steps:

1. Open the transformation scenario dialog box and select the publishing template you want to export and use as a starting point.
2. **Optional:** You can set one or more transformation parameters from the **Parameters** tab and the edited parameters will be exported along with the selected template. You will see which parameters will be exported in the dialog box that is displayed after the next step.
3. Click the **Save template as** button.

Step Result: This opens a template package configuration dialog box that contains some options and displays the parameters that will be exported to your template package.

4. Specify a name for the new template.
5. **Optional:** Specify a template description.
6. **Optional:** The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (**DITA Map WebHelp Responsive** or **DITA Map to PDF - based on HTML5 & CSS**). You can use the **Include WebHelp customization** and **Include PDF customization** options to specify whether your custom template will include both types of customizations.
7. **Optional:** For **WebHelp Responsive** customizations, you can select the **Include HTML Page Layout Files** option if you want to copy the default *HTML Page Layout Files (on page 1316)* in your template package. They are helpful if you want to change the structure of the generated HTML pages.
8. In the **Save as** field, specify the name and path of the ZIP file where the template will be saved.

Step Result: A new ZIP archive will be created on disk in the specified location with the specified name.

9. Open the `.opt` file in the editor and customize it to suit your needs.

For more information about creating and customizing publishing templates, watch our video demonstration:

<https://www.youtube.com/embed/zNmXfKWwO8>

Creating a Publishing Template Using the Oxygen Styles Basket

Another way to create an *Oxygen Publishing Template (on page 2270)* is to use the **Oxygen Styles Basket**. This tool is a handy free-to-use web-based visual tool that helps you create your own *Publishing Template Package* to customize your **DITA Map WebHelp Responsive** transformation scenarios.

It is based on galleries that you can visit to pick styling aspects to create a custom look and feel. Various different types of styles can be selected (such as fonts, tables, lists, spacing, code) and all changes can be seen in the **Preview** pane. You can also click the **See Results** button to generate a preview of either WebHelp or PDF output.

It is possible to **Download** the current template or **Upload** a previously generated template for further customization.

Figure 399. Oxygen Styles Basket Interface

Resources

For more information about the **Oxygen Styles Basket**, see the following resources:

- **Video: Introducing the New Oxygen Styles Basket**
- **Webinar: Using Oxygen Styles Basket to Create CSS Customization from Scratch**

Related information

[Publishing Template Package Contents for WebHelp Responsive Customizations \(on page 1300\)](#)

How to Edit a Packed Publishing Template

To edit an existing *Oxygen Publishing Template (on page 2270)* package, follow these steps:

1. Unzip the ZIP archive associated with the *Oxygen Publishing Template* in a separate folder.
2. Link the folder associated with the template in the **Project** view.
3. Using the **Project** view, you can modify the resources (CSS, JS, fonts) within the *Oxygen Publishing Template* folder to fit your needs.
4. Open the publishing template descriptor file (.opt extension) in the editor and modify it to suit your needs.
5. **Optional:** Once you finish your customization, you can archive the folder as a ZIP file.

Related Information:

[Publishing Template Package Contents for PDF Customizations \(on page 1470\)](#)

[Publishing Template Package Contents for WebHelp Responsive Customizations \(on page 1300\)](#)

How to Add a Publishing Template to the Publishing Templates Gallery

To add the publishing template to your templates gallery, follow these steps:

1. Open the transformation scenario dialog box by editing a WebHelp Responsive transformation.
2. In the **Templates** tab, click the **Configure Publishing Templates Gallery** link to.

This will open the preferences page.

3. Click the **Add** button and specify the location of your template directory.

Your template directory is now added to the **Additional Publishing Templates Galleries** list.

4. Click **OK** to return to the transformation scenario dialog box.

All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

How to Use a Publishing Template from a Command Line

Before you run the transformation, you need to know if the publishing template has a [single template descriptor file](#) or [multiple descriptor files \(on page 1300\)](#). If you don't know, open the ZIP archive or folder and check for files with the `.opt` extension.

Using a Publishing Template with a Single Descriptor

A template with a single descriptor is used for a single customization.

To run from a command line, you need to use the [webhelp.publishing.template](#) parameter (on page 1433). This parameter specifies the path to the ZIP archive (or root folder) that contains your custom WebHelp Responsive template.

Command-Line Example:

- Windows

```
dita.bat
--format=webhelp-responsive
--input=c:\path\to\mySample.ditamap
--output=c:\path\to\output
-Dwebhelp.publishing.template=custom-template
```

- Linux/macOS

```
dita
--format=webhelp-responsive
--input=/path/to/mySample.ditamap
```

```
--output=/path/to/output  
-Dwebhelp.publishing.template=custom-template
```

**Tip:**

You can also start the `dita` process by passing it a [DITA OT Project File](#). Inside the project file you can specify as parameters for the `webhelp-responsive` transformation type the WebHelp-related parameters.

Using a Publishing Template with Multiple Descriptors

A template with multiple descriptors contains multiple customizations.

Because the publishing template is self-contained, it is used to reuse resources that are common to multiple publications.

To run from a command line, you need to use the [webhelp.publishing.template](#) (on page 1433) and [webhelp.publishing.template.descriptor](#) (on page 1433) parameters.

The [webhelp.publishing.template](#) (on page 1433) parameter specifies the path to the ZIP archive (or root folder) while the [webhelp.publishing.template.descriptor](#) (on page 1433) parameter specifies the name of the descriptor you want to use.

Command-Line Example:

- Windows

```
dita.bat  
  
--format=webhelp-responsive  
  
--input=c:\path\to\mySample.ditamap  
  
--output=c:\path\to\output  
  
-Dwebhelp.publishing.template=custom-template  
  
-Dwebhelp.publishing.template.descriptor=flowers.opt
```

- Linux/macOS

```
dita  
  
--format=webhelp-responsive  
  
--input=/path/to/mySample.ditamap  
  
--output=/path/to/output  
  
-Dwebhelp.publishing.template=custom-template  
  
-Dwebhelp.publishing.template.descriptor=flowers.opt
```

**Tip:**

You can also start the `dita` process by passing it a [DITA OT Project File](#). Inside the project file you can specify as parameters for the `webhelp-responsive` transformation type the WebHelp-related parameters.

How to Share a Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder in your project.
2. Go to **Options > Preferences > DITA > Publishing** and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to **Project Options**.
4. Share your project file (`.xpr`).

Troubleshooting: Errors Encountered when Loading Templates

When the **Templates** tab of a **WebHelp Responsive** transformation scenario dialog box is opened, all templates (built-in and custom) are loaded and validated. Specifically, certain elements in the [template descriptor file \(on page 1300\)](#) are checked for validity. If errors are encountered that prevents the template from loading, the following message will be displayed toward the bottom of the dialog box:

 Some templates could not be loaded. [More details](#)

If you click the **More details** link, a window will open with more information about the encountered error. For example, it might offer a hint that the element is missing from the expected [descriptor file structure \(on page 1300\)](#).

Also, if a template could be loaded, but certain elements could not be found in the [descriptor file \(on page 1300\)](#), a warning icon () will be displayed on the template's image (in the **Templates** tab of the transformation dialog box). For example, this happens if a valid [preview-image element \(on page 1303\)](#) cannot be found.

Converting Old Templates to Newer Versions

WebHelp templates that were created in older versions of Oxygen XML Developer can be converted to the Publishing Template format that was introduced in Oxygen XML Developer version 20.0. This section contains several procedures for converting old templates depending on the version they were created in.

Convert Version 25 - 27.0 Publishing Templates to Version 27.1

If you have a custom Publishing Template that was created in Oxygen XML Developer version 25, 26, or 27.0, the following conversion procedure is required for the template to be compatible with Oxygen XML Developer version 27.1:

1. In the **Project** view, add the root directory for your custom Publishing Template (you can [use a linked folder \(on page 364\)](#) and the easiest way to do this is to drag and drop the folder).

**Note:**

If your template is stored as a ZIP archive, you first need to unzip it.

2. Expand your template directory, right-click the `page-templates` subfolder, and select **Refactoring > XML Refactoring**.
3. In the **XML Refactoring** dialog box, scroll to the **Publishing Template** section and select **Migrate HTML Page Layout Files to v27.1**, then click **Next**.
4. The **Scope** should be left as **Selected project resources**.
5. You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.
6. Click **Finish** to perform the conversion.

Result: The converted Publishing Template can now be used in version 27.1.

[Convert Version 20 Publishing Templates to Version 21 \(on page 1346\)](#)

Convert Version 24.1 Publishing Templates to Version 25

If you have a custom Publishing Template that was created in Oxygen XML Developer version 24.1, the following conversion procedure is required for the template to be compatible with Oxygen XML Developer version 25.0:

1. In the **Project** view, add the root directory for your custom Publishing Template (you can [use a linked folder \(on page 364\)](#) and the easiest way to do this is to drag and drop the folder).

**Note:**

If your template is stored as a ZIP archive, you first need to unzip it.

2. Expand your template directory, right-click the `page-templates` subfolder, and select **Refactoring > XML Refactoring**.
3. In the **XML Refactoring** dialog box, scroll to the **Publishing Template** section and select **Migrate HTML Page Layout Files to v25**, then click **Next**.
4. The **Scope** should be left as **Selected project resources**.

5. You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.
6. Click **Finish** to perform the conversion.

Result: The converted Publishing Template can now be used in version 25.0.

[Convert Version 20 Publishing Templates to Version 21 \(on page 1346\)](#)

Convert Version 24.0 Publishing Templates to Version 24.1

If you have a custom Publishing Template that was created in Oxygen XML Developer version 24.0, the following conversion procedure is required for the template to be compatible with Oxygen XML Developer version 24.1:

1. In the **Project** view, add the root directory for your custom Publishing Template (you can [use a linked folder \(on page 364\)](#) and the easiest way to do this is to drag and drop the folder).

Note:

If your template is stored as a ZIP archive, you first need to unzip it.

2. Expand your template directory, right-click the `page-templates` subfolder, and select **Refactoring > XML Refactoring**.
3. In the **XML Refactoring** dialog box, scroll to the **Publishing Template** section and select **Migrate HTML Page Layout Files to v24.1**, then click **Next**.
4. The **Scope** should be left as **Selected project resources**.
5. You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.
6. Click **Finish** to perform the conversion.

Result: The converted Publishing Template can now be used in version 24.1.

Related information

[Convert Version 22 Publishing Templates to Version 23 \(on page 1345\)](#)

[Convert Version 21 Publishing Templates to Version 22 \(on page 1346\)](#)

[Convert Version 20 Publishing Templates to Version 21 \(on page 1346\)](#)

Convert Version 23 Publishing Templates to Version 24

If you have a custom Publishing Template that was created in Oxygen XML Developer version 23.0 or 23.1, the following conversion procedure is required for the template to be compatible with Oxygen XML Developer version 24:

1. In the **Project** view, add the root directory for your custom Publishing Template (you can [use a linked folder \(on page 364\)](#) and the easiest way to do this is to drag and drop the folder).

**Note:**

If your template is stored as a ZIP archive, you first need to unzip it.

2. Expand your template directory, right-click the `page-templates` subfolder, and select **Refactoring > XML Refactoring**.
3. In the **XML Refactoring** dialog box, scroll to the **Publishing Template** section and select **Migrate HTML Page Layout Files to v24**, then click **Next**.
4. The **Scope** should be left as **Selected project resources**.
5. You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.
6. Click **Finish** to perform the conversion.

Result: The converted Publishing Template can now be used in version 24.

Related information

Convert Version 21 Publishing Templates to Version 22

If you have a custom Publishing Template that was created in Oxygen XML Developer version 21.0 or 21.1, the following conversion procedure is required for the template to be compatible with Oxygen XML Developer version 22:

1. In the **Project** view, add the root directory for your custom Publishing Template (you can [use a linked folder \(on page 364\)](#) and the easiest way to do this is to drag and drop the folder).

**Note:**

If your template is stored as a ZIP archive, you first need to unzip it.

2. Expand your template directory, right-click the `page-templates` subfolder, and select **Refactoring > XML Refactoring**.
3. In the **XML Refactoring** dialog box, scroll to the **Publishing Template** section and select **Migrate HTML Page Layout Files to v22**, then click **Next**.
4. The **Scope** should be left as **Selected project resources**.
5. You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.
6. Click **Finish** to perform the conversion.

Result: The converted Publishing Template can now be used in version 22.

Changing the Layout and Styles

This section contains topics that explain how to customize the output using CSS, inserting HTML fragments, changing the layout of the main page, and more.

How to Use CSS Styling to Customize the Output

The most common way to customize WebHelp Responsive output is to use custom CSS styling. This method can be used to make small, simple styling changes or more advanced, precise changes. To implement the styling in your WebHelp output, you simply need to create the custom CSS file and reference it in your transformation scenario (using an [Oxygen Publishing Template \(on page 2270\)](#) or a transformation parameter). This custom file will be the final CSS to be applied so its content will override the styles in the other pre-existing CSS files.

Using CSS Inspector to Identify Content for Custom CSS File

You can use your browser's CSS inspector to identify the pertinent code in the current CSS files and you can even make changes directly in the CSS inspector to test the results so that you know exactly what content to use in your custom CSS file.

In most popular browsers (such as Chrome, Firefox, and Edge), you can access the CSS inspector by using **F12** or by selecting **Inspect Element** (or simply **Inspect**) from the contextual menu.

Tip:

When using Safari on macOS, you must first enable the Develop menu by going to the Advanced settings and selecting **Show Develop menu in menu bar**. Then you can select **Show Web Inspector** from the Develop menu or click **Command + Option + I**.

Create the Custom CSS

As a practical example, the following procedure changes the background color of the footer bar in the WebHelp output:

1. Use the browser's CSS inspector to identify the current CSS code that styles the footer bar. In this particular case, the pertinent code that would be identified is:

```
.wh_footer {
  font-size: 15px;
  line-height: 1.7em;
  background-color: #000;
}
```

2. If you want to test the color you want to apply as the background of this particular element, use the browser's CSS inspector to change the value of the `background-color` attribute. After you find a suitable color, copy that new code.
3. Create a custom CSS file and paste or enter the copied code. For example:

```
.wh_footer {
  background-color: #255890;
}
```

4. Save the custom CSS file at a location of your convenience.
5. Reference the CSS file in a *WebHelp Responsive* transformation using an *Oxygen Publishing Template* (on page 1348) or the `args.css` parameter (on page 1349).

Fastpath:

Regenerating the output to see the changes made in the CSS is not required. Instead, you can directly edit the files in *WebHelp Output Directory/oxygen-webhelp/template* and reload the page in your browser. Once you obtained the desired output, simply copy the stylesheet back to your publishing template folder.

Referencing the CSS Using a Publishing Template

1. If you have not already created a Publishing Template, see *How to Create a Publishing Template* (on page 1476).
2. Using the **Project** view, copy your custom CSS in a folder inside the publishing template root folder (for example, in the `custom_footer_template/resources` folder).
3. Open the *template descriptor file* (on page 1300) associated with your publishing template and add your custom CSS in the *resources* section.

```
<publishing-template>
  ...
  <webhelp>
    ...
```

```
<resources>
...
<css file="resources/MyCustom.css"/>
```

4. Open the *DITA Map WebHelp Responsive* transformation scenario.
5. Click the **Choose Custom Publishing Template** link and select your template.
6. Click **OK** to save the changes to the transformation scenario.
7. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

Referencing the CSS Using the args.css Parameter

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and open the **Parameters** tab.
2. Set the `args.css` parameter to the path of your custom CSS file.
3. Set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

How to Insert Custom HTML Content

You can add custom HTML content in the WebHelp Responsive output by inserting it in a well-formed XML file (or specifying it in a **well-formed** XHTML fragment) that will be referenced in the transformation (either from an *Oxygen Publishing Template (on page 2270)* or using one of the [HTML fragment placeholder parameters \(on page 1434\)](#)). This content may include references to additional JavaScript, CSS, and other types of resources, or such resources can be inserted inline within the HTML content that is inserted in the XML file.

The XML File

There are several things to consider regarding this XML file:

- **Well-Formedness** - If the content of the file is not *XML Well-formed (on page 544)*, the transformation will automatically convert non-well-formed HTML content to a well-formed XML equivalent (assuming the `webhelp.enable.html.fragments.cleanup` transformation parameter is set to **true**).

For example, if the HTML content includes several `<script>` or `<link>` elements, the XML fragment would have multiple root elements and to make it well-formed, it would be wrapped it in an `<html>` element.

This element tag will be filtered out and only its children will be copied to the output documents.

Similarly, you can wrap your content in `<head>`, `<body>`, `<html/head>`, or `<html/body>` elements.

**Note:**

The converted fragments are stored in a file located in the `whr-html-fragments` subfolder of the transformation's temporary directory.

**Tip:**

If you do not want the transformation to automatically convert non-well-formed content into well-formed XML content, you can set the `webhelp.enable.html.fragments.cleanup` transformation parameter to **false**. This will instead cause the transformation to fail if at least one HTML fragment is not well-formed.

- **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the built-in `${oxygen-webhelp-output-dir}` macro to specify their paths relative to the output directory:

```
<html>
  <script type="text/javascript" src="${oxygen-webhelp-output-dir}/js/test.js"/>
  <link rel="stylesheet" type="text/css"
        href="${oxygen-webhelp-output-dir}/css/test.css" />
</html>
```

If you want that the path of your resource to be relative to the [templates directory \(on page 1297\)](#), you can use the `${oxygen-webhelp-template-dir}` macro.

To copy the referenced resources to the output directory, follow the procedure in: [How to Copy Additional Resources to Output Directory \(on page 1413\)](#).

- **Inline JavaScript or CSS Content:**

JavaScript:

```
<script type="text/javascript">
  /* Include JavaScript code here. */

  function myFunction() {
    return true;
  }
</script>
```

CSS:

```
<style>
  /* Include CSS style rules here. */

  *{
    color:red
  }
```

```

}
</style>

```

Note:

If you have special characters (e.g. &, <) that break the well-formedness of the XML fragment, it is important to place the content inside an XML comment.

Otherwise, the WebHelp transformation automatically wraps inline JavaScript or CSS content in an XML comment. Also, if the commented content contains constructs that are not allowed in an XML comment, those constructs are escaped.

[Important] XML comment tags (both the start and end tags) must be on lines by themselves. If they are on the same line as any of the script's content, it will likely result in a JavaScript error.

```

<script type="text/javascript">

  <!--

    /* Include JavaScript code here. */

    function myFunction() {

      return true;

    }

  -->

</script>

```

Using WebHelp Macros

The XML file can use WebHelp macros, which are variables that will be expanded when the content of the HTML fragment file will be copied in the final output.

There are two possibilities for using macros:

- **Directly in attribute values** - For example, if you want to reference a JavaScript file from the Publishing Template directory, you can use the following construct:

```

<script type="text/javascript" src="{path(oxygen-webhelp-template-dir)}/"></script>

```

- **In text content** - Using the `<whc:macro>` template component:

```

<script type="text/javascript">

  var outDirPath = '<whc:macro value="{path(oxygen-webhelp-output-dir)}"'

  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>' ;

```

```
console.log("The output directory path is:", outDirPath);
</script>
```

**Note:**

When using the `<whc:macro>` element, you should also include the `xmlns:whc="http://www.oxygenxml.com/webhelp/components"` namespace declaration for the `whc` prefix. This is necessary for the XML fragment to be well-formed.

The following *macros* are supported:

i18n

For localizing a string.

```
${i18n(string.id)}
```

param

Returns the value of a transformation parameter.

```
${param(webhelp.show.main.page.tiles)}
```

env

Returns the value of an environment variable.

```
${env(JAVA_HOME)}
```

system-property

Returns the value of a system property.

```
${system-property(os.name)}
```

timestamp

Can be used to format the current date and time. Accepts a string (as a parameter) that determines how the date and time will be formatted (format string or *picture string* as it is known in the XSLT specification). The format string must comply with the [rules of the XSLT `format-dateTime` function specification](#).

```
${timestamp([h1]:[m01] [P] [M01]/[D01]/[Y0001])}
```

path

Returns the path associated with the specified path ID. The following paths IDs are supported:

- **oxygen-webhelp-output-dir** - The path to the output directory. The path is relative to the current HTML file.
- **oxygen-webhelp-assets-dir** - The path to the `oxygen-webhelp` subdirectory from the output directory. The path is relative to the current HTML file.

- **oxygen-webhelp-template-dir** - The path to the template directory. The path is relative to the current HTML file.

```
${path(oxygen-webhelp-template-dir)}
```

Note:

New paths IDs can be added by overriding the `wh-macro-custom-path` template from `com.oxygenxml.webhelp.responsive\xsl\template\macroExpander.xsl`:

```
<!-- Extension template for expanding a custom path macro. -->
<xsl:template name="wh-macro-custom-path">
  <xsl:param name="pathId"/>
  <xsl:value-of select="$pathId"/>
</xsl:template>
```

map-xpath

Can be used to execute an XPath expression over the DITA map file from the temporary directory.

Tip:

Available in all template layout HTML pages.

```
${map-xpath(/map/title)}
```

topic-xpath

Can be used to execute an XPath expression over the current topic.

Tip:

Available only in the topic HTML page template (`wt_topic.html`).

```
${topic-xpath(string-join(//shortdesc//text(), ' '))}
```

oxygen-webhelp-build-number

Returns the current WebHelp distribution ID (build number).

```
${oxygen-webhelp-build-number}
```

Referencing the HTML fragment using a Publishing Template

1. If you have not already created a Publishing Template, see [Working with Publishing Templates \(on page 1336\)](#).
2. Insert the HTML content in a file that is XML well-formed (for example, `custom-html.xml`).
3. Using the **Project** view, copy your custom XML file in a folder inside publishing the template root folder (for example, in the `custom_footer_template/html-fragments` folder).

4. Open the [template descriptor file \(on page 1300\)](#) associated with your publishing template and add a reference to the custom HTML fragment in the *html-fragments* section.

```
<publishing-template>
...
<webhelp>
...
<html-fragments>
  <fragment
    file="html-fragments/custom-html.xml"
    placeholder="webhelp.fragment.head"/>
  </fragment>
</html-fragments>
</webhelp>
</publishing-template>
```

**Note:**

If you want to insert the content in another location within the output document, you can reference the XML file from any other [HTML Fragment extension points \(on page 1307\)](#).

5. Open the *DITA Map WebHelp Responsive* transformation scenario.
6. Click the **Choose Custom Publishing Template** link and select your template.
7. Click **OK** to save the changes to the transformation scenario.
8. Run the transformation scenario.

Results: Your additional content will be included at the end of the `<head>` element of your output document.

Referencing the HTML Fragment using a Transformation Parameter

1. Insert the HTML content in a well-formed XML file.
2. Edit the *DITA Map WebHelp Responsive* transformation scenario and open the **Parameters** tab.
3. Edit the value of the `webhelp.fragment.head` parameter and set it to the absolute path of your XML file.

**Note:**

If you want to insert the content in another location within the output document, you can reference the XML file from any other [HTML Fragment extension points \(on page 1307\)](#).

4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

Results: Your additional content will be included at the end of the `<head>` element of your output document.

[Publishing Template Package Contents for WebHelp Responsive Customizations \(on page 1300\)](#)

How to Change Numbering Styles for Ordered Lists

Ordered lists (``) are usually numbered in XHTML output using numerals. If you want to change the numbering to alphabetical, follow these steps:

1. Define a custom `@outputclass` value and set it as an attribute of the ordered list, as in the following example:

```
<ol outputclass="number-alpha">
  <li>A</li>
  <li>B</li>
  <li>C</li>
</ol>
```

2. Add the following code snippet in a custom CSS file:

```
ol.number-alpha{
  list-style-type:lower-alpha;
}
```

3. Reference the CSS file in a *WebHelp Responsive* transformation using an *Oxygen Publishing Template* (on page 1355) or the `args.css` parameter (on page 1356).

Referencing the Custom CSS from a Publishing Template

1. If you have not already created a Publishing Template, see [How to Create a Publishing Template](#) (on page 1476).
2. Using the **Project** view, copy your custom CSS in a folder inside the publishing template root folder (for example, in the `custom_footer_template/resources` folder).
3. Open the [template descriptor file](#) (on page 1300) associated with your publishing template and add your custom CSS in the `resources` section.

```
<publishing-template>
...
<webhelp>
...
<resources>
...
<css file="resources/MyCustom.css"/>
```

4. Open the *DITA Map WebHelp Responsive* transformation scenario.
5. Click the **Choose Custom Publishing Template** link and select your template.
6. Click **OK** to save the changes to the transformation scenario.
7. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

Referencing the CSS Using the *args.css* Parameter

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and open the **Parameters** tab.
2. Set the `args.css` parameter to the path of your custom CSS file.
3. Set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

How to Add Syntax Highlights for Codeblocks in the Output

Syntax Highlighting makes it easier to read the semantics of the structured content by displaying each type of code (language) in different colors and fonts. The application provides the ability to add syntax highlights in codeblocks for DITA to PDF or HTML-based output through the use of the `@outputclass` attribute and a variety of predefined values are available.

To provide syntax highlighting in the codeblocks that appear in the output, add the `@outputclass` attribute on the `<codeblock>` element and set its value to one of the predefined language values. The **Content Completion Assistant** offers a list of the possible values when adding the `@outputclass` attribute in **Text** mode but there are also two simple ways to set the value in **Author** mode:

- Select the `<codeblock>` element in the editor and in the **Attributes** view, click on the **Value** cell for the `@outputclass` attribute and select one of the predefined values (for example, `language-xml`).
- Select the `<codeblock>` element in the editor and use the **Alt + Enter** keyboard shortcut to open the in-place attributes editor window. Then select one of the predefined values from the **Value** drop-down menu.

The predefined values that can be selected are:

- language-json
- language-yaml
- language-xml
- language-bourne
- language-c
- language-cmd
- language-cpp
- language-csharp
- language-css
- language-dtd
- language-ini
- language-java

- language-javascript
- language-lua
- language-perl
- language-powershell
- language-php
- language-python
- language-ruby
- language-sql
- language-xquery

**Attention:**

It is recommended that you do not add inline elements in the codeblocks when using this `@outputclass` attribute, as it may lead to improper highlighting.

**Tip:**

Starting with version 24.0, the language values can also be set without using the `language-` prefix.

Example:

The following codeblock with the `@outputclass` set as `language-css`:

```
<codeblock outputclass="language-css" id="codeblock_1">@page preface-page {
  background-color:silver;
  @top-center{
    content: "Custom Preface Header";
  }
}
*[class ~= "topic/topic"][@topicrefclass ~= "bookmap/preface"] {
  page: preface-page;
}</codeblock>
```

would like this in WebHelp output:

```
@page preface-page {
  background-color:silver;
  @top-center{
    content: "Custom Preface Header";
  }
}
*[class ~= "topic/topic"][@topicrefclass ~= "bookmap/preface"] {
  page: preface-page;
}
```

How to Show or Hide Navigation Links in Topic Pages

The [topic pages \(on page 1255\)](#) in WebHelp Responsive output can contain navigation links (← **Previous** / **Next** → arrows) that can be used to navigate to the previous or next topic.

How to Control Which Topic Pages Include Navigation Links

The navigation links are controlled by the `@collection-type` attribute. For example, if you set `collection-type="sequence"` on a parent topic reference in your DITA map, navigation links will be generated in the output for all of its child topics (from children to parent, and from child to previous sibling and next sibling).

```
<map id="example_map" title="Example Map">
  <topicref href="../topics/ParentTopic.dita" collection-type="sequence">
    <topicref href="../topics/Childtopic.dita"/>
  </topicref>
```

How to Generate Navigation Links for All Topics (Ignoring the Collection Type Attribute)

You can use the `webhelp.default.collection.type.sequence` parameter in the transformation and set its value to `yes` to generate navigation links for all topics, regardless of whether or not the `collection-type` attribute is present.

How to Hide All Navigation Links

To hide all navigation links, use the `webhelp.show.navigation.links` parameter in the transformation and set its value to `no`.

How to Change the Main Page Layout

This section contains topics that explain how to customize the layout of the main page in the WebHelp Responsive output.

How to Customize the Menu

By default, the menu component is displayed in all WebHelp Responsive pages. However, you might want to hide it completely, or only display some of its menu entries.

How to Hide Some of the Menu Entries

There are two methods for doing this. One of them involves editing the [DITA map \(on page 2268\)](#) and marking the topics that do not need to be included in the menu, and another one that uses a small CSS customization.

Editing the DITA Map

To edit the metadata in the *DITA map* to control which topics will not be displayed in the menu, follow these steps:

1. Open the *DITA map* in the **Text** editing mode of Oxygen XML Developer.
2. Add the following metadata information in the `topicref` element (or any of its specializations) for each topic you do not want to be displayed in the menu:

```
<topicmeta>
  <data name="wh-menu">
    <data name="hide" value="yes"/>
  </data>
</topicmeta>
```

Customizing the CSS

To customize the CSS to control which topics will not be displayed in the menu, follow these steps:

1. Make sure you set an ID on the topic that you do not want to include in the menu.
2. Create a new CSS file that contains a rule that hides the menu entry generated for the topic (identified by the topic ID `growing-flowers` in the following example). The CSS file should have content that is similar to this:

```
.wh_top_menu *[data-id='growing-flowers'] {
  display:none;
}
```

3. Reference the CSS file in a *WebHelp Responsive* transformation using an *Oxygen Publishing Template* (on page 1348) or the `args.css` parameter (on page 1349).

How to Hide the Entire Menu

If you do not want to include a main menu in the pages of the WebHelp Responsive output, you can instruct the transformation scenario to skip the menu generation completely.

Using a Publishing Template

To hide the menu using an *Oxygen Publishing Template* (on page 1297), follow this procedure:

1. If you have not already created a Publishing Template, see [How to Create a Publishing Template](#) (on page 1476).
2. Open the [template descriptor file](#) (on page 1300) associated with your publishing template and add the `webhelp.show.top.menu` parameter in the *parameters* section with its value set to `no`.

```
<publishing-template>
  ...
  <webhelp>
    ...
    <parameters>
      <parameter name="webhelp.show.top.menu" value="no"/>
    </parameters>
  </webhelp>
```

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To hide the menu using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
2. Open the **Parameters** tab and set the `webhelp.show.top.menu` parameter to `no`.
3. Click **OK** to save the changes to the transformation scenario.
4. Run the transformation scenario.

How to Add a Welcome Message in the WebHelp Responsive Main Page

The main page of the WebHelp Responsive output contains a set of [empty placeholders \(on page 1307\)](#) that can be used to display customized text fragments. These placeholders are available to you through WebHelp Responsive transformation scenario parameters. For example, the placeholder identified through the `webhelp.fragment.welcome` parameter displays text content above the search box in the main page.

Using a Publishing Template

To add a customized welcome message in the main page of the WebHelp Responsive output using an [Oxygen Publishing Template \(on page 1297\)](#), follow this procedure:

1. If you have not already created a Publishing Template, see [How to Create a Publishing Template \(on page 1476\)](#).
2. Open the [template descriptor file \(on page 1300\)](#) associated with your publishing template and add the `webhelp.fragment.welcome` parameter in the *parameters* section with its value set to one of the following:
 - A small well-formed XHTML fragment (such as: `<i>Welcome to the User Guide</i>`).
 - A path to a file that contains well-formed XHTML content.

```
<publishing-template>
...
<webhelp>
...
<parameters>
  <parameter name="webhelp.fragment.welcome"
    value="path/to/welcome.xhtml" type="filePath"/>
</parameters>
</webhelp>
```

3. Open the *DITA Map WebHelp Responsive* transformation scenario.

4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

Result: In the WebHelp output, your custom message will be displayed above the search box in the main page.

Using a Transformation Scenario in Oxygen XML Editor/Author

Important:

Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated.

To add a customized welcome message in the main page of the WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
2. Open the **Parameters** tab and set the `webhelp.fragment.welcome` parameter with its value set to one of the following:
 - A small well-formed XHTML fragment (such as: `<i>Welcome to the User Guide</i>`).
 - A path to a file that contains well-formed XHTML content.
3. Click **OK** to save the changes to the transformation scenario.
4. Run the transformation scenario.

Result: In the WebHelp output, your custom message will be displayed above the search box in the main page.

Related information

[How to Insert Custom HTML Content \(on page 1349\)](#)

How to Create a Custom Footer

The main page of the WebHelp Responsive output contains a set of [empty placeholders \(on page 1307\)](#) that can be used to display customized text fragments. These placeholders are available to you through WebHelp Responsive transformation scenario parameters. For example, the placeholder identified through the `webhelp.fragment.footer` parameter displays the custom content at the bottom of the page.

Using a Publishing Template

To create a custom footer in the WebHelp Responsive output using an [Oxygen Publishing Template \(on page 1297\)](#), follow this procedure:

1. If you have not already created a Publishing Template, see [How to Create a Publishing Template \(on page 1476\)](#).
2. Open the [template descriptor file \(on page 1300\)](#) associated with your publishing template and add the `webhelp.fragment.footer` parameter in the `html-fragments` section with its value set to a path of a file that contains well-formed XHTML content.

```
<publishing-template>
...
<webhelp>
...
<html-fragments>
  <fragment file="html/footer.xhtml" placeholder="webhelp.fragment.footer"/>
</html-fragments>
</webhelp>
```

Important:

This parameter should only be used if you are using a valid, purchased license of Oxygen XML Developer (do not use it with a trial license).

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

Result: In the WebHelp output, your custom footer will be displayed at the bottom of the page.

Using a Transformation Scenario in Oxygen XML Editor/Author

Important:

Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated.

To create a custom footer in the WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
2. Open the **Parameters** tab and set the `webhelp.fragment.footer` parameter with its value set to one of the following:

- A small well-formed XHTML fragment.
 - A path to a file that contains well-formed XHTML content.
3. Click **OK** to save the changes to the transformation scenario.
 4. Run the transformation scenario.

Result: In the WebHelp output, your custom footer will be displayed at the bottom of the page.

How to Configure the Tiles on the WebHelp Responsive Main Page

The *tiles* version of the main page of the WebHelp Responsive output displays a tile for each topic found on the first level of the *DITA map* (on page 2268). However, you might want to customize the way they look or even to hide some of them.

Depending on your particular setup, you can choose to customize the tiles either by setting metadata information in the *DITA map* or by customizing the CSS that is associated with the *DITA map*.

How to Hide Some of the Tiles

If your documentation is very large or there is a large number of topics on the first level, you might want to hide some of the tiles. Also, this might be useful if you only want to display the topics in the first page that are most relevant to your intended audience.

There are two methods for doing this. One of them involves editing the *DITA map* and marking the topics that do not need to be displayed as tiles, and another one that uses a small CSS customization level to hide some tiles identified by the ID of the topic.

Editing the DITA Map

To edit the metadata in the *DITA map* to control which topics on the first level of the *DITA map* will not be displayed as a tile, follow these steps:

1. Open the *DITA map* in the **Text** editing mode of Oxygen XML Developer.
2. Add the following metadata information in the `<topicref>` element (or any of its specializations) for each first-level topic that you do not want to be displayed as a tile:

```
<topicmeta>
  <data name="wh-tile">
    <data name="hide" value="yes"/>
  </data>
</topicmeta>
```

Customizing the CSS

To customize the CSS to control which topics on the first level of the *DITA map* will not be displayed as a tile, follow these steps:

1. Make sure you set an ID on the topic you want to hide.
2. Create a new CSS file that contains a rule that hides the tile generated for the topic (identified in the following example by the topic ID `growing-flowers`). The CSS file should have content that is similar to this:

```
.wh_tile [data-id='growing-flowers'] {
    display:none;
}
```

3. Reference the CSS file in a *WebHelp Responsive* transformation using an *Oxygen Publishing Template* (on page 1348) or the `args.css` parameter (on page 1349).

How to Add an Image to the Tiles

There are two methods that you can use to add an image to a tile. One of them involves editing the *DITA map*, and the other uses a CSS customization.

Editing the DITA Map

To edit the metadata in the *DITA map* to set an image to be displayed in a tile, follow these steps:

1. Open the *DITA map* in the **Text** editing mode of Oxygen XML Developer.
2. Add the following metadata information in the `<topicref>` element (or any of its specializations) for each first-level topic that will have an image displayed in the corresponding tile:

```
<topicmeta>
  <data name="wh-tile">
    <data name="image" href="img/tile-image.png" format="png">
      <data name="attr-width" value="64"/>
      <data name="attr-height" value="64"/>
    </data>
  </data>
</topicmeta>
```

Note:

The `@attr-width` and `@attr-height` attributes can be used to control the size of the image, but they are optional.

Customizing the CSS

To customize the CSS to set an image to be displayed in a tile, follow these steps:

1. Make sure you set an ID on the topic that you want the tile to include an image.
2. Create a new CSS file that contains a rule that associates an image with a specific tile. The CSS file should have content that is similar to this:

```
.wh_tile[data-id='growing-flowers']> div {
    background-image:url('resources/flower.png');
}
```

3. Reference the CSS file in a *WebHelp Responsive* transformation using an *Oxygen Publishing Template* (on page 1348) or the `args.css` parameter (on page 1349).

Adding Graphics and Media Resources

This section contains topics that explain how to add media resources to the published output or the output directory.

How to Add a Logo Image in the Title Area

You can customize **WebHelp Responsive** output to include a logo in the title area. It will be displayed before the publication title. You can also specify a URL that can be used to send users to a specific website when they click the logo image.

This customization can be done using an *Oxygen Publishing Template* or using a transformation scenario from within **Oxygen XML Editor/Author**.

Using a Publishing Template

To add a logo in the title area of your WebHelp output using an *Oxygen Publishing Template* (on page 1297), follow this procedure:

1. If you have not already created a Publishing Template, see [How to Create a Publishing Template](#) (on page 1476).
2. Open the [template descriptor file](#) (on page 1300) associated with your publishing template and add the `<logo>` element in the `<resources>` section and set the `@file` attribute value to the path of your logo.
3. If you also want to add a link to your website when you click the logo image, set its URL in the `@target-url` attribute.

```
<publishing-template>
...
<webhelp>
...
<resources>
  <logo
    file="images/logo.png"
    target-url="http://www.example.com"
    alt="Alternate text for the logo image"
    new-tab="true"/>
  </resources>
</webhelp>
```

4. Open the *DITA Map WebHelp Responsive* transformation scenario.

5. Click the **Choose Custom Publishing Template** link and select your template.
6. Click **OK** to save the changes to the transformation scenario.
7. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To add a logo in the title area of your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
2. Open the **Parameters** tab and set the `webhelp.logo.image` parameter to the path of your logo.
3. If you also want to add a link to your website when you click the logo image, set its URL in the `webhelp.logo.image.target.url` parameter.
4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

How to Add a Favicon in WebHelp Systems

You can add a custom *favicon* to your WebHelp output by simply using a parameter in the transformation scenario to point to your *favicon* image.

This customization can be done using an *Oxygen Publishing Template* or using a transformation scenario from within **Oxygen XML Editor/Author**.

Using a Publishing Template

To add a *favicon* to your WebHelp output using an *Oxygen Publishing Template (on page 1297)*, follow this procedure:

1. If you have not already created a Publishing Template, see [Working with Publishing Templates \(on page 1336\)](#).
2. Open the [template descriptor file \(on page 1300\)](#) associated with your publishing template and add the `<favicon>` element in the *resources* section. The path to the image is relative to the template root folder.

```
<publishing-template>
...
<webhelp>
...
<resources>
...
<favicon file="images/favicon.png"/>
```

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

Result: Browsers that provide *favicon* support display the *favicon* (typically in the browser's address bar, in the list of bookmarks, and in the history).

Using a Transformation Scenario in Oxygen XML Editor/Author

To add a *favicon* to your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
2. Open the **Parameters** tab and set the `webhelp.favicon` parameter to the path of your image.
3. Click **OK** to save the changes to the transformation scenario.
4. Run the transformation scenario.

How to Add Video and Audio Objects in DITA WebHelp Output

You can insert references to video and audio media resources (such as videos, audio clips, or embedded HTML frames) in your DITA topics and then publish them to WebHelp output. The media objects can be played directly in all HTML5-based outputs, including WebHelp systems.

To add media objects in the WebHelp output generated from DITA documents, follow the procedures below.

Adding Videos to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the video by adding an `<object>` element, as in one of the following examples:

```
<object outputclass="video" type="video/mp4" data="MyVideo.mp4" />
```

or, instead of the `@data` attribute, you can specify the video using a parameter like this:

```
<object outputclass="video">
  <param name="src" value="videos/MyVideo.mp4" />
</object>
```

2. Apply a **DITA to WebHelp** transformation to obtain the output.

Result: The transformation converts the `<object>` element to an HTML5 `<video>` element.

```
<video controls="controls"><source type="video/mp4" src="MyVideo.mp4"></source>
</video>
```

Adding Audio Clips to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the audio clip by adding an `<object>` element, as in one of the following examples:

```
<object outputclass="audio" type="audio/mpeg" data="MyClip.mp3" />
```

or, instead of the `@data` attribute, you can specify the video using a parameter like this:

```
<object outputclass="audio">
  <param name="src" value="audio/MyClip.mp3"/>
</object>
```

2. Apply a **DITA to WebHelp** transformation to obtain the output.

Result: The transformation converts the `<object>` element to an HTML5 `<audio>` element.

```
<audio controls="controls"><source type="audio/mpeg" src="MyClip.mp3"></source>
</audio>
```

Adding Embedded HTML Frames (such as YouTube videos) to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the embedded object by manually adding an `<object>` element, as in one of the following examples:

```
<object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4"/>
```

or, instead of the `@data` attribute, you can specify the object using a parameter like this:

```
<object outputclass="iframe">
  <param name="src" value="http://www.youtube.com/embed/m_vv2s5Trn4"/>
</object>
```

2. If you want the video to be allowed to play in full screen mode once the document is converted to XHTML output, also add an `allowfullscreen` parameter and set its value to **true**:

```
<object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4"/>
  <param name="allowfullscreen" value="true"/>
</object>
```

3. Apply a **DITA to WebHelp** transformation to obtain the output.

Result: The transformation converts the `<object>` element to an HTML5 `<iframe>` element.

```
<iframe controls="controls" src="https://www.youtube.com/embed/m_vv2s5Trn4">
</iframe>
```

How to Add MathML Equations in WebHelp Output

Currently, the majority of modern browsers have native support to render **MathML** equations embedded in the **HTML** code. If your browser that does not have support for MathML, [MathJax](#) is a solution to properly view MathML equations embedded in **HTML** content in a variety of browsers.

If you have DITA content that has embedded **MathML** equations and you want to properly view the equations in published HTML output types (such as WebHelp), you need to add a reference to the MathJax script in the **head** element of all HTML files that have the equation embedded.

For example:

```
<script type="text/javascript" id="MathJax-script" async
  src="https://cdnjs.cloudflare.com/ajax/libs/mathjax/3.0.0/es5/latest?tex-mml-ctml.js">
</script>
```

Result: The equation should now be properly rendered in the WebHelp output for other browsers.

[Getting Started with MathJax Components](#)

Searching the Output

This section contains topics that explain how to use some of the search features in WebHelp Responsive output.

Built-in JS Based Search Engine Customizations

How to Change Element Scoring in Search Results

The WebHelp **Search** feature is enhanced with a rating mechanism that computes scores for every page that matches the search criteria. HTML tag elements are assigned a scoring value and these values are evaluated for the search results. The WebHelp directory includes a properties file that defines the scoring values for tag elements and this file can be edited to customize the values according to your needs.

To edit the scoring values of HTML tag element for enhancing WebHelp search results, follow these steps:

1. Edit the scoring properties file for DITA. The properties file includes instructions and examples to help you with your customization. The file is located in: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\indexer\scoring.properties`.

The following values can be edited in the `scoring.properties` file:

```
h1 = 10
h2 = 9
h3 = 8
h4 = 7
h5 = 6
h6 = 5
b = 5
strong = 5
em = 3
i=3
u=3
div.toc=-10
title=20
div.ignore=ignored
```

```
meta_keywords = 20
meta_indexterms = 20
meta_description = 25
shortdesc=25
```

2. Save your changes to the file.
3. Re-run your WebHelp transformation.

How to Index Japanese Content

To optimize the indexing of Japanese content in WebHelp pages, the *Lucene Kuromoji Japanese analyzer* can be used. This analyzer is included in the **Oxygen XML Editor/Author** installation kit.

Restriction:

The *Kuromoji* analyzer does not work if your WebHelp output is accessed locally. In this scenario, a warning message will be displayed informing you that the *Kuromoji* analyzer is disabled.

It is possible to hide this warning message by using a transformation parameter named `webhelp.enable.search.kuromoji.js`. By default, its value is **yes**, which means the *Kuromoji* analyzer is enabled by default. To hide the warning message, set the value of that parameter to **no** using either of the methods listed below. When it is set to **no**, the *Kuromoji* analyzer is disabled even if you deploy your WebHelp output on a web server.

Using a Publishing Template

To add a logo in the title area of your WebHelp output using an *Oxygen Publishing Template* (on page 1297), follow this procedure:

1. If you have not already created a Publishing Template, see [How to Create a Publishing Template](#) (on page 1476).
2. Open the [template descriptor file](#) (on page 1300) associated with your publishing template and add the `default.language` parameter in the `parameters` section with its value set to `ja-jp`.

```
<publishing-template>
...
<webhelp>
...
<parameters>
  <parameter name="default.language" value="ja-jp"/>
</parameters>
</webhelp>
```

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To activate the Japanese indexing in your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit a **DITA to WebHelp** transformation scenario and in the **Parameters** tab, set the value of the `default.language` parameter to `ja-jp`.

Note:

Alternatively, you could set the `@xml:lang` attribute on the root of the *DITA map* (on page 2268) and the referenced topics to `ja-jp`. Another alternative for DITA output is to use the `webhelp.search.japanese.dictionary` parameter to specify a path to a Japanese dictionary that will be used by the *Kuromoji* morphological engine (note that the encoding for the dictionary must be **UTF8**).

2. Run the WebHelp transformation scenario to generate the output.

How to Implement a Custom Search Filter

It is possible to implement a custom search filter (search input component) in your WebHelp Responsive output. The search input component is where users enter search queries to locate certain content within the WebHelp output.

To integrate a custom search filter, follow these steps:

1. If you have not already created a Publishing Template, see [How to Create a Publishing Template](#) (on page 1476).
2. Create the following items in the folder that contains your publishing descriptor file (the `.opt` file):
 - A folder named `js`.
 - A folder named `fragments`.
3. In the `js` folder, create a file named `search-filter.js`.
4. As a starting point, you can copy the following content to the `search-filter.js` file:

```
/**
 * Object that implements the methods required by WebHelp to run a search filter.
 */
function CustomSearchFilter() {

  /**
   * Method required to run the search filter in webhelp. It is called when the users
   * executes the query in the search page.
   *
   * @param {WebHelpAPI.SearchResult} searchResult The search result for the executed query.
   *
   * @return A list of WebHelpAPI.SearchResult objects
   */
}
```

```

    */

    this.filterResults = function (searchResult) {

        // implement filter

        return filteredResults;

    }

}

// Set the Search Filter to WebHelp
WebHelpAPI.setCustomSearchFilter(new CustomSearchFilter());

...

```

**Note:**

See the [API Search Objects](#) section (on page 1382) for details on how to create a `WebHelpAPI.SearchResult` object.

5. Implement your custom search filter.
6. In the **fragments** folder, create a file named **search-filter-script-fragment.xml**.
7. In the **search-filter-script-fragment.xml** file, define the scripts that are required for your custom search filter to run. For example:

```

<div>

    <script src="{oxygen-webhelp-template-dir}/js/search-filter.js"></script>

</div>

```

8. Copy the **js** folder to the output folder during the transformation process. For this, open the `.opt` file and add the following content in the `<resources>` section (see [Template Resources](#) (on page 1303) for more details):

```

<fileset>

    <include name="js/**"/>

</fileset>

```

9. Set the transformation parameters needed to enable the custom search filter. For this, open the `.opt` file and add the following content inside the `<webhelp>` element:

```

<html-fragments>

    <fragment file="fragments/search-filter-script-fragment.xml"

        placeholder="webhelp.fragment.head.search.page"/>

</html-fragments>

```

10. Run the transformation with this publishing template selected.

How to Exclude Certain DITA Topics from Search Results

There are several ways to exclude certain DITA resources from your WebHelp system's search results. This is useful if you have topics in your *DITA map* (on page 2268) structure that you do not want to be included in search results for your WebHelp system. The first method involves setting a parameter in the WebHelp

transformation scenario and the second involves setting an attribute for each DITA topic reference that you want to exclude.

Transformation Parameter Method

To exclude DITA topics from WebHelp search results using a transformation parameter, follow these steps:

1. Create a simple text file that will contain your excluded file patterns. Each pattern must be on a new line. The patterns are considered to be relative to the output directory and they accept wildcards such as '*' (matches zero or more characters) or '?' (matches one character). For more information about the patterns, see <https://ant.apache.org/manual/dirtasks.html#patterns>.

Example: Suppose that in your project, you want to exclude all files located in the `resources` directory and all files located in the `topics` directory that have a `.bak` file extension. You could create a simple text file (for example, named `exclude.properties`), and add the following lines:

```
resources/*
topics/*.bak
```

2. Set the `webhelp.search.custom.excludes.file` parameter to specify the path to the file that contains the excluded file patterns (for example, `exclude.properties` in step 1). The parameter can be specified in the *parameters* section of the template descriptor file (on page 1305) associated with your publishing template or in the **Parameters** tab of the transformation scenario dialog box in **Oxygen XML Editor/Author**.
3. Run the transformation.

Search Attribute Method

The WebHelp **Search** engine does not index DITA topics that have the `@search` attribute set to `no`.

To exclude DITA topics from WebHelp search results using this attribute, follow these steps:

1. Edit the *DITA map* and for any `<topicref>` that you want to exclude from search results, set the `@search` attribute to `no`. For example:

```
<topicref href="../../../topics/internal-topic1.dita" search="no"/>
```

2. Save your changes to the *DITA map*.
3. Run your WebHelp system transformation.

Oxygen Feedback Search Engine

How to Configure Faceted Search in WebHelp Output

A *faceted search* is a powerful tool that allows users to refine search results by selecting filters or facets. *Facets* are predefined categories that are associated with search results. By selecting one or more facets, users can narrow down their search results to a specific category or set of categories.

Configure Oxygen Feedback as an External Search Engine

To enable faceted searches, you need to have a search engine that supports this functionality. The **Oxygen Feedback** search engine implements faceted searches and can be easily configured as a search engine for WebHelp, see [Adding Oxygen Feedback to WebHelp Responsive Documentation \(on page 1334\)](#) for more details.

Attention:

The default search engine that comes embedded in the WebHelp Responsive output does not support faceted searches.

Defining Facets Using a DITA Subject Scheme Map

A [subject scheme map](#) can be used to define controlled values and subject definitions. *Subject definitions* are classifications and sub-classifications that compose a tree. Subject definitions provide semantics that can be used in conjunction with taxonomies and ontologies.

The `<subjectdef>` element is used to define both a subject category and a list of controlled values. The parent `<subjectdef>` element defines the category, and the children `<subjectdef>` elements define the controlled values.

The following example defines the "Operating system" category, with "Linux" and "Windows" sub-categories. The controlled values (facet values) are: "RedHat Linux", "SUSE Linux", "Windows 7", and "Windows 10".

```
<subjectScheme>
...
<hasInstance>
  <subjectdef keys="os" navtitle="Operating system">
    <subjectdef keys="linux" navtitle="Linux">
      <subjectdef keys="redhat" navtitle="RedHat Linux"/>
      <subjectdef keys="suse" navtitle="SUSE Linux"/>
    </subjectdef>
    <subjectdef keys="windows" navtitle="Windows">
      <subjectdef keys="win7" navtitle="Windows 7"/>
      <subjectdef keys="win10" navtitle="Windows 10"/>
    </subjectdef>
  </subjectdef>
</hasInstance>
...
</subjectScheme>
```

Associating Faceted Values With a Topic Using a DITA Classification Map

The [classification domain](#) provides elements that enable map authors to indicate information about the subject matter of DITA topics. The subjects are defined in subject scheme maps, and the subjects are referenced using the `@keyref` attribute.

The following example shows you how to associate a faceted value with a topic:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE map PUBLIC "-//OASIS//DTD DITA Classification Map//EN" "classifyMap.dtd">
<map>
  <title>Classification map</title>
  <topicref keyref="how-to-install-on-suse.dita">
    <topicsubject keyref="linux">
      <subjectref keyref="suse"/>
    </topicsubject>
  </topicref>
  <topicref keyref="how-to-install-win7.dita">
    <topicsubject keyref="windows">
      <subjectref keyref="win7"/>
    </topicsubject>
  </topicref>
</map>
```

Note:

The facet information cascades into child `<topicref>` elements.

Refining the Search Results by Using Facets in the Search Page

The configured facets are displayed in the search page, allowing you to narrow down the results.

When a user selects a facet, the search results are updated to only include the topics that match the selected facets. If multiple facet values are selected from the same category/facet, the search results display all topics with at least one facet. On the other hand, if multiple facet values from distinct facets are selected, the search results display all topics with all selected facet values.

[Adding Oxygen Feedback to WebHelp Responsive Documentation \(on page 1334\)](#)

How to Add Searchable Labels in WebHelp Output

It is possible to add *searchable labels* in WebHelp Responsive output that can be clicked to search for topics with that exact same label. Labels are textual words attached to a DITA topic that enables it to be easily found using the search function. These labels can help you organize your topics, making it more accessible to retrieve topics for a specific text.

Configure Oxygen Feedback as an External Search Engine

To enable *searchable labels*, you need to have a search engine that supports this functionality. The **Oxygen Feedback** search engine implements *searchable labels* and can be easily configured as a search engine for

WebHelp. See [Adding Oxygen Feedback to WebHelp Responsive Documentation \(on page 1334\)](#) for more details.

Attention:

The default search engine that comes embedded in the WebHelp Responsive output does not support searchable labels. It will simply perform a standard search using the content within the label.

How to Add Searchable Labels in a DITA Topic

The generation of *searchable labels* in the WebHelp Responsive output is activated by default. You need to insert the desired text (to be displayed in the label in the output) in a `<keyword>` element with an `@outputclass` attribute set to **label** within the prolog of each topic that you want to have that label displayed in the output.

Note:

You can right-click anywhere within the topic in **Author** mode and select **Insert > Insert Label** to quickly insert the needed structure in the prolog.

For example:

```
<prolog>
  <metadata>
    <keywords>
      <keyword outputclass="label">Customization</keyword>
    </keywords>
  </metadata>
</prolog>
```

This would add a label that contains the text "Customization" in the output for the particular topic. If the user clicks that label, the search engine will search for all topics that have this same label defined.

Transformation Parameters for Generating Searchable Labels

You can have more control over how the labels are generated in the WebHelp Responsive output by using the `webhelp.labels.generation.mode` transformation parameter. The possible values for this parameter are:

- **keywords-label** - Generates labels for each defined `<keyword>` element that has the `@outputclass` attribute value set to **label**.
- **keywords** - Generates labels for each defined `<keyword>` element. If the topic contains `<keyword>` elements with the `@outputclass` attribute value set to **label**, then only these elements will have labels generated for them in the output.
- **disable** - Disables the generation of labels in the WebHelp Responsive output.

**Note:**

The default value for the **webhelp.labels.generation.mode** transformation parameter is **keywords-label**.

Searchable Labels in WebHelp Responsive Output

The WebHelp Responsive transformation will generate a component that renders the text value of the `<keyword>` element. When the user clicks that component, they will be redirected to the search page with the search query populated for them and the search engine will display all topics that have the same text value defined in the prolog.

Custom Search Engine

How to Integrate Google Search in WebHelp Responsive Output

It is possible to integrate the *Google Search Engine* into your **WebHelp Responsive** output and you can specify where you want the results to appear in your WebHelp page.

Using a Publishing Template

To integrate the *Google Search Engine* into your WebHelp Responsive output using an *Oxygen Publishing Template (on page 1297)*, follow this procedure:

1. Go to the [Google Custom Search Engine page](#) using your Google account.
2. Select the **Create a custom search engine** button.
3. Follow the on-screen instructions to create a search engine component for your site.

**Important:**

For the **Layout**, you must select **Results only** for the *Google Search Engine* to work with **Oxygen XML WebHelp Responsive**.

4. At the end of this process you should obtain a code snippet that looks like this:

```
<script async src="https://cse.google.com/cse.js?cx=xxxxxxxxxxxxxxxx"></script>
<div class="gcse-searchresults-only"></div>
```

5. Create a folder named `html-fragments`, and in that folder, create a file named `google-script.html`.
6. Inside `google-script.html`, add only the `<script>` element. The file should look like this:

```
<script async src="https://cse.google.com/cse.js?cx=xxxxxxxxxxxxxxxx"></script>
```

7. In the `html-fragments` folder, create another file named `google-results.html`.
8. Inside `google-results.html`, add only the `<div>` element and include the `data-autoSearchOnLoad="true"` `data-queryParameterName="searchQuery"` attributes. The file should look like this:

```
<div class="gcse-searchresults-only" data-autoSearchOnLoad="true"
data-queryParameterName="searchQuery"></div>
```

**Note:**

For more information about other supported attributes, see [Google Custom Search: Supported Attributes](#).

- Open the [template descriptor file \(on page 1300\)](#) associated with your publishing template and add the `webhelp.google.search.script` parameter in the parameters section, setting its value to reference `google-script.html`. Then add the `webhelp.google.search.results` parameter, with its value set to `google-results.html`.

```
<publishing-template>
...
<webhelp>
...
<parameters>
...
<parameter
name="webhelp.google.search.script"
value="html-fragments/google-script.html"
type="filePath" />
<parameter
name="webhelp.google.search.results"
value="html-fragments/google-results.html"
type="filePath" />
</parameters>
</webhelp>
</publishing-template>
```

- Open the *DITA Map WebHelp Responsive* transformation scenario.
- Click the **Choose Custom Publishing Template** link and select your template.
- Click **OK** to save the changes to the transformation scenario.
- Run the transformation scenario.

**Important:**

The Google search feature will not work locally, it must be deployed on an HTTP server.

Using a Transformation Scenario in Oxygen XML Editor/Author

To integrate the *Google Search Engine* into your WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the [Google Custom Search Engine page](#) using your Google account.
2. Select the **Create a custom search engine** button.
3. Follow the on-screen instructions to create a search engine for your site.

**Important:**

For the **Layout**, you must select **Results only** for the *Google Search Engine* to work with **Oxygen XML WebHelp Responsive**.

4. At the end of this process you should obtain a code snippet that looks like this:

```
<script async src="https://cse.google.com/cse.js?cx=xxxxxxxxxxxxxxxx"></script>
<div class="gcse-searchresults-only"></div>
```

5. Create a file named `google-script.html`, and add only the `<script>` element. The file should look like this:

```
<script async src="https://cse.google.com/cse.js?cx=xxxxxxxxxxxxxxxx"></script>
```

6. Create a file named `google-results.html`, add only the `<div>` element and include the `data-autoSearchOnLoad="true"` `data-queryParameterName="searchQuery"` attributes. The file should look like this:

```
<div class="gcse-searchresults-only" data-autoSearchOnLoad="true"
data-queryParameterName="searchQuery"></div>
```

**Note:**

For more information about other supported attributes, see [Google Custom Search: Supported Attributes](#).

7. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
8. Switch to the **Parameters** tab and edit the `webhelp.google.search.script` parameter to reference the `google-script.html` file. Then edit the `webhelp.google.search.results` parameter to reference the `google-results.html` file.
9. Click **Ok** and run the transformation scenario.

**Important:**

The Google search feature will not work locally, it must be deployed on an HTTP server.

Replacing the Search Engine Only

It is possible to replace the internal search engine that is used by **Oxygen XML WebHelp** by using a custom JavaScript file. This customization method allows you to replace the search engine but keep the search results presentation.

To replace WebHelp's internal search engine, follow this procedure:

1. If you have not already created a Publishing Template, see [How to Create a Publishing Template \(on page 1476\)](#).
2. Create the following items in the folder that contains your publishing descriptor file (the `.opt` file):
 - A folder named `js`.
 - A folder named `fragments`.
3. In the `js` folder, create a file named `search-engine.js`.
4. As a starting point, you can copy the following content to the `search-engine.js` file:

```

/**
 * Object that implements the methods required by WebHelp to run a search engine.
 */

function CustomSearchEngine() {

  /**
   * Method required to run the search engine in webhelp. Handler when the users
   * executes the query in the search page.
   *
   * @param {String} query          The search input string from the user.
   * @param {Function} successHandler Needs to be called if the search operation is executed
   *                                successfully. The parameter needs to have the type of
   *                                WebHelpAPI.SearchResult
   * @param {Function} errorHandler Needs to be called if the search operation fails to
   *                                execute successfully. It needs to have the type
   *                                of String.
   */

  this.performSearchOperation = function(query, successHandler, errorHandler) {

    // implement search engine

    // const searchRestult = externalSearchEngine(query);

    // convert the result to WebHelpApi.SearchResult

    // const formattedResult = convert(searchRestult);

    // call successHanlder with the converted result.

    // successHandler(formattedResult)

  }

  /**
   * Method required to run the search engine in webhelp. Handler when the
   * page is changed in the search page.
   *
   * @param {Integer} pageToShow    The page to be dispalyed.
   * @param {Integer} maxItemsPerPage The maximum # of items that can be displayed on a page.
   * @param {String} query          The search input string from the user.

```

```

* @param {Function} successHandler Needs to be called if the search operation is executed
*
*                               successfully. The parameter needs to have the type of
*                               WebHelpAPI.SearchResult
* @param {Function} errorHandler Needs to be called if the search operation fails to
*                               execute successfully. It needs to have the type
*                               of String.
*/

this.onPageChangedHandler = function(pageToShow, maxItemsPerPage, query, successHandler,
errorHandler) {

    // implement search engine

    // const searchResult = externalSearchEngine(pageToShow, maxItemsPerPage, query);

    // convert the result to WebHelpApi.SearchResult

    // const formattedResult = convert(searchResult);

    // call successHandler with the converted result.

    // successHandler(formattedResult)

}

}

// Set the Search Engine to WebHelp
WebHelpAPI.setCustomSearchEngine(new CustomSearchEngine());

```

**Note:**

See the [API Search Objects](#) section (*on page 1382*) for details on how to convert your custom search engine results to `WebHelpAPI.SearchResult`.

5. Implement your search engine.
6. In the `fragments` folder, create a file named `search-engine-script-fragment.xml`.
7. In the `search-engine-script-fragment.xml` file, define the scripts that are required for your search engine to run. For example:

```

<div>

    <script src="{oxygen-webhelp-template-dir}/js/search-engine.js"></script>

</div>

```

8. Copy the `js` folder to the output folder during the transformation process. For this, open the `.opt` file and add the following content in the `<resources>` section (see [Template Resources](#) (*on page 1303*) for more details):

```

<fileset>

    <include name="js/**"/>

</fileset>

```

9. Set the transformation parameters needed to enable the search filter. For this, open the `.opt` file and add the following content inside the `<webhelp>` element:

```
<html-fragments>
  <fragment file="fragments/search-engine-script-fragment.xml"
    placeholder="webhelp.fragment.head.search.page" />
</html-fragments>
```

API Search Objects

To replace the WebHelp Search Engine, you will need to convert your custom search result into WebHelp API Objects that WebHelp will use to render your search result on the search page. To convert your custom search result, you will have to create the following objects:

1. *WebHelpAPI.SearchMeta* is a JavaScript object used to hold additional information for the search result. To create such an object, the following fields are required:

- **String: searchEngineName** - The name of the search engine used to retrieve the search result.
- **Integer: totalSearchItems** - The total number of search items the search engine returned.
- **Integer: currentPage** - The current page to display.
- **Integer: maxItemsPerPage** - The maximum number of items that can be displayed on a page.
- **Integer: totalPages** - The number of total pages for the search result.
- **String: originalSearchExpression** - The query string the user typed in the search input field.

```
conase searchMeta = new WebHelpAPI.SearchMeta(searchEngineName, totalSearchItems, currentPage,
maxItemsPerPage, totalPages, origianlSearchExpresion);
```

2. *WebHelpAPI.SearchDocument* is a JavaScript object used to hold the search result for a single topic/HTML page. To create such an object, the following fields are required:

- **String: linkLocation** - The URL to the topic.
- **String: title** - The topic title.
- **String: shortDescription** - The topic short description.

```
const searchDocument = new WebHelpAPI.SearchDocument(linkLocation, title, shortDescription);
```

3. *WebHelpAPI.SearchResult* is a JavaScript object used to display the search results in the search page.

To create such an object, the following fields are required:

- **WebHelpAPI.SearchMeta: searchMeta** - Contains additional information for the search result.
- **Array[WebHelpAPI.SearchDocument]: documents** - An array with the matching documents (HTML pages) for the search result.

```
conase searchMeta = new WebHelpAPI.SearchMeta(searchEngineName, totalSearchItems, currentPage,
maxItemsPerPage, totalPages, origianlSearchExpresion);

const searchDocument = new WebHelpAPI.SearchDocument(linkLocation, title, shortDescription);

const documents = [searchDocument]; // An array with one element.

const searchResult = new WebHelpAPI.SearchResult(searchMeta, documents);
```

Replacing the Search Engine and Results Presentation

It is possible to integrate a custom search engine and replace the search results area into your WebHelp Responsive output. This is done by using the following transformation parameters:

webhelp.fragment.custom.search.engine.results

This parameter can be used to replace the search results area with custom XHTML content. The value of the parameter is the path to an XHTML file that contains your custom content.

webhelp.fragment.custom.search.engine.script

This parameter can be used to replace WebHelp's built-in search engine with your own custom search engine. The value of the parameter is the path to an XHTML file that contains the scripts required for your custom search engine to run.

To integrate a custom search engine into your WebHelp Responsive output, follow these steps:

1. If you have not already created a Publishing Template, see [How to Create a Publishing Template \(on page 1476\)](#).
2. Create the following items in the folder that contains your publishing descriptor file (the `.opt` file):
 - A file named `custom-search-results-fragment.xml`.
 - A file named `custom-search-script-fragment.xml`.
 - A folder named `js`.
3. In the **custom-search-results-fragment.xml** file, define the HTML structure that will be used as the search results area. For example:

```
<div id="cumstom-search-results">...</div>
```

Note:

The custom search engine script will need to find an HTML element from the HTML structure that will be used as the search results area and write the search results inside it. In this example, it is the `<div>` element with the id `custom-search-results`.

4. In the `js` folder, create a file named **custom-search.js**.
5. As a starting point, you can copy the following content to the **custom-search.js** file:

```
document.addEventListener('DOMContentLoaded', (event) => {
  const params = new URLSearchParams(window.location.search);
  const searchQuery = params.get('searchQuery');
  // Implement your custom search engine
  // Display the search results
});
```

**Important:**

The value entered by the user in the search page will be available in the URL's query parameters in a parameter named `searchQuery`.

**Attention:**

`URLSearchParams` is not supported on all browsers (it is used as an example). A list with the supported browsers can be found [here](#). A different solution should be used if you need to support other browsers.

6. Implement your custom search engine.

**Note:**

The search results should be pushed into the `<div>` element created earlier with the id `custom-search-results`.

7. In the **custom-search-script-fragment.xml** file, define the scripts that are required for your custom search engine to run. For example:

```
<div>
  <script src="${oxygen-webhelp-template-dir}/js/custom-search.js"></script>
</div>
```

8. Copy the **js** folder to the output folder during the transformation process. For this, open the `.opt` file and add the following content in the `<resources>` section (see [Template Resources \(on page 1303\)](#) for more details):

```
<fileset>
  <include name="js/**"/>
</fileset>
```

9. Set the transformation parameters needed to enable the custom search engine. For this, open the `.opt` file and add the following content inside the `<webhelp>` element:

```
<html-fragments>
  <fragment file="custom-search-script-fragment.xml"
    placeholder="webhelp.fragment.custom.search.engine.script"/>
  <fragment file="custom-search-results-fragment.xml"
    placeholder="webhelp.fragment.custom.search.engine.results"/>
</html-fragments>
```

10. Run the transformation with this publishing template selected.

**Tip:**

A sample publishing template that overrides WebHelp's default search engine is available to download [here](#). You can use it as a starting point for your customization.

How to Display Custom Title in Search Results

It is possible to display a custom title for topics in the search results page. This can be achieved by adding the `<searchtitle>` element inside the particular DITA topic (or within the topic reference in the DITA map). The `<searchtitle>` element is used to specify the title that is displayed by search tools that locate the topic. This is useful when the topic has a title that makes sense in the context of a single information set, but may be too general in a list of search results. If the `<searchtitle>` is specified, then the search results page will display the contents inside the `<searchtitle>` as the topic title.

For details about the `<searchtitle>` element (including an example), see <https://docs.oasis-open.org/dita/v1.2/os/spec/langref/searchtitle.html>.

How to Trigger a Search Query When WebHelp is Loaded

You can use the `searchQuery` URL parameter to perform a search operation when WebHelp is loaded. This opens the search results page with the specified search query processed. The URL should look something like this:

```
http://localhost/webhelp/search.html?searchQuery=deploying%20feedback
```

Configuring the Search Engine Optimization

A **DITA Map WebHelp** transformation scenario produces a `sitemap.xml` file that is used by search engines to aid crawling and indexing mechanisms. A *sitemap* lists all pages of a WebHelp system and allows web admins to provide additional information about each page, such as the date it was last updated, change frequency, and importance of each page in relation to other pages in your WebHelp deployment.

**Important:**

If the `webhelp.sitemap.base.url` parameter is specified, the `loc` element will contain the value of this parameter plus the relative path to the page. If the `webhelp.sitemap.base.url` parameter is not specified, the `loc` element will only contain the relative path of the page.

You can also set these additional parameters:

- **webhelp.sitemap.change.frequency** - Specifies how frequently the WebHelp pages are likely to change (accepted values are: `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, and `never`).
- **webhelp.sitemap.priority** - Specifies the priority of each page (a value ranging from 0.0 to 1.0).

The structure of the `sitemap.xml` file looks like this:

```
<urlset xmlns="http://www.sitemaps.org/schemas/sitemap/0.9">
  <url>
    <loc>http://www.example.com/topics/introduction.html</loc>
    <lastmod>2014-10-24</lastmod>
    <changefreq>weekly</changefreq>
    <priority>0.5</priority>
  </url>
  <url>
    <loc>http://www.example.com/topics/care.html#care</loc>
    <lastmod>2014-10-24</lastmod>
    <changefreq>weekly</changefreq>
    <priority>0.5</priority>
  </url>
  . . .
</urlset>
```

Each page has a `<url>` element structure containing additional information, such as:

- **loc** - The URL of the page. This URL must begin with the protocol (such as `http`), if required by your web server. It is constructed from the value of the `webhelp.sitemap.base.url` parameter from the transformation scenario and the relative path to the page (collected from the `href` attribute of a `topicref` element in the *DITA map*).

Note:

The value must have fewer than 2,048 characters.

- **lastmod** (optional) - The date when the page was last modified. The date format is `YYYY-MM-DD hh:mm:ss`.
- **changefreq** (optional) - Indicates how frequently the page is likely to change. This value provides general information to assist search engines, but may not correlate exactly to how often they crawl the page. Valid values are: `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, and `never`. The first time the `sitemap.xml` file is generated, the value is set based upon the value of the `webhelp.sitemap.change.frequency` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.

Note:

The value `always` should be used to describe documents that change each time they are accessed. The value `never` should be used to describe archived URLs.

- **priority** (optional) - The priority of this page relative to other pages on your site. Valid values range from 0.0 to 1.0. This value does not affect how your pages are compared to pages on other sites. It only lets

the search engines know which pages you deem most important for the crawlers. The first time the `sitemap.xml` file is generated, the value is set based upon the value of the `webhelp.sitemap.priority` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.

Creating and Editing the `sitemap.xml` File

Follow these steps to produce a `sitemap.xml` file for your WebHelp system, which can then be edited to fine-tune search engine optimization:

1. **Edit** the transformation scenario you currently use for obtaining your WebHelp output. This opens the **Edit DITA Scenario** dialog box.
2. Open the **Parameters** tab and set a value for the following parameters:
 - **webhelp.sitemap.base.url** - The URL of the location where your WebHelp system is deployed.

Note:

This parameter is required for Oxygen XML Developer to generate the `sitemap.xml` file.

- **webhelp.sitemap.change.frequency** - How frequently the WebHelp pages are likely to change (accepted values are: `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, and `never`).
 - **webhelp.sitemap.priority** - The priority of each page (value ranging from 0.0 to 1.0).
3. Run the transformation scenario.
 4. Look for the `sitemap.xml` file in the transformation's output folder. Edit the file to fine-tune the parameters of each page, according to your needs.

Localization

This section contains topics that explain how to use the localization support in WebHelp Responsive output.

How to Localize the Interface of WebHelp Responsive Output

Oxygen XML Developer comes with support for the following built-in languages: English, French, German, Japanese, and Chinese. It is possible to edit existing localization strings or add a new language.

Static labels used in the WebHelp output are stored in translation files that have the `strings-lang1-lang2.xml` name format, where `lang1` and `lang2` are ISO language codes. For example, the US English labels are kept in the `strings-en-us.xml` file.

These translation files are collected from two locations:

- [DITA-OT-DIR/plugins/org.dita.base/xsl/common](#) folder - DITA-OT's default translations (generated text for `<note>`, `<fig>`, and `<table>` elements).
- [DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/resources/localization](#) folder - These translations are contributed by the WebHelp plugin and extend the default ones provided by DITA-OT. The labels defined in this folder take precedence over the DITA-OT defaults.

There are two major reasons you may want to use modify the translation files: to modify the existing strings or to translate to a new language.

Related Information:

[How to Index Japanese Content \(on page 1370\)](#)

[Customizing Generated Text](#)

Modifying the Existing Strings

To modify the generated text for WebHelp transformations, you need to create a DITA-OT extension plugin that uses the `dita.xsl.strings` extension point. The following procedure is for changing English labels, but you can adapt it for any language:

1. Create a `com.oxygenxml.webhelp.localization` plugin directory inside the `DITA-OT-DIR/plugins/` location.
2. Create a `plugin.xml` file inside that `com.oxygenxml.webhelp.localization` directory with the following content:

```
<plugin id="com.oxygenxml.webhelp.localization">
  <require plugin="com.oxygenxml.webhelp.responsive"/>

  <feature extension="dita.xsl.strings" file="webhelp-extension-strings.xml"/>
</plugin>
```

3. Create a `webhelp-extension-strings.xml` file with the following content:

```
<langlist>
  <lang xml:lang="en" filename="strings-en-us.xml"/>
  <lang xml:lang="en-us" filename="strings-en-us.xml"/>
</langlist>
```

4. Copy the strings you want to change from [the translation files \(on page 1387\)](#) to the `strings-en-us.xml` file. Make sure you leave the name attribute unchanged because this is the key used to look up the string. A sample content might be:

```
<strings xml:lang="en-US">
  <str name="Figure">Fig</str>
```

```
<str name="Draft comment">ADDRESS THIS DRAFT COMMENT</str>
</strings>
```

5. Use the **Integrate/Install DITA-OT Plugins** transformation scenario (on page 1124) found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box (on page 1240).

Adding a New Language

To add a new language for WebHelp transformations, you need to create a DITA-OT extension plugin that uses the *dita.xml.strings* extension point. The following sample procedure is for adding translation files for the Polish language, but you can adapt it for any language:

1. Create a `com.oxygenxml.webhelp.localization` plugin directory inside the *DITA-OT-
DIR/plugins/* location.
2. Create a `plugin.xml` file inside that `com.oxygenxml.webhelp.localization` directory with the following content:

```
<plugin id="com.oxygenxml.webhelp.localization">
  <require plugin="com.oxygenxml.webhelp.responsive"/>

  <feature extension="dita.xml.strings" file="webhelp-extension-strings.xml"/>
</plugin>
```

3. Create a `webhelp-extension-strings.xml` file with the following content:

```
<langlist>
  <lang xml:lang="pl" filename="strings-pl-pl.xml"/>
  <lang xml:lang="pl-PL" filename="strings-pl-pl.xml"/>
</langlist>
```

4. Copy the WebHelp strings file (*DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/
oxygen-webhelp/resources/localization/strings-en-us.xml*) to your plugin directory, and rename it as `strings-pl-pl.xml`.
5. In the `strings-pl-pl.xml` file, change the `@xml:lang` attribute on the root element that conforms with the new language.

```
<strings xml:lang="pl-PL">
  ...
</strings>
```

6. Copy the common DITA-OT strings defined in the *DITA-OT-DIR/plugins/org.dita.base/xsl/
common/strings-en-us.xml* file into the file created at step 4. It defines a set generated text available for HTML-based transformations (such as `<note>`, `<fig>`, and `<table>` elements). Translate the content of each `<str>` element (make sure to leave the `@name` attribute unchanged).

```
<strings xml:lang="pl-PL">
  ...
  <str name="webhelp.content" js="true" php="false">Polish translation for 'Content'.</str>
  <str name="webhelp.search" js="true" php="false">Polish translation for 'Search'.</str>
```

```

...
<str name="Figure">Polish translation for 'Figure'</str>
<str name="Table">Polish translation for 'Table'</str>
...
</strings>

```

7. Use the [Integrate/Install DITA-OT Plugins](#) transformation scenario (on page 1124) found in the **DITA Map** section in the [Configure Transformation Scenario\(s\)](#) dialog box (on page 1240).

How to Activate Support for Right-to-Left (RTL) Languages

To activate support for RTL (right-to-left) languages in WebHelp output, edit the *DITA map* (on page 2268) and set the `@xml:lang` attribute on its root element (`<map>`). The corresponding attribute value can be set for following RTL languages:

- **ar-eg** - Arabic
- **he-il** - Hebrew
- **ur-pk** - Urdu

Integrating Social Media and Google Tools in the WebHelp Output

This section contains topics that explain how to integrate some of the most popular social media sites in WebHelp output.

How to Add a Facebook Like Button in WebHelp Responsive Output

It is possible to integrate Facebook™ into your **WebHelp Responsive** output and you can specify where you want the widget to appear in your WebHelp page.

Using a Publishing Template

To add a Facebook™ *Like* widget to your WebHelp output using an *Oxygen Publishing Template* (on page 1297), follow this procedure:

1. Go to the [Facebook Developers](#) website.
2. Fill in the displayed form, then click the **Get Code** button.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`. Make sure you follow these rules:
 - The file must be well-formed.
 - The code for each `<script>` element must be included in an XML comment.
 - The start and end tags for the XML comment must be on a separate line. The content of the XML file should look like this:

```

<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!--

```

```

        (function(d, s, id) {

            var js, fjs = d.getElementsByTagName(s)[0];
            if (d.getElementById(id)) return;

            js = d.createElement(s); js.id = id;

            js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";

            fjs.parentNode.insertBefore(js, fjs);

        }(document, 'script', 'facebook-jssdk'));

    -->

</script>

<div class="fb-like" data-layout="standard" data-action="like"

    data-show-faces="true" data-share="true"/>

</div>

```

4. Open the [template descriptor file](#) (on page 1300) associated with your publishing template.
5. Use one of the parameters that begin with *webhelp.fragment* (on page 1307) in the *html-fragments* section of the descriptor file. Set the value of that parameter to reference the `facebook-widget.xml` file that you created earlier.

```

<publishing-template>
...
<webhelp>
...
<html-fragments>
  <fragment
    file="HTML-fragments/facebook-widget.xml"
    placeholder="webhelp.fragment.after.toc_or_tiles"/>
  </html-fragments>
</webhelp>

```

6. Open the *DITA Map WebHelp Responsive* transformation scenario.
7. Click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes to the transformation scenario.
9. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To add a Facebook™ *Like* widget to your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the [Facebook Developers](#) website.
2. Fill in the displayed form, then click the **Get Code** button.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`. Make sure you follow these rules:
 - The file must be well-formed.
 - The code for each `<script>` element must be included in an XML comment.

- The start and end tags for the XML comment must be on a separate line. The content of the XML file should look like this:

```

<div id="facebook">

  <div id="fb-root"/>

  <script>

    <!--

      (function(d, s, id) {

        var js, fjs = d.getElementsByTagName(s)[0];

        if (d.getElementById(id)) return;

        js = d.createElement(s); js.id = id;

        js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";

        fjs.parentNode.insertBefore(js, fjs);

      }(document, 'script', 'facebook-jssdk'));

    -->

  </script>

  <div class="fb-like" data-layout="standard" data-action="like"

    data-show-faces="true" data-share="true"/>

</div>

```

4. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
5. Switch to the **Parameters** tab. Depending on where you want to display the button, edit [one of the parameters that begin with *webhelp.fragment* \(on page 1307\)](#). Set that parameter to reference the [facebook-widget.xml](#) file that you created earlier.
6. Click **Ok** and run the transformation scenario.

How to Add Tweet Button in WebHelp Responsive Output

It is possible to integrate X™ (formerly known as Twitter) into your **WebHelp Responsive** output and you can specify where you want the widget to appear in your WebHelp page.

Using a Publishing Template

To add a X™ *Tweet* widget to your WebHelp Responsive output using an [Oxygen Publishing Template \(on page 1297\)](#), follow this procedure:

1. Go to the [Tweet button generator](#) page.
2. Fill in the displayed form. The **Preview and code** area displays the code that you will need.
3. Copy the code snippet displayed in the **Preview and code** area and paste it into a `<div>` element inside an XML file called `tweet-button.xml`. Make sure you follow these rules:
 - The file must be well-formed.
 - The code for each `<script>` element must be included in an XML comment.
 - The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```

<div id="twitter">

  <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>

  <script>

    <!--

      !function (d, s, id) {

        var

          js, fjs = d.getElementsByTagName(s)[0], p = /^http:/.test(d.location)

        ? 'http': 'https';

        if (! d.getElementById(id)) {

          js = d.createElement(s);

          js.id = id;

          js.src = p + '://platform.twitter.com/widgets.js';

          fjs.parentNode.insertBefore(js, fjs);

        }

      }

      (document,

        'script', 'twitter-wjs');

    -->

  </script>

</div>

```

4. Open the [template descriptor file \(on page 1300\)](#) associated with your publishing template.
5. Use one of the parameters that begin with *webhelp.fragment* ([on page 1307](#)) in the *html-fragments* section of the descriptor file. Set the value of that parameter to reference the `tweet-button.xml` file that you created earlier.

```

<publishing-template>

  ...

  <webhelp>

    ...

    <html-fragments>

      <fragment

        file="HTML-fragments/tweet-button.xml"

        placeholder="webhelp.fragment.after.toc_or_tiles"/>

    </html-fragments>

  </webhelp>

```

6. Open the *DITA Map WebHelp Responsive* transformation scenario.
7. Click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes to the transformation scenario.
9. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To add a X™ *Tweet* widget to your WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the [Tweet button generator](#) page.
2. Fill in the displayed form. The **Preview and code** area displays the code that you will need.
3. Copy the code snippet displayed in the **Preview and code** area and paste it into a `<div>` element inside an XML file called `tweet-button.xml`. Make sure you follow these rules:
 - The file must be well-formed.
 - The code for each `<script>` element must be included in an XML comment.
 - The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```
<div id="twitter">
  <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
  <script>
    <!--
      !function (d, s, id) {
        var
          js, fjs = d.getElementsByTagName(s)[0], p = /^http:/.test(d.location)
        ? 'http': 'https';
        if (! d.getElementById(id)) {
          js = d.createElement(s);
          js.id = id;
          js.src = p + '://platform.twitter.com/widgets.js';
          fjs.parentNode.insertBefore(js, fjs);
        }
      }
      (document,
        'script', 'twitter-wjs');
    -->
  </script>
</div>
```

4. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
5. Switch to the **Parameters** tab. Depending on where you want to display the button, edit [one of the parameters that begin with `webhelp.fragment` \(on page 1307\)](#). Set that parameter to reference the `tweet-button.xml` file that you created earlier.
6. Click **Ok** and run the transformation scenario.

How to Integrate Google Analytics in WebHelp Responsive Output

You can use *Google Analytics* to track and report site data for your **WebHelp Responsive** output.

Using a Publishing Template

To integrate *Google Analytics* into your WebHelp Responsive output using an *Oxygen Publishing Template (on page 1297)*, follow this procedure:

1. Create a new [Google Analytics account](#) (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a **Tracking Code** that contains your *Tracking ID*. A **Tracking Code** looks like this:

```
<script>

(function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
(i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
})(window,document,'script','//www.google-analytics.com/analytics.js','ga');

ga('create', 'UA-XXXXXXX-X', 'auto');
ga('send', 'pageview');

</script>
```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called `googleAnalytics.xml`. Note that the file should only contain the tracking code.
5. Open the [template descriptor file \(on page 1300\)](#) associated with your publishing template.
6. Use the `webhelp.fragment.after.body` parameter ([on page 1435](#)) in the `html-fragments` section of the descriptor file. Set the value of that parameter to reference the `googleAnalytics.xml` file that you created earlier. The content of this file will be copied at the end of all generated output pages, right before the ending `<body>` element. This ensures that the page is loaded before the Google Analytics servers are contacted, thus reducing page loading time.

```
<publishing-template>
...
<webhelp>
...
<html-fragments>
  <fragment
    file="HTML-fragments/googleAnalytics.xml"
    placeholder="webhelp.fragment.after.body"/>
  </html-fragments>
</webhelp>
```

7. Open the *DITA Map WebHelp Responsive* transformation scenario.
8. Click the **Choose Custom Publishing Template** link and select your template.
9. Click **OK** to save the changes to the transformation scenario.
10. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To integrate *Google Analytics* into your WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Create a new [Google Analytics account](#) (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a **Tracking Code** that contains your *Tracking ID*. A **Tracking Code** looks like this:

```
<script>
  (function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
  (i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
  m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
  })(window,document,'script','/www.google-analytics.com/analytics.js','ga');

  ga('create', 'UA-XXXXXXXX-X', 'auto');
  ga('send', 'pageview');
</script>
```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called `googleAnalytics.xml`. Note that the file should only contain the tracking code.
5. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
6. Switch to the **Parameters** tab. Edit the `webhelp.fragment.after.body` parameter (*on page 1435*) and set it to reference the `googleAnalytics.xml` file that you created earlier. The content of this file will be copied at the end of all generated output pages, right before the ending `<body>` element. This ensures that the page is loaded before the Google Analytics servers are contacted, thus reducing page loading time.
7. Click **Ok** and run the transformation scenario.

Ant Extensions for WebHelp Responsive

The WebHelp Responsive plugin provides extension points that allow you to implement custom Ant targets to perform additional operations before and after certain processing stages. The following extension points are available in WebHelp Responsive:

whr-init-pre

Runs a custom Ant target before the `whr-init` processing stage.

whr-init-post

Runs a custom Ant target after the `whr-init` processing stage.

whr-collect-indexterms-pre

Runs a custom Ant target before the `whr-collect-indexterms` processing stage.

whr-collect-indexterms-post

Runs a custom Ant target after the `whr-collect-indexterms` processing stage.

whr-toc-xml-pre

Runs a custom Ant target before the `whr-toc-xml` processing stage.

whr-toc-xml-post

Runs a custom Ant target after the `whr-toc-xml` processing stage.

whr-context-help-map-pre

Runs a custom Ant target before the `whr-context-help-map` processing stage.

whr-context-help-map-post

Runs a custom Ant target after the `whr-context-help-map` processing stage.

whr-sitemap-pre

Runs a custom Ant target before the `whr-sitemap` processing stage.

whr-sitemap-post

Runs a custom Ant target after the `whr-sitemap` processing stage.

whr-copy-resources-pre

Runs a custom Ant target before the `whr-copy-resources` processing stage.

whr-copy-resources-post

Runs a custom Ant target after the `whr-copy-resources` processing stage.

whr-create-topic-pages-pre

Runs a custom Ant target before the `whr-create-topic-pages` processing stage.

whr-create-topic-pages-post

Runs a custom Ant target after the `whr-create-topic-pages` processing stage.

whr-create-main-page-pre

Runs a custom Ant target before the `whr-create-main-page` processing stage.

whr-create-main-page-post

Runs a custom Ant target after the `whr-create-main-page` processing stage.

whr-create-search-page-pre

Runs a custom Ant target before the `whr-create-search-page` processing stage.

whr-create-search-page-post

Runs a custom Ant target after the `whr-create-search-page` processing stage.

whr-create-indexterms-page-pre

Runs a custom Ant target before the `whr-create-indexterms-page` processing stage.

whr-create-indexterms-page-post

Runs a custom Ant target after the `whr-create-indexterms-page` processing stage.

whr-search-index-pre

Runs a custom Ant target before the `whr-search-index` processing stage.

whr-search-index-post

Runs a custom Ant target after the `whr-search-index` processing stage.

To use Ant extension points for WebHelp Responsive, follow these steps:

1. In the `DITA-OT-DIR/plugins/` folder, create a folder for this plugin (for example, `com.oxygenxml.webhelp.responsive.custom.ant.extensions`).
2. Create a **plugin.xml** file (in the folder you created in step 1) that extends the WebHelp Responsive plugin and specifies an Ant extension point with your custom Ant project file that contains the new build targets. For example:

```
<plugin id="com.oxygenxml.webhelp.responsive.custom.ant.extensions">
  <require plugin="com.oxygenxml.webhelp.responsive"/>
  <feature extension="ant.import" file="custom_build_file.xml"/>
</plugin>
```

3. Create the **custom_build_file.xml** file (in the folder you created in step 1) that contains your custom Ant project implementing one or more extension points:

```
<project name="custom.ant.extensions.integrator" basedir=".">
  <target name="custom-whr-init-pre" extensionOf="whr-init-pre">
    <echo>Extension point that executes before whr-init</echo>
  </target>
  <target name="custom-whr-init-post" extensionOf="whr-init-post">
    <echo>Extension point that executes after whr-init</echo>
  </target>
</project>
```

4. Integrate the plugin into the DITA-OT. In the `DITA-OT-DIR/bin` directory of the [DITA Open Toolkit](#), run one of the following scripts, depending on your operating system:
 - Windows: `DITA-OT-DIR/bin/dita.bat --install`
 - Linux/macOS: `sh DITA-OT-DIR/bin/dita --install`
5. Execute a DITA Map to WebHelp Responsive transformation script.

XSLT Extensions for WebHelp Responsive

Since WebHelp Responsive output is primarily obtained by running XSLT transformations over the DITA input files, one customization method would be to override the default XSLT templates that are used by the WebHelp Responsive transformations.

There are two methods available to override the XSLT stylesheets implied by the WebHelp Responsive transformation.

- Use *XSLT-import extension points* from an *Oxygen Publishing Template* (on page 2270).

**Note:**

Use this method if you want to affect only the transformations that use this *publishing template*.

- Use *XSLT-import extension points* from a DITA-OT extension plugin.

**Note:**

This method will affect all the outputs generated with the WebHelp system.

Related information

[WebHelp Responsive XSLT-Import and XSLT-Parameter Extension Points](#) (on page 1447)

How to Use XSLT Extension Points from a Publishing Template

It is possible to declare a WebHelp [XSLT-Import Extension Points](#) (on page 1448) in an *Oxygen Publishing Template* (on page 1469) to override or add additional XSLT processing.

Example:

```
<publishing-template>
...
<webhelp>
...
<xslt>
  <extension
    id="com.oxygenxml.webhelp.xsl.createMainPage"
    file="xsl/customMainPage.xsl"/>
</xslt>
```

Use Case 1: Add Copyright Information Extracted from a DITA Bookmap

Suppose you want to customize the WebHelp Responsive main page by adding information about the legal rights associated with the book in the footer (for example, copyright dates and owner). This information is specified in the bookmap:

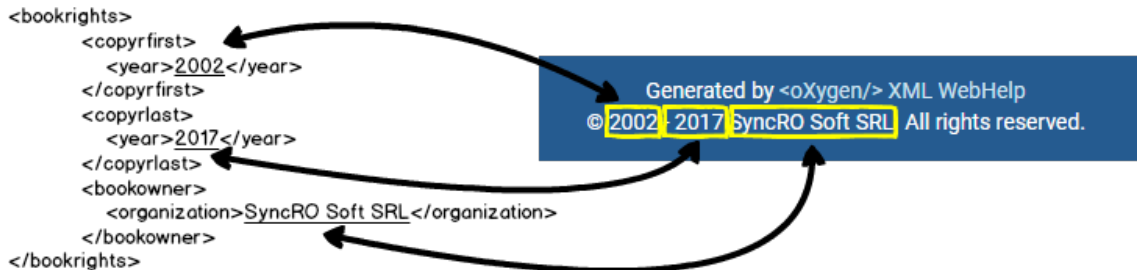

```
<bookrights>
  <copyrfirst>
    <year>2002</year>
  </copyrfirst>
  <copyrlast>
    <year>2017</year>
  </copyrlast>
```

```

<bookowner>
  <organization>SyncRO Soft SRL</organization>
</bookowner>
</bookrights>

```

Figure 400. Example: Copyright Information Added in the WebHelp Footer

The XSLT stylesheet that generates the main page is located in: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createMainPage.xsl`. This XSLT stylesheet declares the `copy_template` mode that processes the `main page template` (on page 1317) to expand its components. The main page template declares a component for the footer section that looks like this:

```

<div class=" footer-container text-center ">
  <whc:include_html href="{webhelp.fragment.footer}"/>
</div>

```

To add this functionality using a *Oxygen Publishing Template*, follow these steps:

1. If you have not already created a Publishing Template, see [How to Create a Publishing Template](#) (on page 1476).
2. Link the folder associated with the publishing template to your current project in the **Project** view.

Step Result: You should have the `custom_footer_template` folder linked in your project.

3. Using the **Project** view, create an `xsl` folder inside the project root folder.

Step Result: You should have the `custom_footer_template/xsl` folder in your project.

4. Create your customization stylesheet (for example, `customMainPage.xsl`) in the `custom_footer_template/xsl` folder. Edit it to override the template that produces the footer section:

```

<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  xmlns:oxygen="http://www.oxygenxml.com/functions"
  exclude-result-prefixes="xs"
  version="3.0">

  <xsl:template match="*:div[contains(@class, 'footer-container')]" mode="copy_template">

    <!-- Apply the default processing -->

```

```

<xsl:next-match/>

<!-- Add a div containing the copyright information -->
<div class="copyright_info">

  <xsl:choose>

    <!-- Adds the start-end years if they are defined -->
    <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst) and
exists($toc/*:topicmeta/*:bookrights/*:copyrlast)">

      <span class="copyright_years">

        &#xa9;<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>

        -<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrlast"/>

      </span>

    </xsl:when>

    <!-- Adds only the first year if last is not defined. -->
    <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)">

      <span class="copyright_years">

        &#xa9;<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>

      </span>

    </xsl:when>

  </xsl:choose>

  <xsl:if test="exists($toc/*:topicmeta/*:bookrights/*:bookowner/*:organization)">

    <span class="organization">

      <xsl:text> </xsl:text><xsl:value-of

        select="$toc/*:topicmeta/*:bookrights/*:bookowner/*:organization"/>

      <xsl:text>. All rights reserved.</xsl:text>

    </span>

  </xsl:if>

</div>
</xsl:template>

</xsl:stylesheet>

```

5. Open the [template descriptor file \(on page 1300\)](#) associated with your publishing template and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.webhelp.xsl.createMainPage` XSLT extension point.

```

<publishing-template>
  ...
  <webhelp>
    ...
    <xslt>

```

```
<extension
  file="xslt/customMainPage.xsl"
  id="com.oxygenxml.webhelp.xsl.createMainPage"/>
```

6. Open the *DITA Map WebHelp Responsive* transformation scenario.
7. Click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes to the transformation scenario.
9. Run the transformation scenario.

Bonus: Add Generation Time in the Output Footer

An additional customization for the main page is to add the generation time in its footer. A transformation parameter is used to control whether or not this customization is active.

Note:

This can also be done directly by using an [HTML fragment \(on page 1307\)](#). You can see a [sample project on GitHub](#) that uses an HTML fragment to show the generation time.

Figure 401. Generation Time Added in the WebHelp Footer

To add this functionality, follow these steps:

1. In the customization stylesheet that you just created (for example, **customMainPage.xsl**), modify the template by adding the following XSLT code at the end (before the closing `</div>` element).

```
<xsl:if test="oxygen:getParameter('webhelp.footer.add.generation.time') = 'yes'">
  <div class="generation_time">
    Generation date: <xsl:value-of
      select="format-dateTime(
        current-dateTime(),
        '[h1]:[m01] [P] on [M01]/[D01]/[Y0001].')"/>
  </div>
</xsl:if>
```

Note:

The `oxygen:getParameter(param.name)` function can be called to get the value of any WebHelp transformation parameter. Just make sure the `xmlns:oxygen="http://www.oxygenxml.com/functions"` namespace is declared in the stylesheet.

2. Open the [template descriptor file \(on page 1300\)](#) associated with your publishing template and set the `webhelp.footer.add.generation.time` parameter to the default value.

```

<publishing-template>
    ...
    <webhelp>
        ...
        <parameters>
            <parameter
                name="webhelp.footer.add.generation.time"
                value="yes"/>

```

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. In the **Parameters** tab, you can change the value of the `webhelp.footer.add.generation.time` parameter.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

Use Case 2: Display Footnotes Below Tables

Suppose you want to separate the footnotes displayed in the WebHelp Responsive pages so that all footnotes are displayed at the end of the page except those within tables that are displayed just after them.

To add this functionality using a *Oxygen Publishing Template*, follow these steps:

1. If you have not already created a Publishing Template, see [How to Create a Publishing Template \(on page 1476\)](#).
2. Link the folder associated with the publishing template to your current project in the **Project** view.

Step Result: You should have the `custom_template` folder linked in your project.

3. Using the **Project** view, create an `xsl` folder inside the project root folder.

Step Result: You should have the `custom_template/xsl` folder in your project.

4. Create your customization stylesheet (for example, `tablesFootnotes.xsl`) in the `custom_template/xsl` folder with the following content:

```

<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:oxy="http://www.oxygenxml.com/extensions/author"
    exclude-result-prefixes="#all"
    version="3.0">

    <!--
        Match only top level tables (i.e tables that are not nested in other tables),
        that contains some footnotes.
    -->

    <xsl:template match="
        *[contains(@class, 'topic/table')]

```

```

[not(ancestor::*[contains(@class, 'topic/table')])]

<xsl:variable name="top-level-table" select="."/>

<xsl:next-match>

  <xsl:with-param name="top-level-table" select="$top-level-table" tunnel="yes"/>

</xsl:next-match>

<!-- Create a list with all the footnotes from the current table. -->

<div outputclass="table-fn-container">

  <xsl:for-each select="//*[contains(@class, 'topic/fn')]">

    <!--

      Try to preserve the footnote ID, if available, so that the xrefs will have a target.

    -->

    <div id="{if(@id) then @id else generate-id(.)}">

      <xsl:variable name="unique-id" select="generate-id($top-level-table)"/>

      <xsl:variable name="fn-id">

        <xsl:number from="$top-level-table" level="any"/>

      </xsl:variable>

      <xsl:call-template name="commonattributes"/>

      <a name="tbl_{$unique-id}_fntarg_{$fn-id}" href="#tbl_{$unique-id}_fnsrc_{$fn-id}">

        <sup>

          <xsl:value-of select="$fn-id"/>

        </sup>

      </a>

      <xsl:text> </xsl:text>

      <xsl:apply-templates/>

    </div>

  </xsl:for-each>

</div>

</xsl:template>

<!--

  Process footnotes both inside and outside tables (based on the top-level-table parameter).

-->

<xsl:template match="*[contains(@class, ' topic/fn ')]" name="topic.fn">

  <xsl:param name="xref"/>

  <xsl:param name="top-level-table" tunnel="yes"/>

  <!-- Footnotes with IDs must be ignored, they are accessible only through xrefs. -->

  <xsl:if test="not(@id) or $xref = 'yes'">

    <xsl:variable name="unique-id" select="

      if ($top-level-table) then

```

```

        generate-id($top-level-table)

    else

        ()"/>

<xsl:variable name="fn-id" select="

    if ($top-level-table) then

        index-of($top-level-table//*[contains(@class, 'topic/fn')], .)

    else

        index-of//*[contains(@class, 'topic/fn')]

    [not(ancestor::*[contains(@class, 'topic/entry')])], .)"/>

<xsl:variable name="callout" select="@callout"/>

<xsl:variable name="converged-callout" select="

    if (string-length($callout) > 0) then

        $callout

    else

        $fn-id"/>

<a>

<!-- Generate different attributes based on the presence of a parent table. -->

<xsl:attribute name="name" select="

    if ($top-level-table) then

        concat('tbl_', $unique-id, '_fnsrc_', $fn-id)

    else

        concat('fnsrc_', $fn-id)"/>

<xsl:attribute name="href" select="

    if ($top-level-table) then

        concat('#tbl_', $unique-id, '_fntarg_', $fn-id)

    else

        concat('#fntarg_', $fn-id)"/>

<sup>

    <xsl:value-of select="$converged-callout"/>

</sup>

</a>

</xsl:if>

</xsl:template>

<!--

    The xrefs to footnotes with IDs inside table-cells. We need to recalculate

    their indexes if their referenced footnote is also in the table.

-->

<xsl:template match="

    *[contains(@class, 'topic/xref')][@type = 'fn']

    [ancestor::*[contains(@class, 'topic/entry')]]">

<xsl:param name="top-level-table" tunnel="yes"/>

```

```

<xsl:variable name="topic-id" select="substring-after(@href, '#')"/>
<xsl:variable name="element-id" select="substring-after($topic-id, '/')"/>
<xsl:variable name="destination">
  <xsl:choose>
    <xsl:when test="$element-id = ''">
      <xsl:value-of select="$topic-id"/>
    </xsl:when>
    <xsl:otherwise>
      <xsl:value-of select="$element-id"/>
    </xsl:otherwise>
  </xsl:choose>
</xsl:variable>

<xsl:variable name="fn" select="
  $top-level-table//*[contains(@class, 'topic/fn')][@id = $destination]"/>
<xsl:choose>
  <xsl:when test="$fn">
    <xsl:variable name="unique-id" select="generate-id($top-level-table)"/>
    <!-- There is a reference in the table, recalculate index. -->
    <xsl:variable name="fn-id" select="
      index-of($top-level-table//*[contains(@class, 'topic/fn')], $fn)"/>
    <a name="tbl_{\$unique-id}_fnsrc_{\$fn-id}" href="#tbl_{\$unique-id}_fntarg_{\$fn-id}">
      <sup>
        <xsl:value-of select="$fn-id"/>
      </sup>
    </a>
  </xsl:when>
  <xsl:otherwise>
    <!-- There is no reference in the table, keep original index. -->
    <xsl:next-match/>
  </xsl:otherwise>
</xsl:choose>
</xsl:template>

<!--
  Output footnotes below tables and at the end of the topic.
-->

<xsl:template match="*[contains(@class, ' topic/fn ')]" mode="genEndnote">
  <!-- Do not process footnotes from tables. -->
  <xsl:if test="not(node()/ancestor::*[contains(@class, 'topic/table')])">
    <div>

```

```

<!-- Do not number footnotes from tables. -->

<xsl:variable name="fn-id" select="index-of(//*[contains(@class, 'topic/fn')]
[not(ancestor::*[contains(@class, 'topic/entry')]), .)"/>

<xsl:variable name="callout" select="@callout"/>

<xsl:variable name="converged-callout" select="
  if (string-length($callout) > 0) then
    $callout
  else
    $fn-id"/>

<xsl:call-template name="commonattributes"/>

<xsl:choose>

  <xsl:when test="@id and not(@id = '')">

    <xsl:variable name="topic-id" select="
      ancestor::*[contains(@class, ' topic/topic ')] [1]/@id"/>

    <xsl:variable name="ref-id" select="concat($topic-id, '/', @id)"/>

    <xsl:choose>

      <xsl:when test="key('xref', $ref-id)">

        <a>

          <xsl:call-template name="setid"/>

          <sup>

            <xsl:value-of select="$converged-callout"/>

          </sup>

        </a>

        <xsl:text> </xsl:text>

      </xsl:when>

      <xsl:otherwise>

        <sup>

          <xsl:value-of select="$converged-callout"/>

        </sup>

        <xsl:text> </xsl:text>

      </xsl:otherwise>

    </xsl:choose>

  </xsl:when>

  <xsl:otherwise>

    <a name="fntarg_{$fn-id}" href="#fnsrc_{$fn-id}">

      <sup>

        <xsl:value-of select="$converged-callout"/>

      </sup>

    </a>

    <xsl:text> </xsl:text>

  </xsl:otherwise>

```

```

</xsl:choose>

<xsl:apply-templates/>

</div>

</xsl:if>

</xsl:template>

</xsl:stylesheet>

```

5. Open the **template descriptor file** (on page 1300) associated with your publishing template and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.webhelp.xsl.dita2webhelp` XSLT extension point.

```

<publishing-template>
...
<webhelp>
...
<xslt>
  <extension
    file="xslt/tablesFootnotes.xsl"
    id="com.oxygenxml.webhelp.xsl.dita2webhelp"/>

```

6. Open the *DITA Map WebHelp Responsive* transformation scenario.
7. Click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes to the transformation scenario.
9. Run the transformation scenario.

How to Use XSLT Extension Points from a DITA-OT Plugin

In this example, the main page footer is modified by adding copyright information extracted from the DITA bookmap or by adding the output generation time. The first use-case uses an *XSLT-Import* extension point while the second uses an *XSLT-Parameter* extension point.

Note:

This customization is available as a GitHub project at: <https://github.com/oxygenxml/com.oxygenxml.webhelp.responsive.custom.footer>.

Use Case 1: WebHelp *XSLT-Import* extension point to add copyright information extracted from a DITA Bookmap

Suppose you want to customize the WebHelp Responsive main page by adding information about the legal rights associated with the book in the footer (for example, copyright dates and owner). This information is specified in the bookmap:

```

<bookrights>
  <copyrfirst>

```

```

<year>2002</year>

</copyfirst>

<copylast>

  <year>2017</year>

</copylast>

<bookowner>

  <organization>SyncRO Soft SRL</organization>

</bookowner>

</bookrights>

```

Figure 402. Example: Copyright Information Added in the WebHelp Footer

The XSLT stylesheet that generates the main page is located in: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createMainPage.xsl`. This XSLT stylesheet declares the `copy_template` mode that processes the main page template to expand its components. The `main page template` (on page 1317) declares a component for the footer section that looks like this:

```

<div class=" footer-container text-center ">

  <whc:include_html href="{webhelp.fragment.footer}"/>

</div>

```

In the following example, the extension stylesheet will add a template that matches this component. It applies the default processing and adds the copyright information at the end.

```

<xsl:template match="*:div[contains(@class, 'footer-container')]" mode="copy_template">

  <!-- Apply the default processing -->

  <xsl:next-match/>

  <!-- Add a div containing the copyright information -->

  <div class="copyright_info">

    <xsl:choose>

      <!-- Adds the start-end years if they are defined -->

      <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyfirst) and
                    exists($toc/*:topicmeta/*:bookrights/*:copylast)">

        <span class="copyright_years">

          &#xa9;<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyfirst"/>

          -<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copylast"/>

```

```

        </span>

    </xsl:when>

    <!-- Adds only the first year if last is not defined. -->

    <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)">

        <span class="copyright_years">

            &#xa9;<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>

        </span>

    </xsl:when>

</xsl:choose>

<xsl:if test="exists($toc/*:topicmeta/*:bookrights/*:bookowner/*:organization)">

    <span class="organization">

        <xsl:text> </xsl:text><xsl:value-of

            select="$toc/*:topicmeta/*:bookrights/*:bookowner/*:organization"/>

        <xsl:text>. All rights reserved.</xsl:text>

    </span>

</xsl:if>

</div>

</xsl:template>

```

You can implement this functionality with a WebHelp extension plugin that uses the **com.oxygenxml.webhelp.xsl.createMainPage** extension point (on page 1448). This extension point allows you to specify a customization stylesheet that will override the template described above.

To add this functionality as a DITA-OT plugin, follow these steps:

1. In the `DITA-OT-DIR\plugins\` folder, create a folder for this plugin (for example, `com.oxygenxml.webhelp.responsive.custom.footer`).
2. Create a **plugin.xml** file (in the folder you created in step 1) that specifies the extension point and your customization stylesheet. For example:

```

<plugin id="com.oxygenxml.webhelp.responsive.custom.footer">

    <feature extension="com.oxygenxml.webhelp.xsl.createMainPage"

        file="custom_mainpage.xsl"/>

</plugin>

```

3. Create your customization stylesheet (for example, **custom_mainpage.xsl**), and edit it to override the template that produces the footer section:

```

<xsl:template match="*:div[contains(@class, 'footer-container')]" mode="copy_template">

    <!-- Apply the default processing -->

    <xsl:next-match/>

```

```

<!-- Add a div containing the copyright information -->
<div class="copyright_info">
  <xsl:choose>
    <!-- Adds the start-end years if they are defined -->
    <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst) and
      exists($toc/*:topicmeta/*:bookrights/*:copyrlast)">
      <span class="copyright_years">
        &#xa9;<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
        -<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrlast"/>
      </span>
    </xsl:when>
    <!-- Adds only the first year if last is not defined. -->
    <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)">
      <span class="copyright_years">
        &#xa9;<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
      </span>
    </xsl:when>
  </xsl:choose>

  <xsl:if test="exists($toc/*:topicmeta/*:bookrights/*:bookowner/*:organization)">
    <span class="organization">
      <xsl:text> </xsl:text><xsl:value-of
        select="$toc/*:topicmeta/*:bookrights/*:bookowner/*:organization"/>
      <xsl:text>. All rights reserved.</xsl:text>
    </span>
  </xsl:if>
</div>
</xsl:template>

```

4. Use the **Integrate/Install DITA-OT Plugins** transformation scenario (on page 1124) found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box (on page 1240).
5. Run a **DITA Map WebHelp Responsive** transformation scenario to obtain the customized side TOC.

Use-Case 2: WebHelp XSLT-Parameter Extension Point to Control if Generation Time is Displayed in the Output

Another possible customization for the main page is to add the generation time in its footer. You can use an *XSLT-Parameter* extension point to control whether or not this customization is active. In this case, you can use the `com.oxygenxml.webhelp.xsl.createMainPage.param` extension point (on page 1449).

Figure 403. Generation Time Added in the WebHelp Footer

To add this functionality, follow these steps:

1. Create a DITA-OT plugin structure by following the first 3 steps in the [procedure above \(on page 1408\)](#).
2. In the customization stylesheet that you just created (for example, **custom_mainpage.xml**), declare `webhelp.footer.add.generation.time` as a global parameter and modify the template by adding the following XSLT code at the end.

```
<xsl:if test="$webhelp.footer.add.generation.time = 'yes'">
  <div class="generation_time">
    Generation date: <xsl:value-of select="format-dateTime(
      current-dateTime(), '[h1]:[m01] [P] on [M01]/[D01]/[Y0001].')"/>
  </div>
</xsl:if>
```

3. Edit the **plugin.xml** file to specify the **com.oxygenxml.webhelp.xml.createMainPage.param** extension point and a custom parameter file by adding the following line:

```
<feature extension="com.oxygenxml.webhelp.xml.createMainPage.param" file="params.xml"/>
```

4. Create a custom parameter file (for example, **params.xml**). It should look like this:

```
<dummy>
  <param name="webhelp.footer.add.generation.time"
    expression="{webhelp.footer.add.generation.time}"
    if="webhelp.footer.add.generation.time"/>
</dummy>
```

5. Use the [Integrate/Install DITA-OT Plugins](#) transformation scenario (on page 1124) found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box (on page 1240).
6. Edit a **DITA Map WebHelp Responsive** transformation scenario and in the **Parameters** tab (on page), specify the desired value (yes or no) for your custom parameter (`webhelp.footer.add.generation.time`).
7. Run the transformation scenario.

Miscellaneous Customization Topics

This section contains miscellaneous topics about how to customize the WebHelp Responsive output.

How to Copy Additional Resources to Output Directory

You can copy additional resources (such as graphics, JavaScript, CSS, entire folders, or other resources) to the output directory either by using an [Oxygen Publishing Template \(on page 2270\)](#) or the `webhelp.custom.resources` parameter.

Copying Additional Resources to the Output Directory using a Publishing Template

1. If you have not already created a Publishing Template, see [How to Create a Publishing Template \(on page 1476\)](#).
2. Add a new `<fileset>` element in the `resources` section of the template descriptor file (on page 1303).

```
<publishing-template>
...
<webhelp>
...
<resources>
  <fileset>
    <include name="custom-resources/**/*" />
    <exclude name="**/*.git" />
  </fileset>
</resources>
</webhelp>
</publishing-template>
```

Note:

Relative paths in the descriptor file are relative to the template root folder.

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

Results: All files from the custom resources directory will be copied to the *WebHelp Output Directory/oxygen-webhelp/template* folder.

Copying Additional Resources to the Output Directory using a Transformation Parameter

1. Place all your resources in the same directory.
2. Edit the *DITA Map WebHelp Responsive* transformation scenario and open the **Parameters** tab.
3. Edit the value of the `webhelp.custom.resources` parameter and set it to the absolute path of the directory in step 1.
4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

Results: All files from the new directory will be copied to the root of the WebHelp output directory.

How to Add an Edit Link to Launch Oxygen XML Web Author

You can embed *Edit* links in the DITA WebHelp Responsive output that will automatically launch a particular document in [Oxygen XML Web Author](#). A reviewer can then click the link to open the particular file in Oxygen XML Web Author where they can make or propose changes.

Using a Publishing Template

To embed an *Edit* link in the DITA Map WebHelp Responsive output using an [Oxygen Publishing Template \(on page 1297\)](#), follow this procedure:

1. If you have not already created a Publishing Template, see [Working with Publishing Templates \(on page 1336\)](#).
2. Open the [template descriptor file \(on page 1300\)](#) associated with your publishing template and add the following parameters with their values set to the URLs:
 - **editlink.ditamap.edit.url** - The URL of the DITA map used to publish your content. The easiest way to obtain the URL is to open the map in Web Author or Content Fusion and copy the URL from the browser's address bar.
 - **editlink.additional.query.parameters** - Optional query parameters to be appended to each generated edit link. Each parameter must start with & (e.g. `&tags-mode=no-tags`).

```
<publishing-template>
...
<webhelp>
...
<parameters>
  <parameter name="editlink.ditamap.edit.url"
             value="webdav-https://dav.box.com/dav/my.ditamap"/>
</parameters>
</webhelp>
```

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

Result: In the WebHelp output, all topics will have an **Edit** link to the right side of the title and clicking the link will launch that particular document in Oxygen XML Web Author.

For example:

- **Windows**
`dita.bat -i c:\mySample.ditamap -f webhelp-responsive
-Deditlink.ditamap.edit.url=webdav-https://dav.box.com/dav/my.ditamap`
- **macOS/ Linux**
`dita -i /mySample.ditamap -f webhelp-responsive
-Deditlink.ditamap.edit.url=webdav-https://dav.box.com/dav/my.ditamap`

Using a Transformation Scenario in Oxygen XML Editor/Author

To embed an *Edit* link in the DITA Map WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit a **DITA Map WebHelp Responsive** transformation scenario and open the **Parameters** tab.
2. Set values for the following parameters:
 - **editlink.ditamap.edit.url** - The URL of the Oxygen XML Web Author that have opened the DITA map for editing.
 - **editlink.additional.query.parameters** - Optional query parameters to be appended to each generated edit link. Must start with & (e.g.: *&tags-mode=no-tags*).
3. Run the transformation scenario.

Result: In the WebHelp output, all topics will have an **Edit** link to the right side of the title and clicking the link will launch that particular document in Oxygen XML Web Author.

[Web Author Customization Guide: Embedding an Edit Link that will Launch Web Author](#)

How to Flag DITA Content in WebHelp Output

Flagging content in WebHelp output involves defining a set of images that will be used for marking content across your information set.

To flag DITA content, you need to create a filter file that defines properties that will be applied on elements to be flagged. Generally, flagging is supported for *block elements (on page 2267)* (such as paragraphs), but not for phrase-level elements within a paragraph. This ensures that the images that will flag the content are easily scanned by the reader, instead of being buried in the text.

Using a Publishing Template

To flag content in DITA Map to WebHelp output using an *Oxygen Publishing Template (on page 1297)*, follow this procedure:

1. Create a DITA filter file (DITAVAL) and add it in a directory of your choice (for example, named `myFile.ditaval`).
2. Define the property for the elements you want to be flagged. For example, if you want to flag any element that has the `@audience` attribute set to `programmer`, the content of the DITAVAL file should look like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<val>
  <prop att="audience" val="programmer" action="flag"
  img="D:\resource\delta.gif" alt="sample alt text"/>
</val>
```

**Note:**

For an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.

3. Open the [template descriptor file \(on page 1300\)](#) associated with your publishing template and add the `args.filter` parameter in the `parameters` section with its value set to the path of the DITAVAL file you created.

```
<publishing-template>
...
<webhelp>
...
<parameters>
  <parameter name="args.filter" value="resources/myFile.ditaval"/>
</parameters>
</webhelp>
```

4. Open the *DITA Map WebHelp Responsive* transformation scenario.
5. Click the **Choose Custom Publishing Template** link and select your template.
6. Click **OK** to save the changes to the transformation scenario.
7. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To flag content in the DITA Map to WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Create a DITA filter file (DITAVAL) and add it in a directory of your choice (for example, named `myFile.ditaval`).
2. Define the property for the elements you want to be flagged. For example, if you want to flag any element that has the `@audience` attribute set to `programmer`, the content of the DITAVAL file should look like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<val>
  <prop att="audience" val="programmer" action="flag"
  img="D:\resource\delta.gif" alt="sample alt text"/>
</val>
```

**Note:**

For an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.

3. Edit a **DITA Map to WebHelp** transformation scenario.

4. Specify the DITAVAL file in the **Filters** tab (with the **Use DITAVAL File** option).
5. Run the transformation scenario.

How to View MathML Equations in HTML Output

By default, only **Firefox** can render **MathML** equations embedded in the **HTML** code. **MathJax** is a solution to properly view MathML equations embedded in **HTML** content in a variety of browsers.

If you have DocBook or DITA content that has embedded **MathML** equations and you want to properly view the equations in published HTML output types (WebHelp, CHM, EPUB, etc.), you need to add a reference to the MathJax script in the **head** element of all HTML files that have the equation embedded.

For example:

```
<script type="text/javascript"
  src="https://cdnjs.cloudflare.com/ajax/libs/mathjax/2.7.1/MathJax.js?config=TeX-AMS-MML_HTMLorMML">
</script>
```

Alternate Method for DITA

For DITA documents, you can also use the following procedure:

1. Create an XML file that contains a script similar to the one shown in the example above.
2. Edit the DITA Map transformation scenario and open the **Parameters** tab.
3. Set the following parameter to point to the XML file created in step 1:
 - **WebHelp Responsive Systems** - Set the `webhelp.fragment.head` parameter to point to your XML file.
 - **Any other type of HTML-based publishing** - Set the `args.hdf` parameter to point to your XML file.
4. Run the transformation scenario.

Result: The equation should now be properly rendered in other browsers, such as Edge, IE, or Chrome.

How to Disable Caching in WebHelp Responsive Output

In cases where a set of WebHelp Responsive pages need to be updated on a regular basis to deliver the latest version of the documentation, the WebHelp pages should always be requested from the server upon re-loading it in a web browser on the client side, (rather than re-using an outdated *cached* version in the browser).

To disable caching in WebHelp Responsive output, follow this procedure:

1. Create a new well-formed XML file and add the following code snippet:

```
<meta http-equiv="Pragma" content="no-cache" />
<meta http-equiv="Expires" content="-1" />
```

Note:

The code should look like this:

```
<!DOCTYPE html>

<html xmlns="http://www.w3.org/1999/xhtml">

  <head>

    <meta http-equiv="Pragma" content="no-cache" />

    <meta http-equiv="Expires" content="-1" />

  </head>

</html>
```

2. Edit the *DITA Map WebHelp Responsive* transformation scenario and open the **Parameters** tab.
3. Edit the value of the `webhelp.fragment.head` parameter and set it to the absolute path of your XML file.
4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

Result: Your additional content is included at the end of the `<head>` element of your output document.

How to Add a Link to PDF Documentation

It is possible to add a component in your WebHelp output that links to an external PDF resource. For example, it could link to the PDF equivalent of the documentation. This is achieved by configuring some transformation parameters and the link component is added in the header/breadcrumb stripe, next to the navigation links.

The transformation parameters used for generating a PDF link component in the WebHelp Responsive output are:

webhelp.pdf.link.url

Specifies the target URL for the PDF link component.

webhelp.pdf.link.text

Specifies the text for the PDF link component.

webhelp.pdf.link.icon.path

Specifies the path or URL of the image icon to be used for the PDF link component. If not specified, a default icon is used.

webhelp.show.pdf.link

Specifies whether or not the PDF link component is shown in the WebHelp Responsive output. Allowed values are: **yes** (default) and **no**.

webhelp.pdf.link.anchor.enabled

Specifies whether or not the current topic ID should be appended as the name destination at the end of the PDF link. Allowed values are: **yes** (default) and **no**.

How to Add a Custom Component for WebHelp Output

This topic explains how to use several customization methods to define and implement a custom component for WebHelp output pages.

Predefined components

The WebHelp output is based on a set of [HTML Page Layout Files \(on page 1316\)](#) that define the default layout of the generated pages. Each layout file is made of a set of various components. Each component is described using an associated XML element that is processed at the generation time resulting in its associated component being included in the output pages.

Here are a few examples of predefined components: **Logo, Title, Menu, Search Input, Topics Tiles, Topic Breadcrumb, Topic Content, Publication Table of Contents**. A complete list with all the available components is available here: [Layout of the Responsive Page Types \(on page 1251\)](#).

For example, the page component that is used to define the Search Input field in the WebHelp HTML pages is defined as follows:

```
<!-- Search form -->
<whc:webhelp_search_input class="navbar-form wh_topic_page_search search" role="form"/>
```

At publishing time, the above component will be expanded into:

```
<div class=" wh_search_input navbar-form wh_topic_page_search search">
  <form id="searchForm" method="get" role="search" action="../search.html">
    <div>
      <input type="search" placeholder="Search "
        class="wh_search_textfield ui-autocomplete-input" id="textToSearch"
        name="searchQuery" aria-label="Search query" required="required"
        autocomplete="off"/>
      <button type="submit" class="wh_search_button" aria-label="Search">
        <span class="search_input_text">Search</span>
      </button>
    </div>
  </form>
</div>
```

Customization Methods

The most common customization methods for the WebHelp Responsive output include:

- Apply [custom CSS styles \(on page 1347\)](#) to change the default layout and styles.
- Insert additional HTML content [\(on page 1349\)](#) using one of the available [HTML Fragment Placeholder parameters \(on page 1307\)](#).
- Extend the default processing using [XSLT Extension Points \(on page 1306\)](#).
- Configure available [Transformation Parameters \(on page 1433\)](#).

Use Case: Custom Link Component

For the subsequent procedure, suppose you have a DITA project for a User Manual and you also have various video demonstrations available on your website that supplement the documentation. You may want to link a video demonstration for a particular feature in its associated DITA topic in the WebHelp output.

You could simply add a link somewhere in your DITA topic, but this approach would not be very suitable for a printable (PDF) version of your User Manual. Thus, you need to include the link to the associated video demonstration only in the WebHelp output of your User Manual (and not the PDF version).

One way to link a video with its associated topic is to include its URL in the metadata section. For example:

```
<prolog>
  <metadata>
    <othermeta name="video-link" content="https://www.youtube.com/watch?v=zNmXfKwXw08"/>
  </metadata>
</prolog>
```

Next, you need to instruct WebHelp to pick up the URL from the metadata and generate a link in a specific location of the HTML output page. You can achieve this by creating your own WebHelp custom component.

Creating a Custom Component

You can combine several of the available customization methods to define and implement your own WebHelp custom component.

Figure 404. Custom Component

To create a custom component that displays a link to the current topic's associated video tutorial, follow these steps:

1. Define your component. For example, it may have the following form:

```
<comp:video-link xmlns:comp="http://example.com/custom-components"/>
```

The component is an XML element that belongs to a custom defined namespace.

2. Insert the component in your topic pages. To do this, you will have to save the associated XML element in an HTML Fragment file (for example, named `video-link-fragment.xml`).
3. Reference the HTML Fragment file in your current [Publishing Template's descriptor file](#) (*on page 1300*) and associate it with an HTML Fragment placeholder that is available for the topic pages (`webhelp.fragment.before.topic.toolbar` in this case):

```
<html-fragments>

  <fragment file="component/html-fragment/video-link-fragment.xml"

    placeholder="webhelp.fragment.before.topic.toolbar" />

</html-fragments>
```

**Note:**

The HTML Fragment file is referenced using a path relative to the Publishing Template root directory.

4. Create a custom XSLT file that processes the custom component and picks up the video URL available in the current topic's metadata and generates a link to the page that contains the video:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"

  xmlns:xs="http://www.w3.org/2001/XMLSchema"

  xmlns:comp="http://example.com/custom-components"

  exclude-result-prefixes="xs comp"

  version="3.0">

  <!-- Custom component implementation -->

  <xsl:template match="comp:video-link" mode="copy_template">

    <xsl:param name="ditaot_topicContent" tunnel="yes" />

    <!-- Look for a 'video-link' <meta> element in the current topic content -->

    <xsl:variable name="videoLinkMeta"

      select="$ditaot_topicContent//*[meta[@name='video-link']]"/>

    <xsl:if test="exists($videoLinkMeta)">

      <div class="video-link-container">

        <a href="{ $videoLinkMeta[1]/@content}"

          class="video-link" target="_blank" aria-label="Video">

          <span>Video</span>

        </a>

      </div>

    </xsl:if>

  </xsl:template>

</xsl:stylesheet>
```

The HTML content generated for your component will look like this:

```
<div class="video-link-container">

  <a href="https://www.youtube.com/watch?v=zNmXfKwXw08"

    class="video-link" target="_blank"

    aria-label="Video">

    <span>Video</span>

  </a>

</div>
```

```

</a>
</div>

```

5. Reference the above XSL file in your Publishing Template's descriptor file using the XSLT extension point associated with the XSL module that generates an HTML file for each DITA topic:

```

<xslt>
  <extension file="component/xsl/video-link-impl.xsl"
    id="com.oxygenxml.webhelp.xsl.dita2webhelp"/>
</xslt>

```

6. Create a custom CSS file that contains the rules for styling the output for your component:

```

@import url('https://fonts.googleapis.com/icon?family=Material+Icons');

.video-link-container {
  display: flex;
  align-items: center;
  flex-grow: 10;
  justify-content: flex-end;
}

.video-link {
  display: flex;
  align-items: center;
  color: #fff !important;
}

.video-link:before {
  content: "smart_display";
  font-family: 'Material Icons';
  font-size: 20px;
  display: inline-block;
  word-wrap: normal;
  white-space: nowrap;
}

.video-link span {
  display: none;
}

.wh_right_tools {
  padding: 0;
}

```

7. Reference the above CSS file in your Publishing Template's descriptor file:

```

<resources>
  <!-- ..... -->
  <css file="component/css/video-link.css"/>
</resources>

```

Result: An icon that is a link to the video appears in the header stripe in the output page.

Figure 405. Custom Link to Video Component

Sample Publishing Template

A sample Publishing Template that contains all the above customizations is available here: <https://github.com/oxygenxml/oxygen-publishing-template-samples/tree/master/templates/video-link-custom-component>.

How to Generate Google Structured Data

It is possible to generate Google Structured Data (`<script>` elements that contain a JSON-LD object) in the DITA WebHelp Responsive output. Google uses this JSON-LD object to better understand the contents of the page and display special search results in a Google Search.

Tip:

For more details, see [Google Search Central: Understand how structured data works](#).

To generate Google Structured Data in WebHelp output, use the following transformation parameter:

google.structured.data

Specifies whether or not Google Structured Data will be generated in the output. If set to **yes**, the transformation automatically generates Google Structured Data for **Questions and Answers** topics, DITA Task topics, and from `<data>` elements found inside a topic that has the `@name="oxy:question"` construct. If set to **no** (default value), the transformation will not generate Google Structured Data.

Generating Google Structured Data for DITA Tasks Topics

When Google Structured Data is enabled, the DITA Task `<title>`, `<shordesc>`, and `<step>` elements are mapped to the `HowTo` JSON-LD object. For example, the following DITA Task topic:

```

<task id="task_id">

  <title>My task</title>

  <shortdesc>Task description</shortdesc>

  <steps>

    <step>

      <cmd>Step 1 content.</cmd>

    </step>

    <step>

      <cmd>Step 2 content.</cmd>

    </step>

  </steps>

</task>

```

will generate the following structure in the output:

```

<script type="application/ld+json" id="jsonld-howto">
{
  "@context": "https://schema.org",
  "@type": "HowTo",
  "name": "My task",
  "description": "Task description",
  "supply": [],
  "tool": [],
  "step": [
    {
      "@type": "HowToStep",
      "text": "<span class=\"topic/ph task/cmd ph cmd\">Step 1 content.</span>"
    },
    {
      "@type": "HowToStep",
      "text": "<span class=\"topic/ph task/cmd ph cmd\">Step 2 content.</span>"
    }
  ]
}
</script>

```

Generating for Questions and Answers Topics

When Google Structured Data is enabled, the QA topic `<qagroup>` elements are mapped to the [FAQPage](#) JSON-LD object. For example, the following QA topic:

```

<qatopic id="qa_id">

  <title>Faq Page 1</title>

  <qabody>

```

```

<qagroup>

  <question>What is a car engine?</question>

  <answer>The car engine is a device that uses fuel to create mechanical power that can

    turn the car's wheels.</answer>

</qagroup>

</qabody>

</qatopic>

```

will generate the following structure in the output:

```

<script type="application/ld+json" id="jsonld-faq">
{
  "@context": "https://schema.org",
  "@type": "FAQPage",
  "mainEntity": [
    {
      "@type": "Question",
      "name": "What is a car engine?",
      "acceptedAnswer": {
        "@type": "Answer",
        "text": "<div class=\"- topic/div qatopic/answer div answer\">The car engine is a
device that uses fuel to create mechanical power that can turn the car's wheels.</div>"
      }
    }
  ]
}
</script>

```

Generating from `data` elements found inside a topic

When Google Structured Data is enabled, the WebHelp Responsive transformation will map the `<data>` elements found inside a topic to a `FAQPage` JSON-LD object. There are 2 different use cases depending on where the `<data>` element is found in the document:

- In the `<prolog>` element. For example, this content:

```

<concept id="lawnmowerconcept">

  <title>Lawnmower</title>

  <shortdesc>The lawnmower is a machine used to cut grass in the yard.</shortdesc>

  <prolog>

    <metadata>

      <data name="oxy:question">What tools are necessary to cut the grass?</data>

    </metadata>

  </prolog>

</concept>

```

```

    <p>Lawnmowers can be electric, gas-powered, or manual.</p>

</tbody>

</concept>

```

will generate the following structure in the output:

```

<script type="application/ld+json" id="jsonld-faq">
{
  "@context": "https://schema.org",
  "@type": "FAQPage",
  "mainEntity": [
    {
      "@type": "Question",
      "name": "What tools are necessary to cut the grass?",
      "acceptedAnswer": {
        "@type": "Answer",
        "text": "<div class=\"- topic/body concept/conbody body conbody\">
          <p class=\"- topic/shortdesc shortdesc\">The lawnmower is a machine
used to cut grass in the yard.</p> <p class=\"- topic/p p\">Lawnmowers can be electric,
gas-powered, or manual.</p> </div>"
      }
    }
  ]
}
</script>

```

Important:

The answer represents the HTML result of the entire content inside the topic.

- Inside the topic body elements. For example, content:

```

<topic id="concept-id">
  <title>Morning</title>
  <shortdesc>In the morning we have breakfast.</shortdesc>
  <body>
    <ul>
      <data name="oxy:question">What do people drink in the morning?</data>
      <li>Tea</li>
      <li>Milk</li>
    </ul>
  </body>
</topic>

```

will generate the following structure in the output:

```

<script type="application/ld+json" id="jsonld-faq">
  {
    "@context": "https://schema.org",
    "@type": "FAQPage",
    "mainEntity": [
      {
        "@type": "Question",
        "name": "What do people drink in the morning?",
        "acceptedAnswer": {
          "@type": "Answer",
          "text": "<div class=\"- topic/body body\"><ul class=\"- topic/ul ul\"></ul>
<li class=\"- topic/li li\">Tea</li> <li class=\"- topic/li li\">Milk</li> </div>"
        }
      }
    ]
  }
</script>

```

Important:

The answer represents the HTML result of the entire block where the `<data>` element is located inside.

How to Group Related Links by Type

By default, all links from DITA relationship tables or related link elements within topics are grouped under one "Related information" heading:

```

Related information
  Target Topic
  Target Concept
  Target Task

```

It is possible to group the links by target type (topic type) by setting the `webhelp.rellinks.group.mode=group-by-type` parameter. The output will look like this:

```

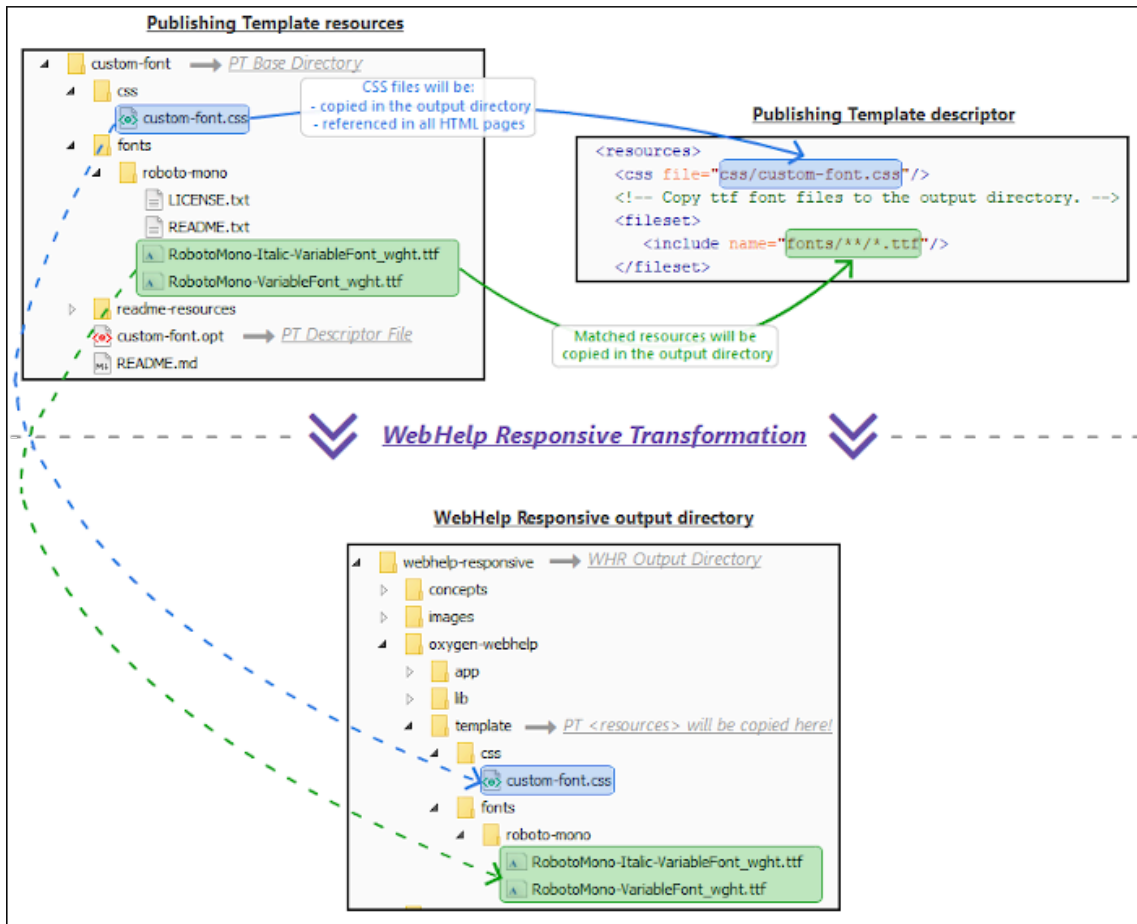

Related concepts
  Target Concept
Related tasks
  Target Task
Related information
  Target Topic

```

How to Use a Local Font in WebHelp Responsive Output

It is possible to use a local fonts in WebHelp Responsive output by copying the local font file to the output directory through a Publishing Template and referencing the font files using `@font-face` rules within a custom CSS.

Figure 406. Referencing Local Fonts in a Publishing Template

To use a local font in your WebHelp Responsive output, follow these steps:

1. If you have not already created a Publishing Template, see [How to Create a Publishing Template \(on page 1476\)](#).
2. Add the local font files to the `fonts` folder within your Publishing Template directory structure. For example:

```
fonts/roboto-mono/RobotoMono-Italic-VariableFont_wght.ttf
fonts/roboto-mono/RobotoMono-VariableFont_wght.ttf
```

3. Configure WebHelp Responsive to copy the font file to the output directory. Define a `<fileset>` that matches the location of the font files in the `<resources>` section of your Publishing Template's descriptor file.

```
<resources>
  <!-- Copy ttf font files to the output directory. -->
  <fileset>
```

```

<include name="fonts/**/*.ttf"/>

</fileset>

</resources>

```

All the files matched by this fileset will be copied to the output directory. The additional resources will be copied in the following subfolder of the output directory:

```
{OUTPUT-DIR}/oxygen-webhelp/template/
```

4. Create a custom CSS file in your Publishing Template directory.

```
css/custom-font.css
```

5. Reference the CSS file in the `<resources>` section of the Publishing Template's descriptor file. This means that the CSS file will be referenced in each HTML page within the WebHelp Responsive output.

```

<resources>

  <css file="css/custom-font.css"/>

  <!-- ... -->

</resources>

```

6. Add `@font-face` definitions that reference the font files in your custom CSS file. The font files can be referenced using relative URLs since the CSS and the font files included in the Publishing Template package will be copied together in the output folder.

```

@font-face {

  font-family: 'Roboto Mono';

  font-style: normal;

  src: url('../fonts/roboto-mono/RobotoMono-VariableFont_wght.ttf') format('truetype');

}

@font-face {

  font-family: 'Roboto Mono';

  font-style: italic;

  src: url('../fonts/roboto-mono/RobotoMono-Italic-VariableFont_wght.ttf') format('truetype');

}

```

7. Add a CSS rule that applies the custom font on all elements.

```

body {

  font-family: 'Roboto Mono', sans-serif;

}

```

8. Run the transformation with the publishing template selected.

Figure 407. Output Example

How to Use JQuery in WebHelp Responsive Output

The JQuery library that comes bundled with WebHelp is accessible in the browser's global context so that developers have access to use it.

To use the JQuery library in your WebHelp Responsive output, follow these steps:

1. If you have not already created a Publishing Template, see [How to Create a Publishing Template](#).
2. Create the following items in the folder that contains your publishing template's descriptor file (the `.opt` file):
 - A folder named **js**
 - A folder named **fragments**
3. In the **js** folder, create a file named `custom.js`.
4. As a starting point, you can copy the following content to the `custom.js` file:

```
$(document).ready(function () {
    // Your JQuery code.
});
```

5. In the **fragments** folder, create a file named `jquery-scripts.html` with the following content:

```
<html>

  <script src="{oxygen-webhelp-template-dir}/js/custom.js" defer="defer"></script>

</html>
```

**Important:**

Make sure that the `@defer` attribute is present on the `<script>` element.

- Copy the `js` folder to the output folder during the transformation process. For this, open the `.opt` file and add the following content in the `<resources>` section (see [Template Resources](#) for more details):

```
<fileset>
  ...
  <include name="js/**" />
  ...
</fileset>
```

- Include the `jquery-scripts.html` file in your WebHelp Responsive output by opening the `.opt` file and add the following content inside the `<webhelp>` element:

```
<html-fragments>
  <fragment file="jquery-scripts.html" placeholder="webhelp.fragment.head"/>
</html-fragments>
```

- Run the transformation with your publishing template selected.

How to Display Certain Elements as Tabs

It is possible to display the following elements as tabs in the WebHelp output:

- Lists (both `` and `` elements)
- Definition lists (`<dl>` element)
- Choice tables (`<choicetable>` element)

For this, you just need to add the `@outputclass="wh-tabbed"` attribute on the element.

**Note:**

The tab name is extracted from:

- The first `<ph>` in lists.
- The first `<dt>` in definition lists.
- The first `<choption>` in choice tables.

Here are some examples:

- List

```
<ul outputclass="wh-tabbed">
  <li>
    <ph>Windows</ph>
    <ol>
      <li>First instruction for Windows</li>
      <li>Second instruction for Windows</li>
    </ol>
  </li>
  <li>
    <ph>Linux</ph>
    <ol>
      <li>First instruction for Linux</li>
      <li>Second instruction for Linux</li>
      <li>Third instruction for Linux</li>
    </ol>
  </li>
  <li>
    <ph>Mac</ph>
    <ol>
      <li>First instruction for Mac</li>
      <li>Second instruction for Mac</li>
    </ol>
  </li>
</ul>
```

- Definition List

```
<dl outputclass="wh-tabbed">
  <dentry>
    <dt>Version 1</dt>
    <dd>Instructions for Version 1</dd>
  </dentry>
  <dentry>
    <dt>Version 2</dt>
    <dd>Instructions for Version 2</dd>
  </dentry>
</dl>
```

- Choice Table

```
<choicetable outputclass="wh-tabbed">
  <chrow>
    <choption>First</choption>
    <chdesc>First option description</chdesc>
```

```

</chrow>

<chrow>

WebHelp Responsive Transformation Parameters

In addition to the [common DITA-OT transformation parameters](#) and the [HTML-based Output Parameters](#), there are numerous other supported parameters that are specific to the WebHelp Responsive output.

Publishing Template Parameters

webhelp.publishing.template

Specifies the path to the ZIP archive (or root folder) that contains your custom WebHelp Responsive template.

Note:

The built-in templates are stored in the `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates` folder.

Note:

Relative paths are resolved based on the current working directory.

webhelp.publishing.template.descriptor

Specifies the name of the descriptor to be loaded from the WebHelp Responsive template package. If it is not specified, the first encountered descriptor will be automatically loaded.

Custom Resource Parameters

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

webhelp.favicon

The file path that points to an image to be used as a *favicon* in the WebHelp output.

webhelp.logo.image.target.url

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

webhelp.logo.image.target.url.new.tab

Specifies if the URL of the link that is set on the logo image will be opened in a new tab.

webhelp.logo.image

Specifies a path to an image displayed as a logo in the left side of the output header.

webhelp.logo.image.alt

Specifies a value that will be set in the `@alt` attribute of the logo image. If the parameter is not specified, the `@alt` attribute will contain the publication title. Note that this parameter makes sense only in conjunction with the `webhelp.logo.image` parameter.

Oxygen Feedback Parameter

webhelp.fragment.feedback

You can integrate **Oxygen Feedback** with your WebHelp Responsive output to provide a comments area at the bottom of each page where readers can offer feedback. When you create an **Oxygen Feedback site configuration**, an HTML fragment is generated during the final step of the creation process and that fragment should be set as the value for this parameter.

Context Sensitive Help Parameter

webhelp.csh.disable.topicID.fallback

Specifies whether or not topic ID *fallbacks* are enabled when computing the mapping of context sensitive help and `resourceid` information is not available. Possible values are **false** (default) and **true**.

HTML Fragment Extension Parameters

webhelp.enable.html.fragments.cleanup

Enables or disables the automatic conversion of HTML fragments to well-formed XML. If set to **true** (default), the transformation automatically converts non-well-formed HTML content to a well-formed XML equivalent. If set to **false**, the transformation will fail if at least one HTML fragment is not well-formed.

webhelp.enable.scroll.to.search.term

Specifies whether or not the page should scroll to the first search term when opening the search results page. Possible values are **no** (default) and **true**.

webhelp.fragment.after.body

This parameter can be used to display a given XHTML fragment after the body in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.body.main.page

This parameter can be used to display a given XHTML fragment after the body in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.body.search.page

This parameter can be used to display a given XHTML fragment after the body in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.body.terms.page

This parameter can be used to display a given XHTML fragment after the body in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.body.topic.page

This parameter can be used to display a given XHTML fragment after the body in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.feedback

This parameter can be used to display a given XHTML fragment after the **Oxygen Feedback** commenting component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.header

This parameter can be used to display a given XHTML fragment after the header section in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.header.main.page

This parameter can be used to display a given XHTML fragment after the header section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.header.search.page

This parameter can be used to display a given XHTML fragment after the header section in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.header.terms.page

This parameter can be used to display a given XHTML fragment after the header section in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.header.topic.page

This parameter can be used to display a given XHTML fragment after the header section in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.logo_and_title

This parameter can be used to display a given XHTML fragment after the logo and title in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.main.content.area

This parameter can be used to display a given XHTML fragment after the main content section in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.main.content.area.main.page

This parameter can be used to display a given XHTML fragment after the main content section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.main.content.area.topic.page

This parameter can be used to display a given XHTML fragment after the main content section in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.main.page.search (deprecated)

This parameter is deprecated. Use `webhelp.fragment.after.search.input.main.page` instead.

webhelp.fragment.after.publication.toc

This parameter can be used to display a given XHTML fragment before the publication's table of contents component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.search.input

This parameter can be used to display a given XHTML fragment after the search field in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.search.input.main.page

This parameter can be used to display a given XHTML fragment after the search field in all the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.search.input.search.page

This parameter can be used to display a given XHTML fragment after the search field in all the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.search.input.terms.page

This parameter can be used to display a given XHTML fragment after the search field in all the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.search.input.topic.page

This parameter can be used to display a given XHTML fragment after the search field in all the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.toc_or_tiles

This parameter can be used to display a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.top_menu

This parameter can be used to display a given XHTML fragment after the top menu in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.topic.breadcrumb

This parameter can be used to display a given XHTML fragment after the breadcrumb component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.topic.content

This parameter can be used to display a given XHTML fragment after the topic's content in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.topic.toc

This parameter can be used to display a given XHTML fragment after the topic's table of contents component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.topic.toolbar

This parameter can be used to display a given XHTML fragment after the toolbar buttons above the topic content in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.body

This parameter can be used to display a given XHTML fragment before the page body in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.body.main.page

This parameter can be used to display a given XHTML fragment before the page body in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.body.search.page

This parameter can be used to display a given XHTML fragment before the page body in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.body.terms.page

This parameter can be used to display a given XHTML fragment before the page body in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.body.topic.page

This parameter can be used to display a given XHTML fragment before the page body in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.feedback

This parameter can be used to display a given XHTML fragment before the **Oxygen Feedback** commenting component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.logo_and_title

This parameter can be used to display a given XHTML fragment before the logo and title. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.main.content.area

This parameter can be used to display a given XHTML fragment before the main content section in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.main.content.area.main.page

This parameter can be used to display a given XHTML fragment before the main content section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.main.content.area.search.page

This parameter can be used to display a given XHTML fragment before the main content section in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.main.content.area.terms.page

This parameter can be used to display a given XHTML fragment before the main content section in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.main.content.area.topic.page

This parameter can be used to display a given XHTML fragment before the main content section in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.main.page.search (deprecated)

This parameter is deprecated. Use `webhelp.fragment.before.search.input.main.page` instead.

webhelp.fragment.before.publication.toc

This parameter can be used to display a given XHTML fragment before the publication's table of contents component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.search.input

This parameter can be used to display a given XHTML fragment before the search field in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.search.input.main.page

This parameter can be used to display a given XHTML fragment before the search field in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.search.input.search.page

This parameter can be used to display a given XHTML fragment before the search field in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.search.input.terms.page

This parameter can be used to display a given XHTML fragment before the search field in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.search.input.topic.page

This parameter can be used to display a given XHTML fragment before the search field in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.toc_or_tiles

This parameter can be used to display a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.top_menu

This parameter can be used to display a given XHTML fragment before the top menu in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.topic.breadcrumb

This parameter can be used to display a given XHTML fragment before the breadcrumb component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.topic.content

This parameter can be used to display a given XHTML fragment before the topic's content in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.topic.toc

This parameter can be used to display a given XHTML fragment before the topic's table of contents component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.topic.toolbar

This parameter can be used to display a given XHTML fragment before the toolbar buttons above the topic content in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.custom.search.engine.results

This parameter can be used to replace the search results area with custom XHTML content. The value of the parameter is the path to an XHTML file that contains your custom content.

webhelp.fragment.custom.search.engine.script

This parameter can be used to replace WebHelp's built-in search engine with your own custom search engine. The value of the parameter is the path to an XHTML file that contains the scripts required for your custom search engine to run.

webhelp.fragment.footer

This parameter can be used to display a given XHTML fragment as the page footer in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**Important:**

This parameter should only be used if you are using a valid, purchased license of Oxygen XML Developer (do not use it with a trial license).

webhelp.fragment.head

This parameter can be used to display a given XHTML fragment in the header section in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.head.main.page

This parameter can be used to display a given XHTML fragment in the header section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.head.search.page

This parameter can be used to display a given XHTML fragment in the header section in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.head.terms.page

This parameter can be used to display a given XHTML fragment in the header section in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.head.topic.page

This parameter can be used to display a given XHTML fragment in the header section in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.welcome

This parameter can be used to display a given XHTML fragment as a welcome message (or title). The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**Note:**

All the XHTML fragments can contain [WebHelp Responsive Macros \(on page 1351\)](#).

Output Component Parameters**webhelp.default.collection.type.sequence**

Specifies if the **sequence** value will be used by default when the `@collection-type` attribute is not specified. This option is helpful if you want to have *Next* and *Previous* navigational buttons generated for all HTML pages. Allowed values are **no** (default) and **yes**.

webhelp.enable.sticky.header

Controls whether or not the header section will remain *sticky* in the output. Possible values are **yes** (default) or **no**.

webhelp.enable.sticky.publication.toc

Controls whether or not the publication table of contents will remain *sticky* in the output. Possible values are **yes** (default) or **no**.

webhelp.enable.sticky.topic.toc

Controls whether or not the topic table of contents will remain *sticky* in the output. Possible values are **yes** (default) or **no**.

webhelp.figure.title.placement

Controls the placement of the title for figures (relative to the image). Possible values include **top** (default) and **bottom**.

webhelp.labels.generation.mode

Controls whether or not labels are generated in the output. These labels are useful because users can easily search for topics with the same label by simply clicking on the label presented in the output. Possible values are:

- **keywords-label** - Generates labels for each defined `<keyword>` element that has the `@outputclass` attribute value set to **label**.
- **keywords** - Generates labels for each defined `<keyword>` element. If the topic contains `<keyword>` elements with the `@outputclass` attribute value set to **label**, then only these elements will have labels generated for them in the output.
- **disable** - Disables the generation of labels in the Webhelp Responsive output.

webhelp.merge.nested.topics.related.links

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, *Related Tasks*, *Related References*, *Related Information*) are merged into a single group. The default value is `yes`.

webhelp.publication.toc.hide.chunked.topics

Specifies if the table of contents will contain links for *chunked* topics. The default value is `yes`.

webhelp.publication.toc.links

Specifies which links will be included in the table of contents. The possible values are:

- **chapter** (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor's siblings), and the parent chapter.
- **topic** - The TOC will only include links for the current topic and its direct children.
- **all** - The TOC will include all links.

webhelp.publication.toc.tooltip.position

By default, if a topic contains a `<shortdesc>` element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

- **left**
- **right** (default)
- **top**
- **bottom**
- **hidden** - The tooltip will not be displayed.

webhelp.rellinks.group.mode

Specifies the related links grouping mode. All links can be grouped into a single "Related Information" heading or links can be grouped by their target type (topic, task, or concept).

Allowed values: **single-group** (default) or **group-by-type**.

webhelp.show.breadcrumb

Specifies if the breadcrumb component will be presented in the output. The default value is `yes`.

webhelp.show.changes.and.comments

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is `no`.

webhelp.show.child.links

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is `no`.

webhelp.show.full.size.image

Specifies if responsive images that are displayed with a smaller dimension than their original size can be clicked to see an enlarged version of the image. The default value is `yes`.

webhelp.show.indexterms.link

Specifies if an icon that links to the index terms page will be displayed in the output. The default value is `yes` (meaning the index terms icon is displayed). If set to `false`, the index terms icon is not displayed in the output and the index terms page is not generated.

webhelp.show.main.page.tiles

Specifies if the tiles component will be presented in the main page of the output. For a *tree* style layout, this parameter should be set to `no`.

webhelp.show.main.page.toc

Specifies if the table of contents will be presented in the main page of the output. The default value is `yes`.

webhelp.show.expand.collapse.sections

Specifies if links to collapse sections will be presented within each topic in the output. Collapsing sections will collapse all collapsible elements (nested topics with titles, sections with titles, or tables with titles). The default value is `yes`.

webhelp.show.navigation.links

Specifies if navigation links will be presented in the output. The default value is `yes`.

webhelp.show.print.link

Specifies if a print link or icon will be presented within each topic in the output. The default value is `yes`.

webhelp.show.publication.toc

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is `yes`.

webhelp.show.topic.toc

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each `<section>` within the current topic that contains an `@id` attribute and the section corresponding to the current scroll position is highlighted. The default value is `yes`.

webhelp.show.top.menu

Specifies if a menu will be presented at the topic of the main page in the output. The default value is `yes`.

webhelp.skip.main.page.generation

If set to `true`, the default main page is not generated in the output. The default value is `false`.

webhelp.table.title.placement

Controls the placement of the title for tables. Possible values include **top** (default) and **bottom**.

webhelp.top.menu.activated.on.click

When this parameter is activated (set to `yes`), clicking an item in the top menu will expand the submenu (if available). You can then click on a submenu item to open the item (topic). You can click outside the menu or press **ESC** to hide the menu. When set to `no` (default), hovering over a menu item displays the menu content.

webhelp.top.menu.depth

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is `3`. A value of `0` means that the menu has unlimited depth.

webhelp.topic.collapsible.elements.initial.state

Specifies the initial state of collapsible elements (nested topics with titles, sections with titles, tables with titles or index term groups). The possible values are `collapsed` or `expanded` (default value).

Search-Related Parameters

webhelp.enable.search.autocomplete

Specifies if the *Autocomplete* feature is enabled in the WebHelp search text field. The default value is `yes`.

webhelp.google.search.results

A file path that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element `gcse:searchresults-only`. You can use all supported attributes for this element. It is recommended to set the `@linkTarget` attribute to `frm` for frameless (*iframe*) version of WebHelp or to `contentWin` for the frameset version of WebHelp. The default value for this attribute is `_blank` and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used `<gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>`.

webhelp.google.search.script

A file path that specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google.

webhelp.search.default.operator

Makes it possible to change the default operator for the search engine. Possible values are `and`, `or` (default). If set to `and` while the search query is WORD1 WORD2, the search engine only returns results for topics that contain both WORD1 and WORD2. If set to `or` and the search query is WORD1 WORD2, the search engine returns results for topics that contain either WORD1 or WORD2.

webhelp.search.enable.pagination

Specifies whether or not search results will be displayed on multiple pages. Allowed values are `yes` or `no`.

webhelp.search.index.elements.to.exclude

Specifies a list of HTML elements that will not be indexed by the search engine. The value of the `@class` attribute can be used to exclude specific HTML elements from indexing. For example, the `div.not-indexed` value will not index all `<div>` elements that have a `@class` attribute with the value of `not-indexed`. Use a comma separator to specify more than one element.

webhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the *Kuromoji* morphological engine for indexing Japanese content in the WebHelp pages. The encoding for the dictionary must be **UTF8**.

webhelp.search.page.numberOfItems

Specifies the number of search results items displayed on each page. This parameter is only used when the **webhelp.search.enable.pagination** parameter is enabled.

webhelp.search.ranking

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

webhelp.search.stop.words.exclude

Specifies a list of words that will be excluded from the default list of *stop words* that are filtered out before the search processing. Use comma separators to specify more than one word (for example: `if,for,is`).

webhelp.search.stop.words.include

Specifies a list of words that will be ignored by the search engine. Use a comma separator to specify more than one word.

webhelp.sitemap.base.url

Base URL for all the `<loc>` elements in the generated `sitemap.xml` file. If this parameter is specified, the `loc` element will contain the value of this parameter plus the relative path to the page. If this parameter is not specified, the `loc` element will only contain the relative path of the page (the relative file path from the `@href` attribute of a `<topicref>` element from the *DITA map*, appended to this base URL value).

webhelp.sitemap.change.frequency

The value of the `<changefreq>` element in the generated `sitemap.xml` file. The `<changefreq>` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `<changefreq>` element is not added in `sitemap.xml`. Allowed values: `<empty string>` (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

webhelp.sitemap.priority

The value of the `<priority>` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `<priority>` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `<priority>` element is not added in `sitemap.xml`.

Publishing Speedup Parameters

parallel

A common parameter with other transformation types. When set to **true** (default value is **false**), the publishing pre-processing stages are run in parallel slightly improving the publishing time.

store-type

A common parameter with other transformation types. When set to **memory**, the processing stages use internal memory to store temporarily processed documents, thus decreasing the publishing time but slightly increasing the amount of internal memory used for the process.

When publishing on Windows, setting this parameter can decrease the publishing times by about one-third.

Note:

The `fix.external.refs.com.oxygenxml` parameter is not supported when running the transformation from a command line. This parameter is normally used to specify whether or not the application tries to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references.

Parameters for Adding a Link to PDF Documentation in WebHelp Responsive Output

The following transformation parameters can be used to generate a PDF link component in the WebHelp Responsive output (for example, it could link to the PDF equivalent of the documentation):

webhelp.pdf.link.url

Specifies the target URL for the PDF link component.

webhelp.pdf.link.text

Specifies the text for the PDF link component.

webhelp.pdf.link.icon.path

Specifies the path or URL of the image icon to be used for the PDF link component. If not specified, a default icon is used.

webhelp.pdf.link.anchor.enabled

Specifies whether or not the current topic ID should be appended as the name destination at the end of the PDF link. Allowed values are: **yes** (default) and **no**.

webhelp.show.pdf.link

Specifies whether or not the PDF link component is shown in the WebHelp Responsive output. Allowed values are: **yes** (default) and **no**.

[Setting DITA-OT Parameters](#)

WebHelp Responsive XSLT-Import and XSLT-Parameter Extension Points

XSLT extension points can be used from either from an *Oxygen Publishing Template* or from a DITA-OT extension plug-in.

Extension Points from an Oxygen Publishing Template

The publishing template allows you to specify an XSLT extension point. The extension point will only affect the transformations that use the particular template.

**Important:**

While the publishing templates only support referencing one extension point at a time, you can use `xslt:include` or `xslt:import` to aggregate multiple modules.

For a specific example of how to use an extension in a publishing template, see: [How to Use XSLT Extension Points from a Publishing Template \(on page 1399\)](#).

Example:

```
<publishing-template>
...
<webhelp>
...
<xslt>
  <extension
    id="com.oxygenxml.webhelp.xsl.createMainPage"
    file="xsl/customMainPage.xsl"/>
</xslt>
```

Extension Points from a DITA-OT Extension Plug-in

The DITA-OT plug-in installer adds an XSLT import statement in the default WebHelp XSLT so that the XSLT stylesheet referenced by the extension point becomes part of the normal build. You can use these extension points to override XSLT processing steps.

Example:

```
<plugin id="com.oxygenxml.webhelp.responsive.extension">
  <feature extension="com.oxygenxml.webhelp.xsl.dita2webhelp"
    file="xsl/fixup.xsl"/>
</plugin>
```

XSLT-Import Extension Points

The following extension points are supported:

com.oxygenxml.webhelp.xsl.dita2webhelp

Extension point to override the XSLT stylesheet (`dita2webhelp.xsl`) that produces an HTML file for each DITA topic. The location of this file is `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\dita2webhelp\dita2webhelp.xsl`

com.oxygenxml.webhelp.xsl.createMainPage

Extension point to override the XSLT stylesheet (`createMainPage.xsl`) that produces the WebHelp Responsive main HTML page (`index.html`). The location of this file is `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createMainPage.xsl`

com.oxygenxml.webhelp.xsl.createNavLinks

Extension point to override the XSLT stylesheets that are used to generate navigation links in the WebHelp Responsive pages. These stylesheets can be found in the `navLinks` folder: `DITA-OT-
DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\navLinks\`

com.oxygenxml.webhelp.xsl.createSearchPage

Extension point to override the XSLT stylesheet (`createSearchPage.xsl`) that produces the WebHelp Responsive search HTML page (`search.html`). The location of this file is `DITA-OT-
DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles
\createSearchPage.xsl`

com.oxygenxml.webhelp.xsl.createIndexTermsPage

Extension point to override the XSLT stylesheet (`createIndextermsPage.xsl`) that produces the WebHelp Responsive index terms HTML page (`indexterms.html`). The location of this file is `DITA-OT-
DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles
\createIndextermsPage.xsl`

com.oxygenxml.webhelp.xsl.createTocXML

Extension point to override the XSLT stylesheet (`tocDita.xsl`) that produces the `toc.xml` file. This file contains information extracted from the *DITA map (on page 2268)* and it is mainly used to construct the WebHelp Table of Contents and navigational links. The path to this stylesheet is: `DITA-OT-
DIR\plugins\com.oxygenxml.webhelp.responsive\xsl
\navLinks\tocDita.xsl`.

com.oxygenxml.webhelp.xsl.contextHelpMap

Extension point to override the XSLT stylesheet (`contextHelpMapDita.xsl`) that generates the context sensitive help mapping. The path to this stylesheet is: `DITA-
OT-
DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\contextHelp
\contextHelpMapDita.xsl`.

XSLT-Parameter Extension Points

If your customization stylesheet declares one or more XSLT parameters and you want to control their values from the transformation scenario, you can use one of the following XSLT parameter extension points:

com.oxygenxml.webhelp.xsl.dita2webhelp.param

Use this extension point to pass parameters to the stylesheet specified using the `com.oxygenxml.webhelp.xsl.dita2webhelp` extension point (on page 1448).

com.oxygenxml.webhelp.xsl.createMainPage.param

Use this extension point to pass parameters to the stylesheet specified using the `com.oxygenxml.webhelp.xsl.createMainPage` extension point (on page 1448).

com.oxygenxml.webhelp.xsl.createNavLinks.param

Use this extension point to pass parameters to the stylesheet specified using the [com.oxygenxml.webhelp.xsl.createNavLinks](#) extension point (on page 1449).

com.oxygenxml.webhelp.xsl.createSearchPage.param

Use this extension point to pass parameters to the stylesheet specified using the [com.oxygenxml.webhelp.xsl.createSearchPage](#) extension point (on page 1449).

com.oxygenxml.webhelp.xsl.createIndexTermsPage.param

Use this extension point to pass parameters to the stylesheet specified using the [com.oxygenxml.webhelp.xsl.createIndexTermsPage](#) extension point (on page 1449).

com.oxygenxml.webhelp.xsl.createTocXML.param

Use this extension point to pass parameters to the stylesheet specified using the [com.oxygenxml.webhelp.xsl.createTocXML](#) extension point (on page 1449).

com.oxygenxml.webhelp.xsl.contextHelpMap.param

Use this extension point to pass parameters to the stylesheet specified using the [com.oxygenxml.webhelp.xsl.contextHelpMap](#) extension point (on page 1449).

DITA to PDF Output Customization

Oxygen XML Developer provides support for generating PDF output using transformation scenarios for certain types of documents (for example, DITA, DocBook, TEI, and JATS) and Oxygen XML Developer supports several different types of processors. There are numerous ways to customize the published output to fit your specific needs.

CSS-based DITA to PDF Customization

Oxygen XML Developer comes bundled with a **DITA-OT CSS-based PDF Publishing Plugin** for transforming DITA maps or single topics to PDF, while styling the resulting output using CSS. It is the base of two types of transformation scenarios:

DITA Map Transformation Type (DITA Map PDF - based on HTML5 & CSS)

This transformation type converts DITA maps to PDF using a CSS-based processing engine and HTML5 as an intermediate format. For this transformation, the `pdf-css-html5` transtype is used. Because the structure of the HTML5 intermediate format resembles the one used in WebHelp output, it is possible to reuse parts of your CSS file you developed for a WebHelp customization.

Single Topic Transformation Type (DITA PDF - based on HTML5 & CSS)

This transformation type converts a single DITA topic to PDF using a CSS-based processing engine and HTML5 as an intermediate format. For this transformation, the `pdf-css-html5-single-topic` transtype is used. This transformation is derived from the DITA Map PDF - based on HTML5 & CSS transformation type but applies on a single topic.

Overview

This section contains topics that provide a basic overview of the **DITA-OT CSS-based PDF Publishing Plugin**, technical details, and some additional resources to help you with your customizations.

Tip:

For more information and some tips in regard to publishing DITA documents to PDF using CSS, watch our Webinars:

- [Transforming DITA documents to PDF using CSS, Part 1 – Page Definitions, Cover Page and PDF Metadata.](#)
- [Transforming DITA documents to PDF using CSS, Part 2 – Book Design, Pagination, Page Layout, and Bookmarks.](#)
- [Transforming DITA documents to PDF using CSS, Part 3 – Advanced Fonts Usage.](#)
- [Transforming DITA documents to PDF using CSS, Part 4 – Advanced CSS Rules.](#)
- [Transforming XML and HTML documents to PDF using CSS, Part 1 – Basic CSS Layout.](#)
- [Transforming XML and HTML documents to PDF using CSS, Part 2 – Lists, Tables and Images.](#)
- [Transforming XML and HTML documents to PDF using CSS, Part 3 – Global Page Layout.](#)
- [Transforming XML and HTML documents to PDF using CSS, Part 4 – Advanced Functionalities.](#)

Resources

Customizing the PDF output requires knowledge of CSS, Paged Media, and DITA. The following list provides some resources to help you:

- **CSS** - You can find a good tutorial here: https://developer.mozilla.org/en-US/docs/Learn/CSS/Introduction_to_CSS. Also, the specification is available on the W3C (<https://www.w3.org/Style/CSS/Overview.en.html>) or on the MDN (<https://developer.mozilla.org/en-US/docs/Web/CSS>) websites.
- **CSS Paged Media** - This is a part of the CSS specification that shows how to organize your publication in pages, how to use headers/footers, page breaks, and other page-related issues. The specification is

available here: <https://www.w3.org/TR/CSS2/page.html>. Also, there is a set of hands-on examples in the **Oxygen PDF Chemistry** user guide: <https://www.oxygenxml.com/doc/ug-chemistry/>.

- **DITA** - You will need a basic understanding of DITA elements, attributes, and structure. A good resource is *The DITA Style Guide - Best Practices for Authors* by Tony Self. It is available at: www.ditastyle.com and: https://www.oxygenxml.com/dita/styleguide/c_DITA_Authoring_Concepts.html. You can find all the details for every DITA element on OASIS website: <http://docs.oasis-open.org/dita/v1.2/os/spec/DITA1.2-spec.html>.
- **HTML5** - You will need a good knowledge of HTML5. You can find resources here: <https://developer.mozilla.org/en-US/docs/Web/Guide/HTML/HTML5>
- **Webinars** - Some helpful webinars are available on our website: https://www.oxygenxml.com/publishing_engine/videos.html?category=Webinars. They explain how to generate PDF from DITA documents using CSS, step-by-step.

Related Information:

[DITA-OT DAY 2017: Using CSS to Style PDF Output](#)

Supported Processors

The **DITA-OT CSS-based PDF Publishing Plugin** supports the following CSS processors:

- **Oxygen PDF Chemistry** - This is recommended processor because the built-in CSS files were fine-tuned for this processor. For example, [metadata extraction \(on page 1539\)](#) only functions with this processor. If the plugin is started from an **Oxygen XML Editor/Author** distribution, a Chemistry installation is not needed.
- **Prince XML** - A commercial product, available at: <https://www.princexml.com/>.
- **Antenna House** - A commercial product, available at: <https://www.antennahouse.com/formatter>.

Technical Details

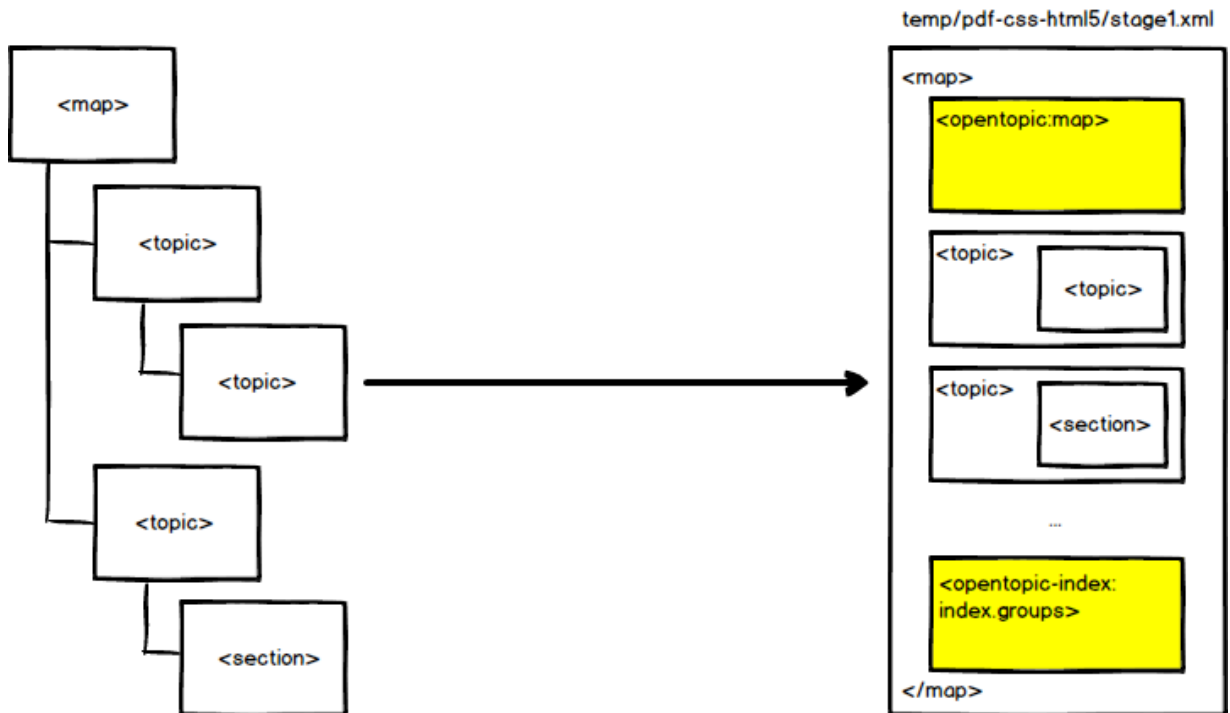

The **DITA-OT CSS-based PDF Publishing Plugin** comes bundled in the **Oxygen XML Editor/Author** distributions. The plugin ID is: **com.oxygenxml.pdf.css**. It is installed in the `[OXYGEN-INSTALL-DIR]frameworks/dita/DITA-OT/plugins/com.oxygenxml.pdf.css` folder.

It has the following transformation types:

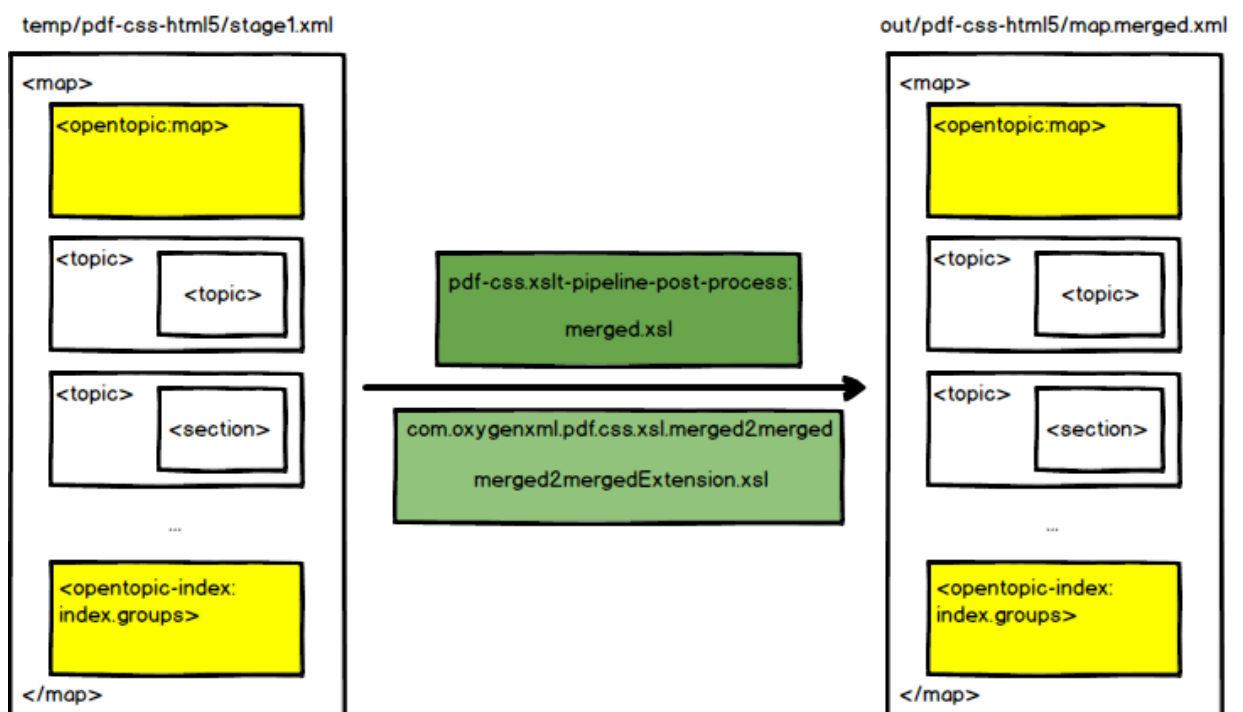

- **pdf-css-html5** (*DITA Map PDF - based on HTML5 & CSS transformation*) - CSS styling applied over a merged HTML5 document (the merged DITA map converted to HTML5).
- **pdf-css-html5-single-topic** (*DITA PDF - based on HTML5 & CSS transformation*) - CSS styling applied over a merged HTML5 document (the merged DITA topic converted to HTML5).

This is how it works:

1. It expands all the topic references into a temporary clone of the map, resolving keys and reused content. For the single topic transformation the result is a file with the keys and content resolved.
2. It generates a structure for the table of contents and index. The result is a merged map with all the references resolved. When transforming a single topic, the TOC and Index are not added to the merged file, this includes only the contents of the topic.

3. It post-processes the merged map. It fixes some of the structure in the TOC and index, moves the *frontmatter* and *backmatter* to the correct places, transforms any change tracking and review processing instructions to elements that can be styled later, etc. During this phase, the `com.oxygenxml.pdf.css.xsl.merged2merged` (on page 1672) extension points are also called. The result is another merged map.

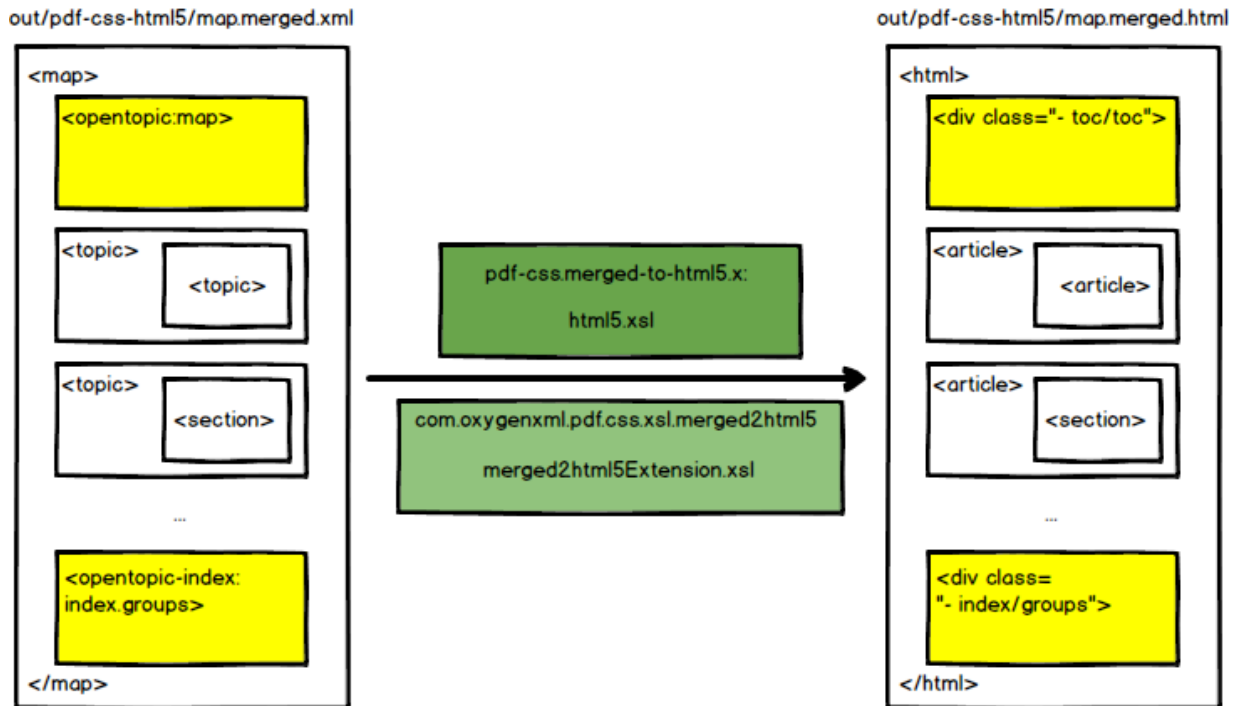

Note:

In the single topic transformation type (**DITA PDF - based on HTML5 & CSS**), these steps are simplified.

4. It converts the post-processed merged map or topic into a single HTML5 file. The generated HTML elements have the `@class` attribute from their original DITA elements. This means that you can either use selectors that were designed for DITA structure, or ones for the HTML structure. For more details, see [Reusing the Styling for WebHelp and PDF Output](#) (on page 1625). During this phase, the `com.oxygenxml.pdf.css.xsl.merged2html5` (on page 1672) extensions points are also called.

5. It uses a collection of CSS stylesheets against the merged HTML5 file and uses a PDF processor to generate the final PDF. References to the CSS files are collected from the [publishing template \(on page 1470\)](#).

out/pdf-css-html5/map.merged.html

out/pdf-css-html5/map.pdf

Increasing Memory Allocation for Java

If you are working with a large project with extensive metadata or key references, you may need to increase the amount of memory that is allocated to the Java process that performs the publishing.

There can be two situations where an out of memory error can be triggered:

- From the DITA-OT basic processing (the preparation of the merged HTML document).
- From the Chemistry PDF CSS processor (the transformation of the merged HTML document to PDF).

When the Transformation is Started from Oxygen

To alter the memory allocation setting from the transformation scenario, follow these steps:

1. Open the **Configure Transformation Scenario(s)** dialog box.
2. Select your transformation scenario, then click **Edit**.
3. Go to the **Advanced** tab.
4. Uncheck the **Prefer using the "dita" command** option
5. Locate the **JVM Arguments** and increase the default value. For instance, to set 2 gigabytes as the maximum amount of memory, you can use: `-Xmx2g`. If you do not specify the `-Xmx` value in this field, by default, the application will use a maximum of 512 megabytes when used with a 32-bit Java Virtual Machine and one gigabyte with a 64-bit Java Virtual Machine.

**Note:**

This memory setting is used by both the DITA-OT process and the Chemistry CSS processor.

When the Transformation is Started from the Command Line

- **If the DITA-OT process fails with Out Of Memory Error:** you can change the value of the `ANT_OPTS` environment variable from a command line for a specific session.

Example: To increase the JVM memory allocation to 1024 MB for a specific session, issue the following command from a command prompt (depending on your operating system):

- Windows

```
set ANT_OPTS=%ANT_OPTS% -Xmx1024M
```

- Linux/macOS

```
export ANT_OPTS="$ANT_OPTS -Xmx1024M"
```

**Tip:**

To persistently change the memory allocation, change the value allocated to the `ANT_OPTS` environment variable on your system.

- **If the Chemistry PDF CSS processor fails with an Out Of Memory Error:** try adding the `baseJVMArgLine` parameter to the DITA-OT command line. For example:

```
-DbaseJVMArgLine=-Xmx2048m
```

Transformation Parameters

This list includes the most common customization parameters that are available in the **DITA Map PDF - based on HTML5 & CSS** transformation scenario. Other standard DITA-OT parameters were omitted for clarity, but they are supported.

**Note:**

These parameters must be prefixed by "-D" when used from a command line.

antenna-house.option.setting.file	Path to the Antenna House Option Setting File (eg: <code>C:\path\to\formatter\options\settings.xml</code> on Windows).
args.allow.external.coderefs	Enables the inclusion of code files that are located outside the DITA map folder hierarchy, referenced using the DITA <code><coderef></code> element. Allowed values are yes or no (default).
args.chapter.layout	Specifies whether chapter-level TOCs are generated for bookmarks. When set to MINITOC , a small section with links is added at the begin-

	<p>ning of each chapter. The default is BASIC. For details, see: Table of Contents on a Page (Mini TOC) (on page 1574).</p> <p>Allowed values:</p> <ul style="list-style-type: none"> • BASIC - No chapter TOC is created. • MINITOC - A chapter-level TOC is generated. • MINITOC-BOTTOM-LINKS - A chapter-level TOC is generated, with the links under the chapter description.
args.css	You can use this to specify a list of CSS URLs to be used in addition to those specified in the publishing template. The files must have URL syntax and be separated using semicolons.
args.css.param.*	You can use this parameter pattern to set attributes on the root of the merged map. This means you can activate specific CSS rules from your custom CSS using custom attributes. For examples, see: Styling Through Custom Parameters (on page 1668) .
args.css.param.clone-referenced-footnotes	<p>You can use this parameter to control the footnotes behavior:</p> <ul style="list-style-type: none"> • When set to yes, footnotes that are referenced multiple times throughout a publication are cloned and placed at the bottom of the page for each occurrence. • When set to no (default value), only the first footnote reference is placed at the bottom of the page and subsequent references point back to the original footnote.
args.css.param.numbering	<p>You can use this parameter to change the numbering of the first-level topics (chapters) and nested topics. Allowed values:</p> <ul style="list-style-type: none"> • shallow - Only the topics from the first level are numbered (chapters). This is the default. • deep - All the topics from the map are numbered (nested topics up to level 3). • deep-chapter-scope - Similar to deep, but in addition, the page numbers, figures, and table numbers are reset at the start of each first-level topic (chapter). The table and figure titles (and the links to them) are prefixed with the chapter numbers. The generic cross reference links contain both the first-level topic (chapter) numbers and the page numbers to avoid ambiguity. This parameter value is only available for the DITA Map PDF - based on HTML5 & CSS transformation scenario.

	<ul style="list-style-type: none"> • deep-chapter-scope-no-page-reset - Similar to <code>deep-chapter-scope</code>, but the page numbers do not reset at the start of each first-level topic (chapter). The generic cross reference links contain only the page number. This parameter value is only available for the DITA Map PDF - based on HTML5 & CSS transformation scenario. <p>For more details, see Numbering Types (on page 1560).</p>
<code>args.css.param.numbering-sections</code>	Controls whether or not the sections are included in the table of contents. When set to yes (sections are included), they are numbered according to the numbering scheme set by the <code>args.css.param.numbering</code> parameter.
<code>args.css.param.show-onpage-lbl</code>	Controls whether or not the links will have an <code>on page NN</code> label after them. This parameter has different defaults, depending on the transformation type. For map transformations (<code>pdf-css-html5</code> trans type), the default is yes . For topic transformations (<code>pdf-css-html5-single-topic</code> trans type), the default is no .
<code>args.css.param.show-profiling-attributes</code>	Controls whether or not the profiling attributes are displayed in the output. Allowed values: <ul style="list-style-type: none"> • yes • no (default)
<code>args.css.param.title.layout</code>	Changes the structure of the title element. In the output, the title area consists of two parts: one is the number of the chapter (and optionally, the sections number), and one is the title text. This parameter allows a switch between normal text flow (in-line flow) and a table layout where the number is placed in one cell and the text in the other (to avoid wrapping text under the chapter number). <ul style="list-style-type: none"> • normal • table (avoid wrapping text under counter)
<code>args.draft</code>	Specifies whether or not the content of <code><draft-comment></code> and <code><required-cleanup></code> elements is included in the output. Allowed values: <ul style="list-style-type: none"> • no (default) - No draft information is shown in the output. • yes - The draft information is shown in the output.

args.figurelink.style	<p>Specifies how cross references to figures are styled in output. Allowed values:</p> <ul style="list-style-type: none"> • NUMBER - Only the number of the figures are shown in links. • TITLE - Only the title of the figures are shown in links. • NUMTITLE (default) - Both the title and number of the figures are shown in links.
args.gen.task.lbl	<p>Specifies whether or not to generate headings for sections within task topics. Allowed values: YES or NO (default). When set to YES, headings such as "About this task", "Before you begin", "Procedure", or "What to do next", are shown in the task contents.</p>
args.hyph.dir	<p>Specifies the directory that contains custom hyphenation dictionaries. For more details see: Hyphenation (on page 1604).</p>
args.input	<p>Specifies the main DITA map file for your documentation project.</p>
args.keep.output.debug.files	<p>Specifies whether or not the debug files generated during the transformation should be kept in the output folder. Allowed values: YES (default) or NO.</p>
args.output.base	<p>Specifies the name of the output file without a file extension. By default, the name of the PDF file is derived from the name of the DITA map file. This parameter allows you to override it.</p> <p>A common use-cases is to use the ditamap title instead of the dita-map filename, the parameter value then become <code>\${xpath_eval(normalize-space(string-join(*[contains(@class, 'map/map')]/*[contains(@class, 'topic/title')]/text()))}</code>.</p> <div data-bbox="576 1451 1437 1720" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>To replace spaces by a custom separator the query should call the <code>replace()</code> function: <code>\${xpath_eval(replace(normalize-space(string-join(*[contains(@class, 'map/map')]/*[contains(@class, 'topic/title')]/text()), 's', '_'))}</code>.</p> </div>
args.rellinks.group.mode	<p>Specifies the related links grouping mode. All links can be grouped into a single "Related Information" group or links grouped by their target type (topic, task, or concept). Allowed values: single-group (default) or group-by-type. For more details see: How to Group Related Links by Type (on page 1636).</p>

args.tablelink.style	<p>Specifies how cross references to tables are styled in output. Allowed values:</p> <ul style="list-style-type: none"> • NUMBER - Only the number of the tables are shown in links. • TITLE - Only the title of the tables are shown in links. • NUMTITLE (default) - Both the title and number of the tables are shown in links.
clean.temp	<p>Specifies whether or not the DITA-OT deletes the files in the temporary directory after it finishes a build. Allowed values: yes (default) or no.</p>
chemistry.log.file	<p>Specifies the path to the <code>logback.xml</code> configuration file used by Chemistry. For more details, see: Console Logging (on page 1466).</p>
chemistry.security.policy	<p>Specifies a Java policy file that applies to the Chemistry process. A template can be found here: plugins/com.oxygenxml.pdf.css/lib/oxygen-pdf-chemistry/config/chemistry.policy.</p>
chemistry.security.resources.dir	<p>Path to an additional folder that Chemistry will use to read its resources (CSS, images). The process already has read access to the input map folder, the publishing templates folder, and the OPE install folder. This optional parameter should only be used when the <code>chemistry.security-.policy</code> parameter is set.</p>
chemistry.security.resources-.host	<p>The host, specified as <code>name:port</code>, that Chemistry will use to get resources (e.g. CSS files, images, fonts). This optional parameter should only be used when the <code>chemistry.security.policy</code> parameter is set.</p>
chemistry.security.workspace	<p>Specifies a directory where the temporary files and font cache created by the Chemistry process need to be stored. This becomes required when the <code>chemistry.security.policy</code> is specified.</p>
chemistry.sign.keystore	<p>Specifies the path to the keystore file used by Chemistry to sign the PDF. This parameter must be set if you want to sign your PDF.</p>
chemistry.sign.location	<p>Specifies the location of the person/company who certified the PDF.</p>
chemistry.sign.name	<p>Specifies the name of the person/company who certified the PDF.</p>
chemistry.sign.password	<p>Specifies the export password of the keystore used to sign the PDF. Mandatory if the keystore has been exported with a password.</p>
chemistry.sign.reason	<p>Specifies the reason for certifying the PDF.</p>
css.processor.path.antenna-house	<p>Path to the Antenna House executable file that needs to be run to generate the PDF (for example, <code>C:\path\to\AHFCmd.exe</code> on Windows).</p>
css.processor.path.chemistry	<p>Path to the Oxygen PDF Chemistry executable file that needs to be run to generate the PDF (for example, <code>C:\path\to\chemistry.bat</code> on Win-</p>

	dows). If this parameter is not set, the plugin will use the system's PATH environment variable to locate and start Oxygen PDF Chemistry .
css.processor.path.prince	Path to the Prince executable file that needs to be run to generate the PDF (for example, <code>C:\path\to\prince.exe</code> on Windows).
css.processor.type	Specifies the processor to use for the transformation. Allowed values: chemistry (default), antenna-house , or prince .
default.language	Specifies the default language for source documents. Examples: fr , de , zh , etc. Depending on the transformation type, the actual number of supported languages can vary, see: Localization (on page 1709) .
drop.block.margins.at.page-boundary	Specifies that the top and bottom margins associated with a block element should be discarded when the block is at the top or bottom of the page. Allowed values: YES (default) or NO .
editlink.ditamap.edit.url	Use this parameter to add an <i>Edit</i> link next to the topic title in the Web-Help output. When a user clicks the link, the topic is opened in Oxygen XML Web Author or Content Fusion where they can make changes that can be saved to a file server. The value should be set as the edit URL of the <i>main DITA map</i> used for publishing your output. The easiest way to obtain the URL is to open the map in Web Author or Content Fusion and copy the URL from the browser's address bar.
editlink.additional.query.parameters	You can use this optional parameter to add additional parameters to be appended to each generated edit link. Each parameter must start with <code>&</code> (for example: <code>&tags-mode=no-tags</code>).
editlink.remote.ditamap.url (deprecated)	Use this parameter in conjunction with <code>editlink.web.author.url</code> to add an <i>Edit</i> link next to the topic title in the PDF output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the custom URL of the <i>main DITA map</i> . For example, a GitHub custom URL might look like this: <code>https://getFileContent/oxygenxml/userguide/master/UserGuide.ditamap</code> .
editlink.web.author.url (deprecated)	This parameter needs to be used in conjunction with <code>editlink.remote.ditamap.url</code> to add an <i>Edit</i> link next to the topic title in the PDF output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the URL of the Web Author installation. For example: <code>https://www.oxygenxml.com/oxygen-xml-web-author/</code> .
enable.chunk.processing	Enables the processing of the <code>@chunk</code> attribute. By default, this stage is skipped but it needs to be enabled, for example, if both the <code>@chunk</code> and

	<code>@copy-to</code> attributes are present on a <code><topicref></code> . Accepted values: true or false .
<code>enable.latin.glyph.substitutions</code>	<p>When set to yes (default), glyph substitution is enabled (if the particular font supports it). This applies to Latin-based scripts only (the substitutions are always enabled in other types of scripts). If you encounter problems rendering or copying accented glyphs (e.g. <i>umlauts</i> or other <i>diacritics</i>), it might be helpful to set this parameter to no to disable the font glyph substitutions. Another example of a case when you might need to disable the substitutions is a situation where an accented character cannot be mapped to a compound glyph, resulting in the glyph not being rendered in the PDF output.</p> <div style="border: 1px solid #00a0e3; border-radius: 10px; padding: 10px; background-color: #e6f2ff;"> <p> Warnings:</p> <ul style="list-style-type: none"> • Disabling substitutions also disables Latin ligatures. • Disabling substitutions is not recommended unless absolutely necessary. It is better practice to use another font if you can find one that does not have the rendering issues. </div>
<code>expand.xpath.in.svg.templates</code>	Expands XPath expressions (whose format is <code>#{expression}</code>) contained in SVG templates. Allowed values: yes (default) or no .
<code>figure.title.placement</code>	Controls the title placement of the figures, relative to the image. Possible values include top (default) and bottom .
<code>filter.unused.glossentries</code>	When set to no (default), all glossary entries are displayed in the glossary. If set to yes , only referenced entries are displayed.
<code>fix.external.refs.com.oxygenxml</code>	The DITA Open Toolkit usually has problems processing references that point to locations outside of the processed DITA map directory. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: true or false (default).
<code>hide.frontpage.toc.index.glossary</code>	When set to yes , the generated structures (table of contents, index list, front page, etc.) are removed from the output. The default is no .
<code>image.resolution</code>	You can use this parameter to set the default resolution used by images. It works mainly on <i>vector</i> images since <i>raster</i> images have their resolu-

	tion defined in their metadata. The default is 96 (dpi). For more information, see how to change images resolution (on page 1637) .
pdf.accessibility	When set to yes , the PDF output is generated in compliance with the PDF/Universal Accessibility standard (also known as ISO 14289). The default is no .
pdf.archiving.mode	Specifies the archiving mode. The PDF output will be generated in compliance with the PDF/A standard. Allowed values (not set by default): <ul style="list-style-type: none"> • PDF/A-1a • PDF/A-1b • PDF/A-2a • PDF/A-2b • PDF/A-2u • PDF/A-3a • PDF/A-3b • PDF/A-3u
pdf.version	Use this parameter to specify the version of the produced PDF. It has no impact on the set of PDF features used by the engine, but may be used to signal a compatibility level to the PDF readers. The default is 1.5 .
pdf.security.restrict.printhq	Restricts high quality printing. Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no .
pdf.security.restrict.assembledoc	Restricts assembling document (e.g. adding pages). Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no .
pdf.security.restrict.accesscontent	Restricts extracting text and graphics. Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no .
pdf.security.restrict.fillinforms	Restricts filling in existing interactive forms. Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no .
pdf.security.restrict.annotations	Restricts filling in existing interactive forms. Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no .
pdf.security.restrict.print	Restricts printing. Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no .
pdf.security.restrict.copy	Restricts copying content. Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no .
pdf.security.restrict.edit	Restricts copying content. Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no .

pdf.security.user.password	User password. The document can be opened using this password. When the owner password parameter is not specified, the user password gives full rights to the people using it. When the owner password parameter is specified, the people can open the document using the user password but restrictions will apply. Missing by default.
pdf.security.owner.password	Owner password. There are no restrictions for people using this password.
pdf.security.encrypt.metadata	Encrypts the metadata. By default active when other security parameters are set. Accepted values: yes or no .
show.changes.and.comments	When set to yes , the user comments, colored highlights and tracked changes are shown in the output.
show.changes.and.comments-as.changebars	When set to yes (default) and the <code>show.changes.and.comments</code> parameter is also set to yes , the user comments and tracked changes are shown as change bars in the PDF output. This parameter can be used in conjunction with the <code>show.changes.and.comments.as.pdf.sticky.notes</code> parameter to choose whether the change bars are displayed in footnotes or sticky notes. You can override this from your customization CSS (on page 1481) .
show.changes.and.comments-as.pdf.sticky.notes	When set to yes (default) and the <code>show.changes.and.comments</code> parameter is also set to yes , the user comments and tracked changes are shown in the PDF output as sticky note annotations. When set to no , the comments and tracked changes are left in the document model and are styled by the default CSS rules as footnotes. You can override this from your customization CSS (on page 1481) .
show.changed.text.in.pdf.sticky-notes.content	When set to yes (default) and both the <code>show.changes.and.comments</code> and <code>show.changes.and.comments.as.pdf.sticky.notes</code> parameters are also set to yes , the inserted and deleted text is shown in the sticky note annotations. When set to no , only the <i>inserted</i> and <i>deleted</i> labels are shown in the annotations (this is useful for search scope).
show.image.map.area.numbers	When set to yes , a counter for each area from the image map is displayed over the image, near the defined shape. The default is no .
show.image.map.area.shapes	When set to yes , each of the image map area shapes is displayed with a translucent fill over the image. You can use this to debug your image maps. The default is no .
show.media.as.link	When set to yes , media objects will not appear and an external link is generated for each one instead.

sort.and.group.glossentries	When set to no (default), elements in the glossary are sorted based upon the document order. If set to yes , elements in the glossary are sorted alphabetically and grouped by their first letter.
store-type	Setting this parameter to memory will increase the processing speed and thus, could help decrease the publishing time.
table.title.placement	Controls the placement of the title for tables. Possible values include top (default) and bottom .
table.title.repeat	Specifies whether or not a table caption should repeat on other pages when the table spans onto multiple pages. The caption is not repeated for tables nested in lists or other tables. Allowed values are yes (default) or no .
use.css.for.embedded.svg	When set to yes (default), the CSS files specified in the publishing template or by the <code>args.css</code> parameter are also applied on embedded SVG elements. Allowed values are yes and no .
use.navtitles.in.all.links	Specifies whether a <code><navtitle></code> defined in a topic or a topic reference should be used as the display name for all links or only in the table of contents. Allowed values are yes and no (default).
parallel	Specifies whether or not certain pre-processing tasks should be run in parallel. Setting this parameter to true may add a small increase to the publishing speed. Allowed values are: true and false (default).

The following parameters can be used to specify a publishing template:

pdf.publishing.template	Specifies the path to the folder containing the custom PDF template.
pdf.publishing.template.descriptor	Specifies the name of the descriptor file to be loaded from the PDF template folder or package. If not specified, the first encountered descriptor file is loaded.

The following parameter is available on all DITA transformations when using the **Oxygen Publishing Engine**:

args.disable.security.checks	<p>Specifies whether or not to load external entities that are not solved through catalogs. For security reasons, the default is no.</p> <p>Allowed values:</p> <ul style="list-style-type: none"> • yes • no (default)
------------------------------	--

The following parameters are only available for the **DITA PDF - based on HTML5 & CSS** single DITA topic transformation scenario (`pdf-css-html5-single-topic` trans type):

args.root.map	Specifies the path of the root map file used to expand the key references in the published topic.
args.enable.root.map.key.processing	<p>Indicates whether or not the keys should be processed using the root map parameter.</p> <p>Allowed values:</p> <ul style="list-style-type: none"> • auto (default) • yes • no

Console Logging

To activate the logging of the last processing stage, involving the usage of the Chemistry processor to generate the PDF from the merged HTML, use the `-v` (or `--verbose`) DITA-OT parameter from the command line.

Note:

When the transformation is started from an **Oxygen** application, this parameter is automatically set.

Chemistry Console Logging

Besides the global verbosity, it is possible to control **Oxygen PDF Chemistry** console logging separately by creating a custom `logback.xml` configuration file. This is helpful if you want to hide the INFO messages or write the logs into a separate file.

Related Information:

[Oxygen PDF Chemistry: Logging](#)

License Key

When running the **Oxygen PDF Chemistry** engine or the **Oxygen Publishing Engine** from inside a started **Oxygen XML Editor/Author** installation, an extra license key is not required. The sections below pertain to running the publishing from the command line.

Chemistry License

If you have an **Oxygen PDF Chemistry** license key, you will be able to generate PDF output that is not stamped with the **Chemistry** logo image from the command line.

To install your **Chemistry** license key:

- If you are using the version of **Chemistry** that comes bundled in **Oxygen XML Editor/Author**, save the license key text in a file with the name `licensekey.txt` and place it in the `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/lib/oxygen-pdf-chemistry` folder.
- If you are using another **Chemistry** installation, make sure you place the `licensekey.txt` file in that folder.

Oxygen Publishing Engine License

If you have purchased a license for the **Oxygen Publishing Engine**, you will be able to produce both PDF and WebHelp output without any restrictions from the command line.

To install your **Oxygen Publishing Engine** license key, save the license key text in a file with the name `licensekey.txt` and place it in the `DITA-OT-DIR` folder.

Generating PDF Output

The publishing process can be initiated from a transformation scenario within **Oxygen XML Editor/Author**, from a command line outside **Oxygen XML Editor/Author**, or from an integration server.

Generating PDF from a Command Line

To publish the PDF output from a command line outside of **Oxygen XML Editor/Author**, you can use the `dita` startup script that comes bundled with the *DITA Open Toolkit* distribution.

The command line supports all [the parameters specific to the PDF transformation \(on page 1456\)](#). Here is an example of how to write the commands:

- Windows

```
dita.bat -f pdf-css-html5 -i C:\path\to\map.ditamap -o C:\path\to\output\folder -v
```

- Linux/macOS

```
dita -f pdf-css-html5 -i /path/to/map.ditamap -o /path/to/output/folder -v
```

Note:

You can use the long form of the command-line options (e.g. `--format` or `--input`).

Generating PDF from an Integration Server

PDF output can be automatically generated from a Continuous Integration/Continuous Delivery system, such as *Jenkins*.

To integrate PDF output with the Jenkins CI tool, follow these steps:

1. Create a Maven project to incorporate **Oxygen Publishing Engine**.
2. Go to the root of your Maven project and edit the `pom.xml` file to include the following fragment:

```

<project xmlns="http://maven.apache.org/POM/4.0.0"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://maven.apache.org/POM/4.0.0
    http://maven.apache.org/xsd/maven-4.0.0.xsd">

  <modelVersion>4.0.0</modelVersion>

  <groupId>com.oxygenxml</groupId>
  <artifactId>oxygen-oxygen-pdf-css-generator</artifactId>
  <version>1.0</version>

  <properties>

    <!-- The path to Oxygen Publishing Engine -->
    <dita-ot-dir>/path/to/oxygen-publishing-engine</dita-ot-dir>

    <!-- The path to the DITA map that you want to process. -->
    <input-file>/path/to/map.ditamap</input-file>

    <!-- The path of the output directory. -->
    <output-dir>/path/to/output/folder</output-dir>

    <!-- The path to the PDF publishing template folder (containing the .opt file). -->
    <publishing-template>/path/to/template/folder</publishing-template>
  </properties>

  <build>
    <plugins>
      <plugin>
        <groupId>org.codehaus.mojo</groupId>
        <artifactId>exec-maven-plugin</artifactId>
        <version>1.6.0</version>
        <executions>
          <execution>
            <id>generate-pdf-css</id>
            <phase>generate-sources</phase>
            <goals>
              <goal>exec</goal>
            </goals>
            <configuration>
              <executable>${dita-ot-dir}/bin/dita</executable>
              <arguments>
                <argument>--format=pdf-css-html5</argument>
                <argument>--input=${input-file}</argument>
                <argument>--output=${output-dir}</argument>
                <argument>-Dpdf.publishing.template=${publishing-template}</argument>
                <argument>-v</argument>
              </arguments>
            </configuration>
          </execution>
        </executions>
      </plugin>
    </plugins>
  </build>
</project>

```

```

        </arguments>

    </configuration>

</execution>

</executions>

</plugin>

</plugins>

</build>

</project>

```

3. Go to the Jenkins top page and create a new Jenkins job. Configure this job to suit your particular requirements, such as the build frequency and location of the Maven project.

Publishing Templates

An *Oxygen Publishing Template* defines all aspects of the layout and styles for output obtained from the following transformation scenarios:

- **WebHelp Responsive**
- **DITA Map PDF - based on HTML5 & CSS**

It is a self-contained customization package stored as a ZIP archive or folder that can easily be shared with others. It provides the primary method for customizing the output.

Tip:

You can start creating publishing templates by using the **Oxygen Styles Basket**. <https://styles.oxygenxml.com>

Some possible customization methods include:

- Add additional template resources to customize the output (such as logos, *Favicons*, or CSS files).
- Extend the default processing by specifying one or more XSLT extension points.
- Specify one or more transformation parameters to customize the output.
- Customize various aspects of the output through simple CSS styling.
- For **WebHelp Responsive** output, change the layout of the main page or topic pages by customizing which components will be displayed and where they will be positioned in the page.

The following graphics are possible sample structures for *Oxygen Publishing Template* packages:

Figure 408. Oxygen Publishing Template Package (WebHelp Responsive)

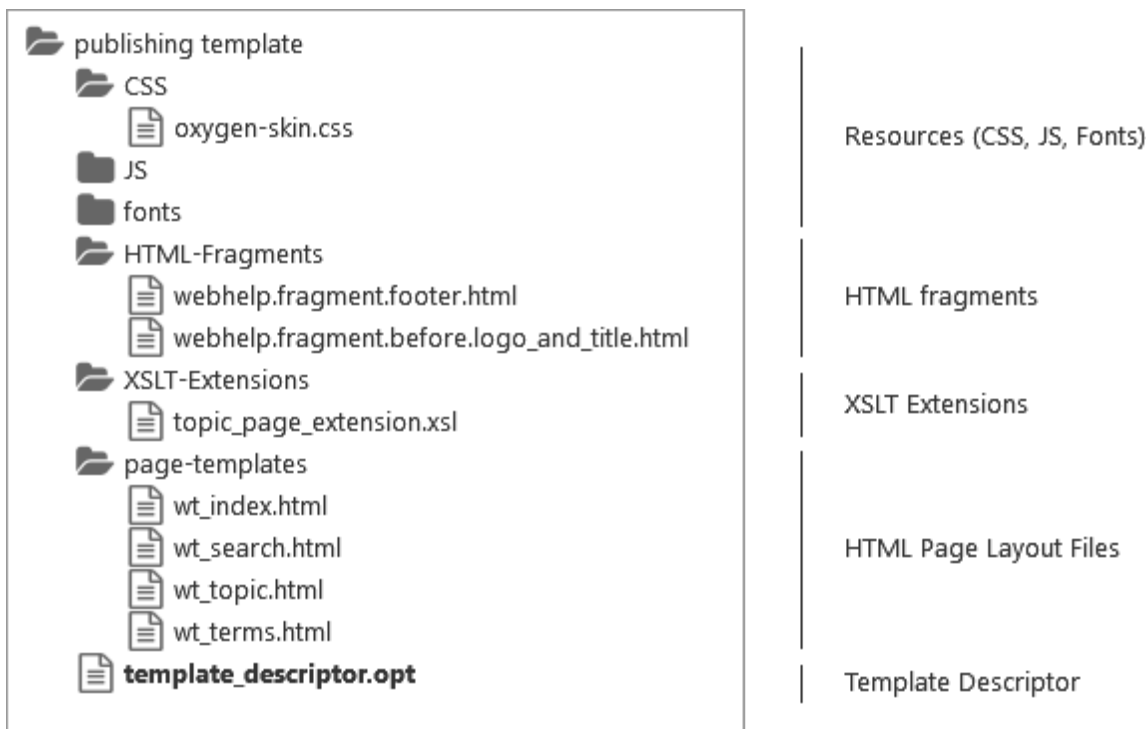

Figure 409. Oxygen Publishing Template Package (PDF)

For information about creating and customizing publishing templates, and how to adjust the WebHelp and PDF output through CSS styling and other customization methods, watch our Webinar: [Creating Custom Publishing Templates for WebHelp and PDF Output](#). The Webinar slides and sample project are also available from that webpage.

- [How to Share a Publishing Template \(on page 1481\)](#)

Publishing Template Package Contents for PDF Customizations

An *Oxygen Publishing Template* for PDF output must contain a template descriptor file and at least one CSS file, and may contain other resources (such as graphics, XSLT files, etc.). All the template resources can be

stored in either a ZIP archive or in a folder. It is recommended to use a ZIP archive because it is easier to share with others.

Template Descriptor File

Each publishing template includes a descriptor file that defines the meta-data associated with template. It is an XML file with certain elements that defines all the resources included in a template (such as CSS files, images, and transformation parameters).

The template descriptor file must have the `.opt` file extension and must be located in the templates' root folder.

A PDF template descriptor might look like this:

```
<publishing-template>
  <name>Flowers</name>

  <pdf>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
    <preview-image file="flowers-preview.png" />

    <resources>
      <css file="flowers.css" />
    </resources>

    <parameters>
      <parameter name="figure.title.placement" value="top" />
    </parameters>
  </pdf>
</publishing-template>
```

Tip:

It is recommended to edit the template descriptor in **Oxygen XML Editor/Author** because it provides content completion and validation support.

Template Name and Description

Each template descriptor file requires a `<name>` element. This information is displayed as the name of the template in the transformation scenario dialog box.

Optionally, you can include a `<description>` and it displayed when the user hovers over the template in the transformation scenario dialog box.

```

<publishing-template>
  <name>Flowers</name>
  <description>Flowers themed light colored template</description>
  ...

```

Template Author

Optionally, you can include author information in the descriptor file and it displayed when the user hovers over the template in the transformation scenario dialog box. This information might be useful if users run into an issue or have questions about a certain template.

If you include the `<author>` element, a `<name>` is required and optionally you can include `<email>`, `<organization>`, and `<organizationUrl>`.

```

<publishing-template>
  ...
  <author>
    <name>John Doe</name>
    <email>jdoe@example.com</email>
    <organization>ACME</organization>
    <organizationUrl>http://www.example.com/jdoe</organizationUrl>
  </author>
  ...

```

PDF Element

The `<pdf>` element contains various details about the template and its resources that define the PDF output. It is a required element if you intend on using a DITA Map to PDF transformation scenario. The elements that are allowed in this `<pdf>` section specify the [template tags \(on page 1473\)](#), [template preview image \(on page 1473\)](#), [resources \(on page 1473\)](#) (such as CSS files), [transformation parameters \(on page 1474\)](#), or [XSLT extensions \(on page 1475\)](#).

```

<pdf>
  <tags>
    ...
  </tags>
  <preview-image file="MyPreview.png"/>
  <resources>
    ...
  </resources>
  <parameters>
    ...

```

```

</parameters>

</pdf>

```

Template Tags

The `<tags>` section provides meta information about the template (such as color theme). Each *tag* is displayed at the top of the **Templates** tab window in the transformation scenario dialog box and they help the user filter and find particular templates.

```

<publishing-template>
...
<pdf>
  <tags>
    <tag>purple</tag>
    <tag>light</tag>
  </tags>

```

Template Preview Image

The `<preview-image>` element is used to specify an image that will be displayed in the transformation scenario dialog box. It provides a visual representation of the template to help the user select the right template. The image dimensions should be 200 x 115 pixels and the supported image formats are: JPEG, PNG, or GIF.

You can also include an `<online-preview-url>` element to specify the URL of a published sample of your template. This will display an  **Online preview** icon in the bottom-right corner of the image in the transformation scenario dialog box and if the user clicks that icon, it will open the specified URL in their default browser.

```

<publishing-template>
...
<pdf>
...
  <preview-image file="ashes/ashes-tree.png"/>
  <online-preview-url=https://www.example.com/samples/tiles/ashes</online-preview-url>

```

Template Resources

The `<resources>` section of the descriptor file specifies a set of resources (CSS files) that are used to customize various components in the generated output. These resources will be copied to the output folder during the transformation process. At least one CSS file must be included (using the `<css>` element).

```

<publishing-template>
...
<pdf>
...
  <resources>

```

```

<css file="css/custom_styles.css"/>

<css file="css/custom_fonts.css"/>

</resources>

```

**Note:**

All relative paths specified in the descriptor file are relative to the template root folder.

Transformation Parameters

You can also set one or more transformation parameters in the descriptor file.

```

<publishing-template>
...
<pdf>
...
<parameters>
  <parameter name="show.changes.and.comments" value="yes"/>
</parameters>
</pdf>

```

The following information can be specified in the `<parameters>` element:

Parameter name

The name of the parameter. It may be one of the transformation parameters listed in the **Parameters** tab of the **DITA Map PDF - based on HTML5 & CSS** transformation scenario or a DITA-OT PDF-based output parameter.

**Note:**

It is not recommended to specify an input/output parameter in the descriptor file (such as the input Map, DITAVAL file, or temporary directory).

**Attention:**

JVM arguments like `-Xmx` cannot be specified as a transformation parameter.

Parameter Value

The value of the parameter. It should be a relative path to the template root folder for file paths parameters.

Parameter Type

The type of the parameter: `string` or `filepath`. The `string` value is default.

After creating a publishing template (on page 1476) and adding it to the templates gallery (on page 1480), when you select the template in the transformation scenario dialog box, the **Parameters** tab will automatically be updated to include the parameters defined in the descriptor file. These parameters are displayed in italics.

XSLT Extension Points

The publishing templates support one or more XSLT extension points. They can be specified using the `<xslt>` element in the descriptor file using the following structure:

```
<publishing-template>
...
<pdf>
...
<xslt>
  <extension
    id="com.oxygenxml.pdf.css.xsl.merged2html5"
    file="xslt/merged2html5Extension.xsl"/>
  <extension
    id="com.oxygenxml.pdf.css.xsl.merged2merged"
    file="xslt/merged2mergedExtension.xsl"/>
</xslt>
```

For more information about the available extension points, see: [XSLT Extensions for PDF Transformations \(on page 1672\)](#).

Combining PDF and WebHelp Responsive Customizations in a Template Package

An *Oxygen Publishing Template* package can contain both a PDF and WebHelp Responsive customization in the same template package and you can use that same template in both types of transformations. The template descriptor file can define the customization for both types by including both a `<webhelp>` and `<pdf>` element and some of the resources can be reused. Resources referenced in elements in the `<webhelp>` element will only be used for WebHelp transformations, and resources referenced in the elements in the `<pdf>` element will only be used in PDF transformations.

```
<publishing-template>
  <name>Flowers</name>
  <description>Flowers themed light-colored template</description>

  <webhelp>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
    <preview-image file="flowers-preview.png"/>
  </webhelp>
</publishing-template>
```

```

<resources>

  <css file="flowers-wh.css"/>

  <css file="flowers-page-styling.css"/>

</resources>

<parameters>

  <parameter name="webhelp.show.main.page.tiles" value="no"/>

  <parameter name="webhelp.show.main.page.toc" value="yes"/>

</parameters>

</webhelp>

<pdf>

  <tags>

    <tag>purple</tag>

    <tag>light</tag>

  </tags>

  <preview-image file="flowers-preview.png"/>

  <resources>

    <css file="flowers-pdf.css"/>

    <css file="flowers-page-styling.css"/>

  </resources>

  <parameters>

    <parameter name="show.changes.and.comments" value="yes"/>

  </parameters>

</pdf>

</publishing-template>

```

How to Create a Publishing Template

To create a customization, you can start from scratch or from an existing template, and then adapt it according to your needs.

Creating a Publishing Template Starting from Scratch

To create a new *Oxygen Publishing Template (on page 2270)*, follow these steps:

1. Create a folder that will contain all the template files.
2. In **Oxygen XML Editor/Author**, open the new document wizard (use **File > New** or the  **New** toolbar button), then choose the **Publishing Template Descriptor** template.

Figure 410. Choosing the Publishing Template Descriptor Document Template

3. Save the `.opt` file into your customization directory.
4. Open the `.opt` file in the editor and customize it to suit your needs.

Creating a Publishing Template Starting from an Existing Template

If you are using a **DITA Map WebHelp Responsive** or **DITA Map PDF - based on HTML5 & CSS** transformation, the easiest way to create a new *Oxygen Publishing Template (on page 2270)* is to select an existing template in the transformation scenario dialog box and use the **Save template as** button to save that template into a new template package that can be used as a starting point.

To create a new *Oxygen Publishing Template*, follow these steps:

1. Open the transformation scenario dialog box and select the publishing template you want to export and use as a starting point.
2. **Optional:** You can set one or more transformation parameters from the **Parameters** tab and the edited parameters will be exported along with the selected template. You will see which parameters will be exported in the dialog box that is displayed after the next step.
3. Click the **Save template as** button.

Step Result: This opens a template package configuration dialog box that contains some options and displays the parameters that will be exported to your template package.

4. Specify a name for the new template.
5. **Optional:** Specify a template description.
6. **Optional:** The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (**DITA Map WebHelp Responsive** or **DITA Map to PDF - based on HTML5 & CSS**). You can use the **Include WebHelp customization** and **Include PDF customization** options to specify whether your custom template will include both types of customizations.
7. **Optional:** For **WebHelp Responsive** customizations, you can select the **Include HTML Page Layout Files** option if you want to copy the default *HTML Page Layout Files (on page 1316)* in your template package. They are helpful if you want to change the structure of the generated HTML pages.
8. In the **Save as** field, specify the name and path of the ZIP file where the template will be saved.

Step Result: A new ZIP archive will be created on disk in the specified location with the specified name.

9. Open the `.opt` file in the editor and customize it to suit your needs.

For more information about creating and customizing publishing templates, watch our video demonstration:

<https://www.youtube.com/embed/zNmXfKWwO8>

Creating a Publishing Template Using the Oxygen Styles Basket

Another way to create an *Oxygen Publishing Template (on page 2270)* is to use the **Oxygen Styles Basket**. This tool is a handy free-to-use web-based visual tool that helps you create your own *Publishing Template Package* to customize your **DITA Map WebHelp Responsive** transformation scenarios.

It is based on galleries that you can visit to pick styling aspects to create a custom look and feel. Various different types of styles can be selected (such as fonts, tables, lists, spacing, code) and all changes can be seen in the **Preview** pane. You can also click the **See Results** button to generate a preview of either WebHelp or PDF output.

It is possible to **Download** the current template or **Upload** a previously generated template for further customization.

Figure 411. Oxygen Styles Basket Interface

Resources

For more information about the **Oxygen Styles Basket**, see the following resources:

- **Video: Introducing the New Oxygen Styles Basket**
- **Webinar: Using Oxygen Styles Basket to Create CSS Customization from Scratch**

How to Edit a Packed Publishing Template

To edit an existing *Oxygen Publishing Template (on page 2270)* package, follow these steps:

1. Unzip the ZIP archive associated with the *Oxygen Publishing Template* in a separate folder.
2. Link the folder associated with the template in the **Project** view.
3. Using the **Project** view, you can modify the resources (CSS, JS, fonts) within the *Oxygen Publishing Template* folder to fit your needs.
4. Open the publishing template descriptor file (.opt extension) in the editor and modify it to suit your needs.
5. **Optional:** Once you finish your customization, you can archive the folder as a ZIP file.

How to Use a Publishing Template in a PDF Transformation

From Oxygen XML Editor/Author

A publishing template can be used for PDF output from the **DITA Map PDF - based on HTML5 & CSS** transformation scenario (or from the **DITA PDF - based on HTML5 & CSS** transformation scenario).

The **Templates** tab in the transformation scenario dialog box displays all the templates that are available in your template gallery. To use a particular template in the transformation scenario, simply select it from this tab and then continue configuring the transformation using the other tabs to suit your needs.

To add the publishing template to your templates gallery, follow these steps:

1. Open the transformation scenario dialog box by editing a **DITA Map PDF - based on HTML5 & CSS** transformation (or a **DITA PDF - based on HTML5 & CSS** transformation scenario).
2. In the **Templates** tab, click the **Configure Publishing Templates Gallery** link to.

Step Result: This will open the preferences page.

3. Click the **Add** button and specify the location of your template directory.

Step Result: Your template directory is now added to the **Additional Publishing Templates Galleries** list.

4. Click **OK** to return to the transformation scenario dialog box.

Result: All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

From a Command Line

You can use the `pdf.publishing.template` parameter to point to the `*.opt` (publishing template) file:

```
dita.bat
--input=map\test.ditamap"
"-Dpdf.publishing.template=full_path_to_template_dir/my_template.opt"
--format=pdf-css-html5
...
```

Or use the two parameters to indicate the folder containing the publishing templates and the name of the publishing template file relative to that folder:

```
dita.bat
--input=map\test.ditamap"
```

```
"-Dpdf.publishing.template=full_path_to_template_dir"
"-Dpdf.publishing.template.descriptor=my_template.opt"
--format=pdf-css-html5
...
```

**Tip:**

You can also start the `dita` process by passing it a **DITA OT Project File**. Inside the project file you can specify as parameters for the `webhelp-responsive` transformation type the WebHelp-related parameters.

Related Information:

[Transformation Parameters \(on page 1456\)](#)

How to Share a Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder in your project.
2. Go to **Options > Preferences > DITA > Publishing** and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to **Project Options**.
4. Share your project file (`.xpr`).

Customizing PDF Output Using CSS

The publishing process is driven by a *customization CSS*.

**Warning:**

You should not edit the CSS stylesheet from `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/css/print`. Instead, create your own customization.

To change the styling of the output for the **DITA Map PDF - based on HTML5 & CSS** or the **DITA PDF - based on HTML5 & CSS** transformation scenarios you can either create your own custom CSS rules or create a publishing template using the **Oxygen Styles Basket**.

Create Custom CSS Rules from Scratch

1. Create a CSS file that will contain all of your customizations. It is recommended to create this file in your project directory so you can edit it easily.

**Tip:**

If you use the default Chemistry processor in **Oxygen XML Editor/Author**, you can use LESS instead of CSS. In this case, the customization files should have the `.less` extension.

2. Add your custom CSS rules. As a good starting point, you can check the various topics in this section for assistance with specific types of customizations.
3. Link the CSS file. For this, you have two options:
 - Create a publishing template, create the customization CSS file inside the template folder, and link it to the publishing template descriptor. For assistance, see [Publishing Templates \(on page 1297\)](#).
 - Choose an existing publishing template, then edit the scenario and set the full path to the custom CSS file as the value of the `args.css` parameter. The rules from custom CSS will override the rules from the template CSS files.
4. Run the transformation scenario.

Creating a Publishing Template Using the Oxygen Styles Basket

Another way to create an *Oxygen Publishing Template (on page 2270)* is to use the **Oxygen Styles Basket**. This tool is a handy free-to-use web-based visual tool that helps you create your own *Publishing Template Package* to customize your **DITA Map PDF - based on HTML5 & CSS** transformation scenarios.

It is based on galleries that you can visit to pick styling aspects to create a custom look and feel. Various different types of styles can be selected (such as fonts, tables, lists, spacing, code) and all changes can be seen in the **Preview** pane. You can also click the **See Results** button to generate a preview of either PDF or WebHelp output.

It is possible to **Download** the current template or **Upload** a previously generated template for further customization.

Figure 412. Oxygen Styles Basket Interface

Debugging the CSS

If you notice that some of the CSS properties were not applied as expected, some of the tips offered in this topic might help you with the debugging process.

**CAUTION:**

Do not modify the built-in rules directly in the CSS files from the **Oxygen XML Editor/Author** installation. Instead, copy the rules to your own customization CSS.

Inspecting the Merged Map File

During the transformation stages, two merged map files are created. These files could be used to help debug unexpected results.

1. The first thing you should try is to check the file structure of the **HTML merged map file**. This file can be found in the `out/pdf-css` directory and it has the `.merged.html` file extension (you will also find a `.merged.xml` file that aggregates the entire DITA map structure). You can open the HTML files in **Oxygen XML Editor/Author** to examine the structure. Optionally, you can use the pretty print feature (**Format and Indent**) to make the structure easier to read.
2. If the structure is as expected, you can start checking that the CSS selectors are written correctly against the document structure.
3. If the CSS selectors are correctly written, you can start inspecting how the styles are applied (you can try any of the methods listed below).

Inspecting the Applied Styles Using a Browser

The following procedure explains how to inspect the applied CSS styles using Chrome, but any modern browser can be used and the procedure for each of them is similar:

1. Open the file ending in `.merged.html`.
2. Open the **Chrome Developer Tools** by using  > **More Tools > Developer Tools** (or press **CTRL+SHIFT+I**).
3. Activate the **Rendering** pane by using  > **More Tools > Rendering** then select **print** from the **Emulate CSS media** section. This will activate the CSS selectors enclosed in `@media print {..}`:

**Note:**

This allows you to debug the styling of elements, the table of contents, and the index, but not the styles of the page margin boxes (headers, footers) or page breaks.

4. Right-click on the element you want to inspect and select the **Inspect** action, you will see the element (in the **Elements** pane) and the list of styles that are applied on it (in the **Styles** pane):

The screenshot shows the Oxygen XML Editor interface. The top pane displays the XML structure of a document, with a table element selected. The table element is highlighted in blue, and an arrow points to it with the text "Current inspected element". The table element's HTML is as follows:

```
<table class="- topic/table table frame-none" frame="none" id="d193e286" data-cs="3"> == $0
```

The middle pane shows the "Styles" pane, which displays the styles applied to the selected element. The styles are organized into layers, and the "Styles applied on selected element" section is visible. The styles include:

- Layer <anonymous>: `*[class~="topic/table"]:has(*[class~="topic/title"]) { counter-increment: tablecount; }` (p-tables.css:11)
- Layer <anonymous>: `*[class~="topic/table"], *[class~="topic/simpletable"] { hyphens: auto; }` (p-hyphens.css:17)
- Layer: `.frame-none { border: 0; }` (topic-page-print.css:7)

The right pane shows a visual representation of the table's box model. The table is shown with a margin of 12px, a border, and padding. The table's dimensions are 560x207.500. The visual representation shows the margin, border, and padding around the table content.

Tip:

Clicking any of the stylesheet links from the **Styles** pane opens the original CSS files in the **Sources** pane. Editing the rules in that pane results in a live preview of how the change will affect the output (these modifications will be lost on reload).

Inspecting the Applied Styles Using Oxygen XML Editor/Author

To inspect the applied CSS styles using **Oxygen**:

1. In **Oxygen XML Editor/Author**, open the file ending in `.merged.html`.
2. From the **Styles** toolbar, choose the **+ Print Ready** entry. This will activate certain CSS selectors enclosed in `@media print {...}`.

Note:

This allows you to debug the styling of elements, the table of contents, and the index, but not the styles of the page margin boxes (headers, footers) or page breaks.

- Right-click on the element you want to inspect and select the **Inspect Styles** action. The dedicated **CSS Inspector** view will be opened and it will show the applied CSS rules.

**Tip:**

With this file open in **Author** mode, it might be helpful to switch the **Tags Display Mode** to  **Full Tags with Attributes**. You might be able to identify the selector you need to style without using the **CSS Inspector** view.

Other Debugging Techniques

Here are some other debugging techniques you may find useful:

- Add background and border properties to the specific CSS rule. If they do not appear in the output, then there is a problem with the rule selector.
- Add the `!important` keyword to a property that is not applied, or make the selector more specific (by adding more parent selectors).
- Add the following fragment in your customization CSS to show how the elements are mapped to PDF:

```
* {
  border: 1pt solid blue !important;
}

*:before(1000) {
  content: oxy_name() !important;
  color: orange;
}

*:before(900) {
  content: "[ class= '" attr(class) "'" ] !important;
  color: orange;
}
```

This will show the element name, its class attribute, and will paint a blue border around each of the elements in the output. It will not show the page margin boxes or some content elements that are hidden.

How to Speed up CSS Development and Debugging

You may have already run the **DITA Map PDF - based on HTML5 & CSS** transformation scenario before using this procedure.

You can speed up your CSS development considerably by not invoking the entire pipeline of transforming your DITA maps to PDF. Instead, you can directly transform the [merged map \(on page 1483\)](#) (`.merged.html`) into PDF using **Oxygen PDF Chemistry**.

1. Open the `.merged.html` located in the output directory in the editor.
2. Configure a new **XML to PDF transformation with CSS** scenario. There is no need to set the CSS URL in the resulting dialog box. The stylesheets are already declared in the file `<head>`. This scenario uses the Chemistry CSS processor.
3. **Optional:** Enable the console output of the CSS processor from: **Options > Preferences > XML > PDF Output > CSS-based Processors**.

Now you can make incremental changes to the CSS stylesheet and quickly see the results by transforming the merged file directly.

Fastpath:

If your changes only involve element styling (with no specific paged media CSS rules and properties), you can simply open the merged file in a browser (such as Chrome or Firefox) and refresh at each CSS change, as shown in: [Debugging the CSS \(on page 1483\)](#).

How to Use XPath Expressions in CSS

How to Write XPath Expressions

To use XPath expressions in CSS, you need to use the `oxy_xpath()` function. These XPath expressions are used to extract the content from the HTML merged DITA map document.

The following example shows how to display the product name meta-information before the front page title:

```
*[class~="front-page/front-page-title"]:before {
  text-align: left;
  content: oxy_xpath("//*[contains(@class, 'topic/prodname')]/text()[1]");
  display: block;
}
```

Important:

Do not use the DITA element names directly. You must use the DITA `@class` attribute instead, as these attributes are propagated to the HTML elements while the element names can be lost. By using the class selectors, you also cover DITA specializations.

Tip:

Use the "[1]" XPath predicate to select the first value from the document. Do not forget the parenthesis between the node to be selected.

For example: `oxy_xpath("//*[contains(@class, 'topic/prodname')]/text()[1]")`.

Note that the meta-information might be copied multiple times in the output, inherited by the `<topicref>` elements, so you might get more values than expected.

**Other Notes:**

- You can call the `oxy_xpath()` function in `string-set` property.
- You can use content extracted using the `oxy_xpath()` function in both pseudo-elements and `@page` at-rules.
- Do not use strings as values for pseudo-elements content because they are not supported in them.

How to Debug XPath Expressions

Suppose that you need to display the publication author in the bottom-left part of the cover page.

The ditamap content is the following:

```
<map>
  <title>The Art of Bike Repair</title>
  <topicmeta>
    <author>John Doe</author>
  </topicmeta>
  ...
</map>
```

To debug an XPath expression:

1. Read the [XPath Expressions Guidelines \(on page 1487\)](#).
2. Launch the transformation of the DITA map using your customization CSS.
3. Open the `[MAP_NAME].merged.html` file (from the output folder) in **Oxygen XML Editor/Author**. You will find this inside the HTML:

```
<div class="- front-page/front-page front-page">
  <div class="- map/topicmeta topicmeta">
    <div class="- topic/author author">John Doe</div>
  </div>
  <div class="- front-page/front-page-title front-page-title">
    <div class="- topic/title title">The Art of Bike Repair</div>
  </div>
</div>
```

4. Activate the **XPath Builder view (Window > Show View > XPath/XQuery Builder)**.
5. Paste your XPath expression (for example: `//*[contains(@class, "front-page/front-page")]/*[contains(@class, "map/topicmeta")]/*[contains(@class, "topic/author")]/text()`) and click the  **Execute XPath** button. Check if it returns the expected results.
6. Copy the expression in your customization CSS and define the rules that will use it. For example:

```

:root {

  string-set: author oxy_xpath('//*[contains(@class, "front-page/front-page")] \
  /*[contains(@class, "map/topicmeta")]/*[contains(@class, "topic/author")] /text()');

}

@page front-page {

  @bottom-left {

    content: "Created by " string(author);

  }

}

```

**Note:**

The "\n" character used in the expression allows the multi-line display without breaking the query.

7. Run the transformation again to obtain the desired output.

**Note:**

The XPath builder has a function that allows it to display the document path of the current element from the editor ( **Settings drop-down menu** >  **Update on cursor move**). Alternatively, you can right-click the element in the merged document and select the **Copy XPath** action, then paste it in the XPath builder.

[XPath Builder Documentation](#)

[XPath Examples \(w3schools.com\)](#)

Default Page Definitions

All page definitions are found in: `[PLUGIN_DIR]css/print/p-pages-and-headers.css`.

**Note:**

This is listed solely for illustration purposes, as the plugin might use something different.

There are page definitions for the default page, chapter page, table of contents page, front matter page, back matter page, index page, large tables page, and blank page.

Default Page

The default page imposes a header that contains the publication title, chapter, and section title. They alternate on the left or right side of the page:

```

@page :left {
  @top-left {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " counter(page);
  }
}

@page :right{
  @top-right {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " counter(page);
  }
}

```

**Tip:**

To override the default rules defined for named pages (such as chapter or table of contents), you need to use more specific page rules that contain the page name:

```

@page :left, table-of-contents:left, chapter:left {
  @top-left {
    content: "...";
  }
}

@page :right, table-of-contents:right, chapter:right{
  @top-right {
    content: "...";
  }
}

```

Front Page

The cover page. It clears the headers.

```

@page front-page {
  @top-left-corner { content:none }
  @top-left { content:none }
  @top-center { content:none }
  @top-right { content:none }
  @top-right-corner { content:none }
  @bottom-left-corner { content:none }
  @bottom-left { content:none }
  @bottom-center { content:none }
  @bottom-right { content:none }
}

```

```
@bottom-right-corner{          content:none }
}
```

Table of Contents Page

The table of content page. It clears the headers and uses a lower roman page number in the header.

```
@page table-of-contents {
  @top-left      { content: none; }
  @top-center    { content: none; }
  @top-right     { content: none; }
  @bottom-left   { content: none; }
  @bottom-center { content: none; }
  @bottom-right  { content: none; }
}

@page table-of-contents:left {
  @top-left {
    content: string(toc-header) " | " counter(page, lower-roman);
  }
}

@page table-of-contents:right {
  @top-right {
    content: string(toc-header) " | " counter(page, lower-roman);
  }
}

/* Do not put a header on the first page of the TOC */

@page table-of-contents:first:left {
  @top-left {
    content: none;
  }
}

@page table-of-contents:first:right {
  @top-right {
    content: none;
  }
}
```

Chapter Page

The chapter page is inherited from the default page. The chapter page is associated with the topics marked as chapters, usually direct children of the map. It clears the header from the first page of each chapter. If you need to add other information to the chapter headers, make sure you override these rules in your CSS:

```

@page chapter{
    /* Currently inherit from the default page. */
}

/* No headers on the chapter first page. */
@page chapter:first:left{
    @top-left {
        content: none;
    }
}

@page chapter:first:right{
    @top-right {
        content: none;
    }
}

```

Front Matter and Back Matter Page

The bookmap front matter and back matter page. It clears the headers.

```

@page matter-page {
    @top-left-corner { content:none }
    @top-center { content:none }
    @top-right-corner { content:none }
    @bottom-left-corner { content:none }
    @bottom-left { content:none }
    @bottom-center { content:none }
    @bottom-right { content:none }
    @bottom-right-corner{ content:none }
}

@page matter-page:left {
    @top-left { content: counter(page, lower-roman); }
}

@page matter-page:right {
    @top-right { content: counter(page, lower-roman); }
}

```

Index Page

The index page contains the index terms (and appears only if there are such items in your topics). It uses a lower alpha page number in the footer:

```

@page index {

  @top-left-corner {      content:none }
  @top-left {             content:none }
  @top-right {            content:none }
  @top-right-corner {    content:none }
  @top-center {           content:none }
  @bottom-left-corner {   content:none }
  @bottom-left {          content:none }
  @bottom-right {         content:none }
  @bottom-right-corner{   content:none }
  @bottom-center {

    content: counter(page, lower-alpha);

    font-size: 11pt;
  }
}

@media oxygen-chemistry {

  @page index {

    column-count: 2;

    column-fill: auto;
  }
}

```

When transformed, the page layout is spread on two columns.

Landscape Page

The landscape page contains large tables (for example). The page is rotated and the header is moved on the right side of the page:

```

@page landscape-page:right {

  size: landscape;

  @top-left {

    content: none
  }

  @top-center {

    content: none
  }

  @top-right {

    content: none
  }

  @right-bottom {

```

```

    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " counter(page);
    transform: rotate(90deg);
    vertical-align: middle;
    text-align: right;
}
}

@page landscape-page:left {
    size: landscape;

    @top-left {
        content: none;
    }
    @top-center {
        content: none;
    }
    @top-right {
        content: none;
    }

    @right-top {
        content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " counter(page);
        transform: rotate(90deg);
        vertical-align: middle;
        text-align: left;
    }
}
}

```

Blank Page

The following example clears the header for the blank pages that may be created by a `page-break-before`, `page-break-after`, or by using [double side pagination \(on page 1581\)](#):

```

@page :blank{
    @top-left {
        content: none;
    }
    @top-right {
        content: none;
    }
}
}

```

Page Size

This is where you can find information on how the page sizes are defined.

Page Size - Built-in CSS rules

The `[PLUGIN_DIR]/css/print/p-page-size.css` file contains the default page rules. It uses the US-LETTER size (8.5 X 11 inches). The content of this file is:

```
@page {
  padding-top: 0.2em;
  padding-bottom: 0.2em;
  size: letter;
  margin: 1in;
}
```

Note:

This is listed solely for illustration purposes, as the plugin might use something different.

How to Change the Page Size

Suppose you want to publish using the standard A4 page size, with a margin of 2cm.

In your [customization CSS \(on page 1481\)](#), use:

```
@page {
  size: A4;
  margin: 2cm;
}
```

If you need different margins depending on the page side:

```
@page {
  size: A4;
  margin: 2cm;
}
@page :left{
  margin-right: 4cm;
}
@page :right{
  margin-left: 4cm;
}
```

This would only increase the gutter margins or the inside margins needed for binding of the final book. The other margins would remain 2cm.

How to Change the Page Orientation

Suppose you want to publish on a landscape page orientation. The default is portrait, so you need to change it by using the `size` property. This will contain both the physical measurements and the orientation. In your [customization CSS \(on page 1481\)](#), use:

```
@page {
  size: letter landscape;
}
```

How to Change the Page Settings for a Specific Element

Suppose your publication mainly uses a portrait page orientation, but there are some topics that have wide images. To avoid having the images bleed outside of the page, you could use a wider page setting (landscape).

1. Mark the topic with an `@outputclass` attribute and give it a distinct value (for example, **wide**), you can set the attribute on the root element of the topic or on the `<topicref>` element from the map.

Note:

The `@outputclass` values from the `<topicref>` automatically propagate to the root of the topic from the [merged map \(on page 1483\)](#).

2. In your [customization CSS \(on page 1481\)](#), match the output class and associate it with a named page. In the following example, the page has a landscape orientation and small margins. This technique works for any element (e.g. a table or list) not just for a topic.

```
@page wide-page {
  size: letter landscape;
  margin: 0.5in;
}

*[outputclass = 'wide'] {
  page: wide-page !important;
}
```

Note:

The `!important` rule is necessary to override the default page settings.

Page Headers and Footers

The page headers and footers use string sets defined for publication, part, chapter, and section titles. These string-sets are defined in the [numbering CSS \(on page 1555\)](#):

maptitle

Set to the current map title (on both DITA Maps and Book Maps).

parttitle

Set to the current part number and title, prefixed with " | " (only for DITA bookmaps that use parts).

parttitle-no-prefix

Set to the current part number and title (only for DITA bookmaps that use parts).

chaptertitle

Set to the current chapter number and title, prefixed with " | " (on both Shallow and Deep numbering).

chaptertitle-no-prefix

Set to the current chapter number and title (on both Shallow and Deep numbering).

chaptertitle-only

Set to the current chapter title (on both Shallow and Deep numbering).

sectiontitle

Set to the current section number and title, prefixed with " | " (Deep numbering only).

To see where the default page rules are defined, see: [Default Page Definitions \(on page 1489\)](#).

Important:

The `string-set` CSS property is not additive: matching the same elements will end up breaking the current definitions. A very common use-case is to change one of the `"chaptertitle"` string-set defined in the default CSS (see [How to Change the Header Separators \(on page 1501\)](#)). In this case, the best approach is to copy the default rules into your [customization CSS \(on page 1481\)](#), then alter the property definition by adding your definition to the existing ones or changing the value of the existing ones (without removing them).

Related Information:

[Numbering \(on page 1555\)](#)

Page Headers and Footers - Built-in CSS

The headers and footers are part of the page definitions. To see how the default page layouts are defined, see: [Default Page Definitions \(on page 1489\)](#).

How to Change the Size of Headers and Footers

This is directly related to the page margins and size.

The headers and footers are placed in the so-called [page margin boxes](#), a series of rectangular areas residing in the page margins.

To affect the margins of all page definitions, you may use the following rule:

```
@page {
  margin-top:3cm !important;
  margin-bottom:3cm !important;
  margin-left:2cm !important;
  margin-right:2cm !important;
}
```

If you want to affect only a specific page, like the first page from chapters for instance, you must use more specific page selectors. See the [Default Page Definitions \(on page 1489\)](#) for details.

Note that the page margin boxes fill the entire page margin. This means the `margin-top`, for example, dictates the height of the `@top-left-corner`, `@top-left`, `@top-center`, `@top-right`, `@top-right-corner` margin boxes. These cannot have margins on themselves, so to change the position of the content inside them, you must use `padding` properties:

```
@page {
  @top-left {
    content: "...";
    padding: 1cm;
  }
  ..
}
```

How to Change the Font of the Headers and Footers

To change the font for all the headers and footers, in your [customization CSS \(on page 1481\)](#), add a CSS rule similar to this:

```
@page {
  font-size: 12pt;
  font-family: "Arial";
}
```

Important:

These settings apply to all page margin boxes, but not to the text inside the page.

If you want to change the settings only for a specific page type (for example, the table of contents), use the name of the page:

```
@page table-of-contents {
  font-size: 12pt;
  font-family: "Arial";
}
```

Related Information:[How to Change TOC Header \(on page 1571\)](#)

How to Display Chapter's Headers on First Page

By default, the header is not displayed on the first page of each chapter:

```

/* No headers on the chapter first page. */
@page chapter:first:left{
    @top-left {
        content: none;
    }
}
@page chapter:first:right{
    @top-right {
        content: none;
    }
}

```

If you want to display them on the first page, you just need to override the above default rules with the following default content:

```

@page chapter:first:left{
    @top-left {
        content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " counter(page);
    }
}
@page chapter:first:right{
    @top-right {
        content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " counter(page);
    }
}

```

**Tip:**

It is also possible to import the `[PLUGIN_DIR]/css/print/p-optional-pages-and-headers.css` stylesheet into your custom CSS.

How to Position Text in the Headers and Footers

By default, the name of the publication and chapter titles are placed in the `top-left` or `top-right` page margin boxes:

```

@page :left {
    @top-left {

```

```

    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " counter(page);
}
}

@page :right{
  @top-right {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " counter(page);
  }
}

```

If you want to change this, you should use the `content` CSS properties of other page margin boxes, and inhibit the ones in the above content. For example, to set the chapter title in the page top left corner, you can use:

```

@page :left {
  @top-left {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " counter(page);
  }
  @top-left-corner {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " counter(page);
    white-space: nowrap;
    text-align:left;
  }
}

@page :right{
  @top-right {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " counter(page);
  }
  @top-right-corner {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " counter(page);
    white-space: nowrap;
    text-align:right;
  }
}

```

Note:

The corner page margin boxes are fixed and limited as the available space. Above, the `text-align` and `white-space` properties are used to make the text bleed out of these boxes towards the center of the page. If you plan to add an image or artwork background, you should consider using the technique described in: [How to Decorate the Header by Using a Background Image on the Entire Page \(on page 1505\)](#).

How to Change the Header Separators

There are some `strings` defined for parts, chapters, and sections. Each of these strings start with the `|` character as a separator. For example, in the header of a page, you may find a sequence of strings:

```
My Publication | Introduction | Getting Started
```

- "My Publication" is the value of the `maptitle` string.
- "Introduction" is the value of the `chaptertitle` string.
- "Getting Started" is the value of the `sectiontitle` string.

There might be cases where you want to change this separator. You will need to recompose the header content using the above string sets. Suppose you want to use `-` as the prefix separator. In your [customization CSS \(on page 1481\)](#), add the following CSS rule:

```
*[class ~= "topic/topic"][is-part] > *[class ~= "topic/title"] {
    string-set: parttitle " - " counter(part, upper-roman) " - " content(),
    parttitle-no-prefix " " counter(part, upper-roman) " - " content(),
    chaptertitle "",
    chaptertitle-no-prefix "",
    chaptertitle-only ""; /* Avoid propagating a past chapter title on a new part */
}

*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/title"] {
    string-set: chaptertitle " - " counter(chapter) " - " content(),
    chaptertitle-no-prefix " " counter(chapter) " - " content(),
    chaptertitle-only " " content();
}
```

If you enabled the [deep numbering for chapters and subsections \(on page 1560\)](#), then use:

```
*[class ~= "map/map"][numbering ^= 'deep'] *[class ~= "topic/topic"][is-part] > *[class ~= "topic/title"] {
    string-set: parttitle " - " counter(part, upper-roman) " - " content(),
    parttitle-no-prefix " " counter(part, upper-roman) " - " content(),
    chaptertitle "",
    chaptertitle-no-prefix "",
    chaptertitle-only ""; /* Avoid propagating a past chapter title on a new part */
}

*[class ~= "map/map"][numbering ^= 'deep'] *[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/title"]
{
    string-set: chaptertitle " - " counters(chapter-and-sections, ".") " - " content(),
    chaptertitle-no-prefix " " counters(chapter-and-sections, ".") " - " content(),
    chaptertitle-only " " content(),
    sectiontitle ""; /* Avoid propagating a past section title on a new chapter */
}
```

```

*[class ~= "map/map"][numbering ^= 'deep'] *[class ~= "topic/topic"][[is-chapter]:not([is-part]) > *[class ~= "topic/topic"]
> *[class ~= "topic/title"] {
  string-set: sectiontitle " - " counters(chapter-and-sections, ".") " - " content();
}

```

**Note:**

Always keep in mind that the `string-set` property is not additive (like the majority of CSS properties) so defining new string-sets using the same selector will override the default values.

How to Simplify the Header (Keep Only the Chapter Title)

The headers display information such as *map title*, *part title*, *chapter title*, and *section title*, ending in the page number.

```

content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " counter(page);

```

This might be too much if you have long titles. The solution is to override the default header content.

In your [customization CSS \(on page 1481\)](#), add the following CSS rule:

```

@page :left {
  @top-left {
    content: string(chaptertitle) " | " counter(page);
  }
}

@page :right{
  @top-right {
    content: string(chaptertitle) " | " counter(page);
  }
}

```

**Important:**

Some of the CSS default page rules are more important. If you see that the content does not change:

- Try to also specify the name of the page, to increase the specificity of the rules:

```

@page :left, table-of-contents:left, chapter:left{
  ...
}

@page :right, table-of-contents:right, chapter:right{
  ...
}

```

- Add an `!important` classifier just before the semi-colon.

```
@top-right {
    content: string(chaptertitle) " | " counter(page) !important;
}
```

How to Style a Part of the Text from the Header

If you need to style a fragment of text (for example, a company slogan) with certain colors or font styles, you have several options:

- Use an SVG image as the background for a page margin box or for the entire page. See: [How to Add a Background Image to the Header \(on page 1504\)](#).
- Use the `oxy_label` constructor. This is a function that creates a text label with a set of styles.

```
@page {
    @top-right {
        content: oxy_label(text, "My Company", styles, "color:red; font-size: larger;")
        . . .
        oxy_label(text, "Product", styles, "color:blue; text-decoration:underline;");
    }
}
```

You can combine the `oxy_label` with `oxy_xpath`, to extract and style a piece of text from the document:

```
content: oxy_label(text, oxy_xpath("/some/xpath"), styles, "color:blue; ");
```

Note:

These functions work only with the Chemistry CSS processor.

Note:

You cannot use `string()` inside an `oxy_label()`. As a workaround, to apply styling on the dynamic text retrieved by a `string()` function you can define some overall styles for the entire page margin box and then use the `oxy_label` to style differently the static text.

```
@page {
    @top-right {
        color: red;
        content: oxy_label(text, "My Company", styles, "color:black")
        . . .
        string(chaptertitle); /* This inherits the styling from @top-right*/
    }
}
```

- Use two adjacent page margin boxes, and style them differently:

```

@page {
  @top-center {
    content: "First part";
    color: red;
    text-align:right;
  }
  @top-left {
    content: "- Second part";
    color: blue;
    text-align:left;
  }
}

```

How to Add a Background Image to the Header

A common use-case is to add a background image to one of the page corners.

```

@page :left {
  @bottom-left-corner{
    content: " ";
    background-image: url('https://www.oxygenxml.com/resellers/resources/OxygenXMLEditor_icon.svg');
    background-repeat:no-repeat;
    background-position:50% 50%;
  }
}

```

Important:

Always specify a `content` property. If not, the page margin box will not be generated.

Another use-case is to use the `@top-left` or `@top-right` page margin boxes. These boxes have an automatic layout and they can be very small if they have no content. If there is no text to be placed over the image, use a series of non-breaking spaces (`\A0`) to increase the box width as in the following example (alternatively, you can use the technique described in [How to Decorate the Header by Using a Background Image on the Entire Page \(on page 1505\)](#)):

```

@page :left {
  @top-left{
    content: '\A0\A0\A0\A0\A0\A0\A0\A0\A0\A0';
    background-image: url('https://www.oxygenxml.com/resellers/resources/OxygenXMLEditor_icon.svg');
    background-repeat:no-repeat;
    background-position:50% 50%;
  }
}

```

**Note:**

You can use raster image formats (such as PNG or JPEG), but it is best to use vector images (such as SVG or PDF). They scale very well and produce better results when printed. In addition, the text from these images is searchable and can be selected (if the glyphs have not been converted to shapes) in the PDF viewer.

[Images and Figures \(on page 1636\)](#)

[How to Add a Background Image for the Cover \(on page 1523\)](#)

[How to Add a Link in Headers and Footers \(on page 1511\)](#)

How to Decorate the Header by Using a Background Image on the Entire Page

If you want to precisely position artwork and the page margin boxes are not sufficient, it is possible to use a background image for the entire page.

This technique consists of creating an image (SVG is the best since it is a vector image) as wide as the page that would contain the logo and placing other decorations at the desired locations. This offers the best results and the position of the artwork does not depend on the page margin contents.

Example:

```
@page :left, chapter:left, chapter:first:left {
    background-image: url('img/page_background_image_with_logos_and_artwork_for_left_page.svg');
    background-repeat: no-repeat;
    background-position: 50% 50%;
    background-size: 8.5in 11.5in; /* Optional: Adapt to your page size. */
}
```

For a list of all the possible page names, see: [Default Page Definitions \(on page 1489\)](#).

[How to Add a Background Image for the Cover \(on page 1523\)](#)

How to Change Header Text for Each Topic

It is possible to dynamically change the header depending on the content in a topic. The following example assumes that the data to be presented in the header is located in the metadata section of each topic. One way is to specify it in the DITA map is by using the `<topicmeta>` element for the `<topicref>` topic reference:

```
...
<topicref href="topics/installing.dita">
  <topicmeta>
    <data name="header-data" value="ID778-3211"/>
  </topicmeta>
</topicref>
```

```
</topicmeta>
```

```
...
```

In the above example, there is set of key value pairs with the name `header-data`. This information is automatically copied into the content in the [merged map file \(on page 1483\)](#), like this:

```
<topic ... >
  <title class="- topic/title ">Installing</title>
  <shortdesc class="- topic/shortdesc ">You install components to make them available for your
    solution.</shortdesc>
  <prolog class="- topic/prolog ">
    ...
  <data class="- topic/data " name="header-data" value="ID778-3211"/>
  ...
</topic >
```

This information can be extracted from the CSS:

```
/* Define the string set variable that contains the text extracted from the data element */
*[class ~= "topic/topic"] *[class ~= "topic/data"][name="header-data"] {
  string-set: hdrstr attr(value);
}

/* Using the value='none' stops applying the image. */
*[class ~= "topic/topic"] *[class ~= "topic/data"][name="header-data"][value="none"] {
  string-set: hdrstr "";
}

/* Use the string set variable in one of the page margin boxes. */
@page chapter {
  @top-left-corner {
    content: string(hdrstr);
  }
}
```

Notes:

The string set is applied to all pages that follow the data element, until another data element changes it:

```
...
<topicref href="topics/installing.dita">
  <topicmeta>
    <data name="header-data" value="ID778-3211"/>
  </topicmeta>
</topicref>
<topicref href="..."> <!-- Uses the same value -->
```

```

<topicref href="..."> <!-- Uses the same value -->
<topicref href="..."> <!-- Uses the same value -->
<topicref href="topics/change.dita">
  <topicmeta>
    <data name="header-data" value="ID990-3200"/>
  </topicmeta>
</topicref>
<topicref href="..."> <!-- The string set is changed now -->
<topicref href="..."> <!-- The string set is changed now -->
<topicref href="..."> <!-- The string set is changed now -->

```

To clear the text, use the `none` value:

```

...
  <topicref href="..."> <!-- The string set is void now -->
...

```

How to Change Header Images for Each Chapter

It is possible to dynamically change an image in the header depending on the chapter. For this, you need to define an image reference in the metadata section of each chapter. One way is to specify it in the DITA map by using the `<topicmeta>` element for the `<chapter>` topic reference:

```

...
<chapter href="topics/installing.dita">
  <topicmeta>
    <data name="header-image" value="img/installing.png"/>
  </topicmeta>
...

```

In the above example, there is set of key value pairs with the name `header-image`. The `img/installing.png` is an image reference relative to the DITA map URI. This information is automatically copied into the content in the merged map file (on page 1483), like this:

```

<topic is-chapter="true" ... >
  <title class="- topic/title ">Installing</title>
  <shortdesc class="- topic/shortdesc ">You install components to make them available for your
    solution.</shortdesc>
  <prolog class="- topic/prolog ">
    ...
    <data class="- topic/data " name="header-image" value="img/installing.png"/>
    ...

```

This information can be picked up from CSS:

```

/* Define the string set variable that contains an URL */

*[class ~= "topic/topic"] *[class ~= "topic/data"][name="header-image"] {

    string-set: imgst oxy_url(oxy_xpath('/*/@xtrf'), attr(value));

}

/* Using the value='none' stops applying the image. */

*[class ~= "topic/topic"] *[class ~= "topic/data"][name="header-image"][value="none"] {

    string-set: imgst "";

}

/* Use the string set variable in one of the page margin boxes. */

@page chapter {

    @top-left-corner {

        content: string(imgst);

        font-size:0; /* remove the font ascent and descent */

    }

}

```

Details: The `@value` attribute is used to build a URL relative to the URI of the DITA map. To determine the base URI of the DITA map, the `@xtrf` attribute was used from the root element of the merged map document, extracted using the `oxy_xpath` function.

Notes:

- The image is always aligned vertically to the middle of available space from the page margin box.
- Make sure you use an image of the correct size. For example, if you want to place the image in the top-left corner of the page, assuming the top and left page margins are 1 in, then make sure the image is a square having a size of 1 in.
- The image is applied to all pages that follow the data element, until another data element changes it:

```

...
<chapter href="topics/installing.dita">
    <topicmeta>
        <data name="header-image" value="img/installing.png"/>
    </topicmeta>
</chapter>
<chapter href="..."> <!-- Uses the same installing.png image -->
<chapter href="..."> <!-- Uses the same installing.png image -->
<chapter href="..."> <!-- Uses the same installing.png image -->
<chapter href="topics/change.dita">
    <topicmeta>

```

```

        <data name="header-image" value="img/change.png"/>
    </topicmeta>
</chapter>

<chapter href="..."> <!-- Uses the same change.png image -->
<chapter href="..."> <!-- Uses the same change.png image -->
<chapter href="..."> <!-- Uses the same change.png image -->

```

To clear the image, use the `none` value:

```

...
    <data name="header-image" value="none"/>
...

```

How to Add a Multi-line Copyright Notice to the Footer

Suppose you want to add a footer with the following two lines of text at the end of each page that is shown on the right side:

```

© 2017 - My Company Ltd
All rights reserved

```

For this, you need to specify a rule that matches all the right pages and adds that content in the `bottom-center`. In your [customization CSS \(on page 1481\)](#), add the following CSS rule:

```

@page :right{
    @bottom-center {
        content: "© 2017 - My Company Ltd \A All rights reserved";
        font-size: 0.5em;
        color: silver;
    }
}

```

Note:

Other page rules (such as the *table-of-contents*) override the contents of the `@bottom-center` because they are more specific. If you need to also print the copyright in the TOC pages, then use this as the selector:

```

@page :right, table-of-contents:right {
    ...
}

```

**Note:**

To use new lines (`\n` characters) in your headers or footers, use the `\A` notation, as in the example above.

How to Add a Group of Topics to the Footer

To create a footer that contains the content of several topic files, but only on the last page, there are two possible approaches:

Method 1: Using the `position:fixed` CSS Property

1. Group all the footer topics under a single parent topic, under the last topic from your DITA map. For example, you can have the following map structure:

```
...
End topic
  Footer container topic
    Footer content topic 1
    Footer content topic 2
```

2. Add an `@outputclass=footer` on the `<topic>` root element of the footer container topic, or on its `<topicref>` in the map.
3. Use the CSS `position: fixed` property to position this topic to the bottom of the page:

```
*[outputclass ~= "footer"] {
  position: fixed;

  bottom: 0.5in;
  left: 0.5in;

  width:5in;
  height:200pt;
}
```

**Note:**

Make sure the width and height are enough for the content of the footer to fit. Be careful because the content might bleed out of the page. Use bottom and left values to position the block in the page.

Method 2: Using the `float:footnote` CSS Property

The second approach would be to declare the footer block as a footnote. Assuming the same DITA Map structure as above, you can use the following CSS fragment:

```
*[outputclass ~= "footer"] {
  float:footnote;
```

```

}

*[outputclass ~= "footer"]:footnote-call{
  color:transparent;
  font-size:0;
}

*[outputclass ~= "footer"]:footnote-marker{
  color:transparent;
  font-size:0;
}

```

**Note:**

Use transparent colors and/or zero size font to avoid the display of the footnote counters.

How to Add a Link in Headers and Footers

Method 1: Using an SVG Link Attribute

It is possible to add a link inside the document header (or footer) by using the `<a>` element inside an SVG document. For example, suppose you have the following SVG document named *custom.svg*.

```

<svg width="180" height="20" viewBox="0 0 180 20" xmlns="http://www.w3.org/2000/svg"
  xmlns:xlink="http://www.w3.org/1999/xlink">
  <a xlink:href="https://www.oxygenxml.com/chemistry-html-to-pdf-converter.html">
    <rect x="0" y="0" width="180" height="20" opacity="0"/>
    <text x="5" y="15" fill="blue">Oxygen PDF Chemistry</text>
  </a>
</svg>

```

This creates an SVG link with **Oxygen PDF Chemistry** displayed as its text (the content of the `<text>` element).

**Note:**

If you just want to add a link without text, you can define a rectangle that contains the link instead of text.

To display the link, you just need to set your SVG file as the content of one of the page margin boxes:

```

@page {
  @top-left {
    content: url("custom.svg");
  }
}

```

Method 2: Using the CSS *-oxy-link* Property

It is also possible to add a link inside the document header (or footer) by using the `-oxy-link` property on the `@page` margin box declaration. The entire page margin box will behave as a link and will be clickable.

```
@page {
  @top-left {
    content: "Link";
    -oxy-link: "https://www.oxygenxml.com/";
    color:blue;
  }
}
```

How to Change the Header Styling Depending on Page Side

To modify the styling of the default page headers, add the following CSS rule in your [customization CSS \(on page 1481\)](#):

```
@page :left {
  @top-left {
    color:navy;
    font-style:italic;
  }
  @top-right {
    color:red;
  }
}
```

If you intend to modify **just the headers of the table of contents**, use the `table-of-contents` page rule selector:

```
@page table-of-contents:left {
  @top-left {
    color:navy;
    font-style:italic;
  }
  @top-right {
    color:red;
  }
}
```

How to Use XPath Computed Data or Images in the Header or Footer

A very simple approach is to use the `oxy_xpath` directly in the `content` property:

```
@page front-page {
  @top-center {
    content: "Created: " oxy_xpath('//*[contains(@class, " topic/created "][1]');
```

```

}
}

```

Example 1: Compute the Number of Words

The following example computes the number of words from the publication. It counts all the words, including the ones from the TOC, but does not take the static labels into account:

```

@page front-page {
  @bottom-center {
    content: "Number of words: "
           oxy_xpath("string-length(normalize-space()) - \
                    string-length(translate(normalize-space(),' ','')) +1");
  }
}

```

Note:

The XPath expression from the page rules is evaluated in the context of the document root element, so you will need to use absolute expressions starting with / or //. This is different from the case when the `oxy_xpath` is used in CSS rules that match an element. In this case, the XPath expressions are evaluated in the context of the matched element and you can use relative paths.

Tip:

XPath 2.0 is supported (not schema aware).

Example 2: Retrieve Image from a Document and Insert it in the Header

Another example is to use an image from the document in the publication header:

```

<bookmeta>
  <metadata>
    ...
    <data name="cover">
      <image href="product-cover.png" outputclass="cover-image"/>
    </data>
    ...
  </metadata>
</bookmeta>

```

```

@page {
  @top-center {
    content: url("oxy_xpath('//*[contains(@outputclass, "cover-image")]@href')");
  }
}

```

If the URL returned by `oxy_xpath` is not absolute, it is considered to be relative to the CSS file. To obtain an absolute URL from one relative to the XML document, you can use in the XPath expression functions like `resolve-uri` and `document-uri`:

```
@page {
  @top-center {
    content: url(oxy_xpath("resolve-uri(//*[contains(@outputclass, 'cover-image')]/@href), document-uri(//)"));
  }
}
```

Example 3: Insert the Current Date in the Footer

Another example is to use the `oxy_xpath` function to compute the current date and insert it in the publication footer:

```
@page {
  @bottom-left {
    content: oxy_xpath('current-date()');
  }
}
```

Example 4: Picking up Metadata from the Original Map

Another example is to use the `oxy_xpath` function to extract the title, or any other element text value from the original processed DITA map file. For this, you can use the `@xtrf` attribute that is set on the root element of the merged map. This attribute contains the URL of the input map.

```
:root{
  string-set: maptitle oxy_xpath('document(@xtrf)//*[contains(@class, " map/map ")]//*[contains(@class, " topic/title ")]/text()');
}
```

<http://zvon.org/xxl/XPathTutorial/General/examples.html>

[Oxygen User Guide: oxy_xpath\(\) Function](#)

How to Add a Line Under the Header

There are two ways to add a horizontal line under the header.

Method 1: Add a Border in the Page Margin Boxes

To add a horizontal line that would stretch across the width of the page, add a bottom border to each of the 5 margin boxes in the top side of the page (`top-left-corner`, `top-left`, `top-center`, `top-right`, `top-right-corner`).

If you consider that the space between the header and the bottom border is too large, you could also change the alignment by adding a `vertical-align: bottom;` declaration in the page margin boxes.

For example, if you need to set some text as a header in the top-left margin box and insert a horizontal line under it, the customization CSS would look something like this:

```
@page chapter, chapter:first:left:right, front-page{

    padding-top: 1em;

    @top-left {

        content: "Custom header";

        color: gray;

        border-bottom: 1px solid black;

        vertical-align: bottom;

    }

    @top-center{

        content: " ";

        border-bottom: 1px solid black;

        vertical-align: bottom;

    }

    @top-right{

        content: " ";

        border-bottom: 1px solid black;

        vertical-align: bottom;

    }

    @top-right-corner{

        content: " ";

        border-bottom: 1px solid black;

        vertical-align: bottom;

    }

    @top-left-corner{

        content: " ";

        border-bottom: 1px solid black;

        vertical-align: bottom;

    }

}
```

**Note:**

The `padding-top: 1em;` is used to avoid the border at the bottom of the header that joins with the page content.

Method 2: Use a Background Image

An alternative method is to add a horizontal line/border under an existing header (or in any other part of the page) using an SVG image, as described in [How to Add a Background Image to the Header \(on page 1504\)](#).

How to Change the Headings Using a Parameter

Suppose you need to change the headings of your publication by specifying a static text in a parameter.

First, establish a name for your parameter (it must start with the `args.css.param.` prefix). For example, you could name it `args.css.param.heading.text`. It will have the text value that you will pass when starting the transformation. This parameter does not have to be registered anywhere as it will be automatically recognized and passed as an XML attribute on the root of the merged file, as specified in [Styling Through Custom Parameters \(on page 1668\)](#).

Next, alter your customization CSS to make use of the parameter value. In the example below, the text is placed in the central part of the header:

```
@page front-page, table-of-contents, chapter {
  @top-center{
    content: oxy_xpath("/*/@heading.text");
  }
}
```

**Note:**

You can use any XPath 2.0 here. It will be executed in the context of the merged map document, so you can collect data from it. You can use *if/then/else* expressions if your parameter is a switch.

The text does not affect the first pages from the page sequences because [the built-in CSS page rules \(on page 1489\)](#) clear the content from the headers. If you need the text content on all pages, you might consider adding an `!important` keyword after the `content` property value, or increase the specificity of the page selectors, like this:

```
@page front-page,
  table-of-contents,
  table-of-contents:first:left,
  table-of-contents:first:right,
  chapter:first:left,
  chapter:first:right{
  @top-center{
    ...
```

```

}
}

```

Another use case is to alter the string-sets that are used in the headers (not the headers directly), as it is explained here: [How to Use XPath Computed Data or Images in the Header or Footer \(on page 1512\)](#). You can use this technique to alter the chapter titles as in the following example:

```

*[class ~= "map/map"][numbering^='deep']
  *[class ~= "topic/topic"][is-chapter]:not([is-part]) >
    *[class ~= "topic/title"] {
      string-set:
        chaptertitle " | " counters(chapter-and-sections, ".") " - " oxy_xpath("/*/@heading.text") content(),
        sectiontitle "";
    }

```

**Note:**

This is a rule copied from `p-numbering-deep.css` and it may change if future versions.

How to Change the Headings depending on the Language

It is possible to customize the text displayed in the headings depending on the language of the publication.

In this case, you can simply use of the `@lang` attribute in your customization CSS. In the following example, the page counter displayed in the bottom part of the page is preceded by the word "Page", according to the selected language:

```

@page chapter {
  @bottom-center {
    content: oxy_xpath("if (@lang='es') then 'Página' \
                        else if (@lang='it') then 'Pagina' \
                        else 'Page'") " " counter(page);
  }
}

```

**Note:**

Backslashes (`\`) are used to split the XPath into multiple lines to make it easier to read.

How to Display the Chapter and the Page Number in the Footer

It is possible to display the chapter number along with the page number in the footer of each page. For example, a CC-PP (using a 2-digits numbering) display can be done using the following CSS rules:

```

*[class ~= "map/map"] *[class ~= "topic/topic"][is-part] {
  string-set: chapternumber "";
}

```

```

*[class ~= "map/map"] *[class ~= "topic/topic"][is-chapter]:not([is-part]) {
    string-set: chapternumber counter(chapter, decimal-leading-zero);
}

*[class ~= "map/map"] *[class ~= "bookmap/frontmatter"]
*[class ~= "map/map"] *[class ~= "bookmap/backmatter"]
*[class ~= "map/map"] *[class ~= "topic/topic"][is-part] ~ *[class ~= "topic/topic"]:not([is-part]) {
    string-set: chapternumber "";
}

...

@page chapter {
    @bottom-center {
        content: string(chapternumber) "-" counter(page, decimal-leading-zero);
    }
}

```

Page Breaks

The page breaks can be controlled in multiple ways:

1. By creating an `@page` and assigning it to an element will create a page break between this element and the sibling elements that have a different page.
2. Using the CSS properties: `page-break-before`, `page-break-after`, or `page-break-avoid`.
3. In your DITA topic, set the `@outputclass` attribute on the topic root (or any element) to contain one of the `page-break-before`, `page-break-after`, or `page-break-avoid` values. If you want to control the page breaking from the DITA map, use the `@outputclass` attribute on the `<topicref>`, with any of the values mentioned above.

Related Information:

[Double Side Pagination \(on page 1581\)](#)

[Oxygen PDF Chemistry: Controlling Page Breaks](#)

Page Breaks - Built-in CSS

Page break properties are used in: `[PLUGIN_DIR]css/print/p-page-breaks.css`.

How to Avoid Page Breaks in Lists and Tables

To avoid splitting elements over two pages, you can use the `page-break-inside` CSS property. For example, if you want to impose this on tables and lists, then add the following rules to your [customization CSS \(on page 1481\)](#):

```

*[class ~= "topic/table"] {
    page-break-inside:avoid;
}

```

```

*[class ~= "topic/ol"] {
    page-break-inside:avoid;
}

*[class ~= "topic/ul"] {
    page-break-inside:avoid;
}

```

**Note:**

Since the task steps are inherited from `topic/ol`, they will also not be split over two separate pages. However, if you want to allow this, add the following CSS rule:

```

*[class ~= "task/steps"] {
    page-break-inside:auto;
}

```

**Note:**

Another way to do this is to mark the element with an `@outputclass` set to `page-break-avoid`.

How to Force a Page Break Before or After a Topic or Another Element

If you want to force a page break **before all** the second-level topics (for example, sections in chapters that are usually kept flowing one after another without page breaks), add the following in your [customization CSS \(on page 1481\)](#):

```

*[class ~= "map/map"] > *[class ~= "topic/topic"] > *[class ~= "topic/topic"] {
    page-break-before:always;
}

```

If you need to break at third or fourth level topics, add more `.. > *[class ~= "topic/topic"]` selectors to the expression.

If you want to force a page break **for a specific topic**, mark the topic (or any other element you need to control page breaking for) with an `@outputclass` attribute set to one of these values:

page-break-before

Use this for a page break before the marked element.

page-break-after

Use this for a page break after the marked element.

page-break-avoid

Use this to avoid page breaks inside the marked element.

For example, to force a page break before a certain topic, use:

```

<topic outputclass="page-break-before" ... >

```

**Note:**

You can set the output class on the `<topicref>` element from the DITA map instead of the `<topic>` element. In this way you can reuse the topic in another context where the page breaking is not necessary.

You can also control page breaking for lists, paragraphs, or any other block type elements. The following example avoids page breaks inside an ordered list:

```
<ol outputclass="page-break-avoid" ... >
```

How to Add a Blank Page After a Topic

If you want to add a new blank page after a topic, add the following rules to your [customization CSS \(on page 1481\)](#).

Style the separating blank page:

```
@page topic-separating-page{
  @top-left {
    content: "";
  }
  @top-right {
    content: "";
  }
  @top-center {
    content: "This page is blank";
  }
}
```

Associate this page to the `:after` pseudo-element of the topic:

```
*[class~="topic/topic"][outputclass~="add-separator-page"]:after {
  content: " ";
  display: block;
  page: topic-separating-page;
}
```

In the XML content, on the `<topic>` element, set the `@outputclass` to the `add-separator-page` value.

```
<topic outputclass="add-separator-page" ... </topic>
```

The `:after` pseudo-element will be created next to the topic content and will be placed on the `topic-separating-page`.

Use the page margin box selectors to override the default content from the headers/footers.

**Note:**

You can set the output class on the `<topicref>` element from the DITA map instead of the `<topic>` element. This allows you to reuse the topic in another context where the page breaking is not necessary.

How to Enforce a Number of Lines from Paragraphs that Continue in Next Page

In typography, an *orphan* is the first line of a paragraph that appears alone at the bottom of a page (the paragraph continues on a subsequent page), while a *widow* is the last line of a paragraph that appears alone at the top of a page. The default is 2 for each of them. You can control this number by adding the following to your [customization CSS \(on page 1481\)](#):

```
:root {
  widows: 4;
  orphans: 4;
}
```

**Note:**

As a difference from the W3C standard, the `widows` and `orphans` CSS properties are applied to lists as well (the default is 2). This means that a list that spans consecutive pages will have either zero or at least 2 lines on each of the pages.

How to Avoid Page Breaks Between Top-Level Topics (Chapters)

If you plan to publish a simple map with just one level of topics (such as a list of topics), then the automated page breaks between these topics might not be desired.

In this case, you can use the following CSS snippet to disable the page breaks between chapters:

```
*[class ~="topic/topic"][is-chapter] {
  -oxy-page-group:auto;
}
```

Related Information:

[Oxygen PDF Chemistry User Guide: Chapter Page Placement and Styling](#)

Cover (Title) Page

Customizing the cover page is one of the most requested customization requests.

Cover Page - XML Fragment

The [merged map file \(on page 1483\)](#) contains the `<oxy:front-page>` element, as a child of the root element. This contains the metadata and an `<oxy:front-page-title>` element with the title structure.

```

<bookmap xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ... >
  <oxy:front-page xmlns:oxy="http://www.oxygenxml.com/extensions/author">
    <bookmeta xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot"
      ...
    </bookmeta>
    <oxy:front-page-title>
      <booktitle xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot"
        class="- topic/title bookmap/booktitle " >
          <booklibrary class="- topic/ph bookmap/booklibrary ">Retro Tools</booklibrary>
          <mainbooktitle class="- topic/ph bookmap/mainbooktitle ">Tasks</mainbooktitle>
          <booktitlealt class="- topic/ph bookmap/booktitlealt ">Product tasks</booktitlealt>
        </booktitle>
      </oxy:front-page-title>
    </oxy:front-page>
  </bookmap>

```

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```

<div class="- map/map bookmap/bookmap bookmap" ... >
  <div class=" front-page/front-page front-page">
    <div class="- map/topicmeta bookmap/bookmeta boometa">
      ...
    </div>
    <div class=" front-page/front-page-title front-page-title">
      <div class="- topic/title bookmap/booktitle booktitle">
        <div class="- topic/ph bookmap/booklibrary booklibrary">Retro Tools</div>
        <div class="- topic/ph bookmap/mainbooktitle mainbooktitle">Tasks</div>
        <div class="- topic/ph bookmap/booktitlealt booktitlealt">Product tasks</div>
      </div>
    </div>
  </div>

```

Cover Page - Built-in CSS rules

The element with the class `frontpage/frontpage` is associated with a page named *front-page* with no headers or footers. The front page title is styled with a bigger font. The built-in CSS rules are in `[PLUGIN_DIR]/css/print/p-front-page.css`.

```

@media print {

  *[class~="front-page/front-page"] {
    page: front-page;
  }
}

```

```

/* Prevents the front-page title margin collapsing */
*[class~="front-page/front-page"]::before(1000) {
    display:block;
    content:"\A";
    font-size:0;
}

*[class~="front-page/front-page-title"] {
    display:block;
    text-align:center;
    margin-top:3in;
    font-size:2em;
    font-family:arial, helvetica, sans-serif;
    font-weight:bold;
}

@page front-page {
    @top-left-corner { content:none }
    @top-left { content:none }
    @top-center { content:none }
    @top-right { content:none }
    @top-right-corner { content:none }
    @bottom-left-corner { content:none }
    @bottom-left { content:none }
    @bottom-center { content:none }
    @bottom-right { content:none }
    @bottom-right-corner { content:none }
}

```

**Note:**

This is listed solely for illustration purposes, as the plugin might use something different.

How to Add a Background Image for the Cover

The simplest way is to create an SVG image as large as the entire physical page and set it as the background for the *front-page*. This makes it easy to accomplish a good positioning of the graphical elements or artwork. In the foreground, you can place text fragments using a series of `:after` pseudo-elements bound to the front page title.

To set the size to an SVG image, you should specify the `@width` and `@height` attributes on the `<svg>` root element using specified unit values (in, cm, etc.) This should be enough only if all the coordinates from your drawing have unit identifiers.

If you are using unit-less coordinates in your drawing like the following:

```
<polygon points="17.78 826.21 577.51 ....
```

Next, make sure you also specify the `@viewBox` attribute on the `<svg>` root element that defines the abstract rectangle that contains the drawing:

```
<svg xmlns="http://www.w3.org/2000/svg" width="8.5in" height="11in" viewBox="0 0 600 850">
```

The following SVG document has the `@width`, `@height`, and `@viewBox` attributes. The width and height have physical units (in inches), while the view box and rectangle coordinates are unit-less.

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE svg PUBLIC "-//W3C//DTD SVG 1.1//EN"
    "http://www.w3.org/Graphics/SVG/1.1/DTD/svg11.dtd">
<svg xmlns="http://www.w3.org/2000/svg" width="8.5in" height="11in" viewBox="0 0 110 110">
  <desc>A gradient as big as a page.</desc>
  <defs>
    <linearGradient id="lc"
      x1="0%" y1="0%"
      x2="0%" y2="100%"
      spreadMethod="pad">
      <stop offset="0%" stop-color="#00DD00" stop-opacity="1"/>
      <stop offset="100%" stop-color="#00AA00" stop-opacity="1"/>
    </linearGradient>
  </defs>
  <rect x="5" y="5" width="100" height="100" rx="10" ry="10"
    style="fill:url(#lc);
    stroke: #005000;
    stroke-width: 3;"/>
  <text x="33%" y="50%" color="#FFFFAA"> Sample </text>
</svg>
```

This example shows a gradient. It is the size of a US-LETTER page and can be used in a publication using this page size.

Note:

You can use raster image formats (such as PNG or JPEG), but it is best to use vector images (such as SVG or PDF). They scale very well and produce better results when printed. In addition, the text from these images is searchable and can be selected (if the glyphs have not been converted to shapes) in the PDF viewer.

In your customization CSS (*on page 1481*), add the following:

```
@page front-page {
    background-image: url("us-letter.svg");
    background-position: center;
    background-repeat: no-repeat;
    background-size: 100% 100%;
}
```

For smaller artworks, you can use `background-position` with percentage values to position and center the artwork (for example, a company logo):

```
@page front-page {
    background-image: url("company-logo.svg");
    background-position: 50% 5%; /* The first is the alignment on the X axis, the second on the Y axis.*/
    background-repeat: no-repeat;
}
```

Note:

The text from the SVG or PDF background images is searchable in the PDF reader.

How to Display the Background Cover Image Before the Title

It is possible to split the front-page display into two pages so that the background image appears on one page and the title on another. The solution is to define a new page for the main title:

```
@page front-page {
    @top-left { content: none; }
    @top-right { content: none; }
    @bottom-center { content: none; }

    background-image: url("us-letter.svg");
    background-position: center;
    background-repeat: no-repeat;
    background-size: 100% 100%;
}

@page main-title-page {
    @top-left { content: none; }
    @top-right { content: none; }
    @bottom-center { content: none; }
}

*[class ~="front-page/front-page-title"]:before {
    display: block;
}
```

```

content: "\2002";

margin-bottom: 3in;
}

*[class ~= "front-page/front-page-title"] {
  page: main-title-page;
}

```

How to Use Different Background Cover Images Based on Bookmap or Map Information

It is common to use the same CSS file for customizing multiple publications, and you may need to set a different cover for each of them. The solution is to use an XPath expression to extract some information from the document, and based on that, select the SVG images.

```

@page front-page {
  background-image: url(oxy_xpath("\
    if(//*[contains(@class, ' topic/prodname ')] [1] = 'gardening') then 'bg-gardening.svg' else\
    if(//*[contains(@class, ' topic/prodname ')] [1] = 'soil') then 'bg-soil.svg'\
    else 'bg-default.svg'\
  "));
  background-position:center;
}

```

The backslash (\) is used to continue the expression string on the subsequent lines (there should be no spaces after it). For more use cases solved using XPath, see: [Metadata \(on page 1539\)](#).

Related Information:

[Oxygen PDF Chemistry: Graphics](#)

How to Change Styling of the Cover Page Title

Match the front page title element in your [customization CSS \(on page 1481\)](#) based on its class attribute:

```

*[class ~= "front-page/front-page-title"] {
  margin-top: 1in;
  font-size: 3em;
}

```

Important:

Make sure the sum of the top and bottom margins and paddings for this element do not exceed the physical dimension of the page. If this happens, an extra blank page may appear before the cover page. Usually, it is enough to specify only the top margin.

How to Add Text to the Cover Page

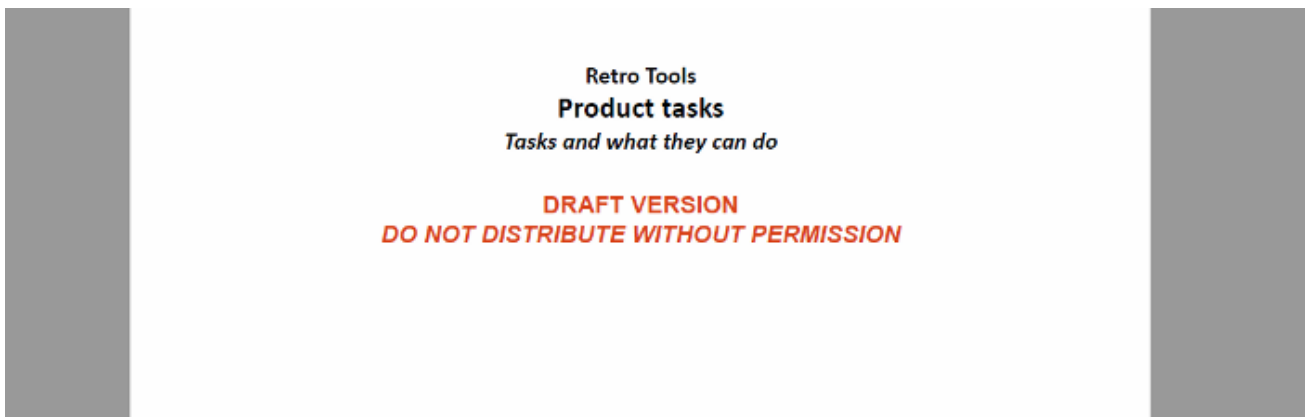

If you need to add arbitrary text to the cover page, you can use the front page title element as an anchor and add as many blocks of text as you need after it, and style them differently.

In your [customization CSS \(on page 1481\)](#), add the following:

```
*[class ~= "front-page/front-page-title"]:after(1) {
    display:block;
    content: "DRAFT VERSION";
    font-size: large;
    color: red;
    text-align:center;
}

*[class ~= "front-page/front-page-title"]:after(2) {
    display:block;
    content: "DO NOT DISTRIBUTE WITHOUT PERMISSION";
    font-size: large;
    color: red;
    text-align:center;
    font-style: italic;
}
```

The result is:

To use content from the document, you can use the `oxy_xpath` function in the `content` property. For a more complex example, including the generation of a new page for the synthetic `:after` elements, see: [How to Show Metadata in the Cover Page \(on page 1544\)](#).

Related Information:

[How to Show Metadata in the Cover Page \(on page 1544\)](#)

How to Place Cover on the Right or Left Side

In your customization CSS (*on page 1481*), add the following CSS rules:

```
*[class ~="front-page/front-page"]{
    page-break-before:left;
}
```

Note:

This will create an empty page at the beginning of the publication, moving the cover content on the needed side.

For more information, see: [Oxygen PDF Chemistry: Controlling Page Breaks](#).

Related Information:

[Double Side Pagination \(on page 1581\)](#)

How to Add a Second Cover Page and Back Cover Page

It is possible to add a second cover page after the front-page by defining another page-selector:

```
@page second-cover {
    @top-left {content: none;}
    @top-right {content: none;}
    @bottom-center {content: none;}

    background-image: url("second-cover.svg");
    background-position: center;
    background-repeat: no-repeat;
    background-size: 100% 100%;
}

*[class ~="front-page/front-page"]:after{
    page: second-cover;
    page-break-after: always;
    display: block;
    content: "\2002";
}
```

If you want to add a back cover page, you should use an `:after` pseudo element on the map itself:

```
*[class ~="map/map"]:after
```

and bind it to another `@page` declaration:

```

@page back-cover {
  @top-left {content: none;}
  @top-right {content: none;}
  @bottom-center {content: none;}

  background-image: url("back-cover.svg");
  background-position: center;
  background-repeat: no-repeat;
  background-size: 100% 100%;
}

*[class ~= "map/map"]:after {
  page: back-cover;
  content: "\2002";
}

```

**Note:**

For any `background-image`, it is recommended to use SVG instead of PNG (or JPG) because it scales it to the page size.

**Tip:**

To add multiple cover pages, use multiple-leveled pseudo selectors, such as `:after(1)`, `:after(2)`. Remember that the larger the value, the more distant the pseudo element is to the target element.

How to Dynamically Add a Second Cover Page

It is possible to dynamically set the path to the SVG image that will be displayed on the secondary cover page.

First, you need to declare a `<data>` element in the *bookmap's* metadata that contains the URL to your cover image:

```

<bookmap>
  <booktitle>
    ...
  </booktitle>
  <bookmeta>
    <metadata>
      <data name="second-cover-url" value="covers/second-cover.svg" />
    </metadata>
  </bookmeta>
  ...
</bookmap>

```

**Note:**

This can also be done on a normal DITA map by using the `<topicmeta>` after the map's `<title>`.

Next, you need to modify the page declaration inside your CSS stylesheet and replace the `background-image` property value with the result of the `oxy_xpath()` function:

```
@page second-cover {
  ...
  background-image: url(oxy_xpath("//*[contains(@class, 'bookmap/bookmeta')]/*[contains(@class,
'topic/data')][@name='second-cover-url']/@value"));
  ...
}
```

**Tip:**

You can reuse the same stylesheet on multiple maps. You just need to change the data value for each of them.

How to Add a Specific Number of Empty Pages After the Cover Page

In your [customization CSS \(on page 1481\)](#), add the following CSS rules:

```
@page my-blank-page {
  /* Hide the page numbers */
  @top-left {content: none;}
  @top-right {content: none;}
}

*[class ~= 'front-page/front-page']:after(1){
  page:my-blank-page;
  display:block;
  content: '\2002';
  color:transparent;
  page-break-after:always;
}

*[class ~= 'front-page/front-page']:after(2){
  page:my-blank-page;
  display:block;
  content: '\2002';
  page-break-after:always;
}

*[class ~= 'front-page/front-page']:after(3){
```

```

page:my-blank-page;

display:block;

content: '\2002';

page-break-after:always;
}

```

**Note:**

The `\2002` character is a space that is not shown on the pages, but gives a value for the content property.

Related Information:

[How to Force an Odd or Even Number of Pages in a Chapter \(on page 1583\)](#)

How to Add a Copyright Page after the Map Cover (Not for Bookmaps)

Regular DITA maps do not have the concept of a copyright notice. This is available only in the DITA *bookmap* structure.

If you are constrained to using a regular map and you need to add a copyright page between the front cover and the TOC, use the following technique:

In your [customization CSS \(on page 1481\)](#), declare a new page layout:

```

@page copyright-notice-page {

  /* Clear the headers for the copyright page */

  @top-left {

    content: none;

  }

  @top-right {

    content: none;

  }

}

```

The element with the class `front-page/front-page` element contains the title of the publication and generates the cover page. A synthetic `:after` element is created that follows this element and it is placed on a different page.

```

*[class ~= "front-page/front-page"]:after {

  display: block;

  page: copyright-notice-page; /* Moves the synthetic element on a new page. */

  content: "Copyright 2018-2019 MyCorp Inc. \A All rights reserved";

  padding-top: 8in; /* Use padding to position the text in the page. */

  text-align: center;
}

```

```

color: blue;
}

```

If you need to add more content as blocks, use the `:after(2)`, `:after(3)` pseudo-elements:

```

*[class~="front-page/front-page"]:after(2){
  display:block;
  page: copyright-notice-page; /* Continue on the same page as the first ':after'. */
  content: "Some more styled text";
  color:red;
}

```

If you want to extract information from the document, use the `oxy_xpath()` function. For example, if the copyright info is stored in the map like this:

```

<map ...>
  <topicmeta>
    <copyright>
      <copyryear year="2018"/>
      <copyrholder>MyCorp Inc.</copyrholder>
    </copyright>
  </topicmeta>
  ...

```

then use this:

```

*[class ~=" front-page/front-page"]:after(3) {
  display: block;
  page: copyright-notice-page;
  content:
    "Year: "
    oxy_xpath('//*[contains(@class, " front-page/front-page ")]/[contains(@class, " map/topicmeta ")]/[contains(@class,
" topic/copyright ")]/[contains(@class, " topic/copyryear ")]/@year')
    "\A Holder: "
    oxy_xpath('//*[contains(@class, " front-page/front-page ")]/[contains(@class, " map/topicmeta ")]/[contains(@class,
" topic/copyright ")]/[contains(@class, " topic/copyrholder ")]/text()');
  color: green;
}

```

How to Remove the Cover Page and TOC

If you need to hide or remove the cover page, the table of contents or other structures, match the elements with a `"front-page/front-page"` and `"toc/toc"` classes in your [customization CSS \(on page 1481\)](#):

```

*[class ~= 'map/map'] > *[class ~= 'toc/toc'] {
    display:none !important;
}

*[class ~= 'map/map'] > *[class ~= 'front-page/front-page']{
    display:none !important;
}

*[class~='topic/topic'] [is-chapter] {
    -oxy-page-group : auto;
}

```

How to Add a Cover in Single-Topic Publishing

It is possible to add a cover page before the topic when publishing a single-topic PDF (without a DITA map) using the DITA PDF - based on HTML5 & CSS transformation scenario.

For example, to add a background image before the published topic, you need to create a new `@page` rule and add it in a block before the actual content of the document:

```

@page topic-cover {
    @top-left {content: none;}
    @top-right {content: none;}

    background-image: url("img/cover.svg");
    background-position: center;
    background-repeat: no-repeat;
    background-size: 100% 100%;
}

:root::before {
    page: topic-cover;
    display: block;
    content: "\2002";
    page-break-after: always;
}

```

How to Use SVG Templates for Creating Dynamic Cover Pages

It is possible to use XPath expressions inside SVG templates to insert dynamic text when creating PDF output using the DITA Map PDF - based on HTML5 & CSS scenario.

Using SVG Template as a Cover Page

A common use-case is when you want to create a custom cover page and this cover should display metadata information (i.e. the author, dates, and copyright information):

1. In the source `<bookmap>`, the various metadata elements are inserted inside the `<bookmeta>` element:

```
<bookmap id="taskbook">
  <booktitle>
    <booklibrary>Retro Tools</booklibrary>
    <mainbooktitle>Product tasks</mainbooktitle>
    <booktitlealt>Tasks and what they can do</booktitlealt>
  </booktitle>
  <bookmeta>
    <author>Howe Tudit</author>
    <critdates>
      <created date="2015-01-01"/>
      <revised modified="2016-04-03"/>
      <revised modified="2016-03-05"/>
    </critdates>
    ...
    <bookrights>
      <copyrfirst>
        <year>2004</year>
      </copyrfirst>
      <copyrlast>
        <year>2007</year>
      </copyrlast>
      <bookowner>
        <organization>Retro Tools, Inc.</organization>
      </bookowner>
    </bookrights>
  </bookmeta>
  ...

```

2. The corresponding `merged.html` file will have the following content:

```
...
<div class="- front-page/front-page front-page">
  <div class="- map/topicmeta bookmap/bookmeta topicmeta bookmeta">
    <div class="- topic/author author">Howe Tudit</div>
    <div class="- topic/critdates critdates">
      <div date="2015-01-01" class="- topic/created created"></div>
      <div modified="2016-04-03" class="- topic/revised revised"></div>
      <div modified="2016-03-05" class="- topic/revised revised"></div>
    </div>
    ...
  <div class="- topic/data bookmap/bookrights data bookrights">
    <div class="- topic/data bookmap/copyrfirst data copyrfirst">

```

```

    <div class="- topic/ph bookmap/year ph year">2004</div>
  </div>
  <div class="- topic/data bookmap/copyrlast data copyrlast">
    <div class="- topic/ph bookmap/year ph year">2007</div>
  </div>
  <div class="- topic/data bookmap/bookowner data bookowner">
    <div class="- topic/data bookmap/organization data organization">Retro Tools,
      Inc.</div>
  </div>
</div>
</div>
<div class="- front-page/front-page-title front-page-title">
  <div class="- topic/title bookmap/booktitle title booktitle">
    <span class="- topic/ph bookmap/booklibrary ph booklibrary">Retro Tools</span>
    <span class="- topic/ph bookmap/mainbooktitle ph mainbooktitle">Product
      tasks</span>
    <span class="- topic/ph bookmap/booktitlealt ph booktitlealt">Tasks and what they
      can do</span>
  </div>
</div>
</div>
...

```

3. The cover image (for example, named `cover.template.svg`) should display `<bookmeta>` node information (author, creation date, and copyright information) and the `<mainbooktitle>` will be displayed rotated.

```

<svg version="1.1" id="Layer_1" xmlns="http://www.w3.org/2000/svg"
  xmlns:xlink="http://www.w3.org/1999/xlink" x="0px" y="0px"
  viewBox="0 0 610 790" style="enable-background:new 0 0 610 790;" xml:space="preserve">
  <style type="text/css">
    .st0{fill:url(#SVGID_1_);}
    .st1{opacity:0.31;fill:#FFFFFF;enable-background:new    ;}
    .st2{fill:#FFFFFF;}
    .st3{fill:#F04C3E;}
    .st4{fill:none;stroke:#FFFFFF;stroke-width:0.3685;stroke-miterlimit:2.6131;}
    .st5{font-family:'Arial';}
    .st6{font-size:24.3422px;}
    .st7{font-size:10px;}
    .st8{font-size:63.3422px;font-weight:bold;}
    .st9{fill:#F04C3E;stroke:#000000;stroke-miterlimit:10;}
  </style>
  <linearGradient id="SVGID_1_" x1="305.6" y1="799.9393" x2="305.6" y2="8.9393"
    gradientUnits="userSpaceOnUse">

```

```

<stop offset="1.848748e-02" style="stop-color:#2F639F"/>
<stop offset="1" style="stop-color:#1C3E72"/>
</linearGradient>
<rect x="0.1" y="0.1" class="st0" width="611" height="791"/>
<path class="st1" d="M143.4,700.51381.3-381.3c35.2-35.2,35.2-92.3,
0-127.5L332.1-0.9H0.1v685.6115.8,15.8C51.1,735.7,108.2,735.7,143.4,700.5z"/>
<path class="st2" d="M1.5,617.6c29.2,22.6,71.4,20.5,98.2-6.31315.2-315.2c29.1-29.1,
29.1-76.3,0-105.4L224.8,0.5H1.5V617.6z"/>
<text transform="matrix(1 0 0 1 419.998 615.9277)" class="st2 st5 st6">
${//*[contains(@class, 'bookmap/bookmeta')]/*[contains(@class, 'topic/author')]}
</text>
<text transform="matrix(1 0 0 1 419.998 660.9277)" class="st2 st5 st6">
${//*[contains(@class, 'bookmap/bookmeta')]/*[contains(@class, 'topic/created')]/@date}
</text>
<text transform="matrix(1 0 0 1 471.998 749.9277)" class="st2 st5 st7">©
${
concat//*[contains(@class, 'bookmap/bookmeta')]/*[contains(@class, 'bookmap/bookrights')]
/*[contains(@class, 'bookmap/organization')], ' ',
/*[contains(@class, 'bookmap/bookmeta')]/*[contains(@class, 'bookmap/bookrights')]
/*[contains(@class, 'bookmap/copyrlast')]/*[contains(@class, 'bookmap/year')]
}
</text>
<text transform="matrix(0.7071 -0.7071 0.7071 0.7071 88.1369 568.6693)" class="st9 st5 st8">
${
/*[contains(@class, 'front-page/front-page-title')]
/*[contains(@class, 'bookmap/mainbooktitle')]
}
</text>
</svg>

```

Notes:

- XPath expressions are not expanded if the SVG template is open in **Author** mode.
- XPath expressions can be tested (without `${}`) using the XPath/XQuery Builder view.
- XPath *Conditional Expressions*, *For Expressions*, and *Let Expressions* are supported.

**Important:**

- If you received the SVG image from someone else (e.g. a graphics designer), make sure that the text from the image was not converted to glyph shapes and that it is rendered using the `<text>` element.
- The SVG `<text>` element does not wrap the text if it overflows the image. If you have longer text that needs to be rendered, you might consider using multiple `<text>` elements and more evolved XPath expressions (for example, using the `substring()` function) to place the text on multiple lines.

**Tip:**

You can ask a designer to fill the image with some placeholders that you can later find and replace with your XPath expressions. In the above SVG, the designer could place the text

Here comes the author, that you replace with `${//*[contains(@class, 'bookmap/bookmeta')]/*[contains(@class, 'topic/author')]}:`

```
<text transform="matrix(1 0 0 1 419.998 615.9277)" class="st2 st5 st6">
  Here comes the author
</text>
```

4. The CSS stylesheet should declare the template file as a **background-image for the cover** (on page 1523). Also the following example hides the `<mainbooktitle>` and its bookmark (it is displayed in the template):

```
@page front-page {
  background-image: url("cover.template.svg");
  background-repeat: no-repeat;
  background-size: 100% 100%;
}

*[class ~="bookmap/booktitle"] {
  display: none;
}

*[class ~="front-page/front-page-title"]
> *[class ~="bookmap/booktitle"]
> *[class ~="bookmap/mainbooktitle"] {
  bookmark-level: 0;
}
```

5. After the transformation, the final document cover will look like this:

[How to Use XPath Expressions in CSS \(on page 1487\)](#)

[SVG Templates](#)

Metadata

DITA has a solid vocabulary for specifying metadata. There are `<prolog>` elements in the topics, and `<topicmeta>`, `<bookmeta>` elements in the bookmaps. They can be used to define authors, dates, audiences, organizations, etc. See: <https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/metadata-in-maps-and-topics.html>

It is up to you to decide where this information should be presented, in the PDF content or in the PDF document properties.

Metadata - XML Fragment

In the *merged map file (on page 1483)*, the metadata section is placed inside the `<oxy:front-page>` element. This is different from the original placement in the map or bookmap (after the title), but allows for the usage of information from it in the title page.

Bookmaps

This is an example of a section taken from a merged bookmap. It only contains some of the possible metadata elements. The `bookmeta` metadata section is inherited from `topicmeta`:

```
<bookmap xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/"
  xmlns:opentopic-index="http://www.idiominc.com/opentopic/index" cascade="merge"
  class="- map/map bookmap/bookmap "
  ditaarch:DITAArchVersion="1.3" >

  <oxy:front-page xmlns:oxy="http://www.oxygenxml.com/extensions/author">

  <bookmeta xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot"
    class="- map/topicmeta bookmap/bookmeta ">

    <author class="- topic/author ">Howe Tudit</author>

    <bookid class="- topic/data bookmap/bookid ">

    <isbn class="- topic/data bookmap/isbn ">071271271X</isbn>

    <booknumber class="- topic/data bookmap/booknumber ">SG99-9999-00</booknumber>

    <maintainer class="- topic/data bookmap/maintainer ">

    <organization class="- topic/data bookmap/organization ">ACME Tools</organization>

    <person class="- topic/data bookmap/person "/>

  </maintainer>

</bookid>

<bookrights class="- topic/data bookmap/bookrights ">

  ...

  <bookowner class="- topic/data bookmap/bookowner ">

<organization class="- topic/data bookmap/organization ">ACME Tools, Inc.</organization>

  </bookowner>

</bookrights>
```

```

</bookmeta>

<oxy:front-page-title>
    ...
...

```

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```

<div
  class="- map/map bookmap/bookmap bookmap" ... >

  <div class=" front-page/front-page front-page">

    <div
      class="- map/topicmeta bookmap/bookmeta boometa">

      <div class="- topic/author author">Howe Tudit</div>

      <div class="- topic/data bookmap/bookid bookid">

        <div class="- topic/data bookmap/isbn isbn">071271271X</div>

        <div class="- topic/data bookmap/booknumber booknumber">SG99-9999-00</div>

        <div class="- topic/data bookmap/maintainer maintainer">

          <div class="- topic/data bookmap/organization organization">ACME Tools</div>

          <div class="- topic/data bookmap/person person"/>

        </div>

      </div>

      <div class="- topic/data bookmap/bookrights bookrights">

        ...

        <div class="- topic/data bookmap/bookowner bookowner">

          <div class="- topic/data bookmap/organization organization">

            ACME Tools, Inc.

          </div>

        </div>

      </div>

    </div>

  </div>

  <div class=" front-page/front-page-title front-page-title">

    ...
...

```

Maps

The maps have a more simple structure, they use the `<topicmeta>` element for metadata sections. This is also a simplified example, as there may be many more elements in the metadata section:

```

<map xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/"
      xmlns:opentopic-index="http://www.idiominc.com/opentopic/index"
      cascade="merge" class="- map/map "
      ditaarch:DITAArchVersion="1.3">
  ...

<oxy:front-page xmlns:oxy="http://www.oxygenxml.com/extensions/author">

  <topicmeta class="- map/topicmeta ">
    <author class="- topic/author ">Dan C</author>
    <metadata class="- topic/metadata ">
      <prodinfo class="- topic/prodinfo ">
        <prodname class="- topic/prodname ">oXygen PDF CSS DITA Plugin</prodname>
      </prodinfo>
    </metadata>
    <audience class="- topic/audience "/>
  </topicmeta>
  ...

```

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```

<div xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/"
      xmlns:opentopic-index="http://www.idiominc.com/opentopic/index"
      cascade="merge" class="- map/map "
      ditaarch:DITAArchVersion="1.3">
  ...

<div class=" front-page/front-page front-page">

  <div class="- map/topicmeta topicmeta">
    <div class="- topic/author author">Dan C</div>
    <div class="- topic/metadata metadata">
      <div class="- topic/prodinfo prodinfo">
        <div class="- topic/prodname prodname">oXygen PDF CSS DITA Plugin</div>
      </div>
    </div>
    <div class="- topic/audience audience"/>
  </topicmeta>
  ...

```

Metadata - Built-in CSS rules

The `[PLUGIN_DIR]/css/print/p-meta.css` file contains the rules that extract metadata.

How to Create a Searchable PDF

To make a PDF searchable, you need to add some `<keyword>` or `<indexterm>` elements inside bookmaps, maps, or topics. Most of the search engines will parse the resulting document and extract those keywords and create a search base.

Note:

Both `<keyword>` and `<indexterm>` elements can be combined inside the `<keywords>` element. They will be equally processed by the search engine.

In the generated PDF, keywords are displayed in the Document Properties.

Bookmaps

If you want your keywords to appear inside a bookmap, you need to define them inside the `<bookmeta>` element:

```
<bookmap>
...
<bookmeta>
  <keywords>
    <keyword>web server</keyword>
    <keyword>hard disk</keyword>
  </keywords>
</bookmeta>
```

Maps

If you want your keywords to appear inside a map, you need to define them inside the `<topicmeta>` element:

```
<map>
...
<topicmeta>
  <keywords>
    <keyword>flowers</keyword>
    <indexterm>care and preparation</indexterm>
    <keyword>seasons</keyword>
  </keywords>
</topicmeta>
```

Topics

If you want your keywords to appear inside one or more topics, you need to define them inside the `<prolog>` element:

```

<topic>
  ...
  <prolog>
    <metadata>
      <keywords>
        <indexterm>iris</indexterm>
      </keywords>
    </metadata>
  </prolog>

```

**Warning:**

Keywords must be at map level or at topic level, you cannot combine them.

How to Add the Publication Audience to the Custom PDF Metadata

The audience element indicates the users the publication is addressing. This can be placed inside a `<topicmeta>` element in a `<map>` as in the following example:

```

<map>
  ...
  <topicmeta>
    ...
    <audience type="programmer" job="programming" experiencelevel="expert"/>

```

To collect the `@type` attribute, add the following in your customization CSS (on page 1481):

```

*[class ~= "map/map"] > *[class ~= "map/topicmeta"] > *[class ~= "topic/audience"] {
  -oxy-pdf-meta-custom: "Audience" attr(type);
}

```

**Notice:**

It is best to use the class selector (such as `*[class ~= "map/topicmeta"]`) instead of `topicmeta` to cover cases where the elements are specialized (for instance, in a bookmap the `bookmeta` is a `topicmeta`, so your selector will also function for bookmaps, not only simple maps).

**Note:**

The selector begins with `map >` to choose the `<topicmeta>` that is a direct child of the map, not other `<topicmeta>` elements from other `<topicref>` elements.

**Tip:**

You can define multiple key value pairs by separating them with commas:

```
-oxy-pdf-meta-custom: "Audience" attr(type), "Job" attr(job)
```

The metadata is displayed in the **Custom** tab of the **Document Properties** dialog box from Acrobat Reader:

How to Show Metadata in the Cover Page

The following CSS extensions are used in the subsequent examples:

- **oxy_xpath** - Executes an XPath expression and returns string content. Use this whenever you need to extract data from an element other than the one matched by the CSS rule selector.
- **:after(N)** - Creates more than one *after* pseudo-element. The argument value represents how far the generated content is from the real content. For example, in the [second code snippet in the next section \(on page 1545\)](#), the content of the `:after` is closer to the title (upper) than the content of the `:after(2)`.

**Note:**

The `attr()` CSS function can also be used but it is limited to extracting attribute values from the matched element.

Processing Metadata for Bookmaps

Suppose you need to present the **Author** and the **ISBN** (when it exists) just under the publication title and suppose your bookmap contains:

```
<bookmap id="taskbook">
  <booktitle>
    <booklibrary>Retro Tools</booklibrary>
    <mainbooktitle>Product tasks</mainbooktitle>
    <booktitlealt>Tasks and what they can do</booktitlealt>
  </booktitle>
  <bookmeta>
    <author>Howe Tudit</author>
    <critdates>
      <created date="1/1/2015"/>
      <revised modified="3/4/2016"/>
      <revised modified="3/5/2016"/>
    </critdates>
    <bookid>
      <isbn>071271271X</isbn>
      <booknumber>SG99-9999-00</booknumber>
    ...
  </bookmeta>
</bookmap>
```

The entire `<booktitle>` element content is displayed on the first page of the PDF, so if you need to add the information after it, in your [customization CSS \(on page 1481\)](#), add the following CSS rules:

```
*[class ~= "bookmap/booktitle"]:after {
  display: block;
  content: "by " oxy_xpath('//*[contains(@class, " bookmap/bookmeta ")]//*[contains(@class, " topic/author ")]/text()');
  margin-top: 4em;
  text-align: center;
  color: gray;
}

*[class ~= "bookmap/booktitle"]:after(2) {
  display: block;
  content: oxy_xpath('if(//*[contains(@class, " bookmap/isbn ")]) then concat("ISBN ", /*[contains(@class, " bookmap/isbn ")])/text() else "");
  text-align: center;
  color: gray;
}
```

Processing Metadata for DITA Maps

Suppose you need to present the **Revision Date** just under the publication title and suppose your DITA map contains:

```
<map>
  <title>Growing Flowers</title>
  <topicmeta>
    <critdates>
      <revised modified="2021-04-26"/>
    </critdates>
  ...
```

The entire `<title>` element content is displayed on the first page of the PDF. If you need to add the information after it, add the following CSS rules in your [customization CSS \(on page 1481\)](#):

```
*[class ~= "front-page/front-page-title"] > *[class ~= "topic/title"]:after {
  display: block;
  content: "last revision " oxy_xpath('//*[contains(@class, " map/topicmeta ")] [1] \
  /*[contains(@class, " topic/revised ")]/@modified');
  margin-top: 4em;
  text-align: center;
  color: gray;
}
```

Note:

The `[1]` predicate is used to avoid duplicated results as the *topicmeta* is included in all children topics.

Generating Synthetic Pages for Metadata

Suppose you need to show this information on a page that follows the title page, instead of on the title page. In this case, you need to prepare a named page and place the content in it. Add the following rules in your [customization CSS \(on page 1481\)](#):

```
@page page-for-meta {
  background-color: yellow; /* Just to see it better*/
  @top-left-corner {
    content: ""; /* Remove the default header */
  }
  @top-right-corner {
    content: ""; /* Remove the default header */
  }
}

*[class ~= "bookmap/booktitle"]:after {
```

```

    page: page-for-meta;
}

*[class ~= "bookmap/booktitle"]:after(2) {
    page: page-for-meta;
}

```

How to Show Metadata in the Header or Footer

The header and footer are composed of page margin boxes that can be populated with static text by using *string-sets*.

If you need to add some of the map metadata to the header of the front page (for example, the **creation date**), add the following CSS rules in your [customization CSS \(on page 1481\)](#):

```

*[class ~= "front-page/front-page"] >
  *[class ~= "map/topicmeta"] >
    *[class ~= "topic/critdates"] >
      *[class ~= "topic/created"]{
        string-set: mapcreated attr(date);
      }

@page front-page {
  @top-center {
    content: "Created: " string(mapcreated);
  }
}

```

Note:

The *front-page* is the name of a page that used to present the element with the class "front-page/front-page". The above page rule is combined with the default styles.

How to Show Metadata Information (Revision History) in the Topic Prologue

This topic explains how to present metadata information that is normally hidden in the published output. For the example that follows, this will be the revision history list:

```

<task id="task_3ml_qm3_rf">
  <title>Removing the battery</title>
  <shortdesc/>
  <prolog>
    <change-historylist>
      <change-item>
        <change-revisionid>abd3</change-revisionid>
        <change-completed>Build no 1.</change-completed>

```

```

    </change-item>

    <change-item>

        <change-revisionid>bc72</change-revisionid>

        <change-completed>Build no 2.</change-completed>

    </change-item>

</change-historylist>

```

By default, the `<prolog>` element is hidden (`display:none`) and has several properties that make it collapse, even if the display property is changed.

- It has a transparent color.
- The font has size zero.
- The width and height values are zero.

Start by resetting the prolog properties, but only for prologs that contains a history list. The others will be kept hidden.

```

*[class~="topic/prolog"]:has(*[class~="relmgmt-d/change-historylist" ]){
    display:block;
    color:inherit;
    font-size:1rem;
    width:auto;
    height:auto;
}

```

Next, the following will keep the children of the prolog hidden (other than the change history):

```

*[class~="topic/prolog"]:has(*[class~="relmgmt-d/change-historylist" ]) > *:not([class~="relmgmt-d/change-historylist" ]) {
    display:none;
}

```

The `<change-item>`, `<change-revisionid>`, and `<change-completed>` (like the descendants of the `<change-historylist>`) are specializations of the `topic/data` element and are also hidden in the output, so you need to make them visible. In the following selector, you can add more classes, depending on what elements you want to be visible.

```

*[class~="relmgmt-d/change-item" ],
*[class~="relmgmt-d/change-revisionid" ],
*[class~="relmgmt-d/change-completed" ] {
    display:block;
}

```

Now some styling for the entire list:

```

*[class~="relmgmt-d/change-historylist" ] {
    font-size:1rem;
    border: 3pt solid silver;
}

```

```
padding: 0.5em;
}
*[class~="relmgmt-d/change-historylist"]:before {
    content: "Revision History:";
    font-weight:bold;
}
```

And the child elements:

```
/* Example of styling some of the descendends of the history list. */
*[class~="relmgmt-d/change-item"] {
    margin:1em;
}
*[class~="relmgmt-d/change-revisionid"]:before {
    content: "Revision ID: " !important;
    font-weight:bold;
}
*[class~="relmgmt-d/change-completed"]:before {
    content: "Completed: " !important;
    font-weight:bold;
}
```

In the output, the history list is now visible:

Removing the battery

```
Revision ID: abd3
Completed: Build no 1.

Revision ID: bc72
Completed: Build no 2.
```

How to Remove or Change the PDF Keywords

The keywords defined in the prolog sections of topics are automatically collected and set as PDF keywords. These are shown by the readers in the PDF document properties window.

If you need to remove them, you can use the following CSS snippet in your [customization CSS \(on page 1481\)](#):

```
:root {
    -oxy-pdf-meta-keywords: "";
}
```

To change them, if you have a hard-coded list, you just enumerate each of them in the property content, separating them with comma:

```
:root {
  -oxy-pdf-meta-keywords:"alpha, beta, gamma";
}
```

If you need to extract them by other criteria from the merged map, you can use the `oxy_xpath()` function instead of the hard-coded list.

How to Remove the PDF Publication Title Property

The title defined in the PDF reader is automatically collected from the map's main title.

If you want to display the map name instead of the title, you can use one of the following rules in your customization CSS (*on page 1481*):

```
/*
 * Titles (maps).
 */
*[class ~="front-page/front-page-title"] *[class ~="topic/title"]:not([class ~="bookmap/booktitle"]) {
  -oxy-pdf-meta-title: unset;
}
```

```
/*
 * Titles (bookmaps).
 */
*[class ~="front-page/front-page"] *[class ~="bookmap/booktitle"] > *[class ~="bookmap/mainbooktitle"] {
  -oxy-pdf-meta-title: unset;
}
```

How to Change the PDF Publication Title Property

The `<title>` element of a bookmap is quite complex and contains elements for the book library and an alternate title:

```
<booktitle>
  <booklibrary>Retro Tools</booklibrary>
  <mainbooktitle>Main Book Title</mainbooktitle>
  <booktitlealt>Book Title Alternative</booktitlealt>
</booktitle>
```

For the publication title, the built-in CSS uses only the content of the `<mainbooktitle>`. If you want to collect all of the text from the `<booktitle>`, you can add the following rule to your customization CSS (*on page 1481*):

```
:root {
  -oxy-pdf-meta-title: oxy_xpath('(//*[contains(@class, "bookmap/booktitlealt")][1]/text())');
```

```
-oxy-pdf-meta-description: "";
}
```

An XPath expression is used to collect all the `<booktitlealt>` elements from the merged map, select the first one, then use its text.

The built-in CSS uses the `<booktitlealt>` as the PDF description. In the example above, this property is cleared since it was moved as a title.

How to Use Data Elements from the Map to Create Custom PDF Metadata

To use a key value in the CSS, the key must be referenced from the content (either a topic or map).

If you do not have it referenced, you may force a reference by using the `<topicmeta>` or `<bookmeta>` section of your map and a `<data>` element. This has no effect on the published content, but allows the CSS rules to use its content.

```
<bookmeta>
  ...
  <data keyref="my_key" />
  ...
</bookmeta>
```

This is expanded in the merged HTML file to:

```
<div class="- map/topicmeta bookmap/bookmeta topicmeta bookmeta">
  ...
  <div keyref="my_key" class="- topic/data data">
    <div class="- topic/keyword keyword">KEY VALUE</div>
  </div>
  ...
</div>
```

Suppose that you need the expanded key value in the footer of the publication. You can define a string-set on this `data` element:

```
*[class ~=" topic/data"][keyref="my_key"] {
  string-set: key-string content(text);
}
@page {
  @bottom-left {
    content: "My key is: " string(key-string) !important;
  }
}
```

Or you can use the value from a `:before` pseudo-element, like the one for the title:

```

*[class ~= "topic/title"]:before {
  content: oxy_xpath("//*[contains(@class, 'topic/data')][@keyref = 'my_key']//text()");
}

```

Another use-case is to use the key as a source for a custom PDF document property:

```

*[class ~= "topic/data"][keyref="my_key"] {
  -oxy-pdf-meta-custom: attr(keyref) content(text);
}

```

How to Control the PDF Viewer

The PDF document may contain settings for the PDF Viewer. This helps to make the viewing experience common for all of the readers. For example, you can specify the zoom level that the document is presented, or whether the outline view should be displayed.

There are several CSS properties you can use. These properties should be set on the root element. If they are set on multiple elements, the first one will be taken into account.

Examples

- To hide the PDF Viewer toolbar and menu bar:

```

:root {
  -oxy-pdf-viewer-hide-menubar: true;
  -oxy-pdf-viewer-hide-toolbar: true;
}

```

- To make the document be displayed with a different zoom level:

```

:root {
  -oxy-pdf-viewer-zoom: 50%;
}

```

- To make the PDF Viewer just as large as the displayed document (e.g. if there is a zoom level that makes the document smaller, then the window of the viewer will be just as big as the page):

```

:root {
  -oxy-pdf-viewer-fit-window: true;
}

```

- If you need the pages to be displayed as a single continuous column (to be able to scroll in a single view port), use:

```

:root {
  -oxy-pdf-viewer-page-layout: one-column;
}

```

The supported include: `single-page`, `two-columns-left`, and [more](#).

- To make the document outline view visible, use:

```
:root {
  -oxy-pdf-viewer-page-mode: use-outlines;
}
```

The supported values include: `use-thumbs`, `use-none`. For more details, see the list of [Chemistry extension CSS properties](#).

Front Matter and Back Matter

The *front matter* is a series of topics that are usually placed after the cover page and before the TOC or the content.

The *back matter* is a series of topics that are usually placed after the content of the book.

Front Matter and Back Matter - XML Fragment

In the merged map file ([on page 1483](#)), the *frontmatter* topic references are wrapped in a `<frontmatter>` element that has the class `bookmap/frontmatter`. Then, the referenced content is marked with the attribute `@is-frontmatter="true"`:

```
<bookmap xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...>
  <oxy:front-page class="- front-page/front-page ">
    ...
  </oxy:front-page>
  <opentopic:map xmlns:ot-placeholder="http://suite-sol.com/namespaces/ot-placeholder"
    class="- toc/toc ">
    ...
    <frontmatter xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot"
      class="- map/topicref bookmap/frontmatter ">
      ...
      <topicref class="- map/topicref " href="#unique_1" type="concept">
      ...
    </frontmatter>
  </opentopic:map>
  <concept
    class="- topic/topic concept/concept "
    is-frontmatter="true"
    topicrefclass="- map/topicref bookmap/bookabstract " ...>
```

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```
<div xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...>
  <div class=" front-page/front-page front-page">
```

```

...
</div>
<div class="- toc/toc toc">
  <div class="- map/topicref bookmap/frontmatter topicref frontmatter">
    <div href="#unique_2" type="topic" class="- map/topicref topicref">
      ...
    </div>
  </div>
</div>
<article
  class="- topic/topic concept/concept topic concept nested0"
  is-frontmatter="true"
  topicrefclass="- map/topicref bookmap/bookabstract " ...>

```

**Note:**

The process also applies for the backmatter topic references inside a `<backmatter>` element with the `bookmap/backmatter` class and referenced content with the `@is-backmatter="true"` attribute both in the merged map and merged HTML files.

Front Matter and Back Matter - Built-in CSS

The built-in CSS rules are in `[PLUGIN_DIR]/css/print/p-bookmap-frontmatter-backmatter.css`. By default, it associates the top-level topics that do not represent chapters to a `matter-page` style of page layout. Each child topic starts on a new page.

Related Information:

[Page Headers and Footers \(on page 1496\)](#)

How to Remove Page Breaks Between Front Matter Child Topics

If you do not like the fact that all the topics that enter a bookmap frontmatter start on a new page, you can disable this by using the following rules in your [customization CSS \(on page 1481\)](#):

```

*[class ~="map/map"] > *[class ~="topic/topic"][is-frontmatter]{
  page-break-before: auto;
}

```

How to Style the Front Matter and Back Matter Topics

Style all the Topics with the Same Aspect

All the topics referenced from the `<frontmatter>` and `<backmatter>` bookmap elements are formatted using the `matter-page` as defined in [Default Page Definitions \(on page 1489\)](#). In the merged file, the `<backmatter>` and `<frontmatter>` elements are omitted, and their child topic content is matched using a CSS rule like the one below:

```

*[class ~= "map/map"] > *[class ~= "topic/topic"][is-backmatter],
*[class ~= "map/map"] > *[class ~= "topic/topic"][is-frontmatter]{
  page: matter-page;
  ...
}

```

Style the Topics Depending on Their Role

There might be cases when you need to distinguish between certain types of topics that have different roles in your publication:

- Preface
- Notice
- Abstract
- Copyright

These are referenced from the DITA map by specialized `<topicref>` elements, with different class attribute values.

The class attribute values are then passed by the transformation process onto the corresponding topic elements from the merged map content. For example, a topic that was referenced by a `<preface>` map element now has a "bookmap/preface" value in its `@topicrefclass` attribute:

```

<topic
  class="- topic/topic "
  id="unique_1"
  topicrefclass="- map/topicref bookmap/preface " .. >
...
</topic>

```

This can be used to match and apply various styling choices, or even a particular page layout:

```

@page preface-page {
  background-color:silver;
  @top-center{
    content: "Custom Preface Header";
  }
}

*[class ~= "topic/topic"][@topicrefclass ~= "bookmap/preface"] {
  page: preface-page;
}

```

Numbering

The topics in this section contain some technical details in case you need to fine-tune the way the numbering works.

Numbering - Built-in CSS

The built-in CSS rules are in:

- `[PLUGIN_DIR]/css/print/p-numbering-shallow.css`
- `[PLUGIN_DIR]/css/print/p-numbering-deep.css`
- `[PLUGIN_DIR]/css/print/p-numbering-deep-chapter-scope.css`
- `[PLUGIN_DIR]/css/print/p-numbering-deep-chapter-scope-no-page-reset.css`
- `[PLUGIN_DIR]/css/print/p-numbering-appendix.css`

The first CSS (shallow) contains rules that add a "Chapter NN" before the first-level topics from the publication, the second one (deep) contains rules that add a deep structure of counters on all topics referenced from the map (at any level), the third one (chapter-scope) creates a chapter scope-oriented numbering (meaning that the numbering for pages, tables, figures, and links to them are reset for each chapter), and the last one is similar to the third except that page numbers do not reset. For more details, see [Numbering Types \(on page 1560\)](#).

Numbering - Input XML Fragments

The numbering affects multiple logical parts of your publication, the table of contents, headers/footers, chapter titles, figures and tables titles:

The Table of Contents

The table of contents is a tree of `<topicref>` elements.

```
<map xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ... >
  <oxy:front-page xmlns:oxy="http://www.oxygenxml.com/extensions/author"
    class=" front-page/front-page " >
    ...
  </oxy:front-page>
  <opentopic:map xmlns:opentopic="http://www.idiominc.com/opentopic" class=" toc/toc " >
    <title class="- topic/title ">Publication Title</title>
    ...
    <topicref is-chapter="true" class="- map/topicref " ... >
      <topicmeta class="- map/topicmeta " ... >
        <navtitle href="#unique_1" class="- topic/navtitle ">Overview</navtitle>
        ...
      </topicmeta>
      <topicref class="- map/topicref " ... >
        <topicmeta class="- map/topicmeta " data-topic-id="dcp_resources">
          <navtitle href="#unique_2" class="- topic/navtitle ">Resources</navtitle>
          ...
        </topicmeta>
      </topicref>
    ...
  </map>
```

```

...
</opentopic:map>
...
</map>

```

**Note:**

The `<opentopic:map>` element contains the effective table of contents structure.

**Note:**

The TOC items are the elements with the class: `- map/topicref`.

**Note:**

The ones identified as chapters have the `@is-chapter` attribute set.

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```

<div class="- map/map map" ...>
  <div
    class=" front-page/front-page front-page">
    ...
  </div>
  <div class=" toc/toc toc">
    <div class="- topic/title title">Publication Title</title>
    <div is-chapter="true" class="- map/topicref topicref" ... >
      <div class="- map/topicmeta topicmeta" ... >
        <div href="#unique_1" class="- topic/navtitle navtitle">Overview</div>
        ...
      </div>
      <div class="- map/topicref " ...>
        <div class="- map/topicmeta " data-topic-id="dcp_resources">
          <div href="#unique_2" class="- topic/navtitle ">Resources</div>
          ...
        </div>
      </div>
    </div>
  </div>
  ...
</div>
...
</div>

```

The Header and Footers

These are based on string sets generated for the titles. The complete set of strings is defined in:

`[INSTALLATION_DIR]/css/print/p-numbering-shallow.css/[INSTALLATION_DIR]/css/print/p-numbering-deep.css` (depending on your numbering scheme - default is shallow) and used in `[INSTALLATION_DIR]/css/print/p-pages-and-headers.css`.

The CSS rules that build the string sets are matching the map title from the front page and the titles from the content.

```
<oxy:front-page xmlns:oxy="http://www.oxygenxml.com/extensions/author">
  <oxy:front-page-title>
    <title class="- topic/title ">Publication Title</title>
  </oxy:front-page-title>
</oxy:front-page>
```

For the **DITA Map PDF - based on HTML5 & CSS** transformations:

```
<div class=" front-page/front-page front-page">
  <div class=" front-page-title/front-page-title front-page-title">
    <div class="- topic/title title ">Publication Title</div>
  </div>
</div>
```

The main content is organized as follows:

```
<map xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...>
  ...
  <opentopic:map xmlns:opentopic="http://www.idiominc.com/opentopic">
    ...
  </opentopic:map>

  <topic is-chapter="true" oid="dcpp_overview">
    <title class="- topic/title ">Overview</title>
    <body class="- topic/body ">
      ...
    </body>
    <topic class="- topic/topic " id="unique_2" oid="dcpp_resources">
      <title class="- topic/title ">Resources</title>
      ...
    </topic>
    <topic class="- topic/topic " id="unique_2" oid="dcpp_parameters">
      <title class="- topic/title ">Parameters</title>
      ...
    </topic>
  </topic>
```

For the **DITA Map PDF - based on HTML5 & CSS** transformations:

```
<div class=" map/map map" ...>
  ...
  <div class=" toc/toc toc">
    ...
  </div>

  <div is-chapter="true" oid="dcpo_overview" class="- topic/topic topic">
    <div class="- topic/title title">Overview</title>
    <div class="- topic/body body">
      ...
    </div>
  </div>

  <div class="- topic/topic topic" id="unique_2" oid="dcpo_resources">
    <div class="- topic/title title">Resources</div>
    ...
  </div>

  <div class="- topic/topic topic" id="unique_2" oid="dcpo_parameters">
    <div class="- topic/title title">Parameters</div>
    ...
  </div>
</div>
```

Note:

The topic content comes after the `<opentopic:map>` element.

Note:

The child topics are the elements that have the class `- topic/topic` included in the parents.

Note:

The ones identified as chapters have the `@is-chapter` attribute set.

The Titles of Chapters

The titles from the content are children of the topics:

```
<topic class="- topic/topic " id="unique_2" oid="dcpo_parameters">
  <title class="- topic/title ">Parameters</title>
  ...
</topic>
```

For the **DITA Map PDF - based on HTML5 & CSS** transformations:

```
<div class="- topic/topic topic" id="unique_2" oid="dcpp_parameters">
  <div class="- topic/title title ">Parameters</div>
  ...
</div>
```

**Note:**

The title elements have the class: `- topic/title`. The actual element name can be different.

Numbering Types

The type of numbering that appears in your publication is controlled by the `args.css.param.numbering` parameter.

This parameter activates various sets of CSS rules from the built-in CSS. By default, only the first-level topics (the chapters) are numbered (`shallow` numbering). The following values are accepted:

Table 38. Types of Numbering

Value	Sections/ Nested Topics		Figures & Tables	Pages
	Chapters			
shallow	num-bered	no	counted from the start of the publi-cation	from the start of the publi-cation
deep	num-bered	numbered	counted from the start of the publi-cation	from the start of the publi-cation
deep-chapter-scope	num-bered	numbered	numbering is restarted at the be-ginning of each chapter, adds the chapter number in their titles (and in the links to them), and in the list of tables and list of figures sec-tions	restarted at the beginning of each chapter
deep-chap-ter-scope-no-page-reset	num-bered	numbered	numbering is restarted at the be-ginning of each chapter, adds the chapter number in their titles (and in the links to them), and in the list of tables and list of figures sec-tions	from the start of the publi-cation

Note:

When using any of the deep numbering types, no distinction is made between sections and nested topics. For example, if a topic contains two sections, followed by another nested topic, the sections will be numbered with 1 and 2, and the nested topic with 3.

Notice:

The `deep-chapter-scope` and `deep-chapter-scope-no-page-reset` values are only available for the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.

Examples

Shallow

Each chapter (or first-level topic) is numbered, but sections/nested topics are not numbered. Figures, tables, and pages are numbered sequentially from the start of the publication and they do not reset.

```

Chapter 1. First Chapter

  Page 1

    Topic

      Section

        Table 1

        Table 2

      Topic

      Section

Page 2

  Table 3

Chapter 2. Second Chapter

  Page 3

    Topic

      Table 4

      Table 5

    Topic

Page 4
    
```

It will result in the following content inside the PDF:

Chapter 1. Introduction.....	1
Chapter 2. Care and Preparation.....	2
Pruning.....	2
Garden Preparation.....	3
Chapter 3. Flowers by Season.....	4
Spring Flowers.....	4
Iris.....	4

```
Snowdrop.....6
...

List of Figures

Figure 1: Iris

List of Tables

Table 1: Flowers
```

Deep

All chapters (or first-level topics) and sections/nested topics are numbered (these are also prefixed with the chapter number). Figures, tables, and pages are numbered sequentially from the start of the publication and they do not reset.

```
1. First Chapter
  Page 1
    Topic 1.1
      Table 1
    Topic 1.2
      Table 2
  Page 2
    Table 3
2. Second Chapter
  Page 3
    Topic 2.1
      Table 4
      Table 5
    Topic 2.2
  Page 4
```

It will result in the following content inside the PDF:

```
1. Introduction.....1
2. Care and Preparation.....2
  2.1. Pruning.....2
  2.2. Garden Preparation.....3
3. Flowers by Season.....4
  3.1. Spring Flowers.....4
    3.1.1. Iris.....4
    3.1.2. Snowdrop.....6
...

List of Figures

Figure 1: Iris
```

List of Tables

Table 1: Flowers

Deep Chapter Scope

Each chapter (or first-level topic) is independent (so it can be read separately, as a separate part of your publication). The sections/nested topics, pages, figures, and table counters (and links to them) restart at each chapter. The general cross reference links also display the chapter number before the page number to clearly specify the target.

```

1. First Chapter
  Page 1.1
    Topic 1.1
      Table 1-1
      Link to page 2.2
    Topic 1.2
  Page 1.2
    Table 1-2
2. Second Chapter
  Page 2.1
    Topic 2.1
      Table 2-1
      Table 2-2
      Table 2-3
    Topic 2.2
      Table 2-4
  Page 2.2
    Link to page 1.1

```

It will result in the following content inside the PDF:

```

1. Introduction.....1
2. Care and Preparation.....1
  2.1. Pruning.....1
  2.2. Garden Preparation.....2
3. Flowers by Season.....1
  3.1. Spring Flowers.....1
    3.1.1. Iris.....1
    3.1.2. Snowdrop.....3
  ...
List of Figures
Figure 3-1: Iris

```

List of Tables

Table 2-1: Flowers

Deep Chapter Scope No Page Reset

Each chapter (or first-level topic) is independent (so it can be read separately, as a separate part of your publication). The sections/nested topics, figures, and table counters (and links to them) restart at each chapter, but the page numbers do not reset. The generic cross reference links contain only the page number.

```
1. First Chapter
  Page 1
    Topic 1.1
      Table 1-1
        Link to page 4
    Topic 1.2
  Page 2
    Table 1-2
2. Second Chapter
  Page 3
    Topic 2.1
      Table 2-1
      Table 2-2
      Table 2-3
    Topic 2.2
      Table 2-4
  Page 4
    Link to page 1
```

It will result in the following content inside the PDF:

```
1. Introduction.....1

**Tip:**

When using deep numbering, if you want to exclude sections from being numbered, see [How to Include Topic Sections in TOC \(on page 1566\)](#).

How to Reset Page Numbering at First Chapter/Part

By default, pages are numbered from the start of the publication, but in some cases, you may need to restart the page numbering at the first chapter of your publication.

**Warning:**

The following sections do not apply for `args.css.param.numbering="deep-chapter-scope"` because it already define a specific numbering scheme that resets the page number at each chapter.

Reset Page Numbering in Shallow Context

To reset the page counter at the first part/chapter when the `args.css.param.numbering="shallow"` parameter value is set, use the following rules in your [customization CSS \(on page 1481\)](#):

```
*[class ~= "map/map"] > *:not([class ~= "topic/topic"][is-chapter]) + *[class ~= "topic/topic"][is-chapter] {
  counter-reset: page 1;
}

*[class ~= "map/map"] > *:not([class ~= "topic/topic"][is-part]) + *[class ~= "topic/topic"][is-part] {
  counter-reset: page 1 chapter;
}
```

Reset Page Numbering in Deep Context

To reset the page counter at the first part/chapter when the `args.css.param.numbering="deep"` parameter value is set, use the following rules in your [customization CSS \(on page 1481\)](#):

```
*[class ~= "map/map"][numbering ^= 'deep'] > *:not([class ~= "topic/topic"][is-chapter]) + *[class
  ~= "topic/topic"][is-chapter] {
  counter-reset: page 1 section1;
}

*[class ~= "map/map"][numbering ^= 'deep'] > *:not([class ~= "topic/topic"][is-part]) + *[class ~= "topic/topic"][is-part] {
  counter-reset: page 1 chapter chapter-and-sections;
}
```

Reset Page Numbering in Deep Chapter Scope No Page Reset Context

To reset the page counter at the first part/chapter when the `args.css.param.numbering="deep-chapter-scope-no-page-reset"` parameter value is set, use the following rules in your [customization CSS \(on page 1481\)](#):

```

*[class ~= "map/map"][numbering ^= 'deep'] > *:not([class ~= "topic/topic"][is-chapter]) + *[class
  ~= "topic/topic"][is-chapter] {
  counter-reset: page 1 section1 tablecount figcount !important;
}
*[class ~= "map/map"][numbering ^= 'deep'] > *:not([class ~= "topic/topic"][is-part]) + *[class ~= "topic/topic"][is-part] {
  counter-reset: page 1 chapter chapter-and-sections section1 tablecount figcount !important;
}

```

How to Use Part, Chapter, and Subtopics Numbers in Links

This topic is applicable if you have enabled [deep numbering \(on page 1560\)](#). Suppose you have a link in the third chapter that points to a paragraph in the second subtopic of the first chapter and you need this structural information (1.2) presented to the user, just after the link text. To do this, you can use the `target-counters` CSS function to extract the entire context of the counters from the target. The `chapter-and-sections` built-in counter is already updated with both the chapter number and the nested topics:

```

*[class ~= "topic/xref"]:after {
  content: target-counters(attr(href), chapter-and-sections, ".") !important;
}

```

This counter does not include the part number, so be careful when linking between parts (consider adding the target part number explicitly):

```

*[class ~= "topic/xref"]:after {
  content: "[" target-counter(attr(href), part, upper-roman) "/" target-counters(attr(href),
  chapter-and-sections, ".") "]" !important;
  color:blue;
}

```

Related Information:

[Numbering Types \(on page 1560\)](#)

How to Include Topic Sections in TOC

To include topic sections in the table of contents, set the `args.css.param.numbering-sections` transformation parameter (on page 1456) to **yes**. In this case, they are numbered according the numbering scheme set by the `args.css.param.numbering` parameter (on page 1560).

If you want to prevent topic sections from being numbered in your output, set the value of the `args.css.param.numbering-sections` parameter to **no**.

Table of Contents

The table of contents is a hierarchy of topic titles with links to the topic content.

For plain maps, the TOC is automatically generated. For DITA bookmaps, you will need to add a `<toc>` element in the `<booklists>` element (inside the `<frontmatter>`):

```
<bookmap>
...
<frontmatter>
  <booklists>
    <toc/>
  </booklists>
</frontmatter>
...
...
```

Related Information:

[Table of Contents on a Page \(Mini TOC\) \(on page 1574\)](#)

[List of Tables/Figures \(on page 1579\)](#)

[Index \(on page 1588\)](#)

Table of Contents - XML Fragment

In the merged map file ([on page 1483](#)), the `<opentopic:map>` contains a hierarchy of `<topicref>` elements, or other elements (such as `<chapter>` or `<part>`) that are specializations of `<topicref>`.

Each of the `<topicref>` elements include a *metadata* section that includes the topic title.

```
<bookmap ...>

<oxy:front-page> ... </oxy:front-page>
<oxy:front-matter> ... </oxy:front-matter>

<opentopic:map xmlns:opentopic="http://www.idiominc.com/opentopic" class="- toc/toc ">

  <oxy:toc-title xmlns:oxy="http://www.oxygenxml.com/extensions/author" empty="true"
    class="- toc/title "/>

  <booktitle class="- topic/title bookmap/booktitle ">
    <booklibrary class="- topic/ph bookmap/booklibrary ">Retro Tools</booklibrary>
    <mainbooktitle class="- topic/ph bookmap/mainbooktitle ">Tasks</mainbooktitle>
    <booktitlealt class="- topic/ph bookmap/booktitlealt ">Product Tasks</booktitlealt>
  </booktitle>

  <chapter is-chapter="true">
```

```

class="- map/topicref bookmap/chapter " href="#unique_5" type="topic">

<topicmeta class="- map/topicmeta " data-topic-id="installing">

  <navtitle href="#unique_5" class="- topic/navtitle ">Installing</navtitle>

  ...

</topicmeta>

<topicref class="- map/topicref " href="#unique_6" type="task">

  <topicmeta class="- map/topicmeta " data-topic-id="installstorage">

    <navtitle href="#unique_6" class="- topic/navtitle ">Installing</navtitle>

    ...

  </topicmeta>

  ...

</topicref>

...

</chapter>

```

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```

<div class="- bookmap/bookmap map/map map bookmap" ...>

<div class="- front-page/front-page front-page"> ... </div>

<div class="- bookmap/frontmatter frontmatter"> ... </div>

<div class=" toc/toc toc">

<div class="toc/toc-title toc-title" empty="true"/>

<div class="- topic/title bookmap/booktitle booktitle">

  <div class="- topic/ph bookmap/booklibrary booklibrary">Retro Tools</div>

  <div class="- topic/ph bookmap/mainbooktitle mainbooktitle">Tasks</div>

  <div class="- topic/ph bookmap/booktitlealt booktitlealt">Product Tasks</div>

</div>

<div is-chapter="true"

class="- map/topicref bookmap/chapter topicref chapter " href="#unique_5" type="topic">

  <div class="- map/topicmeta topicmeta" data-topic-id="installing">

    <div href="#unique_5" class="- topic/navtitle navtitle">Installing</div>

    ...

  </div>

```

```

<div class="- map/topicref topicref chapter " href="#unique_6" type="task">
  <div class="- map/topicmeta topicmeta" data-topic-id="installstorage">
    <div href="#unique_6" class="- topic/navtitle navtitle">Installing</div>
    ...
  </div>
  ...
</div>
...
</div>

```

**Note:**

The `<oxy:toc-title>` element is used as a placeholder for the name of the TOC. For instance, you can use the string "Contents", specified on a pseudo-element, in the CSS.

Table of Contents - Built-in CSS

The built-in CSS rules are in: `[PLUGIN_DIR]/css/print/p-toc.css`.

Related Information:

[Page Headers and Footers \(on page 1496\)](#)

How to Increase TOC Depth

By default, only the first three levels of topics are displayed in the Table of Contents of the PDF output.

The CSS rule (see [Table of Contents - Built-in CSS \(on page 1569\)](#)) that hides topics on higher levels is:

```

/* Hide sections below level 3. */
*[class ~="map/topicref"][is-chapter] >
*[class ~="map/topicref"]:not([is-chapter]) >
*[class ~="map/topicref"] >
*[class ~="map/topicref"] {
  display: none;
}

```

If you want to increase the TOC depth so that topic references on level 3 or higher are visible, you can overwrite this rule in your customization CSS like this:

```

*[class ~="map/topicref"][is-chapter] >
*[class ~="map/topicref"]:not([is-chapter]) >
*[class ~="map/topicref"] >
*[class ~="map/topicref"]{
  display:block;
}

```

If the `args.css.param.numbering` parameter is set to a value other than `shallow`, you also need to add the following rules in your customization CSS:

```

*[class ~="map/map"][numbering ^= 'deep']
*[class ~="map/topicref"][is-chapter]:not([is-part]) >
*[class ~="map/topicref"] >
*[class ~="map/topicref"]
*[class ~="map/topicref"] {
    counter-increment: toc-chapter-and-sections;
}

*[class ~="map/map"][numbering ^= 'deep']
*[class ~="map/topicref"][is-chapter]:not([is-part]) >
*[class ~="map/topicref"] >
*[class ~="map/topicref"]
*[class ~="map/topicref"] >
*[class ~="map/topicref"] >
*[class ~="map/topicmeta"] + *[class ~="map/topicref"] {
    counter-reset: toc-chapter-and-sections;
}

*[class ~="map/map"][numbering ^= 'deep']
*[class ~="map/topicref"][is-chapter]:not([is-part]) >
*[class ~="map/topicref"] >
*[class ~="map/topicref"] >
*[class ~="map/topicref"] >
*[class ~="map/topicref"] >
*[class ~="map/topicref"] > *[class ~="map/topicmeta"]:before {
    content: counters(toc-chapter-and-sections, ".") ". ";
}

```

How to Style TOC Entries

Note:

Each of the items from the table of contents is an element that has the `map/topicref` class.

The following example uses the italic font for the label and changes the color and style of the connecting line between the title and the page number.

In your [customization CSS \(on page 1481\)](#), add the following two selectors:

```

/* The toc item label - the topic title */
*[class ~="map/topicref"] *[class ~="topic/navtitle"] {
    font-style:italic;
    color: navy;
}

```

```

/* The dotted line between the topic name and the page number. */
*[class ~= "map/topicref"] *[class ~= "topic/navtitle"]:after {

    content: leader('-') target-counter(attr(href), page);

    color: navy;

}

```

And if you need to alter the indent of the nested table of content items, use the following selector:

```

*[class ~= "map/topicref"] *[class ~= "map/topicref"] {

    margin-left: 1em;

}

```

The numbers can be styled like this:

```

*[class ~= "map/topicref"] > *[class ~= "map/topicmeta"]:before,
*[class ~= "map/topicref"]

    > *[class ~= "map/topicmeta"] > *[class ~= "topic/navtitle"]:before{

    color:blue;

}

```

The following is an example of customizing the font size for the items representing chapters. The chapters are level one topics and are marked in the merged DITA document TOC with the attribute `@is-chapter`.

```

*[class ~= "map/topicref"][is-chapter = "true"] > *[class ~= "map/topicmeta"] > *[class ~= "topic/navtitle"]{

    font-size:2em;

}

```

How to Change TOC Header

In the built-in CSS, there is a page named *table-of-contents*. The default is to have the word 'Contents' in its header (this is localized, using the `toc-header` string defined in the `p-18n.css`) alternating in the left or right side of the header:

```

@page table-of-contents:left {

    @top-left {

        content: string(toc-header) " | " counter(page, lower-roman);

        font-size: 8pt;

    }

}

@page table-of-contents:right {

    @top-right {

        content: string(toc-header) " | " counter(page, lower-roman);

        font-size: 8pt;

    }

}

```

If you need to change this string, or change the color, you should use the following `@page` selectors as a starting point in your [customization CSS \(on page 1481\)](#):

```
@page table-of-contents:left {
  @top-left {
    content: "My publication table of contents | " counter(page, lower-roman);
    color:red;
  }
}

@page table-of-contents:right {
  @top-right {
    content: "My publication table of contents | " counter(page, lower-roman);
    color:red;
  }
}
```

Important:

The first page from the table of contents does not have any content displayed in the header. The default CSS contains rules that disable the content. If you need to also display the numerals on the first page, use the following:

```
@page table-of-contents:first:left {
  @top-left {
    content: string(toc-header) " | " counter(page, lower-roman);
  }
}

@page table-of-contents:first:right {
  @top-right {
    content: string(toc-header) " | " counter(page, lower-roman);
  }
}
```

Related information

[Localization \(on page 1709\)](#)

How to Make the TOC Start on an Odd Page

In your [customization CSS \(on page 1481\)](#), add the following snippet for the *table-of-contents* page:

```
@page table-of-contents{
  -oxy-initial-page-number: auto-odd;
}
```

Related Information:[Double Side Pagination \(on page 1581\)](#)

How to Display a Topic Before the TOC

To display a topic before the *table-of-contents* page, follow these steps:

1. Make sure the topic is referenced on the first level in the DITA map.
2. Set the `@outputclass` to `before-toc` on the `<topicref>`.

```
<topicref href="pathToMyTopic" outputclass="before-toc">
```

Result: When the PDF is processed, the topic will automatically appear before the table of contents.

Related Information:[Controlling the Publication Content \(on page 1670\)](#)

How to Remove Entries from the TOC

To remove entries from the table of contents, set the `@toc="no"` attribute on the `topicrefs` from the map that need to be removed. This is sometimes desirable for the topics listed in the frontmatter or backmatter when using a bookmap.

How to Display Subtopics in TOC

By default, subtopics (nested `<topic>` elements) are not displayed in the Table of Contents. To be displayed, they must be referenced in the DITA map:

```
<map>
  <title>Map</title>
  <topicref href="topic.dita">
    <topicref href="topic.dita#nested1">
      <topicref href="topic.dita#nested11"/>
    </topicref>
  </topicref>
  <topicref href="topic.dita#nested2"/>
</topicref>
</map>
```

where `nestedx` is the subtopic's `@id` value.

**Note:**

By adding the subtopics in the DITA map, they will also appear in the PDF bookmarks.

How to Hide the TOC

To hide the TOC, you have multiple options:

- [Recommended] Use a DITA `<bookmap>` instead of a `<map>`, and omit the `<toc>` element from the `<booklists>`. An example bookmap can be found in the [DITA 1.3 Spec](#).
- Use the transformation parameter: **hide.frontpage.toc.index.glossary** (*on page 1462*).
- Use a `display:none` property to hide the element that contains the TOC structure, and also remove it from the PDF bookmarks tree:

```
[class ~= "map/map"] > *[class ~= "toc/toc"] {
    display:none;
}

[class ~= "map/map"] > *[class ~= "toc/toc"] > *[class ~= "toc/title"]{
    bookmark-label: none;
    -ah-bookmark-label: none;
}
```

Related Information:

[Transformation Parameters](#) (*on page 1456*)

How to Display Short Descriptions in the TOC

To display the short descriptions from the topics in the table of contents, you need to make the `<shortdesc>` element visible.

The following example only makes the short descriptions associated with the chapters visible. The chapters are level one topics and are marked in the merged DITA document TOC with the attribute `@is-chapter`.

In your [customization CSS](#) (*on page 1481*), add the following CSS selector:

```
[class ~= "map/topicref"][is-chapter = "true"] > *[class ~= "map/topicmeta"] > *[class ~= "map/shortdesc"] {
    display:block; /* The default is none - the shortdesc is hidden. */
    color:gray;
}
```

Note:

If you need all the TOC item short descriptions to be visible, remove the `[is-chapter]` condition.

Table of Contents on a Page (Mini TOC)

To add a mini table of contents for each chapter, you need to:

- Use DITA bookmarks instead of regular maps.
- Set the `args.chapter.layout` transformation parameter to either of the following values: **MINITOC** or **MINITOC-BOTTOM-LINKS**.

**Note:**

If the chapter does not have child topics, it will not have a mini TOC in the PDF output.

Layout for MINITOC

This table of contents is positioned between the chapter title and the chapter child topics. It consists of a list of links pointing to the child topics, positioned in the left side of the page, and a description in the right side. This content is collected from the topic file referenced by the chapter `<topicref>` in the map.

Chapter 1. Introduction	
Topics: About this framework. Description	<p>DITA Open Toolkit, or DITA-OT for short, is a set of Java-based, open-source tools that provide processing for content authored in the Darwin Information Typing Architecture</p> <p>The DITA Open Toolkit documentation provides information about installing, running, configuring and extending the toolkit.</p>
About this framework. The framework is DITA.	
Description The framework is composed by a large set of modules.	

Layout for MINITOC-BOTTOM-LINKS

This table of contents is positioned between the chapter title and the chapter child topics. It consists of a chapter description and list of links pointing to the child topics, under the description. This description is collected from the topic file referenced by the chapter `<topicref>` in the map.

Chapter 1. Introduction

DITA Open Toolkit, or DITA-OT for short, is a set of Java-based, open-source tools that provide processing for content authored in the Darwin Information Typing Architecture

The DITA Open Toolkit documentation provides information about installing, running, configuring and extending the toolkit.

Topics:

[About this framework.](#)

[Description](#)

About this framework.

The framework is DITA.

Description

The framework is composed by a large set of modules.

The above chapter example has the following DITA map fragment:

```
<chapter href="topics/chapter-introduction.dita">
  <topicref href="topics/introduction-about.dita" />
  <topicref href="topics/introduction-description.dita" />
</chapter>
```

The `chapter-introduction.dita` file provides the description content that is in the right side of the page.

The children `<topicref>` elements generate the mini TOC links.

Table of Contents for Chapters (Mini TOC) - XML Fragment

In the merged XML file, the mini TOC is built from a related links section and some `<div>` elements that wrap the entire mini TOC and the description area.

chapter/minitoc

Wraps the entire structure, including the content of the chapter `<topicref>`.

chapter/minitoc-links

Wraps the `<related-links>` element. Note that the label of the related links list is internationalized.

chapter/minitoc-desc

Contains the entire content of the topic file referenced by the chapter `<topicref>` element in the map.

```
<div class="- topic/div chapter/minitoc ">
  <div class="- topic/div chapter/minitoc-links ">
    <related-links class="- topic/related-links ">
      <linklist class="- topic/linklist ">
        <desc class="- topic/desc ">
          <ph class="- topic/ph chapter/minitoc-label ">Topics: </ph>
        </desc>
        <link class="- topic/link " href="#unique_2" type="topic" role="child">
          <linktext class="- topic/linktext ">About this framework.</linktext>
        </link>
        <link class="- topic/link " href="#unique_3" type="topic" role="child">
          <linktext class="- topic/linktext ">Description</linktext>
        </link>
      </linklist>
    </related-links>
  </div>
  <div class="- topic/div chapter/minitoc-desc ">
    <shortdesc class="- topic/shortdesc ">DITA Open Toolkit, or DITA-OT for
      short, is a set of Java-based, open-source tools that provide processing
      for content authored in the Darwin Information Typing
      Architecture</shortdesc>
    <body class="- topic/body ">
      <p class="- topic/p ">The DITA Open Toolkit documentation provides information about
        installing, running, configuring and extending the toolkit.</p>
    </body>
  </div>
</div>
```

When using the `pdf-css-html5` transformation, this structure is converted to a set of HTML elements, preserving the class values:

```
<div class="- topic/div chapter/minitoc div minitoc">
  <div class="- topic/div chapter/minitoc-links div minitoc-links">
    <div class="wh_related_links">
      <nav role="navigation" class="- topic/related-links related-links">
        <div class="- topic/linklist linklist linklistwithchild">
          <div class="- topic/desc desc">
            <span class="- topic/ph chapter/minitoc-label ph minitoc-label">Topics: </span>
          </div>
        </div>
      </nav>
    </div>
  </div>
```

```

<ul class="linklist">
  <li class="- topic/link link ulchildlink" href="#unique_2"
    type="topic" role="child">
    <strong>
      <a href="#unique_2">About this framework.</a>
    </strong>
    <br/>
  </li>
  <li class="- topic/link link ulchildlink" href="#unique_3"
    type="topic" role="child">
    <strong>
      <a href="#unique_3">Description</a>
    </strong>
    <br/>
  </li>
</ul>
</div>
</nav>
</div>
</div>
<div class="- topic/div chapter/minitoc-desc div minitoc-desc">
  <div class="- topic/body body">
    <p class="- topic/shortdesc shortdesc">DITA Open Toolkit, or DITA-OT for short,
      is a set of Java-based, open-source tools that provide processing for content
      authored in the Darwin Information Typing Architecture</p>
    <p class="- topic/p p">The DITA Open Toolkit documentation provides information
      about installing, running, configuring and extending the toolkit.</p>
  </div>
</div>
</div>
</div>

```

Table of Contents for Chapters (Mini TOC) - Built-in CSS

The built-in CSS rules are in: `[PLUGIN_DIR]/css/print/p-chapters-minitoc.css`.

How to Style the Table of Contents for Chapters (Mini TOC)

Suppose that you do not want the links and the chapter description to be side by side, but instead place the links above the description. Also, you may choose to remove the label above the links and put all the links in a colored rectangle with decimal numbers before them.

In your *customization CSS (on page 1481)*, add the following selectors:

```

/* Change from inline to blocks to stack them one over the other. */

*[class~="chapter/minitoc-desc"],
*[class~="chapter/minitoc-links"] {
    display: block;
    width: 100%;
}

/* No need for the 'Topics:' label. */
*[class~="chapter/minitoc-links"] *[class~="topic/desc"] {
    display:none;
}

/* Add background for the links list. */
*[class~="chapter/minitoc-links"] {
    background-color:silver;
    padding:0.5em;
}

/* Remove the border and the padding from the description. We do not need that separator. */
*[class~="chapter/minitoc-desc"] {
    border-left:none;
    padding-left:0;
}

/* Add a number before each of the links. */
*[class~="chapter/minitoc-links"] *[class~="topic/link"] {
    display:list-item;
    list-style-type:decimal;
    margin-left:1em;
}

```

Related Information:

[How to Speed up CSS Development and Debugging \(on page 1486\)](#)

List of Tables/Figures

To activate these:

1. The map must be a DITA bookmap.
2. There must be a `<figurelist>` or `<tablelist>` in the *frontmatter* or *backmatter*. In the following example, both of the lists are added just after the table of contents (the `<toc>` element is the placeholder where the table of contents will be created):

```

<frontmatter>

  <booklists>

    <toc/>

    <figurelist/>

    <tablelist/>

  </booklists>

</frontmatter>

```

How to Set a Header for a List of Tables/Figures

Suppose you want to set the headline "Figure List" on the second and subsequent pages associated to a list of figures and something similar for a list of tables.

Start by associating pages to the list of figures and tables from the merged file:

```

*[class~="placeholder/tablelist"] {
  page:tablelist;
  color:green;
}

*[class~="placeholder/figurelist"]{
  page:figurelist;
  color:green;
}

```

Note:

The "placeholder/tablelist" is the class name of the output generated from the `<tablelist>` bookmap element.

Then define the pages:

```

@page figurelist {
  @top-left { content: none; }
  @top-center { content: "Figure List"; }
  @top-right { content: none; }
}

@page figurelist:first {
  @top-left { content: none; }
  @top-center { content: none; }
  @top-right { content: none; }
}

@page tablelist {

```

```

@top-left { content: none; }

@top-center { content: "Table List"; }

@top-right { content: none; }

}

@page tablelist:first {

@top-left { content: none; }

@top-center { content: none; }

@top-right { content: none; }

}

```

How to Remove the Numbers Before a List of Tables or Figures

Suppose you need to remove the "Figure NN" prefix before each entry of a list of figures.

An entry in the generated list of figures from the merged map looks like this:

```

<entry class="- listentry/entry " href="#unique_6_Connect_42_fig_rjy_spn_xgb">

  <prefix class="- listentry/prefix ">Figure</prefix>

  <number class="- listentry/number ">4</number>

  <title class="- topic/title ">This is another figure</title>

</entry>

```

For the HTML merged map, the element names are all `<div>` elements but they have the same class.

So, to hide the label and the number, use:

```

*[class~="listentry/prefix"],
*[class~="listentry/number"] {

  display:none;

}

```

This works for both a list of tables and list of figures since the structure of each entry is the same.

To make it more specific (for example, to apply it only for the list of figures), you can add the selector:

```

*[class~="placeholder/figurelist"] *[class~="listentry/prefix"],
*[class~="placeholder/figurelist"] *[class~="listentry/number"] {

  display:none;

}

```

Double Side Pagination

By default, the processor generates pages that are mirror images (the right page has the header on the right side, the left pages have the header on the left side). The chapters follow one another with no constraint on the page side.

**Note:**

For a plain DITA map, the chapters are the `<topicref>` elements that are placed on the first level. For bookmaps, the chapters are the topics referenced by a `<chapter>` element.

This section contains information about how to position the start of the chapters on an odd folio number. Some of the CSS rules given here as examples are already listed in: [\[INSTALLATION_DIRECTORY\]/css/print/p-optional-double-side-pagination.css](#). You may choose to import this file from your customization CSS (*on page 1481*).

How to Start Chapters on Odd Pages

A common use case is to arrange the chapters of the publication to start on an odd page number.

In your customization CSS (*on page 1481*), add the following:

```
@page chapter {
  -oxy-initial-page-number: auto-odd;
}

@page table-of-contents {
  -oxy-initial-page-number: auto-odd;
}
```

Supported values for `-oxy-initial-page-number` include: **auto**, **auto-even**, **auto-odd**, or a number.

How to Style the Empty (Blank) Pages

By making the chapters start on an odd page, the CSS processor might add blank pages to the previous page sequence as padding.

To style those blank pages add the following code in your customization CSS (*on page 1481*):

```
@page chapter:blank, table-of-contents:blank {
  @top-left      { content: none; }
  @top-center    { content: none; }
  @top-right     { content: none; }
  @bottom-left   { content: none; }
  @bottom-center { content: none; }
  @bottom-right  { content: none; }
}
```

**Note:**

This just removes the headers and footers, but you can use a background image or a header with "Intentionally left blank" text.

Related Information:

[How to Add a Background Image for the Cover \(on page 1523\)](#)

How to Force an Odd or Even Number of Pages in a Chapter

Another use case is to specify a number of pages for a section. Suppose that you have a table of contents that follows the cover page and you need to have an even number of pages. Hence, the next chapter would start on an even page.

In your [customization CSS \(on page 1481\)](#), use the `-oxy-force-page-count` property with an even value:

```
@page table-of-contents {
  -oxy-force-page-count: even;
}
```

Supported values for `-oxy-force-page-count` include: **even, odd, end-on-even, end-on-odd, auto, no-force**.

How to Style the First page of a Chapter

You can use the `:first` page rule selector to control how the first page of a chapter looks. Suppose that you have defined the following layout for your default page and you want to put the publication title (the `maptitle` string) on the header of the first page (instead of the chapter name that is displayed on this page):

In your [customization CSS \(on page 1481\)](#), add the following:

```
@page chapter:first {
  @top-right-corner { content: string(maptitle); }
  @top-left { content: none; }
}
```

Multiple Column Pages

This section contains information about how to handle pages that have multiple columns.

How to Use a Two Column Layout

Change Layout for Predefined Pages

First, you need to identify which of the pages need to be changed. Pages are already defined for the cover page, table of contents, chapter content, and others. The complete list is here: [Default Page Definitions \(on page 1489\)](#).

Next, add the `column-count` and `column-gap` properties to that page. For example:

```
@page chapter{
  column-count:2;
  column-gap:1in;
}
```

If you need some of the elements to expand on all the columns, use the `column-span:all` CSS property. The next snippet makes the chapter titles span both columns:

```
*[class ~="topic/topic"][is-chapter] > *[class ~="topic/title"] {
  column-span:all;
}
```

Limitation:

You cannot use multiple column configurations on the same page. Oxygen XML Developer only takes the `column-count` and `column-gap` properties into account if they are set on `@page` rules, not on elements from the content.

Change Layout for a Specific Topic

If you need to have a different column layout for just one topic, you can use the following technique:

1. Define an `outputclass` on the topic root element.

```
<topic outputclass="two_columns" ...
```

2. Define a CSS rule that changes the `page` property for the matching element.

```
*[class ~="two_columns"],
*[outputclass ~="two_columns"]{
  page: two_column_page !important;
}
```

Tip:

In the selector, use the `class` attribute for the HTML transformation, or `outputclass` for the direct transformation, or leave them both if you are not sure.

Note:

The topics from the first level use the `chapter` page. You must use `!important` because the built-in rules are more specific and you need to override the `page` property.

3. Define a page layout.

```
@page two_column_page {
  column-count: 2;
}
```

Note that the topic will be separated from other sibling topics with different page layouts by page breaks.

Change Column Breaks for Headings

If you need to start each topic on a new column, you can use the following technique:

Suppose you have the following map:

```
<map>
  <title>Map</title>
  <topicref href="first.dita">
    <topicref href="second.dita"/>
  </topicref>
  <topichead navtitle="Topichead">
    <topicref href="second.dita"/>
  </topichead>
</map>
```

You can use the following rules to get the chapter on the new column display:

```
@page {
  column-count: 2;
}

*[class ~= "topic/topic"] *[class ~= "topic/topic"] > *[class ~= "topic/title"] {
  -oxy-column-break-before: always;
}

*[class ~= "topic/title"] + *[class ~= "topic/topic"] > *[class ~= "topic/title"] {
  -oxy-column-break-before: auto;
}
```

Each topic will be displayed on a new column except for topics that only have a title and no content.

[Page Formatting in Oxygen PDF Chemistry](#)

[Multiple Page Formatting in Oxygen PDF Chemistry](#)

Bookmarks

The PDF Bookmarks are used to generate a hierarchical structure similar to a table of contents in a specialized view of your PDF Reader.

By default, the titles defined in the topics are used as bookmark labels.

PDF Bookmarks - Built-in CSS

The PDF bookmarks are generated by matching the titles from the topics in the content. The built-in CSS rules are in: `[PLUGIN_DIR]/css/print/p-bookmarks.css`.

How to Change the Bookmark Labels using the Navigation Title

To change the bookmark labels, you can specify a navigation title in a DITA map or topic.

This will be used as the bookmark label instead of the topic title in the table of contents and the bookmark views. There are two possibilities to do specify it:

1. Place a `<navtitle>` element in the topic reference in the DITA map:

```
...
<topicref href="topics/my_topic.dita" locktitle="yes">
  <topicmeta>
    <navtitle>Introduction</navtitle>
  </topicmeta>
</topicref>
...
```

Note:

As a best practice, a `@locktitle` attribute with the value 'yes' is needed to activate the navigation title. The plugin applies the navigation title even if the attribute is missing.

2. Place a `<navtitle>` element in the topic, as a title alternative.

```
<topic id="other_topic" xml:lang="en-us">
  <title>Normal Title</title>
  <titlealts>
    <navtitle>Navigation Title</navtitle>
  </titlealts>
  <body>
  ...
```

How to Control Bookmarks Depth and Sections Display in PDF.

By default, the PDF bookmarks are generated for up to 7 levels. If you need to limit them (for example, to 2 levels), you can use the following CSS rules in your [customization CSS \(on page 1481\)](#):

```
*[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] > *[class~="topic/title"],
*[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] > *[class~="topic/title"],
*[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] >
*[class~="topic/title"],
*[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"]
*[class~="topic/topic"] > *[class~="topic/title"],
*[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"]
*[class~="topic/topic"] *[class~="topic/topic"] > *[class~="topic/title"] {
  bookmark-label:none;
}
```

These rules clear the labels generated by the titles starting with the depth of 3 (the topic nesting level is given by the selectors `*[class~="topic/topic"]`).

By default, the PDF bookmarks also include the sections. If you need to remove them, you can use the following CSS rule in your [customization CSS \(on page 1481\)](#):

```
*[class ~="topic/topic"] *[class ~="topic/section"] > *[class ~="topic/title"],
*[class ~="topic/topic"] *[class ~="topic/topic"] *[class ~="topic/section"] > *[class ~="topic/title"],
*[class ~="topic/topic"] *[class ~="topic/topic"] *[class ~="topic/topic"] *[class ~="topic/section"] > *[class
~="topic/title"],
*[class ~="topic/topic"] *[class ~="topic/topic"] *[class ~="topic/topic"] *[class ~="topic/topic"] *[class
~="topic/section"] > *[class ~="topic/title"],
*[class ~="topic/topic"] *[class ~="topic/topic"] *[class ~="topic/topic"] *[class ~="topic/topic"] *[class
~="topic/topic"] *[class ~="topic/section"] > *[class ~="topic/title"],
*[class ~="topic/topic"] *[class ~="topic/topic"] *[class ~="topic/topic"] *[class ~="topic/topic"] *[class
~="topic/topic"] *[class ~="topic/topic"] *[class ~="topic/section"] > *[class ~="topic/title" {
    bookmark-label: none;
}
```

How to Specify the Open/Closed PDF Bookmark State

If you want to specify the initial state for the bookmarks (opened/expanded or closed/collapsed), you can use the `bookmark-state` property in your [customization CSS \(on page 1481\)](#).

For example, to specify that all bookmarks for the first three levels are opened (expanded) in the initial state, use:

```
*[class~="topic/topic"] > *[class~="topic/title"],
*[class~="topic/topic"] *[class~="topic/topic"] > *[class~="topic/title"],
*[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] > *[class~="topic/title" {
    bookmark-state:open;
}
```

How to Remove the Numbering From the PDF Bookmarks

By default, the PDF bookmark labels are generated while taking the text set before the chapters titles into account. Since this usually contains the part, chapter, or section numbers, the PDF Bookmarks will make use of them.

The solution is to remove the `content(before)` from the `bookmark-label`, leaving just the `content(text)`.

In your [customization CSS \(on page 1481\)](#), add the following CSS rules:

```
*[class~="topic/topic"] > *[class~="topic/title" {
    bookmark-label: content(text);
    -ah-bookmark-label: content();
}
```

**Important:**

This is a simple example that does not use the possible navigation titles, just the content of the `<title>` element. Copy and modify the built-in CSS for the full CSS rule that matches the `<title>` and `<titlealts>` elements:

```
*[class~="topic/topic"]:has(*[class~="topic/titlealts"]) > *[class~="topic/title"] {...}
```

Related Information:

[Numbering \(on page 1555\)](#)

Index

The content of an `<indexterm>` element is used to produce an index entry in the generated index. You can nest `<indexterm>` elements to create multi-level indexes. The content is not output as part of the topic content, only as part of the index tree.

To add an index to your publication, you just need to add `<indexterm>` elements inside the `<prolog>` section (inside a `<metadata>` element):

```
<title>The topic title.</title>
<prolog>
  <metadata>
    <keywords>
      <indexterm>Installing <indexterm>Water Pump</indexterm></indexterm>
    </keywords>
  </metadata>
</prolog>
<body>
  .....
```

or in the content itself:

```
...
<p>Open the lid then turn the body pump to the right.
<indexterm>Installing <indexterm>Water Pump</indexterm></indexterm>
</p>
...
```

If you are using a bookmap, you need to specify where the index list should be presented (for instance in the *backmatter* of the book. Technically, it is possible to also add it to the *frontmatter*, but this is unusual). This is done using an `<indexlist>` element in the `<booklists>` element (inside the `<backmatter>`):

```
<bookmap>
  ...
```

```

<chapter href="tasks/troubleshooting.dita">
  ...
</chapter>
<backmatter>
  <booklists>
    <indexlist/>
  </booklists>
</backmatter>
</bookmap>

```

For plain maps, the index list is automatically added at the end of the publication, with no need to modify the map.

Index - XML Fragment

In the merged map file (*on page 1483*), the structure that holds the index tree is the `<opentopic-index:index.groups>` element.

```

<map class="- map/map " >
  <oxy:front-page>
    ...
  </oxy:front-page>
  <opentopic:map xmlns:opentopic="http://www.idiominc.com/opentopic">
    ...
  </opentopic:map>
  <topic class="- topic/topic ">
    <title class="- topic/title ">Request Support</title>
    ...
  </topic>
  <opentopic-index:index.groups id="d16e5548">
    ...
  </opentopic-index:index.groups>
</map>

```

Each of the groups contain:

- A label, the starting letter ("T" in the following example).
- A tree of `<opentopic-index:index.entry>` elements.

```

<opentopic-index:index.group>

  <opentopic-index:label>T</opentopic-index:label>

  <opentopic-index:index.entry value="table of contents">
    <opentopic-index:formatted-value>table of contents</opentopic-index:formatted-value>

```

```

<opentopic-index:refID value="table of contents:">
  <oxy:index-link xmlns:oxy="http://www.oxygenxml.com/extensions/author"
    href="#d16e3988"> [d16e3988]
  </oxy:index-link>
</opentopic-index:refID>
<opentopic-index:index.entry value="change header">
  <opentopic-index:formatted-value>change header</opentopic-index:formatted-value>
  <opentopic-index:refID value="table of contents:change header:">
    <oxy:index-link xmlns:oxy="http://www.oxygenxml.com/extensions/author"
      href="#d16e4176">
      [d16e4176] </oxy:index-link>
    </opentopic-index:refID>
  </opentopic-index:index.entry>
<opentopic-index:index.entry value="style">
  <opentopic-index:formatted-value>style</opentopic-index:formatted-value>
  <opentopic-index:refID value="table of contents:style:">
    <oxy:index-link xmlns:oxy="http://www.oxygenxml.com/extensions/author"
      href="#d16e4120">
      [d16e4120] </oxy:index-link>
    </opentopic-index:refID>
  </opentopic-index:index.entry>
</opentopic-index:index.entry>
</opentopic-index:index.group>

```

Each of the entries contain:

- The formatted value (`<opentopic-index:formatted-value>`).
- A link to the publication content (`<opentopic-index:refID>/<oxy:index-link>`).
- Possibly other child entries.

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```

<div class="- map/map map" >
  <div class="front-page/front-page">
    ...
  </div>
  <div class="toc/toc toc">
    ...
  </div>
  <div class="- topic/topic topic">
    <div class="- topic/title title">Request Support</title>
    ...
  </div>

```

```

</div>

<div class=" index/groups groups">
  ...
</div>

</map>

```

The index group content becomes:

```

<div class=" index/group group">
  <div class=" index/label label">T</div>

  <div class=" index/entry entry">
    <div class=" index/formatted-value formatted-value">table of contents</div>
    <div class=" index/refid refid">
      <div class=" index/link link"
        href="#d16e3988"> [d16e3988]
      </div>
    </div>
  </div>

  <div class=" index/entry entry">
    <div class=" index/formatted-value formatted-value">change header</div>
    <div class=" index/refid refid">
      <div class=" index/link link"
        href="#d16e4176"> [d16e4176] </div>
    </div>
  </div>

  <div class=" index/entry entry">
    <div class=" index/formatted-value formatted-value">style</div>
    <div class=" index/refid refid">
      <div class=" index/link link"
        href="#d16e4120"> [d16e4120] </div>
    </div>
  </div>
</div>
</div>
</div>

```

Index - Built-in CSS

All index styling is found in: `[PLUGIN_DIR]css/print/p-index.css`.

How to Style the Index Page Title and the Grouping Letters

In your [customization CSS \(on page 1481\)](#), add the following CSS rules:

```

*[class ~=" index/groups" ] *[class ~=" index/group" ] *[class ~=" index/label" ] {
  font-size:1.5em;
}

```

```

    color:navy;
}

*[class ~= "index/groups"]:before {
    content: "- Index - ";
    color:navy;
    font-size: 4em;
}

```

The result is:

- Index -

F
 footer 37

H
 header 37

T
 table of contents 32
 change header 35
 style 34

How to Style the Index Terms Labels

In your [customization CSS \(on page 1481\)](#), add the following CSS rule:

```

*[class ~= 'index/groups'] *[class ~= 'index/formatted-value'] {
    font-style:oblique;
    color:gray;
}

```

The result is:

Index

F

footer 37

H

header 37

T

table of contents 32

change header 35

style 34

How to Add Filling Dots Between the Index Labels and the Page Numbers

Suppose you want the leader CSS content to generate a row of dots. It is necessary that the parent entry has the text justified.

In your [customization CSS \(on page 1481\)](#), add the following CSS rule:

```
*[class~="index/formatted-value"],
*[class~="index/refid"] {
    display:inline;
}

/* Hide the sequences of links that actually do not contain links. */
*[class~="index/group"] *[class ~="index/entry"] > *[class~="index/refid"]{
    display:none;
}
*[class~="index/group"] *[class ~="index/entry"] > *[class~="index/refid"]:has(*[class~="index/link"]){
    display:inline;
}

*[class~="index/group"] *[class~="index/entry"] {
    text-align:justify;
}
*[class~="index/group"] *[class ~="index/entry"] > *[class~="index/refid"]:before{
    content:leader('.');
}
```

The output now contains the dots:

Index

F		
footer.....		37
H		
header.....		37
T		
table of contents.....		32
change header.....		35
style.....		34

How to Change the Index Page Number Format and Reset its Value

The page number is reset at the beginning of the index page by the built-in CSS rule:

```
*[class ~="index/groups"] {
    counter-reset: page 1;
}
```

If you want to start the page counter from a different initial number, just change the value of this counter. For example, to continue the normal page counting, use:

```
*[class ~="index/groups"] {
    counter-reset: none;
}
```

If you need to style the page number differently (for example, using decimals), add the following CSS rule in your [customization CSS \(on page 1481\)](#):

```
@page index {
    @bottom-center {
        content: counter(page, decimal) }
}
```

How to Impose a Table-like Index Layout

In case you need to place the index labels and links on the same line but with some extra alignment constraints, you can use inline blocks to give the index a table-like appearance:

Index

C

Close programs	8
Computer cover	7,8
configure	10, 10,10

D

database	8, 8, 8, 9, 10, 11,12
----------	-----------------------

H

hard drive	7, 7, 7, 8, 10, 11,12
------------	-----------------------

I

install	7, 8,9
---------	--------

M

maintain	11,11
hdd	
drive	11

You need to place the elements that have the following class on the same line:

index/formatted-value

This is the text of the index term.

index/refid

This element contains a list of links.

A fixed width is used for the formatted value and the links container (almost half of the available width). To achieve the index hierarchical layout, set progressive padding to the formatted value text.

In your [customization CSS \(on page 1481\)](#), add the following CSS rule:

```
*[class~="index/formatted-value"],
*[class~="index/refid"]{
    display:inline-block;
}

*[class~="index/formatted-value"]{
    width:45%;
}

*[class~="index/refid"] {
    width:45%;
}
```

```

/* Hide the sequences of links that actually do not contain links. */
*[class ~= "index/groups"] *[class ~= "index/entry"] > *[class~="index/refid"]{
    display:none;
}
*[class ~= "index/groups"] *[class ~= "index/entry"] > *[class~="index/refid"]:has(*[class~="index/link"]){
    display:inline-block;
}

/* Move the nesting of indexterms from margin to padding */
*[class ~= "index/groups"] *[class ~= "index/entry"] {
    margin-left: 0;
}
*[class ~= "index/groups"]
*[class ~= "index/entry"]
*[class~="index/formatted-value"]{
    padding-left: 0.2em;
}
*[class ~= "index/groups"]
*[class ~= "index/entry"]
*[class ~= "index/entry"]
*[class~="index/formatted-value"]{
    padding-left: 0.4em;
}
*[class ~= "index/groups"]
*[class ~= "index/entry"]
*[class ~= "index/entry"]
*[class ~= "index/entry"]
*[class~="index/formatted-value"]{
    padding-left: 0.6em;
}

/* Some styling */
*[class~="index/formatted-value"],
*[class~="index/refid"]{
    padding:0.2em;
    background-color:#EEEEEE;
}

```

To avoid bleeding of the index term label, you may need to mark it as being hyphenated:

```

*[class~="index/formatted-value"] {
    hyphens:auto;
}

```

To activate hyphenation, see: [How to Enable Hyphenation for Entire Map \(on page 1606\)](#).

Appendices

The `<appendices>` element that is available in the DITA bookmap has a special behavior (based on its sibling nodes):

1. If the bookmap contains `<part>` elements, the `<appendices>` will behave as a part.
2. If the bookmap contains `<chapter>` (and no `<part>`) elements, the `<appendices>` will behave as a chapter.

Note:

The behavior includes page-break, numbering, and title rendering.

For example, if I define a bookmap with a `<part>` element, I will obtain:

```
<part>
  <chapter/>
  <topicref/>
</chapter/>
</part>
<appendices> <!-- Appendices behaves like a Part -->
  <appendix/> <!-- Appendix behaves like a Chapter -->
  <appendix/>
</appendices>
```

For another example, if I define a bookmap with a `<chapter>` element only, I will obtain:

```
<chapter/>
  <topicref/>
</chapter/>
<appendices> <!-- Appendices behaves like a Chapter -->
  <appendix/> <!-- Appendix behaves like a TopicRef -->
  <appendix/>
</appendices>
```

Warning:

If the `<appendices>` element is not defined and the `<appendix>` is used directly instead, then it will behave like a *Part* or *Chapter* using the same pattern as for `<appendices>`.

How To Control Page Break Within Appendices

If you define a bookmap with `<appendices>` and some `<appendix>` elements, you may want the parent `<appendices>` to be on a separate page than its children. This is done automatically if the bookmap contains `<part>` elements. Otherwise, you may need to use the following in your CSS:

```
*[topicrefclass ~= "bookmap/appendix"]:first-of-type {
    page-break-before: always;
}
```

Footnotes

Footnotes are pieces of information that have several purposes, including citations, additional information (copyright, background), outside sources, and more. They are divided as follows:

- **The footnote call** - The number that remains in the content, usually superscripted.
- **The footnote marker** - The number displayed at the bottom of the page (the value matches the footnote call).
- **The footnote text** - The value of the `<fn>` element, also displayed at the bottom of the page.

Footnotes - Built-in CSS

Footnote properties are defined in `[PLUGIN_DIR]/css/print/p-foot-notes.css`.

How to Change Style of the Footnote Markers and Footnote Calls

To bold the footnotes numbers, use some colors, and change the footnote marker, add the following rules to your [customization CSS \(on page 1481\)](#):

```
*[class ~= "topic/fn"]:footnote-call {
    font-weight: bold;
    color:red;
}

*[class ~= "topic/fn"]:footnote-marker {
    content: counter(footnote) " / ";
    font-weight: bold;
    color:red;
}
```

To indent the footnote content displayed at the end of the page, add the following rules to your [customization CSS \(on page 1481\)](#):

```
*[class ~= "topic/entry"] > *[class ~= "topic/fn"] {
    padding-left: 1in;
}

*[class ~= "topic/entry"] > *[class ~= "topic/fn"]:footnote-marker {
    margin-left: 1in;
}
```

Related Information:

https://www.oxygenxml.com/doc/ug-chemistry/topics/ch_footnotes.html

How to Add a Separator Above the Footnotes

The `@footnote` part of a `@page` declaration controls the style of the separator between the page content and the footnotes. For the content, you should set a `leader`. The leader uses a letter or a line style to fill the entire width of the page.

```
@page {
  margin:0.5in;
  ...
  @footnote {
    content: leader(solid);
    color:silver;
  }
}
```

To create a dotted line, you can use the dot character: `leader('.')`. Other commonly used characters are: "-" (dash) and "_" (underscore).

How to Reset the Footnotes Counter

It is possible to reset the footnote counter. For example, if you want to reset the counter at the beginning of each chapter, add one of the following rules to your [customization CSS \(on page 1481\)](#):

```
@page chapter {
  counter-reset: footnote 1;
}

*[class ~= "bookmap/chapter"],
*[class ~= "topic/topic"][is-chapter] {
  counter-reset: footnote 1;
}
```

In a deep numbering context, you need to use the following rule instead:

```
*[class ~= "map/map"][numbering ^= 'deep'] *[class ~= "topic/topic"][is-chapter]:not([is-part]) {
  counter-reset: section1 0 footnote 1;
}
```

or can mark any element with an `@outputclass` value, match that value, and reset the counter at any point in your counter:

```
<p outputclass="reset-footnotes"/>
```

```
*[outputclass ~= "reset-footnotes"] {
    counter-reset: footnote 1;
}
```

How to Display Footnotes Below Tables

In your PDF output, you may want to group all the footnotes contained in a table just below it instead of having them displayed at the bottom of the page.

To add this functionality, use an *Oxygen Publishing Template* and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see [How to Create a Publishing Template \(on page 1476\)](#).
2. Link the folder associated with the publishing template to your current project in the **Project** view.
3. Using the **Project** view, create an `xslt` folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named `merged2mergedExtension.xsl`) with the following content:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:opentopic-func="http://www.idiominc.com/opentopic/exsl/function"
    exclude-result-prefixes="xs opentopic-func"
    version="3.0">

    <!--
        Match only top level tables (i.e tables that are not nested in other tables),
        that contains some footnotes.
    -->

    <xsl:template match="*[contains(@class, 'topic/table')]"
        [not(ancestor::*[contains(@class, 'topic/table')])]
        [//*[contains(@class, 'topic/fn')]]">
        <xsl:next-match>
            <xsl:with-param name="top-level-table" select="." tunnel="yes"/>
        </xsl:next-match>

        <!-- Create a list with all the footnotes from the current table. -->
        <ol class="- topic/ol " outputclass="table-fn-container">
            <xsl:for-each select="//*[contains(@class, 'topic/fn')]">
                <!--
                    Try to preserve the footnote ID, if available, so that the xrefs will have a target.
                -->
                <li class="- topic/li " id="{if(@id) then @id else generate-id(.)}"
                    outputclass="table-fn">
                    <xsl:copy-of select="@callout"/>
                </li>
            </xsl:for-each>
        </ol>
    </template>
</xsl:stylesheet>
```

```

        <xsl:apply-templates select="node()"/>

    </li>

</xsl:for-each>

</ol>

</xsl:template>

<!--
    The footnotes that have an ID must be ignored, they are accessible only
    through existing xrefs (already present in the merged.xml file).

    The above template already made a copy of these footnotes in the OL element
    so it is not a problem if markup is not generated for them in the cell.
-->

<xsl:template

    match="*[contains(@class, 'topic/entry')]//*[contains(@class, 'topic/fn')][@id]"/>

<!--
    The xrefs to footnotes with IDs inside table-cells. We need to recalculate
    their indexes if their referenced footnote is also in the table.
-->

<xsl:template match="*[contains(@class, 'topic/xref')][@type='fn']

    [ancestor::*[contains(@class, 'topic/entry')]]">

    <xsl:param name="top-level-table" tunnel="yes"/>

    <xsl:variable name="destination" select="opentopic-func:getDestinationId(@href)"/>

    <xsl:variable name="fn" select="

        $top-level-table//*[contains(@class, 'topic/fn')][@id = $destination]"/>

    <xsl:choose>

        <xsl:when test="$fn">

            <!-- There is a reference in the table, recalculate index. -->

            <xsl:variable name="fn-number" select="

                index-of($top-level-table//*[contains(@class, 'topic/fn')], $fn)"/>

            <xsl:copy>

                <xsl:apply-templates select="@*"/>

                <xsl:apply-templates select="$fn/@callout"/>

                <xsl:apply-templates select="node()

                    except (text(), *[contains(@class, 'hi-d/sup')])"/>

                <sup class="+ topic/ph hi-d/sup ">

                    <xsl:apply-templates select="child::*[contains(@class, 'hi-d/sup')]/@*"/>

                    <xsl:value-of select="$fn-number"/>

                </sup>

            </xsl:copy>

        </xsl:when>

```

```

<xsl:otherwise>

  <!-- There is no reference in the table, keep original index. -->

  <xsl:next-match/>

</xsl:otherwise>

</xsl:choose>

</xsl:template>

<!--

The footnotes without ID inside table-cells. They are copied in the OL element, but have

no xrefs pointing to them (because they have no ID), so xrefs are generated.

-->

<xsl:template

  match="*[contains(@class, 'topic/entry')]//*[contains(@class, 'topic/fn')][not(@id)]">

  <!-- Determine the footnote index in the document order. -->

  <xsl:param name="top-level-table" tunnel="yes"/>

  <xsl:variable name="fn-number" select="

    index-of($top-level-table//*[contains(@class, 'topic/fn')], .)"/>

  <xref type="fn" class="- topic/xref "

    href="#{generate-id(.)}" outputclass="table-fn-call">

    <xsl:copy-of select="@callout"/>

    <!-- Generate an extra <sup>, identical to what DITA-OT generates for other xrefs. -->

    <sup class="+ topic/ph hi-d/sup ">

      <xsl:value-of select="$fn-number"/>

    </sup>

  </xref>

</xsl:template>

</xsl:stylesheet>

```

5. Open the *template descriptor file* (on page 1471) associated with your *publishing template* (the *.opt* file) and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.pdf.css.xsl.merged2merged` XSLT extension point:

```

<publishing-template>

...

<pdf>

...

<xslt>

  <extension

    id="com.oxygenxml.pdf.css.xsl.merged2merged"

    file="xslt/merged2mergedExtension.xsl"/>

  </xslt>

```

6. Create a **css** folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the *glossary* structure. For example:

```

/* Customize footnote calls, inside the table. */

*[outputclass ~= 'table-fn-call'] {

    line-height: none;

}

*[class ~= "topic/table"] *[class ~= "topic/xref"][type = 'fn'][callout] *[class ~= "hi-d/sup"] {

    content: oxy_xpath("ancestor::*[contains(@class, 'topic/xref')]/@callout");

}

/* Customize the list containing all the table footnotes. */

*[outputclass ~= 'table-fn-container'] {

    border-top: 1pt solid black;

    counter-reset: table-footnote;

}

/* Customize footnotes display, below the table. */

*[outputclass ~= 'table-fn'] {

    font-size: smaller;

    counter-increment: table-footnote;

}

*[outputclass ~= 'table-fn']::marker {

    font-size: smaller;

    content: "(" counter(table-footnote) ";";

}

*[outputclass ~= 'table-fn'][callout]::marker {

    content: "(" attr(callout) ";";

}

/* Customize xrefs pointing to footnotes, inside the table. */

*[class ~= "topic/table"] *[class ~= "topic/xref"][type = 'fn'] {

    color: unset;

    text-decoration: none;

}

*[class ~= "topic/table"] *[class ~= "topic/xref"][type = 'fn']:after {

    content: none;

}

*[class ~= "topic/table"] *[class ~= "topic/xref"][type = 'fn'] *[class ~= "hi-d/sup"]:before {

    content: "(";

}

*[class ~= "topic/table"] *[class ~= "topic/xref"][type = 'fn'] *[class ~= "hi-d/sup"]:after {

```

```

content: " )";
}

```

- Open the *template descriptor file* (on page 1471) associated with your *publishing template* (the `.opt` file) and reference your custom CSS file in the `resources` element:

```

<publishing-template>
...
<pdf>
...
<resources>
  <css file="css/custom.css"/>
</resources>

```

- Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
- In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
- Click **OK** to save the changes and run the transformation scenario.

Hyphenation

Hyphenation specifies how words should be hyphenated when text wraps across multiple lines.

The transformation plugin uses the capabilities of **Oxygen PDF Chemistry** processor to perform hyphenation.

Hyphenation Dictionaries

The Oxygen XML Developer provides built-in hyphenation patterns for the following languages:

Code	Language
da	Danish
de	German
de_CH	German (Switzerland)
en	English
en-GB	English (Great Britain)
es	Spanish
fr	French
it	Italian
nb	Norwegian Bokmål
nl	Dutch
ro	Romanian

Code	Language
ru	Russian
sv	Swedish
th	Thai
pt	Portuguese
da	Danish

The built-in hyphenation pattern license terms are listed in the XML files in the `[CHEMISTRY_INSTALL_DIR]/config/hyph` folder. Most of them comply with the *LaTeX* distribution policy.

Installing New Hyphenation Dictionaries

Oxygen XML Developer uses the *TeX* hyphenation dictionaries converted to XML by the *OFFO* project: <https://sourceforge.net/projects/offo/>.

The `.xml` files allow you to access the licensing terms and you can use them as a starting point to create customized dictionaries (see [How to Alter a Hyphenation Dictionary \(on page 1605\)](#)).

The `.hyp` files are the compiled dictionaries that the Oxygen XML Developer actually uses.

One simple way to add more dictionaries:

1. Download and extract the `offo-hyphenation-compiled.zip` file. This file is a bundle of many dictionary files.
2. Copy the `fop-hyph.jar` file to the `[OXYGEN_INSTALL_DIR]/lib` directory.
3. If you just need a single dictionary, place the `.hyp` or `.xml` file in the `[OXYGEN_INSTALL_DIR]/config/hyph` directory (create that directory if it is missing).

How to Alter a Hyphenation Dictionary

You can copy the dictionaries you need to change in another directory, then use the `-hyph-dir` parameter to refer them inside your transformation.

Each file is named with the language code and has the following structure:

```
<hyphenation-info>

<hyphen-min before="2" after="3"/>

<exceptions>
o-mni-bus
...
</exceptions>
```

```

<patterns>
préémi3nent.
proémi3nent.
surémi3nent.
....
</patterns>

</hyphenation-info>

```

To change the behavior of the hyphenation, you can modify either the patterns or the exceptions sections:

exceptions

Contains the list of words that are not processed using the patterns, each on a single line. Each of the words should indicate the hyphenation points using the hyphen ("-") character. If a word does not contain this character, it will not be hyphenated.

For example, `o-mni-bus` will match the `omnibus` word and will indicate two possible hyphenation points.

Note:

Compound words (i.e. e-mail) cannot be controlled by exception words.

patterns

Contains the list of patterns, each on a single line. A pattern is a word fragment, not a word. The numbers from the patterns indicate how desirable a hyphen is at that position.

For example, `tran3s2act` indicates that the possible hyphenation points are "*tran-s-act*" and the preferable point is the first one, having the higher score of "3".

How to Enable Hyphenation for Entire Map

To enable hyphenation for your entire map:

1. Make sure you set an `@xml:lang` attribute on the root of your map, or set the `default.language` parameter in the transformation.
2. In your [customization CSS \(on page 1481\)](#), add:

```

:root {
  hyphens: auto;
}

```

3. To except certain elements from being hyphenated, use `hyphens:none`. The following example excludes the `<keyword>` elements from being hyphenated:

```
*[class ~= "topic/keyword"] {
    hyphens: none;
}
```

How to Enable/Disable Hyphenation for an Element

1. Make sure you set an `@xml:lang` attribute on the root of your map, or set the `default.language` parameter in the transformation.
2. You have two options to control hyphenation inside an XML element:

CSS Approach

Use the `hyphens` property.

For example, if you want to enable hyphenation in codeblocks:

```
*[class~="pr-d/codeblock"] {
    hyphens: auto;
}
```

If you want to disable hyphenation inside tables:

```
*[class~="topic/table"] {
    hyphens: none;
}
```

Attribute Approach

Use the `@outputclass="hyphens"` or `@outputclass="no-hyphens"` attributes/values.

For example, if you want to enable hyphenation in codeblocks:

```
<codeblock outputclass="hyphens">
    ...
</codeblock>
```

If you want to disable hyphenation inside tables:

```
<table outputclass="no-hyphens" ...>
    ...
</table>
```

Note:

The default built-in CSS enables hyphenation for tables:

```
*[class ~= "topic/table"] {
    hyphens: auto;
}
```

Related information[How to Enable Line Wrap in Code Phrases \(on page 1661\)](#)[How to Disable Hyphenation for a Word](#)

How to Define Hyphenation for a Specific Word

1. Create a new hyphenation dictionary (on page 1605).
2. Add the word under the `<exceptions>` section using hard hyphen symbols between its segments.
3. To make sure the words from your document match against the ones from the "exceptions", make sure that you add capitalized/lower case variants as well.

Related information[How to Disable Hyphenation for a Word](#)[How to Alter a Hyphenation Dictionary \(on page 1605\)](#)[How to Enable/Disable Hyphenation for an Element \(on page 1607\)](#)

How to Force or Avoid Line Breaks at Hyphens

It is possible to force or avoid line breaks inside words with hyphens (`U+2010`). This can be useful, for example, inside tables that have product references if you want the display to remain on a single line (or to split it on multiple lines). To achieve this, you can use the `-oxy-break-line-at-hyphens` property:

The accepted values are:

auto

Words are hyphenated automatically according to an algorithm that is driven by a hyphenation dictionary. This can lead to line breaks at hyphens.

avoid

Words are still hyphenated automatically except no line break will occur on hyphens.

always

Words are still hyphenated automatically except line breaks will be forced on hyphens.

Example:

Suppose you have a products table like this:

```
<table>
  <row>
    <cell>Product-1233-55-88</cell>
    <cell>120</cell>
  <row>
  <row>
    <cell>Product-1244-66-99</cell>
```

```
<cell>112</cell>

<row>

</table>
```

and the following rule in a CSS stylesheet:

```
table {
  -oxy-break-line-at-hyphens: avoid;
}
```

In the output, the list of product references will be displayed in a single line. On the contrary, setting the property value to `always`, will force a break after each hyphen.

Accessibility

By default, the PDF documents produced using this plugin are partially accessible in the sense that most of the paragraphs, tables, lists, headers, and footers are tagged automatically so a PDF reader can use this information to present the content.

Related Information:

[Oxygen PDF Chemistry: Accessibility](#)

Accessibility - Built-in CSS

Accessibility properties are defined in `[PLUGIN_DIR]css/print/p-accessibility.css`.

How to Create Fully Accessible Documents

To make your documents fully accessible (**PDF/UA1** compliant), do the following:

1. The accessibility standard requires that all the fonts be embedded in the PDF. To force font embedding, you have to specify fonts for all elements and for all page margin boxes in your [customization CSS \(on page 1481\)](#). For instance, you can use:

```
body { font-family: Arial }

*[class ~= "pr-d/codeph"], *[class ~= "pr-d/codeblock"] {
  font-family: "Courier New";
}

@page {
  @top-left {font-family: Arial }
  @top-right {font-family: Arial }
  @top-center {font-family: Arial }
  @top-left-corner {font-family: Arial }
  @top-right-corner {font-family: Arial }
```

```

@bottom-left {font-family: Arial }
@bottom-right {font-family: Arial }
@bottom-center {font-family: Arial }
@bottom-left-corner {font-family: Arial }
@bottom-right-corner {font-family: Arial }
}

```

2. Create a new transformation scenario (based on the **DITA Map PDF - based on HTML5 & CSS** or the **DITA PDF - based on HTML5 & CSS** built-in scenario).
3. In the **Parameters** tab, change the value of the `pdf.accessibility` parameter to **yes**.
4. Run the transformation scenario.

Archiving

Your PDF files may need to be archived for security or legal reasons. In this case, the generated file must be compliant to the PDF/A ISO standard.

Related Information:

[Oxygen PDF Chemistry: Archiving](#)

How to Allow Document Archiving

To make your documents archive-able (PDF/A compliant), do the following:

1. The archiving standard requires that all the fonts be embedded in the PDF. To force font embedding, you have to specify fonts for all elements and for all page margin boxes in your [customization CSS \(on page 1481\)](#). For instance, you can use:

```

body { font-family: Arial }

@page {

@top-left {font-family: Arial }
@top-right {font-family: Arial }
@top-center {font-family: Arial }
@top-left-corner {font-family: Arial }
@top-right-corner {font-family: Arial }

@bottom-left {font-family: Arial }
@bottom-right {font-family: Arial }
@bottom-center {font-family: Arial }
@bottom-left-corner {font-family: Arial }
@bottom-right-corner {font-family: Arial }

}

```

2. Create a new transformation scenario, based on the **DITA Map PDF - based on HTML5 & CSS** built-in scenario.
3. In the **Parameters** tab, select a value for the `pdf.archiving.mode` parameter from the list.
4. Run the transformation scenario.

Fonts

Fonts are an important part of the publication. Your font selection should take into consideration both design and the targeted ranges of characters.

Notes:

- Before using a font, make sure you have the permissions to use it and make sure you comply with all the license terms.
- When installing a font on Windows, make sure you select the **Install for all users** option.

To use them in the [customization CSS \(on page 1481\)](#):

- You can place the font files in the same folder as your CSS and use a `@font-face` definition to reference them.
- You can use web fonts (for example, Google Fonts), and import the CSS snippet into your CSS.
- You can use system fonts.

All these techniques are explained in: [Oxygen PDF Chemistry User Manual: Fonts](#).

How to Set Fonts in Titles and Content

Suppose that in your [customization CSS \(on page 1481\)](#), you have defined your font (for example, *Roboto*) using a Google web font:

```
https://fonts.googleapis.com/css2?family=Roboto:ital,wght@0,400;0,700;1,400;1,700&display=swap
```

You can force a font on all elements, then style the ones that need to be different. The advantage of this method is that you do not need to trace all elements that have a font family defined in the built-in CSS files, you just reset them all.

In your [customization CSS \(on page 1481\)](#), add an `!important` rule that associates a font to all the elements from the document:

```
* {
  font-family: "Roboto", sans-serif !important;
}
```

**Note:**

If you want to use the `:root` selector instead of the `*` selector, without the `!important` qualifier, the elements that have a predefined font specified in the built-in CSS will keep that font. If your content uses non-Latin glyphs, it is possible that the built-in fonts do not render them.

Next, if you want to use another font for the document headings, your [customization CSS \(on page 1481\)](#) should contain the following rule:

```
*[class ~="front-page/front-page-title"],
*[class ~="topic/title"] {
  font-family: "Roboto", sans-serif !important;
  font-weight: bold;
}
```

Then, identify the selectors for the elements that need to be styled with a different font than the one associated above. For information on how to do this, see: [Debugging the CSS \(on page 1483\)](#).

For example, if you want the titles or the pre-formatted text to have a different font from the rest, matched by the above `*` selector, you need to use more specific CSS selectors:

```
*[class~="pr-d/codeph"],
*[class~="topic/pre"] {
  font-family: monospace !important;
}
```

**Important:**

These settings do not apply to page margin boxes, only to the text inside the page. If you also want to change the font used in headers and footers, see: [How to Change the Font of the Headers and Footers \(on page 1498\)](#).

Related information

[How to Change the Font of the Headers and Footers \(on page 1498\)](#)

How to Use Fonts for Symbols

For some specific symbols (like arrows), you must use a font or a sequence of fonts that cover the needed character ranges. As an example, suppose the right arrow character is used in a definition list like this:

```
<dentry>
  <dt>&#8594;</dt>
  <dd><ph>This is the right arrow.</ph></dd>
</dentry>
```

If you are using *Roboto*, the character is not found, the # symbol is used and a warning is thrown (see also [Glyph not available in font \(on page 1714\)](#)):

```
[CH] Glyph "?" (0x2192, arrowright) not available in font "Roboto-Bold".
```

The PDF output will then look like this:

```
#
  This is the right arrow.
```

To solve this issue, you can use *Symbol* as a fallback font. In your [customization CSS \(on page 1481\)](#), add:

```
*[class ~= "topic/dlentry"] {
  font-family: "Roboto", Symbol;
}
```

To change the font for the entire publication, not just an element, you can use:

```
:root {font-family: "Roboto", Symbol !important; }

@page {
  @top-left {font-family: "Roboto", Symbol !important; }
  @top-right {font-family: "Roboto", Symbol !important; }
  @top-center {font-family: "Roboto", Symbol !important; }
  @top-left-corner {font-family: "Roboto", Symbol !important; }
  @top-right-corner {font-family: "Roboto", Symbol !important; }

  @bottom-left {font-family: "Roboto", Symbol !important; }
  @bottom-right {font-family: "Roboto", Symbol !important; }
  @bottom-center {font-family: "Roboto", Symbol !important; }
  @bottom-left-corner {font-family: "Roboto", Symbol !important; }
  @bottom-right-corner {font-family: "Roboto", Symbol !important; }
}
```

Tip:

It is possible to use a generic family name as fallback, like `serif`, `sans-serif` or `monospace`, like this you will call upon the processor default [fallback fonts system](#).

How to Use Fonts for Asian Languages

For Asian languages, you must use a font or a sequence of fonts that cover the needed character ranges. If the characters are not found, the # symbol is used.

When you specify a sequence of fonts, if the glyphs are not found in the first font, the next font is selected, and so on until one is found that includes all the glyphs. A common font sequence for Asian languages is as follows:

```
font-family: Calibri, SimSun, "Malgun Gothic", "Microsoft JhengHei";
```

To apply this font sequence, see: [How to Set Fonts in Titles and Content \(on page 1611\)](#).

Some of the Asian fonts do not have italic, bold, or bold-italic variants. In this case, you may use the regular font file with multiple font face definitions to simulate (synthesize) the missing variants. You need to use the `-oxy-simulate-style:yes` CSS property in the font face definition as explained in: [Using Simulated/Synthetic Styles in Oxygen Chemistry](#).

How to Use Asian Fonts in Linux

For Asian languages on Linux distributions, **Oxygen PDF Chemistry** automatically uses `DejaVu` and `Noto CJK` as fallback fonts for Serif, Sans-Serif, and Monospace content.

Warning:

On some distributions, the `Noto CJK` fonts are not available. In this case, you need to install them using the system package manager:

- `fonts-noto-cjk` on Debian family distributions (e.g. Ubuntu).
- `google-noto-cjk-fonts` on Red Hat family distributions (e.g. CentOS).

How to Add a New Asian Font

If you want to add a specific font for Asian languages, you need to declare it inside your [customization CSS \(on page 1481\)](#). The following example uses the `Noto Sans Tamil` font-family:

```
/* Font Declaration */
@font-face {
    font-family: "Noto Sans Tamil";
    font-style: normal;
    font-weight: 400;
    src: url(../fonts/ttf/notosanstamil/NotoSansTamil-Regular.ttf);
}

@font-face {
    font-family: "Noto Sans Tamil";
    font-style: normal;
    font-weight: 700;
    src: url(../fonts/ttf/notosanstamil/NotoSansTamil-Bold.ttf);
}

/* Font Usage */
* {
```

```
font-family: sans-serif, "Noto Sans Tamil";
}
```

How to Set Fonts for Displaying Music

Music is rendered as normal text in most fonts, but some of them will render them as musical glyphs. For example, the *MusGlyphs* font converts the text to music and adjusts it to the surrounding text.

This font is divided in two sub-fonts that act for each of the following categories:

- **MusGlyphs** - Converts all characters that match a musical pattern into music glyphs. It should be used inside the elements that contain only music.
- **MusGlyphs-Text** - Converts only the text prefixed with the @ symbol into music glyphs. The remaining text is displayed normally.

To use this font, you simply need to declare each sub-font then use them in appropriate elements:

```
@font-face {
  font-family: MusGlyphs;
  font-style: normal;
  font-weight: 400;
  src: url(../fonts/otf/musglyphs/MusGlyphs.otf);
}

@font-face {
  font-family: MusGlyphs-Text;
  font-style: normal;
  font-weight: 400;
  src: url(../fonts/otf/musglyphs/MusGlyphs-Text.otf);
}

@font-face {
  font-family: MusGlyphs-Text;
  font-style: normal;
  font-weight: bold;
  src: url(../fonts/otf/musglyphs/MusGlyphs-TextBold.otf);
}

/*
 * All the elements are displayed with the MusGlyphs-Text.
 * If a text is prefixed with @, music will be displayed.
 */

body {
  font-family: MusGlyphs-Text, serif;
}
```

```

/* Elements with @outputclass="music" contain only music. */

*[outputclass ~= "music"] {
    font-family: MusGlyphs, serif;
}

```

Comments, Highlights, and Tracked Changes

The comments and tracked changes can be made visible in the PDF output by setting the `show.changes.and.comments` transformation parameter to `yes`.

Figure 413. Chemistry Annotations in Acrobat Reader

By default, they are shown as PDF text annotations (sticky notes). These are graphical markers in the document content and are also listed in the **Comments** section when opening the output file in Acrobat Reader.

Note:

Comments with the **Mark as Done** flag selected appear with a check mark in the **Comments** section and with a **Completed** label (✓ John Doe Completed).

To avoid rendering the elements as PDF annotations and show them as footnotes instead, you can use the `show.changes.and.comments.as.pdf.sticky.notes` transformation parameter set to `no`.

The comments and changes are included in the [merged map file \(on page 1483\)](#) either as XML elements (`<oxy-insert>`, `<oxy-delete>`, `<oxy-comment>`, `<oxy-attributes>`) in the case of the XML merged map, or as HTML elements with similar classes (`oxy-insert`, `oxy-delete`, `oxy-comment`, `oxy-attributes`) in the case of the HTML merged map. Sub-elements contain meta-information about each change.

Tip:

These elements are automatically recognized and transformed in PDF annotations when using Chemistry as PDF processor.

**Note:**

The inserted text, deleted text, and deleted markup are included in the sticky notes, you can change this behavior by using the `show.changed.text.in.pdf.sticky.notes.content` parameter (on page 1464).

Related Information:

[Transformation Parameters \(on page 1456\)](#)

[Debugging the CSS \(on page 1483\)](#)

Comments and Tracked Changes - Built-in CSS

The built-in CSS that controls the way tracked changes and comments are displayed is found in:

`[PLUGIN_DIR]css/print/p-side-notes.css`.

Comments and Tracked Changes - HTML Fragment

This section contains information about how each type of tracked change is structured in the [merged map HTML file \(on page 1483\)](#).

Insertions

For an insertion type of tracked change, the structure that defines the insertion details is inside a *range* (`oxy-range-start` to `oxy-range-end`), the inserted text is highlighted by a `` element with the class `oxy-insert-hl`, and the details are stored in a `` element with the `oxy-insert` class.

```
<span class="oxy-range-start" id="sc_1" hr_id="1" />

<span class="oxy-insert" href="#sc_1" hr_id="1">
  <span class="oxy-author">dan</span>
  <span class="oxy-content">insert</span>
  <span class="oxy-date">2018/03/15</span>
  <span class="oxy-hour">09:38:29</span>
  <span class="oxy-tz">+02:00</span>
</span>

<span class="oxy-insert-hl">This is an insert!!</span>

<span class="oxy-range-end" hr_id="1" />
```

Comments

Similar to insertions, comments are defined in a *range* (`oxy-range-start` to `oxy-range-end`), the comment details in an element with the class `oxy-comment`, and the highlighted content is wrapped in the `oxy-comment-hl` element.

```

<span class="oxy-range-start" id="sc_1" hr_id="1"/>

<span class="oxy-comment" href="#sc_1" hr_id="1">
  <span class="oxy-author">dan</span>
  <span class="oxy-comment-text">This is a comment.</span>
  <span class="oxy-date">2018/03/15</span>
  <span class="oxy-hour">09:56:59</span>
  <span class="oxy-tz">+02:00</span>
</span>

<span class="oxy-comment-h1">The commented text.</span>

<span class="oxy-range-end" hr_id="1"/>

```

**Note:**

Comments that are marked as done have a `flag="done"` attribute:

```
<span class="oxy-comment" href="#sc_6" hr_id="6" flag="done">
```

Attribute changes

The attribute changes are more complex. The range is empty, and is directly above the affected element (the one that has modified attributes). The element with the class `oxy-attributes` contains details about multiple attribute changes, each stored in an element with the class `oxy-attribute-change`.

```

<element>

<span class="oxy-range-start" id="sc_3" hr_id="3"/>
<span class="oxy-range-end" hr_id="3"/>

<span class="oxy-attributes" href="#sc_3" hr_id="3">

  <span class="oxy-attribute-change" type="inserted" name="platform">
    <span class="oxy-author">dan</span>
    <span class="oxy-current-value">windows</span>
    <span class="oxy-date">2018/03/15</span>
    <span class="oxy-hour">10:05:04</span>
    <span class="oxy-tz">+02:00</span>
  </span>
  ....
  <span class="oxy-attribute-change" type="removed" name="audience">
    ....
  </span>

```

```

</span>
...
</element>

```

Deletions

For a deletion, there are some elements that define the start and end of the deletion, and the highlighted text is wrapped in an element with the class `oxy-delete-hl`.

```

<span class="oxy-range-start" id="sc_2" hr_id="2"/>
<span class="oxy-delete-hl"> This is a deleted text. </span>
<span class="oxy-range-end" hr_id="2"/>

```

There is a structure that offers details about the deletion change, using the element with the class `oxy-delete`. This is linked to the above deletion range by the same ID value:

```

<span class="oxy-delete" href="#sc_2" hr_id="2">
  <span class="oxy-author">dan</span>
  <span class="oxy-content"><img href="../img/ex.gif"></span>
  <span class="oxy-date">2018/03/14</span>
  <span class="oxy-hour">11:38:06</span>
  <span class="oxy-tz">+02:00</span>
</span>

```

Colored Highlights

To show some text as highlighted with a background color:

```

<span class="oxy-color-hl" color="rgba(140,255,140,50)">Some colored text.</span>

```

How to Style Tracked Changes or Comments

Here are some examples showing how to customize tracked changes and highlighted text:

- If you want to change the highlighted text color from the document content, use the `@class="oxy-comment-hl"` attribute (or `@class="oxy-delete-hl"`, `@class="oxy-insert-hl"`):

```

.oxy-comment-hl {
  color:magenta;
}

```

- If you want to change the range labels indicating the start or the end of a change (by default, formatted like this: "[n]...[/n]" where n is the change number), you can use the following selectors:

```

.oxy-range-start:before {
  content: '[START]';
  color:red;
}
.oxy-range-end:before {

```

```

content: '[END]';

color: red;
}

```

- If you want to only show the changes and comments highlights

```

.oxy-range-start,
.oxy-range-end {
    display: none;
}

.oxy-insert,
.oxy-delete {
    display: none;
}

```

**Note:**

No comments will be displayed in the PDF Viewer Comments view after this modification.

How to Style Tracked Changes Shown as Footnotes

**Important:**

This topic is relevant if you have set the `show.changes.and.comments.as.pdf.sticky.notes` transformation parameter to `no`, and therefore the changes are shown as footnotes instead of PDF annotations.

Here are some examples showing how to customize footnotes:

- If you want to change the background color and the border of the comment footnote, add the following snippet in your [customization CSS \(on page 1481\)](#):

```

.oxy-comment {
    background-color: inherit;
    border: 2pt solid yellow;
}

```

Similarly, you can style the other footnotes for `@class="oxy-attributes"`, `@class="oxy-delete"`, and `@class="oxy-insert"`.

- If you want to hide some footnotes (for example, the footnotes associated with the insertions, deletions, or attribute changes when your document contains a lot of tracked changes), add something like this in your [customization CSS \(on page 1481\)](#) (the following example results in the deletions and insertions being hidden, but the comments remain visible):

```

.oxy-attributes,
.oxy-delete,
.oxy-insert{

```

```
float:none;

display:none;

}
```

How to Show Only Change Bars on Tracked Changes

It is possible to only display the change bars for tracked changes (inserted or deleted content) in the PDF document while hiding the other styling for the tracked changes. This is helpful if you want to see the document in a final version while still seeing change bars where content was inserted or deleted.

To achieve this, follow these steps:

1. Set the **show.changes.and.comments** parameter to `yes` and the **show.changes.and.comments.as.pdf.sticky.notes** parameter to `no`.

Step Result: The first parameter causes tracked changes to be visible in your document and styled (e.g. insertions are blue and underlined, while deletions are red with a strike-through). Changing the second parameter to `no` causes the tracked changes to be displayed as a footnote instead of a PDF annotation.

2. Hide the footnotes by adding the following in your [customization CSS \(on page 1481\)](#):

```
.oxy-attributes,
.oxy-comment,
.oxy-delete,
.oxy-insert {

float: initial;

display: none;

}
```

3. Remove the change range markers (the { and } symbols):

```
.oxy-range-start:before,
.oxy-range-end:before {

content:none;

}
```

4. Remove the styling for the insertions and deletions:

```
.oxy-insert-hl{

color:unset;

text-decoration:none;

}

.oxy-delete-hl {

content: "\200b";

text-decoration:none;

}

.oxy-comment-hl{

background-color:unset;
```

```

}

.oxy-color-hl[color]{
  background-color:unset;
}

```

5. **[Optional]** You can improve the visibility of the change bars with this construct:

```

.oxy-range-start[is-changebar]:before(100) {
  -oxy-changebar-color: red;
  -oxy-changebar-width: 3pt;
}

```

Draft Watermarks

A *watermark* is an image displayed as the background of a printed document and it is faded enough to keep the publication text readable. *Draft watermarks* are used to indicate that a document is under construction or has not yet been approved.

How to Add a Draft Watermark on All Pages

To add a draft watermark to all of your publication pages, you can use the following page selector in your [customization CSS \(on page 1481\)](#):

```

@page {
  background-image: url("draft.svg");
  background-position:center;
  background-repeat:no-repeat;
  background-size: 100% 100%;
}

```

If you have already set a background image for other pages (for example, the `front-page` or `table-of-contents`), the above selector won't change them, as they are more specific.

The best practice is to use a different `draft.css` CSS file that imports the customization CSS where the rest of the style changes reside. If you need to publish the content as a draft, use the `draft.css` in your transformation scenario, otherwise directly reference the [customization CSS \(on page 1481\)](#).

Related Information:

[Images and Figures \(on page 1636\)](#)

How to Add a Draft Watermark in the Foreground

If you want the watermark to be displayed above the text (in the foreground), instead of using the standard `background-image` property, you can use the `-oxy-foreground-image` property:

```
@page {
  -oxy-foreground-image: url("draft.svg");
}
```

You can set a more specific selector if you just need to display the foreground in a subset group of pages (for example, `chapter`). In this case, the above selector will not change it since it is more specific.

Note:

The usage of SVG images is preferred because other image types suffer from *pixelation* and because foreground images are stretched to the full page size.

How to Add a Draft Watermark Depending on Metadata

Suppose you want to apply a *Draft watermark* until your DITA bookmap is approved and the map is approved when an `<approved>` element has been added to the metadata section (for example, in the **bookmeta/bookchangehistory** element).

```
<bookmeta>
  <author>John</author>
  <critdates>
    <created date="1/1/2015"/>
    <revised modified="3/4/2016"/>
    <revised modified="3/5/2016"/>
  </critdates>
  <bookchangehistory>
    <approved/>
  </bookchangehistory>
  ...
```

Use `oxy_xpath` every time you need to probe the value from an element other than the one matched by the CSS selector, and test the expression on the merged HTML file using the **Oxygen XPath Builder** view.

You can either use a page selector that imposes the draft watermark on the entire page surface (recommended):

```
@page {
  background-image: url(oxy_xpath("if(//*[contains(@class, 'bookmap/approved')]) then '' else 'draft-watermark.png'"));
  background-position: center;
  background-repeat: no-repeat;
}
```

or use an element selector that restricts the watermark image only to the page area covered by that element:

```

:root, body{
  ... /* same as properties above */
}

```

**Note:**

You can use another element selector to target a specific part of your publication (for example, marking only the tables as drafts).

[How to Debug XPath Expressions \(on page 1488\)](#)

Flagging Content

In DITA, you can mark certain content to flag it or draw attention to it. This is done by defining a flag in a DITAVAL file.

You can attach the DITAVAL file to the DITA map using the `<ditavalref>` element in the map, or by specifying it in the `args.filter` transformation parameter.

In the following example, all the elements that have the attribute `@product` set to `YourProd` is flagged to have a purple background:

```

<val>
...
  <prop action="flag" att="product" val="YourProd" bgcolor="purple"/>
...
</val>

```

Related Information:

[Change Bars](#)

[DITAVAL Elements](#)

How to Flag Content Using Change Bars

As an example, to add a *change bar* (revision mark) for particular content, you can use the following in the DITAVAL file:

```

<val>
  <revprop action="flag"
    changebar="color:blue;style:solid;width:2pt;offset:1.25mm;placement:start" val="new"/>
</val>

```

This would result in any content that is marked with `@rev="new"` having a blue change bar.

How to Flag Content Using Images

You can mark the elements that match a specific profiling condition using images (one for the start, one for the end). The image references are relative to the DITAVAL file.

```
<val>
  <prop action="flag"
        att="product" val="MyProd"
        bgcolor="blue"
        color="yellow" >

    <startflag imageref="startflag.jpg">

      <alt-text>This is the start of my product info</alt-text>

    </startflag>

    <endflag imageref="endflag.jpg">

      <alt-text>This is the end of my product info</alt-text>

    </endflag>
  </prop>
</val>
```

Styling the Content

If you need to change the styles of the elements from the topic contents, you should create a [customization CSS \(on page 1481\)](#) and then add CSS rules. To create the CSS rules, you can use the development tools described in [Debugging the CSS \(on page 1483\)](#).

Reusing the Styling for WebHelp and PDF Output

If you are using the `pdf-css-html5` transformation type, then the generated HTML5 document that is later converted to PDF is very similar to the generated HTML5 pages from the WebHelp Responsive output.

This is an output example from the WebHelp transformation:

```
<h1 class="title topictitle1" id="ariaid-title2">Care and Preparation</h1>
<div class="body">
  <p class="shortdesc">When caring ...</p>
  <p class="p">When caring for your flower garden you want ... </p>
```

And the same example from the PDF transformation (note the additional emphasized class values):

```
<h1 class="- topic/title title topictitle1" id="ariaid-title2">Care andPreparation</h1>
<div class="- topic/body body">
  <p class="- topic/shortdesc shortdesc">When caring ... </p>
  <p class="- topic/p p">When caring for your flower garden you want ... </p>
```

It makes sense to reuse the same CSS rules you developed for one transformation type to the other. The main rule is to use the short class names instead of the long ones. For example, to style the short descriptions with italic font, use:

```
.shortdesc {
  font-style: italic;
}
```

The rule of thumb is that if you have a CSS rule that successfully styles an element in WebHelp, it should apply without any modification in the PDF output.

Titles

Titles in PDF can be classified into two categories:

- Table of contents titles, identified by the `map/topicref` and `topic/navtitle` class attributes.
- Content titles, that can be styled by matching the `topic/title` class attribute.

How to Control Titles Layout

By default, titles are rendered on a single line (with both the chapter/section number and title text). If the title is too long, the text wraps to the next line without any indentation.

```
4.5.5 This is a long title
text that wraps.
```

If you want each line of the title to start at the same location (and indented), you need to set the value of the `args.css.param.title.layout` transformation parameter to **table**. This means that the chapter/section number is placed in one cell and title text is placed in another cell (resulting and indented text):

```
4.5.5 This is a long title
    text that wraps.
```

How to Change Chapters Title Prefix

Changing Prefixes in Shallow Numbering

In shallow numbering (default), to replace the "Chapter N." prefix, use the following rules in your [customization CSS \(on page 1481\)](#):

```
*[class ~= "map/topicref"][is-chapter]:not([is-part]) > *[class ~= "map/topicmeta"] > *[class ~= "topic/navtitle"]:before{
  content: "Module " counter(toc-chapter, decimal-leading-zero) " - ";
}

*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/title"]:before {
  content: "Module " counter(chapter, decimal-leading-zero) "\A";
}
```

Changing Prefixes in Deep Numbering

In deep numbering, to replace the "N." prefix, use the following rules in your [customization CSS \(on page 1481\)](#):

```
*[class ~= "map/map"][numbering ^= 'deep'] *[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class
  ~= "topic/title"]:before,
*[class ~= "map/map"][numbering ^= 'deep'] *[class ~= "topic/topic"][is-chapter]:not([is-part]) *[class ~= "topic/topic"] >
*[class ~= "topic/title"]:before {
  content: counters(chapter-and-sections, ".") "\A";
}
```

How to Remove Parts and Chapter Title Prefixes

Removing Prefixes in Shallow Numbering

In shallow numbering (default), to hide the "Part N" and "Chapter NN" prefixes, use the following rules in your [customization CSS \(on page 1481\)](#):

```
*[class ~= "map/topicref"] > *[class ~= "map/topicmeta"] > *[class ~= "topic/navtitle"]:before {
  display: none !important;
}
*[class ~= "topic/topic"] > *[class ~= "topic/title"]:before {
  display: none !important;
}
```

You can also choose to remove only the "Part N" prefix:

```
*[class ~= "map/topicref"][is-part] > *[class ~= "map/topicmeta"] > *[class ~= "topic/navtitle"]:before {
  display: none !important;
}
*[class ~= "topic/topic"][is-part] > *[class ~= "topic/title"]:before {
  display: none !important;
}
```

Or to remove only the "Chapter NN" prefix:

```
*[class ~= "map/topicref"][is-chapter]:not([is-part]) > *[class ~= "map/topicmeta"] > *[class ~= "topic/navtitle"]:before {
  display: none !important;
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/title"]:before {
  display: none !important;
}
```

Removing Prefixes in Deep Numbering

In deep numbering, to hide the "Part N" and "Chapter NN" prefixes, use the following rules in your customization CSS (*on page 1481*):

```
*[class ~= "map/map"][numbering ^= 'deep'] *[class ~= "map/topicref"] > *[class ~= "map/topicmeta"]:before {
    display: none !important;
}

*[class ~= "topic/topic"] > *[class ~= "topic/title"]:before {
    display: none !important;
}
```

How to Display Chapters Title on a Separate Page

You may want to display the chapters title on a separate page (for example, with a background). To do this, a new page should be defined in your customization CSS (*on page 1481*):

```
@page chapter-title-page {
    background-image: url("resources/title-bg.png");
    background-repeat: no-repeat;
    background-size: 100% 100%;
    background-position: center;
}
```

After that, you need to replace the default "chapter" page definition with the one created before:

```
*[class ~= "topic/topic"][is-chapter] {
    page: chapter-title-page;
}
```

Then, you need to set it back on the content following the title:

```
*[class ~= "topic/topic"][is-chapter] > *[class ~= "topic/title"] ~ *:not([class ~= "topic/title"]) {
    page: chapter;
}
```

Finally, you can customize the title color, size, and more:

```
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/title"] {
    color: white;
    font-size: 32pt;
}
```

Related information

[Default Chapter Page Definition \(*on page 1491*\)](#)

Equations

This processor supports MathML equations.

How to Change the Font of MathML Equations

Suppose that you need to change the font of MathML equations from the documentation, and also add some padding. The MathML fragments are wrapped in elements that have the class `equation-d/equation-block` or `equation-d/equation-inline`, so you can match them with:

```
*[class ~="equation-d/equation-block"],
*[class ~="equation-d/equation-inline"]{
  font-family:"courier new";
  font-size:1.5em;
  padding:1em;
}
```

Note:

An equation can be rendered using multiple classes of fonts (e.g. the *serif*, *sans serif*, *monospace*, *fraktur*, and *doublestruck* classes). Depending on each of the equation symbols, a class is selected for it. The font specified in the CSS rule (as in the preceding example), applies only to the *serif* class. However, if a symbol codepoint is not covered by the currently selected class fonts, it falls back to the font specified in the CSS.

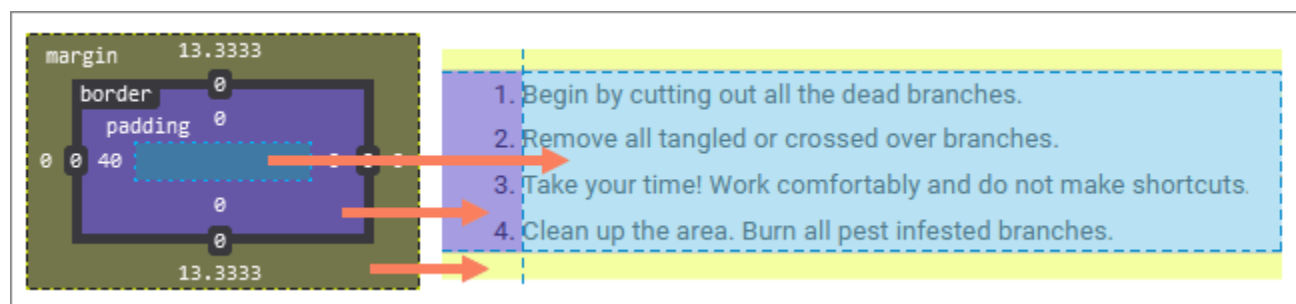

Attention:

Some of the fonts may not be supported. In that case, a default *serif* font is used.

Lists

This is the default layout for lists (both ordered and unordered lists - values are in **px**):

Markers are displayed in the padding area, so they are not included in the principal block box.

The lists are treated differently than ordinary block elements in the sense that their margins are not collapsed with the margins of the neighboring blocks or lists. This is also visible for nested lists. To summarize:

- Setting the `padding-left` or `margin-left` properties on lists will move the whole list.
- Setting the `margin-left` property on list items will move the whole list.
- Setting the `padding-left` property on list items will only move the list item content (not the marker).

**Note:**

If the `padding-left` property is set on lists and the `margin-left` property is set on list items, the result will move the whole list with a combination of both padding and margin values.

How to Style Lists

Some common use-cases for styling lists require you to change each list level separately. For example, for an ordered list:

```

*[class ~= "topic/ol"] > *[class ~= "topic/li"] /* First Level */ {
    font-size: 15pt;
}
*[class ~= "topic/ol"] *[class ~= "topic/ol"] > *[class ~= "topic/li"] /* Second Level */ {
    font-size: 13pt;
}
*[class ~= "topic/ol"] *[class ~= "topic/ol"] *[class ~= "topic/ol"] > *[class ~= "topic/li"] /* Third Level */ {
    font-size: 11pt;
}
/* Etc. */

```

Similarly, for an unordered list:

```

*[class ~= "topic/ul"] > *[class ~= "topic/li"]::marker /* First Level */ {
    color: red;
    content: "\2022";
}
*[class ~= "topic/ul"] *[class ~= "topic/ul"] > *[class ~= "topic/li"]::marker /* Second Level */ {
    color: orange;
    content: "\2022";
}
*[class ~= "topic/ul"] *[class ~= "topic/ul"] *[class ~= "topic/ul"] > *[class ~= "topic/li"]::marker /* Third Level */ {
    color: green;
    content: "\2022";
}
/* Etc. */

```

**Note:**

It is possible to mix lists type simply by mixing `*[class ~= "topic/ol"]` and `*[class ~= "topic/ul"]` in the CSS selector.

How to Align Lists with Page Margins

It is possible to reposition the lists to align them with the rest of the text from the body.

The default CSS rules for the lists are as follows:

```
ol {
    display:block;
    margin-top: 1.33em;
    margin-bottom: 1.33em;
    list-style-type:decimal;
    padding-left: 40px;
}
ul {
    display:block;
    margin-top: 1.33em;
    margin-bottom: 1.33em;
    list-style-type:disc;
    padding-left: 40px;
}
```

To align the lists, the following rules are sufficient in the [customization CSS \(on page 1481\)](#):

```
*[class~="topic/ol"],
*[class~="topic/ul"] {
    padding-left: 0;
    list-style-position: inside;
}
```

Note:

By default, the `list-style-position` property is set to **outside**.

How to Continue List Numbering

It is possible to continue the numbering of an ordered list even when the content is split in multiple `` elements.

You need to define an `@outputclass` attribute on the lists where numbering should continue:

```
<ol>
  <li>First Item</li>
  <li>Second Item</li>
</ol>
<p>A paragraph</p>
<ol outputclass="continue">
  <li>Third Item</li>
</ol>
```

Then set the following content inside your CSS customization:

```

*[class ~= "topic/ol"] {
    counter-reset: item-count;
}

*[class ~= "topic/ol"][outputclass ~= "continue"] {
    counter-reset: none;
}

/* Add counter marker for each list level */
*[class ~= "topic/ol"] > *[class ~= "topic/li"]::marker {
    counter-increment: item-count;
    content: counter(item-count, decimal) ". ";
}

*[class ~= "topic/ol"][type=a] > *[class ~= "topic/li"]::marker{
    content: counter(item-count, lower-alpha) ". ";
}

*[class ~= "topic/ol"][type=A] > *[class ~= "topic/li"]::marker{
    content: counter(item-count, upper-alpha) ". ";
}

*[class ~= "topic/ol"][type=i] > *[class ~= "topic/li"]::marker{
    content: counter(item-count, lower-roman) ". ";
}

*[class ~= "topic/ol"][type=I] > *[class ~= "topic/li"]::marker{
    content: counter(item-count, upper-roman) ". ";
}

```

If the lists do not have the same parent, it is possible to start the numbering directly at a given number by setting the `@outputclass` attribute of the following list to `start-X` (where X is the number you want the list to start with):

```

<table frame="all">
  <title>Table with nested order lists</title>
  <tgroup cols="1">
    <tbody>
      <row>
        <entry>
          <ol>
            <li>First Item</li>
            <li>Second Item</li>
          </ol>
        </entry>
      </row>
    </tbody>
  </tgroup>
</table>

```

```

<entry>

  <ol outputclass="start-3">

    <li>Third Item</li>

    <li>Fourth Item</li>

  </ol>

</entry>

</row>

</tbody>

</tgroup>

</table>

```

Then the following content should be added into the previous CSS customization:

```

*[class ~="topic/ol"][outputclass *= "start-"] {

  counter-reset: item-count oxy_xpath("xs:integer(substring-after(@class, 'start-')) - 1");

}

```

How to Change the Numbering System of Ordered Lists

It is possible to change all lists to have a different numbering system and there are several methods that can be used to achieve this.

Use the `list-style-type` CSS Property.

The **Chemistry** engine supports the following types: `decimal`, `decimal-leading-zero`, `lower-roman`, `upper-roman`, `lower-latin`, `upper-latin`, `lower-alpha`, `upper-alpha`.

```

*[class ~="topic/ol"] {

  list-style-type: lower-roman;

}

```

Change the Content of the `:marker` CSS Pseudo-Element.

The following example emulates the Cyrillic numbering for the list items for an ordered list that has the `@outputclass` attribute set to `cyrillic`:

! **Important:**
This example will work only for lists up to 28 items. You will have to extend it for longer lists!

```

*[class ~="topic/ol"][outputclass ~="cyrillic"] > *[class ~="topic/li"]:marker {

  width: 3em;

}

*[class ~="topic/ol"][outputclass ~="cyrillic"] > *[class ~="topic/li"]:nth-of-type(1):marker{ content: "А" }

*[class ~="topic/ol"][outputclass ~="cyrillic"] > *[class ~="topic/li"]:nth-of-type(2):marker{ content: "Б" }

*[class ~="topic/ol"][outputclass ~="cyrillic"] > *[class ~="topic/li"]:nth-of-type(3):marker{ content: "В" }

```

```

* [class ~="topic/ol"][outputclass ~="cyrillic"] > * [class ~="topic/li"]:nth-of-type(4):marker { content:"г" }
* [class ~="topic/ol"][outputclass ~="cyrillic"] > * [class ~="topic/li"]:nth-of-type(5):marker { content:"д" }
* [class ~="topic/ol"][outputclass ~="cyrillic"] > * [class ~="topic/li"]:nth-of-type(6):marker { content:"е" }
* [class ~="topic/ol"][outputclass ~="cyrillic"] > * [class ~="topic/li"]:nth-of-type(7):marker { content:"ж" }
* [class ~="topic/ol"][outputclass ~="cyrillic"] > * [class ~="topic/li"]:nth-of-type(8):marker { content:"з" }
* [class ~="topic/ol"][outputclass ~="cyrillic"] > * [class ~="topic/li"]:nth-of-type(9):marker { content:"и" }
* [class ~="topic/ol"][outputclass ~="cyrillic"] > * [class ~="topic/li"]:nth-of-type(10):marker { content:"к" }
* [class ~="topic/ol"][outputclass ~="cyrillic"] > * [class ~="topic/li"]:nth-of-type(11):marker { content:"л" }
* [class ~="topic/ol"][outputclass ~="cyrillic"] > * [class ~="topic/li"]:nth-of-type(12):marker { content:"м" }
* [class ~="topic/ol"][outputclass ~="cyrillic"] > * [class ~="topic/li"]:nth-of-type(13):marker { content:"н" }
* [class ~="topic/ol"][outputclass ~="cyrillic"] > * [class ~="topic/li"]:nth-of-type(14):marker { content:"о" }
* [class ~="topic/ol"][outputclass ~="cyrillic"] > * [class ~="topic/li"]:nth-of-type(15):marker { content:"п" }
* [class ~="topic/ol"][outputclass ~="cyrillic"] > * [class ~="topic/li"]:nth-of-type(16):marker { content:"р" }
* [class ~="topic/ol"][outputclass ~="cyrillic"] > * [class ~="topic/li"]:nth-of-type(17):marker { content:"с" }
* [class ~="topic/ol"][outputclass ~="cyrillic"] > * [class ~="topic/li"]:nth-of-type(18):marker { content:"т" }
* [class ~="topic/ol"][outputclass ~="cyrillic"] > * [class ~="topic/li"]:nth-of-type(19):marker { content:"у" }
* [class ~="topic/ol"][outputclass ~="cyrillic"] > * [class ~="topic/li"]:nth-of-type(20):marker { content:"ф" }
* [class ~="topic/ol"][outputclass ~="cyrillic"] > * [class ~="topic/li"]:nth-of-type(21):marker { content:"х" }
* [class ~="topic/ol"][outputclass ~="cyrillic"] > * [class ~="topic/li"]:nth-of-type(22):marker { content:"ц" }
* [class ~="topic/ol"][outputclass ~="cyrillic"] > * [class ~="topic/li"]:nth-of-type(23):marker { content:"ч" }
* [class ~="topic/ol"][outputclass ~="cyrillic"] > * [class ~="topic/li"]:nth-of-type(24):marker { content:"ш" }
* [class ~="topic/ol"][outputclass ~="cyrillic"] > * [class ~="topic/li"]:nth-of-type(25):marker { content:"щ" }
* [class ~="topic/ol"][outputclass ~="cyrillic"] > * [class ~="topic/li"]:nth-of-type(26):marker { content:"э" }
* [class ~="topic/ol"][outputclass ~="cyrillic"] > * [class ~="topic/li"]:nth-of-type(27):marker { content:"ю" }
* [class ~="topic/ol"][outputclass ~="cyrillic"] > * [class ~="topic/li"]:nth-of-type(28):marker { content:"я" }

```

[Oxygen PDF Chemistry User Guide: Lists](#)

Links

Links allow the users to navigate through the documentation.

How to Change 'on page NNN' Link Label

For printed material, it is usually desirable for the links to display a label after the text content (such as "on page 54"). This makes it easier the user to identify the target page. However, if the produced PDF is not printed and is intended only for electronic use, this label may create clutter and make the document harder to read. To eliminate this label, you can simply disable the `args.css.param.show-onpage-lbl` parameter.

This can also be done by adding the following in your [customization CSS \(on page 1481\)](#):

```

* [class ~="topic/xref"][href]:after,
* [class ~="topic/link"][href]:after {

```

```

content: none !important;
}

```

**Note:**

A variant is to remove the "on page" label only and keep the page number:

```

*[class ~="topic/xref"][href]:after,
*[class ~="topic/link"][href]:after {
    content: " (" target-counter(attr(href), page) ")" !important;
}

```

Another use-case is to remove the labels only from links shown in tables cells, and leave the others as they are. For this, you could use a more specific selector:

```

*[class ~="topic/entry"] *[class ~="topic/xref"][href]:after{
    content: none !important;
}

```

How to Change Link Styles

Suppose you want the links to be bold and with an underline. In your [customization CSS \(on page 1481\)](#), add this snippet:

```

*[class ~="topic/xref"][href]:after,
*[class ~="topic/link"][href]:after {
    font-weight: bold;
    text-decoration: underline;
}

```

How to Hide Descriptions in Related Links Sections

The link descriptions that come from DITA relationship tables or related link elements within topics, are structured in the [merged map \(on page 1483\)](#) like this:

```

<related-links class="- topic/related-links ">
  <linkpool class="- topic/linkpool ">
    <link class="- topic/link "
      ...
      role="friend" scope="local" type="topic">
      <linktext class="- topic/linktext ">Salvia</linktext>
      <desc class="- topic/desc ">The salvia plant</desc>
    </link>
  </linkpool>
  ...
</related-links>

```

If you need to hide these descriptions, add the following code in your [customization CSS \(on page 1481\)](#):

```
*[class ~= "topic/link"] > *[class ~= "topic/desc"] {
  display: none;
}
```

How to Group Related Links by Type

By default, all links from DITA relationship tables or related link elements within topics are grouped under one "Related information" heading:

```
Related information
  Target Topic
  Target Concept
  Target Task
```

It is possible to group the links by target type (topic type) by setting the `args.rellinks.group.mode=group-by-type` parameter. The output will look like this:

```
Related concepts
  Target Concept
Related tasks
  Target Task
Related information
  Target Topic
```

Images and Figures

Images are an important part of a publication.

Note:

You can use raster image formats (such as PNG or JPEG), but it is best to use vector images (such as SVG or PDF). They scale very well and produce better results when printed. In addition, the text from these images is searchable and can be selected (if the glyphs have not been converted to shapes) in the PDF viewer.

Related information

[The DITA Style Guide Best Practices for Authors: Image file formats](#)

Images - Built-in CSS

Image properties are defined in `[PLUGIN_DIR]css/print/p-figures-images.css`.

```
*[class ~= "topic/image"] {
  prince-image-resolution: 96dpi;
  -ah-image-resolution: 96dpi;
```

```

image-resolution: 96dpi;

max-width: 100%;

}

```

How to Fix Image Bleeding - Control Image Size

Sometimes the images may be too big for the page. The built-in CSS rules specify a maximum size for images, limiting to the width of the parent block. But if the parent block is itself too wide and bleeds out of page, you might consider specifying a length.

In your [customization CSS \(on page 1481\)](#), add the following snippet:

```

*[class ~="topic/image"] {
    ...

    /* The US-letter page size minus page margins. See p-page-size.css for the current page size. */
    max-width: 6.5in;
}

```

Pay attention to images that have an [image map \(on page 1642\)](#) associated. The built-in rules set the `max-width: auto` for them to avoid scaling. Otherwise, it would cause a misalignment between the image and its clickable areas. These images are best to have a `@width` and `@height` attribute.

How to Change Image Resolution

How to Change the Resolution for Raster Images

This technique changes the size of all **raster** images from your documentation. It will not work for *vector* images, such as PDF or SVG.

The default resolution is 96 dpi (same as in web browsers). You can change it by adding the following in your [customization CSS \(on page 1481\)](#):

```

*[class ~="topic/image"] {
    prince-image-resolution: 300dpi;
    -ah-image-resolution: 300dpi;
    image-resolution: 300dpi;
}

```

Important:

The above selector does not apply to images from the `<imagemap>` element. You can use the following selector for that purpose:

```

*[class ~="ut-d/imagemap"] > *[class ~="topic/image"] {
    ...
}

```

Make sure you verify the area shapes to match the new image boundaries. The pixels specified in the image map area coordinates are always 1/96 in. For more details, see: [How to Use Image Maps \(on page 1642\)](#).

How to Change the Resolution for Vector Images

This technique will change the size of all **vector** images (such as PDF or SVG) and will not affect *raster* images.

Vector images are rendered with a default resolution of 96 dpi. You can change this default value by setting the `image.resolution` transformation parameter (on page 1456) to another value (from 72, 120, 300 and 600).

How to Place Big Images on Rotated Pages

Wide images may bleed out of the page. One solution for this is to use landscape pages for these wide images.

In your customization CSS (on page 1481), add:

```
*[class~="topic/image"][outputclass='land'] {
  page: landscape-page;
}
```

Setting the `@outputclass = 'land'` attribute on the `<image>` element forces the image to be displayed on a new landscape page.

If you want to rotate the entire topic that contains the image, use:

```
*[class~="topic/topic"]:has(*[class~="topic/body"] > *[class~="topic/image"][outputclass="land"]),
*[class~="topic/topic"]:has(*[class~="topic/body"] > * > *[class~="topic/image"][outputclass="land"]),
*[class~="topic/topic"]:has(*[class~="topic/body"] > * > * > *[class~="topic/image"][outputclass="land"]) {
  page: landscape-page;
}
```

How to Place a Text and Image Side by Side

If you need to align text and an image side-by-side, you can use the following technique:

1. Organize your text and image inside a `<div>` element like this:

```
...
<div outputclass="side-by-side">
  <p> This will be in the left side, the next figure in the right. </p>
  <fig>
    <image href="cactus.jpeg" />
  </fig>
```

```
</div>
```

```
...
```

**Note:**

You can use the `@outputclass` attribute to mark the `<div>` elements that have this special layout.

2. In your customization CSS (on page 1481), add:

```
*[outputclass ~= "side-by-side"] > *[class ~= "topic/p"] {
  display:inline-block;
  width: 45%;
}

*[outputclass ~= "side-by-side"] > *[class ~= "topic/fig"] {
  display:inline-block;
  width: 45%;
}
```

The image should fill the entire width of the parent `<fig>` element:

```
*[outputclass ~= "side-by-side"] > *[class ~= "topic/fig"] > *[class ~= "topic/image"] {
  width:100%;
}
```

By default, the bottom of the image is on the same line as the text baseline. If you want the text and the image to be aligned at the top, add these lines:

```
*[outputclass ~= "side-by-side"] > *[class ~= "topic/p"] {
  vertical-align:top;
}

*[outputclass ~= "side-by-side"] > *[class ~= "topic/fig"] {
  vertical-align:top;
}
```

**Note:**

If your figure does not have a title, you can also set `font-size:0pt` to remove the font ascent and descent around the image rectangle.

```
*[outputclass ~= "side-by-side"] > *[class ~= "topic/fig"] {
  vertical-align:top;
  font-size:0pt;
}
```

How to Control the Image Size in Complex Static Content

It is common to have text and images mixed together in a `:before` or `:after` pseudo-element. For example, for notes you may have both artwork and text:

```
*[class ~= "topic/note"]::before {
    content: url('note.png') "Some text";
}
```

If you want to change the size of the image, you have two options:

- Use the `image-resolution` CSS property:

```
*[class ~= "topic/note"] {
    image-resolution:300dpi;
}
```

- Separate the image from the text and apply the width and height CSS properties only on the image, using the width and height properties. You could use multiple `:before` pseudo-elements for that, considering that the farthest content presented before the actual content of an element is matched by the `:before` with the highest number in the brackets:

```
*[class ~= "topic/note"]::before(2) {
    content: url('note.png') ;
    width:0.5in;
}

*[class ~= "topic/note"]::before(1) {
    content: "Some text";
}
```

How to Center Images

DITA defines a `@placement` attribute for the `<image>` elements. The implicit value is `inline`. Suppose that you need to center the images that have the placement set to `break` (for example, they are not on the same line with other content and the images from the `<fig>` element).

In your [customization CSS \(on page 1481\)](#), add:

```
*[class ~= "topic/fig"] {
    text-align:center;
}

/* Other images, with break placement. */
*[class ~= "topic/image"][placement='break']{
    display:block;
    text-align:center;
}
```

```

}

/*
Scaled images are getting a computed width attribute, so we can use the auto margins.
Auto margins function only if the block they apply to has a width.
*/
*[class ~= "topic/image"][placement='break'][width] {
    margin-left:auto;
    margin-right:auto;
    border: 2pt solid red;
}

```

How to Surround Images with Borders

Suppose you want to surround all images contained inside figures that have the placement set to `break` by a border to emphasize them. To resize them, you need to use the width calculated by DITA-OT (by default, blocks use their parent max-width, which is the whole page in this case).

In your [customization CSS \(on page 1481\)](#), add:

```

@namespace dita-ot url('http://dita-ot.sourceforge.net/ns/201007/dita-ot');

*[class ~= "topic/fig"] *[class ~= "topic/image"][placement='break'] {
    border: 1px solid black;
    padding: 1em;
}

*[class ~= "topic/image"][placement='break'][dita-ot|image-width] {
    width: attr(dita-ot|image-width px);
}

```

How to Change/Reset the Figure Numbering

Note:

This topic is applicable for the *DITA Map PDF - based on HTML5* & *CSS DITA PDF - based on HTML5* & *CSS* transformation types.

There are cases when you need to change the aspect of the figure counter that is shown before the figure titles. By default, the figure titles are formatted like this:

```
Figure NN. Lorem Ipsum Title
```

NN is the number of the figure that starts being counted from the beginning of the publication.

One use-case is to have the NN counter be incremented only within one chapter (for example, the first chapter contains "Figure 1" and "Figure 2", and the second chapter starts over with "Figure 1" instead of incrementing to "Figure 3").

You should reset the figure counter on each topic marked as chapter, then hide the label from the figure `<figcaption>` (this is an HTML element generated by the XSL transformation), and create another label using a `:before` selector on the `<figcaption>`.

```
*[class ~= "topic/topic"][is-chapter] {
  counter-reset: figcount;
}

.fig--title-label {
  display: none;
}

*[class ~= "topic/fig"] > .figcap:before {
  display: inline;
  content: "Figure " counter(chapter) "-" counter(figcount) " ";
}
```

Of course you will need to update the links to these figures to show the same number:

```
.fig--title-label-number,
.fig--title-label-punctuation {
  display: none;
}

.fig--title-label-number-placeholder {
  content: target-counter(attr(href), chapter) "-" target-counter(attr(href), figcount) " ";
}
```

How to Fix Missing Images

If your images are not accessible, you may receive an error message in the transformation console like this:

```
Image not found. URI:file:/path/to/my/image
```

This is usually because they are in a folder that is not in the folder subtree of the transformed map or topic.

To solve this, you can set the following transformation parameter: `fix.external.refs.com.oxygenxml=true`.

How to Use Image Maps

To use the DITA `<imagemap>` element in a PDF transformation, follow this procedure:

1. Start by determining the width and height of your image in CSS *pixels* and specify it on the `<image>` element using the `@width` and `@height` attributes.

**Notes:**

- A CSS *pixel* is $1/96$ in, so if the image is created at a `96dpi` resolution, one dot from the image is one pixel in the CSS space. If your image is displayed at [another resolution \(on page 1637\)](#), then it is adjusted accordingly (for example, `192dpi` results in two dots from the image being equal to one pixel in the CSS space).
- You can use other CSS units, including percentages. The percentages are solved relative to the image size and represent a way of creating *responsive* image maps.

**Warning:**

If you publish the content for both PDF and HTML web output, make sure you only use *pixels*, as some browsers only support these units.

Example:

Suppose you have a large image that is 6400x4800 dots, but you want to make it fit in a box of 640x480 CSS *pixels*. In the following snippet, this is done by specifying the width and height attributes. The areas must use coordinates relative to these values.

```
<imagemap>
  <image href="../../images/Gear_pump_exploded.png"
    id="gear_pump_exploded"
    width="640"
    height="480">
    <alt>Gear Pump</alt>
  </image>
</imagemap>
```

2. In the map element, add areas (each with a shape and a set of coordinates):

```
<imagemap>
  <image ...> ... </image>
  <area>
    <shape>circle</shape>
    <coords>172, 265, 14</coords>
    <xref
      href="parts/bushings.dita#bushings_topic/bushings"
      format="dita">Bushings</xref>
  </area>
  <area>
    <shape>poly</shape>
    <coords>568, 81, 576, 103, 468, 152, 455, 130</coords>
```

```

<xref
  href="parts/drive-shaft.dita#drive_shaft_topic/drive_shaft"
  format="dita">Drive Shaft</xref>
</area>
...
</imagemap>

```

The type of areas are the ones defined in the HTML standard: `circle`, `poly`, `rect`, `default`. For more details, see: <https://html.spec.whatwg.org/multipage/image-maps.html#the-area-element>.

Warning:

Areas coordinates are relative the image box and are not affected by the image resizing (change in image width/height or scaling), accordingly to the HTML specs:

“For historical reasons, the coordinates must be interpreted relative to the displayed image after any stretching caused by the CSS 'width' and 'height' properties (or, for non-CSS browsers, the image element's width and height attributes - CSS browsers map those attributes to the aforementioned CSS properties).”

Tip:

Adding the `@scale` attribute on the `<imagemap>` element will scale both the image and areas.

3. Verify how the shapes look in the output. You can make the shapes visible by using **one of the following methods**:

- Using the `show.image.map.area.numbers` and `show.image.map.area.shapes` transformation parameters.
- Adding a CSS snippet to your customization. The shapes have the `image-map-shape` class, the bullet around the image map number (`image-map-number`), and the text inside the bullet (`image-map-number-text`). To make them translucent yellow:

```

.image-map-shape {
  fill: yellow;
  stroke: orange;
  fill-opacity: 0.3;
  stroke-opacity: 0.7;
}
.image-map-number-text {
  visibility: visible;
  stroke: red;
}

```

```
.image-map-number {
    fill: yellow;
    fill-opacity: 1;
}
```

**Remember:**

Make sure the `use.css.for.embedded.svg` parameter is set to 'yes' (it is by default).

**Tip:**

An `<svg>` with links (`<a>`) can be used as an alternative to the DITA `<imagemap>` element. Make sure that each link is a relative URI to an ID inside the publication content.

How to Hide the Image Map Links List

Below every image map, a list of links that point to the image map targets is displayed. This list can be hidden from the final output by using the following CSS selector:

```
.imagemap--areas {
    display: none;
}
```

How to Use SVG Syntax Diagrams

The DITA `<syntaxdiagram>` element is supported by the PDF transformation. To use SVG syntax diagrams, follow this procedure:

1. Download the latest version of the `svg-syntaxdiagrams` plugin, unzip it, and copy all the folders into your `DITA-OT-DIR\plugins` folder (they all start with "com. ").
2. Open a command prompt inside `DITA-OT-DIR\bin` and run the dita install command.
3. You can now add your custom `<syntaxdiagram>` element in your topic, as in the following example:

```
<syntaxdiagram id="syntaxdiagram_ok4_clk_xnb">
  <title>CopyFile</title>
  <groupseq><kwd>COPYF</kwd></groupseq>
  <groupcomp><var>input-filename</var><kwd>*INFILE</kwd></groupcomp>
  <groupseq><var>output-filename</var><kwd>*OUTFILE</kwd></groupseq>
  <groupchoice> <var>input-filename</var> <kwd>*INFILE</kwd></groupchoice>
  <groupchoice> <var>output-filename</var> <kwd>*OUTFILE</kwd></groupchoice>
</syntaxdiagram>
```

4. Run the DITA Map PDF - based on HTML5 & CSS (or DITA PDF - based on HTML5 & CSS) transformation.

**Warning:**

If you are not publishing the content for the first time, you may need to delete the `out/` and `temp/` folders to see the syntax diagram correctly in the `.merged.html` file.

Result: The PDF is generated and the syntax diagram is displayed as a referenced SVG file like this:

Videos

Videos can be referenced in a DITA topic by using the `<object>` element:

```
<object data="path/to/video.mp4" outputclass="video"/>
```

Related information

[Oxygen PDF Chemistry User Guide: Videos](#)

How to Reference a Video Using a Key

Videos can also be referenced in DITA topics by using a key.

The key must be defined in the DITA map like this:

```
<keydef keys="video" href="path/to/video.mp4" format="mp4"/>
```

The key is referenced in the topic with the `@datakeyref` attribute within the `<object>` element:

```
<object datakeyref="video" outputclass="video" width="480" height="270"/>
```

How to Change Video Size

It is possible to set the size for your videos directly from a [custom CSS stylesheet \(on page 1481\)](#):

```
.video {
  width: 480px;
  height: 270px;
}
```

Related information

[Oxygen PDF Chemistry User Guide: Change the Video Size](#)

How to Change the Videos Cover

By default, a placeholder is displayed in place of the video. When clicked, this placeholder launches the video. A popup is presented in Acrobat Reader to enable the Multimedia content (the document must be trusted for the video to launch).

It is possible to change this placeholder with a custom one by using the `-oxy-video-cover` property:

```
.video {
  -oxy-video-cover: url("files/cover.png");
}
```

How to Center Videos

It is possible to center the videos by centering their containers like this:

```
.video-container {
  text-align: center;
}
```

Tables

Tables are widely used in technical documentation. This section contains information about the CSS rules that are used to style them and how to fix some problems.

Tables - Built-in CSS

There is a combination of CSS files that address tables:

- `[PLUGIN_DIR]/css/core/-table-html-cals.css`
- `[PLUGIN_DIR]/css/print/p-tables.css`

How to Avoid a Table Exceeding the Page Width

The DITA specification indicates that tables should have a fixed layout. This can be done in two different ways:

1. **Using proportional or relative measures** - It includes percent values and shares values (i.e. "3*" or "12*").
2. **Using fixed measures** - It includes all the values followed by units (i.e. *in*, *pt*, *px*, and others).

**Important:**

- Although the specification allows you to combine these values, it is **highly recommend** that you only use one method at a time. Combining both methods could lead to a table exceeding the page width and will make the content unreadable.
- If all of the column width values are not declared in the table, the shares values (e.g. "2.5*") will not be used.

How to Handle Wide Tables - Page Rotation

Some of the tables can have a large number of columns. In this case, the table may bleed out of the page. One solution is to use landscape pages for these tables.

Setting the attribute `orient = 'land'` attribute on the table element will force the table to be on a new landscape page.

Another solution is to use automatic detection of wide tables (5 or more columns):

```
*[class~="topic/table"][data-cols='5'],
*[class~="topic/table"][data-cols='6'],
*[class~="topic/table"][data-cols='7'],
*[class~="topic/table"][data-cols='8'],
*[class~="topic/table"][data-cols='9'],
*[class~="topic/table"][data-cols='10'] {
  page: landscape-page;

  max-width: 100%;
  max-height: 100%;
  width: 100%;
  page-break-before: avoid;
}
```

**Note:**

The `landscape-page` page layout is defined in the `[PLUGIN_DIR]/css/print/p-pages-and-headers.css` file.

If you want to rotate the entire topic that contains the big table, use:

```
*[class~="topic/table"][data-cols='5'],
*[class~="topic/table"][data-cols='6'],
*[class~="topic/table"][data-cols='7'],
*[class~="topic/table"][data-cols='8'],
*[class~="topic/table"][data-cols='9'],
*[class~="topic/table"][data-cols='10'] {
```

```

max-width: 100%;

table-layout:auto;
}

*[class~="topic/topic"]:has(*[class~="topic/body"] > *[class~="topic/table"][data-cols='5']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > *[class~="topic/table"][data-cols='6']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > *[class~="topic/table"][data-cols='7']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > *[class~="topic/table"][data-cols='8']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > *[class~="topic/table"][data-cols='9']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > *[class~="topic/table"][data-cols='10']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > * > *[class~="topic/table"][data-cols='5']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > * > *[class~="topic/table"][data-cols='6']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > * > *[class~="topic/table"][data-cols='7']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > * > *[class~="topic/table"][data-cols='8']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > * > *[class~="topic/table"][data-cols='9']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > * > *[class~="topic/table"][data-cols='10']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > * > * > *[class~="topic/table"][data-cols='5']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > * > * > *[class~="topic/table"][data-cols='6']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > * > * > *[class~="topic/table"][data-cols='7']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > * > * > *[class~="topic/table"][data-cols='8']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > * > * > *[class~="topic/table"][data-cols='9']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > * > * > *[class~="topic/table"][data-cols='10']) {
    page: landscape-page;
}

```

**Tip:**

It is also possible to import the `[PLUGIN_DIR]/css/print/p-optional-auto-rotate-wide-tables.css` stylesheet into your custom CSS.

How to Fix Text Bleeding From Table Cells

Slim tables or tables that have many columns make the text from the cells be confined to a small horizontal space. Sometimes this causes long words to bleed outside the cell boundaries.

By default, the built-in CSS automatically activates the hyphenation for the text inside tables as long as your topics have the language specified.

In case the text is still bleeding outside the boundaries, you can also use the `overflow-wrap` property to force the word to break:

```

*[class ~="topic/table"] {
    overflow-wrap: break-word;
}

```

Related Information:[Hyphenation \(on page 1604\)](#)[How to Enable/Disable Hyphenation for an Element \(on page 1607\)](#)

How to Fix Small Images in Table

Tables contained in the output of DITA Map PDF - based on HTML5 & CSS (and DITA PDF - based on HTML5 & CSS) transformations have an automatic layout by default. This means that DITA-OT defines a preferred size on them, optimizing their width/height inside the content to make them as small as possible.

If, for example, you have a two-column table **without defined column widths** and one column contains images while the other column contains text, the table in the generated PDF will have its first column shrunk with smaller images and an enlarged second column (to occupy the least amount of space in the output).

To avoid this, you must *unset* the default image `max-width` so that the original size of the image will be used instead:

```
*[class ~= "topic/image"] {
  max-width: unset;
}
```

How to Center Tables

You can center the tables by using margins `auto`, while the table caption (title) can be centered using the `text-align` property:

```
*[class ~= "topic/table"] {
  margin-left:auto;
  margin-right:auto;
  width: 50%;
  border: 1pt solid blue;
}

*[class ~= "topic/table"] *[class ~= "topic/title"]{
  text-align:center;
}
```

How to Remove the Table NN Label

For the **DITA Map PDF - based on HTML5 & CSS** transformation scenario, the label for a table's title is wrapped in a span element with the class: `table--title-label`.

```
<table ... >
...
<caption class="- topic/title title tablecap">
  <span class="table--title-label">Table
    <span class="table--title-label-number">1. </span></span>
```

```
<span class="table--title">The title of the table</span>
</caption>
...
```

To hide it, set its display to none:

```
.table--title-label {
    display:none;
}
```

For the direct transformation, use:

```
*[class ~= "topic/table"] > *[class ~= "topic/title"]:before {
    content: none;
}
```

How to Customize Rows, Columns and Cells

Common Use-Cases

Here are some common table use-cases and the CSS selectors for customizing table rows, columns, and cells. These examples use the `background-color` CSS property but any CSS property can be used (border, margin, padding, etc.).

- Select all non-header cells:

```
*[class ~= "topic/tbody"] *[class ~= "topic/entry"] {
    background-color: lightgray;
}
```

- Select some table rows (using `:nth-of-type()` pseudo-class):

```
/* Select all even rows. */
*[class ~= "topic/tbody"] *[class ~= "topic/row"]:nth-of-type(even) {
    background-color: lightgray;
}

/* Select the fourth row. */
*[class ~= "topic/tbody"] *[class ~= "topic/row"]:nth-of-type(4) {
    background-color: yellow;
}
```

- Select specific table columns (using `:nth-of-type()` pseudo-class):

```
/* Select all odd columns. */
*[class ~= "topic/tbody"] *[class ~= "topic/entry"]:nth-of-type(odd) {
    background-color: lightgray;
}

/* Select the second column. */
*[class ~= "topic/tbody"] *[class ~= "topic/entry"]:nth-of-type(2) {
```

```
background-color: yellow;
}
```

Applying Properties to Specific Elements

If you need to apply some properties to specific elements, you can use the DITA `@outputclass` attribute:

```
<table frame="none">
  <title>Flowers</title>
  <tgroup cols="3">
    <colspec colname="c1" colnum="1" colwidth="171pt"/>
    <colspec colname="c2" colnum="2" colwidth="99pt"/>
    <colspec colname="c3" colnum="3" colwidth="150pt"/>
    <thead>
      <row>
        <entry>Flower</entry>
        <entry>Type</entry>
        <entry>Soil</entry>
      </row>
    </thead>
    <tbody>
      <row>
        <entry>Chrysanthemum</entry>
        <entry outputclass="colored">perennial</entry>
        <entry>well drained</entry>
      </row>
      <row>
        <entry>Gardenia</entry>
        <entry>perennial</entry>
        <entry>acidic</entry>
      </row>
      <row outputclass="colored">
        <entry>Gerbera</entry>
        <entry>annual</entry>
        <entry>sandy, well-drained</entry>
      </row>
    </tbody>
  </tgroup>
</table>
```

In this case, the selector will be based on this `outputclass`:

```
*[class ~= "topic/table"] *[outputclass ~= "colored"] {
  background-color: yellow;
}
```

How to Add Stripes to a Table

To create a striped look for your tables, you can use the following CSS rules:

```

/* Header background and foreground */
*[class ~= "topic/table"][outputclass ~= "stripes"] > *[class ~= "topic/thead"] > *[class ~= "topic/row"] {
    background-color: blue;
    color:white;
}

/* A default background for the entire table body */
*[class ~= "topic/table"][outputclass ~= "stripes"] > *[class ~= "topic/tbody"] {
    background-color: #e0e0e0;
}

/* Color for the stripes */
*[class ~= "topic/table"][outputclass ~= "stripes"] > *[class ~= "topic/tbody"] > *[class ~= "topic/row"]:nth-child(odd) {
    background-color: cyan;
}

/* Border for the cells */
*[class ~= "topic/table"][outputclass ~= "stripes"] *[class ~= "topic/entry"] {
    border: blue;
}

```

The above rules assume that tables that are to be painted with stripes are marked with an `@outputclass` attribute:

```
<table outputclass="stripes">...</table>
```

If you want to make all tables look the same, you can ignore this attribute and remove the `[outputclass ~= "stripes"]` simple selector from the above rules.

CAUTION:

Applying stripes and thin cell borders can cause rendering issues in the PDF renderer on screen display devices. For more information, see [Disappearing Thin Lines or Cell Borders \(on page 1715\)](#).

How to Display Borders on a Split Cell

By default, if a cell extends onto a second page, its bottom and top borders are discarded. To display these borders, you need to add the following property in your CSS customization:

```

*[class ~= "topic/entry"] {
    -oxy-borders-conditional: retain;
}

```

How to Rotate Content from a Table Cell

In DITA CALS tables, you can rotate the content of a cell by setting the `@rotate` attribute to `1`.

In the following example, the `Sport`, `All terrain`, and `Family` header cells are rotated.

```
<table frame="all" rowsep="1" colsep="1" id="table_dlp_flb_crb">
  <title>Car Features</title>
  <tgroup cols="4">
    <colspec colname="c1" colnum="1" colwidth="14*" />
    <colspec colname="c2" colnum="2" colwidth="1*" align="center" />
    <colspec colname="c3" colnum="3" colwidth="1*" align="center" />
    <colspec colname="c4" colnum="4" colwidth="1*" align="center" />
  <thead>
    <row>
      <entry morerows="1">Car Name</entry>
      <entry namest="c2" nameend="c4">Features</entry>
    </row>
    <row>
      <entry rotate="1">Sport</entry>
      <entry rotate="1">All terrain</entry>
      <entry rotate="1">Family</entry>
    </row>
  </thead>
  <tbody>
    <row>
      <entry>Tesla Model S</entry>
      <entry>X</entry>
      <entry />
      <entry>X</entry>
    </row>
  </tbody>
</table>
```

Table 39. Car Features

Car Name	Features		
	Sport	All terrain	Family
Tesla Model S	X		X

The resulting output will be:

Car Name	Features		
	Sport	All terrain	Family
Tesla Model S	X		X
Nissan Leaf			X
Dacia Duster		X	X

The built-in CSS matches the cells with this attribute and applies the following properties:

```

*[class~="topic/entry"][rotate='1'] {
  transform: rotate(270deg);

  /* Avoid wrapping, including hyphenation */
  white-space:pre;
  hyphens:manual;

  /* The rotated content will start from the lower side of the cell */
  vertical-align:bottom;
}

```

To change the vertical alignment of the content (for example, to move it to the middle of the cell), use the following in your CSS customization:

```

*[class~="topic/entry"][rotate='1'] {
  vertical-align:middle;
}

```

The resulting output will be:

Car Name	Features		
	Sport	All terrain	Family
Tesla Model S	X		X
Nissan Leaf			X
Dacia Duster		X	X

To make the text wrap (for instance, the "All terrain" could be split on two lines), you need to inhibit the whitespace preservation from the built-in CSS. In this case, all spaces will create a line break in the rotated layout. Thus, you can add this in your customization:

```
*[class~="topic/entry"][rotate='1'] {
  vertical-align:middle;
  white-space:normal;
}
```

The resulting output will be:

Car Name	Features		
	Sport	All terrain	Family
Tesla Model S	X		X
Nissan Leaf			X
Dacia Duster		X	X

Note:

The padding and borders set on the table cells are not rotated (only the content of the cell is rotated). You can use `padding-left` (for instance) to move the labels to the horizontal axis.

```
*[class~="topic/entry"][rotate='1'] {
  padding-left:2em;
}
```

How to Add Horizontal Lines to a Choice Table

To add horizontal lines that separate the options within a `<choicetable>`, you can use borders set on each of the rows. The following CSS styles the top header and the first column with some background colors. In a choice table, the first column represents the choice labels.

```
*[class~="task/choptionhd"],
*[class~="task/choptionhd"],
*[class~="task/chdeschd"],
*[class~="task/choption"] {
  background-color: #EEEEEE;
  text-align: left;
}

*[class~="task/choicetable"] {
```

```

border: 2pt solid #EEEEEE;
}

*[class~="task/choicetable"] *[class~="task/chrow"],
*[class~="task/choicetable"] *[class~="task/chhead"]{
border-bottom: 2pt solid #EEEEEE;
}

*[class~="task/choicetable"] *[class~="topic/stentry"] {
border-bottom: none;
border-right: none;
}

```

**Note:**

Using the frame attribute on the choice table will make these selectors apply partially. Please make sure you are designing your customization CSS taking into account all possible values for the frame attribute.

Programming Elements

Programming Elements are used to render lines of programming code. These elements have preserved line endings and use a monospace font in the output.

How to Change Font in Code Blocks

You can change fonts in code blocks to make them easier to read or compliant with your company fonts. To do so, add the following rule to your [customization CSS \(on page 1481\)](#):

```

*[class ~="pr-d/codeblock"],
*[class ~="pr-d/codeblock"] > code {
font-family: 'Consolas', monospace;
}

```

Related information

[Using Web Fonts](#)

[Using Local Font Files](#)

How to Enable Syntax Highlight in Code Blocks

**Note:**

This topic refers only to the **DITA Map PDF - based on HTML5 & CSS** transformation type.

You can use syntax highlighting to make it easier to read your code snippets by displaying each type of code in different colors and fonts. In the DITA topics, set the `@outputclass` attribute on the `<codeblock>` elements to one of these values:

- language-json
- language-yaml
- language-xml
- language-bourne
- language-c
- language-cmd
- language-cpp
- language-csharp
- language-css
- language-dtd
- language-ini
- language-java
- language-javascript
- language-lua
- language-perl
- language-powershell
- language-php
- language-python
- language-ruby
- language-sql
- language-xquery

For example, for a java snippet:

```
<codeblock outputclass="language-java">
  for (int i=0; i <100; i++) {
    // do something
  }
</codeblock>
```

The resulting HTML fragment in the merged HTML5 document is:

```
<pre class="+ topic/pre pr-d/codeblock pre codeblock language-java"
  xml:space="preserve">
  <strong class="hl-keyword" style="color:#7f0055">for</strong>
    (<strong class="hl-keyword" style="color:#7f0055">int</strong>
      i=<span class="hl-number">0</span>; i
        <<span class="hl-number">100</span>; i++) {
  <em class="hl-comment" style="color:#006400">// do something</em>
```

```

}
</pre>

```

And in the output, it is rendered as:

```

for (int i=0; i <100; i++) {
    // do something
}

```

Changing the Colors for the Syntax Highlighting

As you can see in the above example, the HTML elements `` and `` are used to color the content. Since they have a `@style` attribute set, the overriding properties need to be marked with `!important`.

Suppose you want to color the keywords in red and the comments in blue. To do so, add the following to your customization CSS (on page 1481):

```

.hl-keyword {
    color: red !important;
}

.hl-comment {
    color: blue !important;
}

```

How to Add Line Numbering in Code Blocks

Note:

This topic refers only to the **DITA Map PDF - based on HTML5 & CSS** transformation type.

You can add line numbering to make your code snippets easier to read. In the DITA topics, set the `@outputclass` attribute on the `<codeblock>` elements to the `show-line-numbers` value.

Note:

It is possible to use the `@outputclass="show-line-numbers"` together with any of the `language @outputclass` value (e.g. `@outputclass="language-java show-line-numbers"`).

For example, for a java snippet:

```

<codeblock outputclass="show-line-numbers">
public void convert(String systemId, InputStream is) {
    return new FileInputStream();
}
</codeblock>

```

The resulting HTML fragment in the merged HTML5 document is:

```
<pre class="+ topic/pre pr-d/codeblock pre codeblock show-line-numbers"
outputclass="show-line-numbers" xml:space="preserve">
<span class="+ topic/pre-new-line pre-new-line"></span>
<span class="+ topic/pre-new-line pre-new-line">
</span>public void convert(String systemId, InputStream is) {
<span class="+ topic/pre-new-line pre-new-line"></span> return new FileInputStream();
<span class="+ topic/pre-new-line pre-new-line"></span>}
<span class="+ topic/pre-new-line pre-new-line"></span></pre>
```

And in the output, it is rendered as:

```
1
2 public void convert(String systemId, InputStream is) {
3     return new FileInputStream();
4 }
5
```

How to Display Whitespaces in Code Blocks

Note:

This topic refers only to the **DITA Map PDF - based on HTML5 & CSS** transformation type.

You can display whitespace characters in code blocks to visualize indentation in the PDF. In the DITA topics, set the `@outputclass` attribute on the `<codeblock>` elements to the `show-whitespace` value.

Note:

It is possible to use the `@outputclass="show-whitespace"` together with any of the `language` or `show-line-numbers` `@outputclass` values (e.g. `@outputclass="language-java show-line-numbers show-whitespace"`).

For example, for a java snippet:

```
<codeblock outputclass="show-whitespace">
public void convert(String systemId, InputStream is) {
    return new FileInputStream();
}
</codeblock>
```

The resulting HTML fragment in the merged HTML5 document is:

```
<pre class="+ topic/pre pr-d/codeblock pre codeblock show-whitespaces"
outputclass="show-whitespaces" xml:space="preserve">
public·void·convert(String·systemId,·InputStream·is)·{
··return·new·FileInputStream();
```

```

}
</pre>

```

And in the output, it is rendered as:

```

public·void·convert (String·systemId, ·InputStream·is) ·{
··return·new·FileInputStream();
}

```

How to Disable Line Wrapping in Code Blocks

By default, code blocks have the content wrapped to avoid the bleeding of long lines out of the page. To avoid wrapping, add the following in your [customization CSS \(on page 1481\)](#):

```

*[class~="pr-d/codeblock"] {
    white-space: pre;
}

```

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the best solution to distinguish between lines is to leave them wrapped, but color each line with a different background (zebra coloring). An example is provided here: [XSLT Extensions for PDF Transformations \(on page 1672\)](#).

How to Enable Line Wrap in Code Phrases

By default, line wrapping does not apply on inline elements, which could cause some lines of code to bleed out of the page. To allow line wrapping, the property should be set on the parent block with the following rule in your [customization CSS \(on page 1481\)](#):

```

*:has(*[class ~="pr-d/codeph"]) {
    overflow-wrap: break-word;
}

```

Notes:

- It is possible to use `hyphens: auto` instead of `overflow-wrap: break-word`.
- It is possible to use the same rule for software domain elements (e.g. `<filepath>` or `<cmdname>`).

How to Deal with Unwanted Returns in Code Blocks

There are cases where the source file contains long lines of code that need to continue onto the next line in the rendered PDF (to wrap visually).

When the user copies the block from the PDF reader, they get two separated lines. This means that the command fails when users copy it from the PDF to the command-line terminal (because it comes in as two commands).

For example, the command:

```
$gist = ls -l * | count -n | some more
```

May be rendered in the PDF on two lines:

```
$gist = ls -l * | count -n
| some more
```

And this is invalid when used in the terminal.

There is no CSS workaround for this, but you can manually format the command using a continuation character:

- Windows

```
$gist = ls -l * | count -n ^
| some more
```

- Linux/macOS

```
$gist = ls -l * | count -n \
| some more
```

The command-line processor will automatically know that the command continues on the second line.

Notes

Notes contain an additional piece of information that calls attention to particular content. They may have various types (note, tip, fastpath, restriction, important, remember, attention, caution, danger, other).

For information on how to add and manage mixed content before the note icons and labels, see [How to Control the Image Size in Complex Static Content \(on page 1640\)](#).

How to Change Note Icons

Remember:

- The recommended icon format is SVG.
- The default size of the note icons is 24x24px.

To change the default icon for notes that do not have a `@type` attribute, add the following rule to your [customization CSS \(on page 1481\)](#):

```
div.note {
    background-image: url("../img/note.svg");
}
```

For a note with a `@type` attribute set to *warning*, *caution*, or *trouble*, add the following corresponding CSS rule:

```
div.warning {
    background-image: url("../img/warning.svg");
}

div.caution {
    background-image: url("../img/caution.svg");
}

div.trouble {
    background-image: url("../img/troubleshooting.svg");
}
```

For a note with `@type` attribute set to *other* and `@othertype` attribute set to *Safety*, add the following CSS rule:

```
div.note[type="other"][othertype=Safety] {
    background-image: url("../img/life-preserver.svg");
}
```

How to Change Note Colors

To change the background-color for notes that do not have a `@type` attribute, add the following rule to your customization CSS (on page 1481):

```
*[class~="topic/note"]:not([class~="hazard-d/hazardstatement"]) {
    background-color: #50bbff;
}
```

For a note with a `@type` attribute set to *restriction*, add the following CSS rule:

```
*[class~="topic/note"].note_restriction {
    background-color: #ff5566;
}
```

For a note with `@type` attribute set to *other* and `@othertype` attribute set to *Safety*, add the following CSS rule:

```
*[class~="topic/note"][type = "other"][othertype = Safety] {
    background-color: #ffaa00;
}
```

Hazard

Hazards (embodied by the `<hazardstatement>` element) contain warning information. They are based on ANSI Z535 and ISO 3864 standards and may have various values set for the type (`note`, `tip`, `fastpath`, `restriction`, `important`, `remember`, `attention`, `caution`, `notice`, `danger`, `warning`, `other`).

How to Customize Hazard Statements

It is possible to customize hazard statements (`<hazardstatement>` elements) to add an icon, change the borders, change the colors, and more. For example, to customize the *attention* type hazards, add the following rules to your customization CSS (on page 1481):

```

*[class ~= "hazard-d/hazardstatement"][type = "attention"] {
    border-width: 2px;
}

*[class ~= "hazard-d/hazardstatement"][type = "attention"],
*[class ~= "hazard-d/hazardstatement"][type = "attention"] td {
    border-color: #ff9900;
}

.hazardstatement .hazardstatement--attention {
    text-align: left;
    padding-left: 3em;
    background-position: .5em .3em;
    background-image: url("danger.svg");
    background-repeat: no-repeat;
    background-color: #ff9900;
    border-color: #ff9900;
    color: black;
}

```

**Tip:**

The default icon size is 24px and its URL is relative to the CSS stylesheet.

How to Customize Other Type Hazards

It is possible to create custom hazard types by using the `@type` and `@othertype` attributes. For example, to add a high voltage hazard in a microwave manual:

```

<hazardstatement id="hazardstatement_vzy_zdc_syb" type="other" othertype="HIGH_VOLTAGE">
  <messagepanel id="messagepanel_wzy_zdc_syb">
    <typeofhazard>Electrical Shock</typeofhazard>
    <howtoavoid>Do not disassemble or repair the microwave yourself.</howtoavoid>
  </messagepanel>
  <hazardsymbol id="hazardsymbol_z4t_gjc_syb" href="electricity_icon.svg"/>
</hazardstatement>

```

**Tip:**

SVG images are preferred for the `<hazardsymbol>` and you should set both `@height="1em"` and `@width="1em"` to obtain a rendering that is similar to default hazards.

To customize the hazard, add the following rules to your customization CSS (*on page 1481*):

```

/* Change the header color. */
*[othertype ~= "HIGH_VOLTAGE"] .hazardstatement--other {

```

```

content: "HIGH VOLTAGE"; /* Change the hazard text */

background-color: #d84b20;

color: unset;
}

/* Show logo in the header. */

*[othertype ~= "HIGH_VOLTAGE"] .hazardstatement--other::before {

padding: .5rem;

content: url("electricity_icon.svg");

}

/* Show logo in the left cell. */

*[othertype ~= "HIGH_VOLTAGE"] th {

table-column-span: 2 !important;

}

*[othertype ~= "HIGH_VOLTAGE"] .hazardstatement--logo-col {

display: table-column !important;

}

*[othertype ~= "HIGH_VOLTAGE"] td:first-of-type {

display: table-cell !important;

}

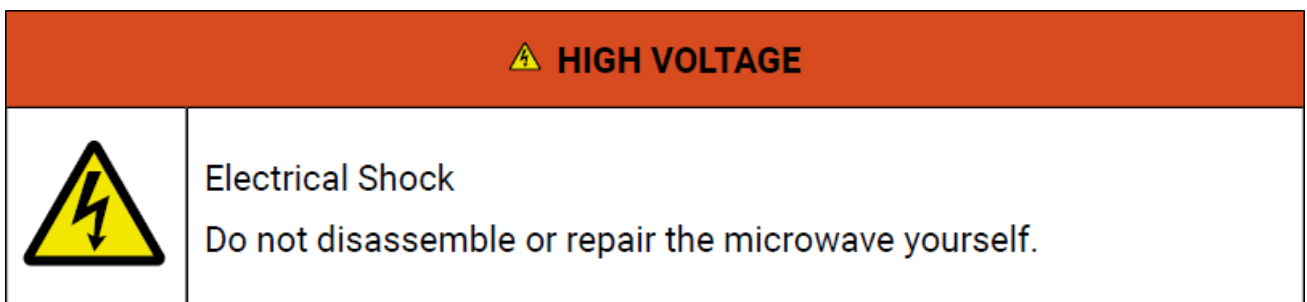

*[othertype ~= "HIGH_VOLTAGE"] .hazardsymbol {

height: 4em; /* Change the symbol dimension */

}

```

The result in the PDF output would look like this:

How to Remove the Hazard Symbol

Remove the Hazard Symbol from the Header

It is possible to remove the symbol that appears in the hazard header (for example, if you consider it redundant with the symbol in the column).

To remove it, simply hide its container with the following rules in your [customization CSS \(on page 1481\)](#):

```
.hazardsymbol-container {
  display: none;
}
```

Remove the Hazard Symbol on the left of the Message Panel

It is possible to remove the column that contains the hazard symbol (for example, if you want to maximize the message panel).

To remove the caution symbols, for example, add the following rules to your [customization CSS \(on page 1481\)](#):

```
.hazardstatement_caution .hazardstatement--logo-col {
  display: none;
}
.hazardstatement_caution th {
  table-column-span: 1
}
.hazardstatement_caution td:first-of-type {
  display: none;
}
```

Tasks

Tasks provide step-by-step instructions that enable a user to perform an operation.

How to Add Requirements Labels

It is possible to add tasks headings by setting the `args.gen.task.lbl` parameter in the transformation. However, **Machinery Tasks** have some extra required elements. It is possible to add labels for these requirements by adding the following rules to your [customization CSS \(on page 1481\)](#):

```
*[class ~= "taskreq-d/reqconds"]:before,
*[class ~= "taskreq-d/reqpers"]:before,
*[class ~= "taskreq-d/supequip"]:before,
*[class ~= "taskreq-d/supplies"]:before,
*[class ~= "taskreq-d/spares"]:before,
*[class ~= "taskreq-d/safety"]:before {
  font-weight: bold;
  padding-left: 20px;
}

*[class ~= "taskreq-d/reqconds"]:before {
  content: "Conditions: ";
}

*[class ~= "taskreq-d/reqpers"]:before {
```

```

content: "Personnel: ";
}
*[class ~= "taskreq-d/personnel"]:before {
content: "Number of workers: " !important;
}
*[class ~= "taskreq-d/perscat"]:before {
content: "Category: " !important;
}
*[class ~= "taskreq-d/perskill"]:before {
content: "Skill level: " !important;
}
*[class ~= "taskreq-d/esttime"]:before {
content: "Time estimate: " !important;
}
*[class ~= "taskreq-d/supequip"]:before {
content: "Equipment: " !important;
}
*[class ~= "taskreq-d/supplies"]:before {
content: "Supplies: " !important;
}
*[class ~= "taskreq-d/spares"]:before {
content: "Spares: ";
}
*[class ~= "taskreq-d/safety"]:before {
content: " Safety: ";
}
}

```

Abbreviated Forms

When using the `<abbreviated-form>` element in your content, it is possible to style the subsequent occurrences differently than the first occurrence. To achieve this, add something similar to the following rule in your customization CSS (*on page 1481*):

```

a:has(dfn[class ~= "abbreviated-form"]) {
color: oxy_xpath("let $cdf:= dfn return if (preceding::dfn[@keyref = $cdf/@keyref]) then 'black' else 'red'");
text-decoration: oxy_xpath("let $cdf:= dfn return if (preceding::dfn[@keyref = $cdf/@keyref]) then 'none' else 'underline'");
}

```

This example would render the first occurrence with a red color and an underline, while the subsequent occurrences would be rendered with a black color and no underline.

Trademarks

Trademarks are used to specify legally registered words and they are often used in technical documentation. To specify a trademark, your DITA content could use a structure similar to this:

```
<tm tmttype="tm">My Product Name</tm>
```

Depending on the value of the `@tmttype` attribute, a different symbol is appended to the text: (®, ™, or ℠).

The structure of the merged HTML document the CSS will apply to is:

```
<span class="- topic/tm tm" tmttype="tm">My Product Name<span
      class="- topic/tmmark tmmark ">™</span></span>
```

How to Style the Trademark Element Text

To change the style of the entire trademark text, you can match the `topic/tm` class like this:

```
*[class ~="topic/tm"] {
  font-weight:bold;
}
```

How to Style the Trademark Symbol

To change the aspect of the trademark symbol, you can use the `topic/tmmark` class. Usually, common fonts already render these symbols smaller and with superscript by default. The following example does it from the CSS:

```
*[class ~="topic/tmmark"] {
  vertical-align: super;
  font-size: smaller;
}
```

Styling Through Custom Parameters

You can activate parts of your CSS by using custom transformation parameters that start with the `args.css.param.` prefix.

These parameters are recognized by the publishing pipeline and are forwarded as synthetic attributes on the root element of the merged map. The last part of the parameter name will become the attribute name, while the value of the parameter will become the attribute value. The namespace of these synthetic attributes is:

<http://www.oxygenxml.com/extensions/publishing/dita/css/params>.

When using the **DITA Map PDF - based on HTML5 & CSS** or the **DITA PDF - based on HTML5 & CSS** transformations, the generated attribute will be in no namespace.

**Notes:**

- Make sure the name of your custom parameter does not conflict with an attribute name that may already exist on the root element.
- Use only Latin alphanumeric characters for parameter names.
- You can set multiple styling parameters at the same time.

How to Limit the Depth of the TOC Using a Parameter

In the following example, a custom parameter is used to switch from a full depth table of contents to a flat one that shows only the titles of the first-level topics (such as chapters, notices, or the preface).

The custom parameter is:

```
args.css.param.only-chapters-in-toc="yes"
```

The CSS that hides the *topicrefs* at level 2 or more:

```
:root[only-chapters-in-toc='yes'] *[class ~= "toc/toc"]
  > *[class ~= "map/topicref"]> *[class ~= "map/topicref"] {
  display:none;
}
```

The `:root[a|only-chapters-in-toc='yes']` selector makes the rule activate only when the attribute is set.

How to Change the Page Size Using a Parameter

In the following example, a custom parameter is used to modify the page size. The parameter is defined in the transformation scenario as:

```
args.css.param.page-size="A4"
```

Then in the CSS, the attribute value is extracted and used as follows:

```
@page {
  size: oxy_xpath('/*/*[@local-name()="page-size"][1]');
}
```

How to Change the Cover Page Using a Parameter

In the following example, a custom parameter is used to set the path of the cover page. The parameter points to an image by using its URL and is defined in the transformation scenario as:

```
args.css.param.cover-page="file:/path/to/cover-page.svg"
```

Then in the CSS, the attribute value is extracted and used as follows:

```
@page front-page {
    background-image: url(oxy_xpath('/*/@*[local-name()="cover-page"][1]'));
}
```

Controlling the Publication Content

It is possible to control the publication content by either using a DITA Bookmap or by specifying additional parameters in the transformation scenario.

Why Use a Bookmap

Using a plain DITA map, the transformation will produce a publication with a front page, a table of contents, chapters with content, and an index at the end. This is appropriate for most cases, but there are some use cases where some adjustments are necessary. For example, if you want to do one of the following:

- Remove the TOC or index.
- Add a glossary.
- Change the position of the TOC or the index relative to the sibling topics.
- Add a *preface*, *frontmatter*, or *backmatter* with copyright notices, abstracts, list of tables, list of figures, etc.

All of these can be achieved using a DITA `<bookmap>` element.

A bookmap has a more elaborate structure than a regular map. You should start by defining the title structure, with a main title and alternative title:

```
<!DOCTYPE bookmap PUBLIC "-//OASIS//DTD DITA BookMap//EN" "bookmap.dtd">
<bookmap id="taskbook">
  <booktitle>
    <mainbooktitle>Publication Title</mainbooktitle>
    <booktitlealt>A very short description of the publication</booktitlealt>
  </booktitle>
```

Then you may define a *frontmatter*. For this, you can link the topics that need to appear before the main content. You can also define the location where the table of contents will be placed. In the example below, it appears between the `abstract.dita` and `foreword.dita` topics:

```
<frontmatter>
  <topicref href="topics/abstract.dita"/>
  <booklists>
    <toc/>
  </booklists>
  <topicref href="topics/foreword.dita"/>
</frontmatter>
```

**Note:**

To remove the TOC from the publication, just omit the `<toc>` element from the `<booklists>` element.

Next, the topics are grouped into chapters:

```
...
<chapter href="topics/installation.dita" />
...
```

**Note:**

If you need more levels, you can use the `<part>` element and then group your chapters under it.

At the end, you could define the structure of the *backmatter*. Just like for the *frontmatter*, you can include some topics and some generated content (such as the index). In the example below, the glossary is defined to come after the index, followed by a list of figures, and a list of tables. At the very end, there is a topic with some thank you notes:

```
<backmatter>
  <topicref href="topics/conclusion.dita"/>
  <booklists>
    <indexlist/>

    <glossarylist>
      <topicref href="topics/xp.dita" keys="xp" print="yes" />
      <topicref href="topics/anti_lock_braking_system.dita" keys="abs" print="yes" />
    </glossarylist>

    <figurelist/>
    <tablelist/>
  </booklists>
  <topicref href="topics/thanks.dita"/>
</backmatter>
```

As you can see, the bookmap offers more control over the final content of the publication than a regular map. It also offers more options for controlling the metadata that will go in the PDF (see the [Metadata \(on page 1539\)](#) topic).

How to Omit the Front Page, TOC, Glossary, Index for a Plain DITA Map

For a plain DITA map, there are no elements that allow you to control if and where to place the generated content such as the title page, table of contents, list of tables, glossary, or index. For the most common use-case, when you want to hide them all and just keep the content, you can use the transformation parameter `hide.frontpage.toc.index.glossary`. See: [Transformation Parameters \(on page 1456\)](#).

Related Information:[How to Remove Entries from the TOC \(on page 1573\)](#)[How to Hide the TOC \(on page 1574\)](#)

How to Make Chapters Look Like Individual Publications

**Note:**

This topic is only applicable for the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.

Sometimes you want to make each chapter independent (i.e. it can be read separately, as a separate part of your publication). For this, you need the page counter, figure, and table counters to restart at each chapter. You can control this by using the `args.css.param.numbering` (on page 1555) command-line parameter.

In addition to numbering, you can force the creation of a [chapter TOC \(on page 1574\)](#).

XSLT Extensions for PDF Transformations

Since PDF output is primarily obtained by running XSLT transformations over the DITA input files, one customization method would be to override the default XSLT templates that are used by the PDF transformation.

The `pdf-css-html5` transformation type uses two stages to transform the merged DITA map (the one that aggregates all the topics) to HTML5:

1. **Stage 1:** Makes some changes on the [merged map \(on page 1483\)](#) and the result is a modified merged map. This stage can be altered by implementing the `com.oxygenxml.pdf.css.xsl.merged2merged` XSLT extension point. This extension overrides the stylesheets found in the following folder: `DITA-OT-DIR\plugins\com.oxygenxml.pdf.css\xsl\merged2merged`.

**Note:**

Use this when you need to filter DITA content.

2. **Stage 2:** Transforms the [merged map \(on page 1483\)](#) to HTML5 and the result is a single HTML document. This stage can be altered by implementing the `com.oxygenxml.pdf.css.xsl.merged2html5` XSLT extension point. This extension overrides the stylesheets found in the following folder: `DITA-OT-DIR\plugins\com.oxygenxml.pdf.css\xsl\merged2html5`.

**Note:**

Use this when you need to change the HTML structures generated for a specific DITA element.

These extension points can be used either from a *Publishing Template* or a DITA-OT extension plugin.

How to Use XSLT Extension Points for PDF Output from a Publishing Template

This section contains some common examples of customizations using both XSLT and CSS stylesheets. These stylesheets must be used as CSS resources and XSLT extension points inside an *Oxygen Publishing Template*.

Tip:

The XSLT extension points are called on specific files during two different phases of the process: `merged2merged` (on page 1453) and `merged2html5` (on page 1454).

How to Style Codeblocks with a Zebra Effect

A possible requirement for your `<codeblock>` elements could be to alternate the background color on each line. Some advantages of this technique is that you can clearly see when text from the `<codeblock>` is wrapped.

Note:

Adding this styling will remove syntax highlights on codeblocks.

This effect can be done by altering the HTML5 output, creating a `div` for each line from the code block, then styling them.

To add this functionality using an *Oxygen Publishing Template*, follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see [How to Create a Publishing Template \(on page 1476\)](#).
2. Link the folder associated with the publishing template to your current project in the **Project** view.
3. Using the **Project** view, create an `xslt` folder inside the project root folder.
4. In this folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="3.0">
  <xsl:template match="*[contains(@class, 'pr-d/codeblock ')]">
    <xsl:variable name="nm">
      <xsl:next-match/>
    </xsl:variable>
    <xsl:apply-templates select="$nm" mode="zebra" />
  </xsl:template>
```

```

<xsl:template match="node() | @" mode="zebra">
  <xsl:copy>
    <xsl:apply-templates select="node() | @" mode="#current"/>
  </xsl:copy>
</xsl:template>

<xsl:template match="*[contains(@class, ' pr-d/codeblock ')]" mode="zebra">
  <xsl:element name="{name()}">
    <xsl:copy-of select="@*" />
    <xsl:attribute name="class" select="concat(@class, ' zebra')"/>
    <xsl:analyze-string regex="\n" select="."/>
    <xsl:matching-substring/>
    <xsl:non-matching-substring>
      <div>
        <xsl:value-of select="."/>
      </div>
    </xsl:non-matching-substring>
  </xsl:analyze-string>
</xsl:element>
</xsl:template>

</xsl:stylesheet>

```

5. Open the *template descriptor file* (on page 1471) associated with your *publishing template* (the `.opt` file) and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.pdf.css.xsl.merged2html5` XSLT extension point:

```

<publishing-template>
  ...
  <pdf>
    ...
    <xslt>
      <extension
        id="com.oxygenxml.pdf.css.xsl.merged2html5"
        file="xslt/merged2html5Extension.xsl"/>
    </xslt>
  </pdf>
</publishing-template>

```

6. Create a `css` folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the `<codeblock>` structure. For example:

```

.zebra {
  padding: 0;
}

.zebra > *:nth-of-type(odd) {

```

```
background-color: lightgray;
}
```

- Open the *template descriptor file* (on page 1471) associated with your *publishing template* (the `.opt` file) and reference your custom CSS file in the `resources` element:

```
<publishing-template>
...
<pdf>
...
<resources>
  <css file="css/custom.css"/>
</resources>
```

- Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
- In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
- Click **OK** to save the changes and run the transformation scenario.

How to Remove the Related Links Section

Suppose that you want the *related links* sections to be removed from the PDF output.

To add this functionality using an *Oxygen Publishing Template*, follow these steps:

- If you have not already created a Publishing Template, you need to create one. For details, see [How to Create a Publishing Template](#) (on page 1476).
- Link the folder associated with the publishing template to your current project in the **Project** view.
- Using the **Project** view, create an `xslt` folder inside the project root folder.
- In this folder, create an XSL file (for example, named `merged2mergedExtension.xsl`) with the following content:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="3.0">
  <xsl:template match="*[contains(@class, ' topic/related-links ')]">
    <!-- Remove. -->
  </xsl:template>
</xsl:stylesheet>
```

- Open the *template descriptor file* (on page 1471) associated with your *publishing template* (the `.opt` file) and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.pdf.css.xsl.merged2merged` XSLT extension point:

```
<publishing-template>
...
```

```

<pdf>
  ...
  <xslt>
    <extension
      id="com.oxygenxml.pdf.css.xsl.merged2merged"
      file="xslt/merged2mergedExtension.xsl"/>
  </xslt>

```

6. Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
7. In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes and run the transformation scenario.

How to Wrap Words in Markup

Suppose you want compound words that contain hyphens (or any other criteria) to be wrapped with inline elements (such as the HTML `<code>` element).

To add this functionality using an *Oxygen Publishing Template*, follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see [How to Create a Publishing Template \(on page 1476\)](#).
2. Link the folder associated with the publishing template to your current project in the **Project** view.
3. Using the **Project** view, create an `xslt` folder inside the project root folder.
4. In this folder, create an XSL file (for example, named `merged2htmlExtension.xsl`) with the following content:

```

<?xml version="1.0" encoding="UTF-8"?>

<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="3.0">

  <xsl:template match="text()">

    <xsl:variable name="txt">
      <xsl:next-match/>
    </xsl:variable>

    <xsl:analyze-string regex="(\w|\-)+" select="$txt">
      <xsl:matching-substring>
        <!-- A word -->
        <xsl:choose>
          <xsl:when test="contains(., '-')">
            <!-- A compound word -->
            <code class="compound-word">

```

```

        <xsl:value-of select="."/>
    </code>
</xsl:when>
<xsl:otherwise>
    <!-- A simple word -->
    <xsl:value-of select="."/>
</xsl:otherwise>
</xsl:choose>
</xsl:matching-substring>
<xsl:non-matching-substring>
    <!-- Not a word -->
    <xsl:value-of select="."/>
</xsl:non-matching-substring>
</xsl:analyze-string>

</xsl:template>
</xsl:stylesheet>

```

5. Open the *template descriptor file* (on page 1471) associated with your *publishing template* (the *.opt* file) and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.pdf.css.xsl.merged2merged` XSLT extension point:

```

<publishing-template>
    ...
    <pdf>
        ...
        <xslt>
            <extension
                id="com.oxygenxml.pdf.css.xsl.merged2merged"
                file="xslt/merged2mergedExtension.xsl"/>
        </xslt>
    </pdf>
</publishing-template>

```

6. Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
7. In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes and run the transformation scenario.

How to Convert Definition Lists into Tables

Suppose you want your definitions lists (`<d1>`) to be displayed as tables in your PDF output.

To add this functionality using an *Oxygen Publishing Template*, follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see [How to Create a Publishing Template \(on page 1476\)](#).
2. Link the folder associated with the publishing template to your current project in the **Project** view.
3. Using the **Project** view, create an `xslt` folder inside the project root folder.

4. In this folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```
<?xml version="1.0" encoding="UTF-8"?>

<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="3.0">

  <xsl:template match="*[contains(@class, ' topic/dl ')]">

    <xsl:call-template name="setaname"/>

    <xsl:apply-templates select="
      *[contains(@class,
        ' ditaot-d/ditaval-startprop ')]" mode="out-of-line"/>

    <!-- Wrap in a table -->

    <table>

      <xsl:call-template name="commonattributes"/>

      <xsl:call-template name="setid"/>

      <xsl:apply-templates/>

    </table>

    <xsl:apply-templates select="
      *[contains(@class,
        ' ditaot-d/ditaval-endprop ')]" mode="out-of-line"/>

  </xsl:template>

  <xsl:template match="*[contains(@class, ' topic/dlentry ')]">

    <!-- Wrap in a table row -->

    <tr>

      <xsl:call-template name="commonattributes"/>

      <xsl:call-template name="setidaname"/>

      <xsl:apply-templates/>

    </tr>

  </xsl:template>

  <xsl:template match="
    *[contains(@class, ' topic/dd ') ] |
    *[contains(@class, ' topic/dt ')]">

    <!-- Wrap in a cell -->

    <td>

      <xsl:call-template name="commonattributes"/>

      <xsl:call-template name="setidaname"/>

      <xsl:apply-templates select="
        ../*[contains(@class,
```

```

' ditaot-d/ditaval-startprop ')]" mode="out-of-line"/>

<xsl:apply-templates/>

<xsl:apply-templates select="
  ../*[contains(@class,
  ' ditaot-d/ditaval-endprop ')]" mode="out-of-line"/>

</td>

</xsl:template>

</xsl:stylesheet>

```

5. Open the *template descriptor file* (on page 1471) associated with your *publishing template* (the *.opt* file) and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.pdf.css.xsl.merged2html5` XSLT extension point:

```

<publishing-template>
...
<pdf>
...
<xslt>
  <extension
    id="com.oxygenxml.pdf.css.xsl.merged2html5"
    file="xslt/merged2html5Extension.xsl"/>
</xslt>

```

6. Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
7. In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes and run the transformation scenario.

How to Display Footnotes Below Tables

In your PDF output, you may want to group all the footnotes contained in a table just below it instead of having them displayed at the bottom of the page.

To add this functionality, use an *Oxygen Publishing Template* and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see [How to Create a Publishing Template](#) (on page 1476).
2. Link the folder associated with the publishing template to your current project in the **Project** view.
3. Using the **Project** view, create an `xslt` folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named `merged2mergedExtension.xsl`) with the following content:

```

<?xml version="1.0" encoding="UTF-8"?>

<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  xmlns:opentopic-func="http://www.idiominc.com/opentopic/exsl/function"

```

```

exclude-result-prefixes="xs opentopic-func"

version="3.0">

<!--
  Match only top level tables (i.e tables that are not nested in other tables),
  that contains some footnotes.
-->

<xsl:template match="*[contains(@class, 'topic/table')][
  not(ancestor::*[contains(@class, 'topic/table')])]
  [//*[contains(@class, 'topic/fn')]]">

  <xsl:next-match>

    <xsl:with-param name="top-level-table" select="." tunnel="yes"/>

  </xsl:next-match>

  <!-- Create a list with all the footnotes from the current table. -->

  <ol class="- topic/ol " outputclass="table-fn-container">

    <xsl:for-each select="//*[contains(@class, 'topic/fn')]">

      <!--
        Try to preserve the footnote ID, if available, so that the xrefs will have a target.
      -->

      <li class="- topic/li " id="{if(@id) then @id else generate-id(.)}"
        outputclass="table-fn">

        <xsl:copy-of select="@callout"/>

        <xsl:apply-templates select="node()"/>

      </li>

    </xsl:for-each>

  </ol>

</xsl:template>

<!--
  The footnotes that have an ID must be ignored, they are accessible only
  through existing xrefs (already present in the merged.xml file).

  The above template already made a copy of these footnotes in the OL element
  so it is not a problem if markup is not generated for them in the cell.
-->

<xsl:template

  match="*[contains(@class, 'topic/entry')//*[contains(@class, 'topic/fn')][@id]"/>

<!--
  The xrefs to footnotes with IDs inside table-cells. We need to recalculate
  their indexes if their referenced footnote is also in the table.
-->

```

```

<xsl:template match="*[contains(@class, 'topic/xref')][@type='fn']
  [ancestor::*[contains(@class, 'topic/entry')]]">
  <xsl:param name="top-level-table" tunnel="yes"/>
  <xsl:variable name="destination" select="opentopic-func:getDestinationId(@href)"/>
  <xsl:variable name="fn" select="
    $top-level-table//*[contains(@class, 'topic/fn')][@id = $destination]"/>
  <xsl:choose>
    <xsl:when test="$fn">
      <!-- There is a reference in the table, recalculate index. -->
      <xsl:variable name="fn-number" select="
        index-of($top-level-table//*[contains(@class, 'topic/fn')], $fn)"/>
      <xsl:copy>
        <xsl:apply-templates select="@*" />
        <xsl:apply-templates select="$fn/@callout" />
        <xsl:apply-templates select="node()
          except (text(), *[contains(@class, 'hi-d/sup')])" />
        <sup class="+ topic/ph hi-d/sup ">
          <xsl:apply-templates select="child::*[contains(@class, 'hi-d/sup')]/@" />
          <xsl:value-of select="$fn-number" />
        </sup>
      </xsl:copy>
    </xsl:when>
    <xsl:otherwise>
      <!-- There is no reference in the table, keep original index. -->
      <xsl:next-match />
    </xsl:otherwise>
  </xsl:choose>
</xsl:template>

<!--
  The footnotes without ID inside table-cells. They are copied in the OL element, but have
  no xrefs pointing to them (because they have no ID), so xrefs are generated.
-->
<xsl:template
  match="*[contains(@class, 'topic/entry')][*[contains(@class, 'topic/fn')][not(@id)]]">
  <!-- Determine the footnote index in the document order. -->
  <xsl:param name="top-level-table" tunnel="yes"/>
  <xsl:variable name="fn-number" select="
    index-of($top-level-table//*[contains(@class, 'topic/fn')], .)"/>
  <xref type="fn" class="- topic/xref "
    href="#{generate-id(.)}" outputclass="table-fn-call">
  <xsl:copy-of select="@callout" />

```

```

    <!-- Generate an extra <sup>, identical to what DITA-OT generates for other xrefs. -->

    <sup class="+ topic/ph hi-d/sup ">

        <xsl:value-of select="$fn-number"/>

    </sup>

</xref>

</xsl:template>

</xsl:stylesheet>

```

5. Open the *template descriptor file* (on page 1471) associated with your *publishing template* (the *.opt* file) and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.pdf.css.xsl.merged2merged` XSLT extension point:

```

<publishing-template>

...

<pdf>

...

<xslt>

    <extension

        id="com.oxygenxml.pdf.css.xsl.merged2merged"

        file="xslt/merged2mergedExtension.xsl"/>

    </xslt>

```

6. Create a `css` folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the *glossary* structure. For example:

```

/* Customize footnote calls, inside the table. */

*[outputclass ~= 'table-fn-call'] {

    line-height: none;

}

*[class ~= "topic/table"] *[class ~= "topic/xref"][type = 'fn'][callout] *[class ~= "hi-d/sup"] {

    content: oxy_xpath("ancestor::*[contains(@class, 'topic/xref')]/@callout");

}

/* Customize the list containing all the table footnotes. */

*[outputclass ~= 'table-fn-container'] {

    border-top: 1pt solid black;

    counter-reset: table-footnote;

}

/* Customize footnotes display, below the table. */

*[outputclass ~= 'table-fn'] {

    font-size: smaller;

    counter-increment: table-footnote;

}

```

```

*[outputclass ~= 'table-fn']::marker {
    font-size: smaller;
    content: "(" counter(table-footnote) ";";
}

*[outputclass ~= 'table-fn'][callout]::marker {
    content: "(" attr(callout) ";";
}

/* Customize xrefs pointing to footnotes, inside the table. */

*[class ~= "topic/table"] *[class ~= "topic/xref"][type = 'fn'] {
    color: unset;
    text-decoration: none;
}

*[class ~= "topic/table"] *[class ~= "topic/xref"][type = 'fn']:after {
    content: none;
}

*[class ~= "topic/table"] *[class ~= "topic/xref"][type = 'fn'] *[class ~= "hi-d/sup"]:before {
    content: "(";
}

*[class ~= "topic/table"] *[class ~= "topic/xref"][type = 'fn'] *[class ~= "hi-d/sup"]:after {
    content: ";";
}

```

- Open the *template descriptor file* (on page 1471) associated with your *publishing template* (the `.opt` file) and reference your custom CSS file in the `resources` element:

```

<publishing-template>
...
<pdf>
...
<resources>
    <css file="css/custom.css"/>
</resources>

```

- Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
- In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
- Click **OK** to save the changes and run the transformation scenario.

How to Wrap Scientific Numbers in Tables Cells

In your PDF output, you may need to wrap scientific numbers on two lines when they are included in table cells.

To add this functionality, use an *Oxygen Publishing Template* and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see [How to Create a Publishing Template \(on page 1476\)](#).
2. Link the folder associated with the publishing template to your current project in the **Project** view.
3. Using the **Project** view, create an **xslt** folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="3.0">

  <!-- Matches text from table cells. -->
  <xsl:template match="*[contains(@class, ' topic/entry ')]/text()">
    <xsl:analyze-string select="." regex="[0-9]\.[0-9]{{2}}e-[0-9]{{2}}">
      <!-- The cell contains a scientific number like 1.23e-08. -->
      <xsl:matching-substring>
        <xsl:variable name="text" select="concat(substring-before(., 'e'),
          'e' &#8203; ', substring-after(., 'e'))"/>
        <xsl:value-of select="$text"/>
      </xsl:matching-substring>
      <xsl:non-matching-substring>
        <xsl:value-of select="."/>
      </xsl:non-matching-substring>
    </xsl:analyze-string>
  </xsl:template>
</xsl:stylesheet>
```

5. Open the *template descriptor file (on page 1471)* associated with your *publishing template* (the `.opt` file) and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.pdf.css.xsl.merged2html5` XSLT extension point:

```
<publishing-template>
  ...
  <pdf>
    ...
    <xslt>
      <extension
        id="com.oxygenxml.pdf.css.xsl.merged2html5"
        file="xslt/merged2html5Extension.xsl"/>
    </xslt>
  </pdf>
</publishing-template>
```

6. Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.

7. In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes and run the transformation scenario.

How to Use a Bullet for Tasks that Contain a Single Step

If a DITA *Task* document only contains one list item (a single `<step>` element), you probably want it to be rendered the same as an unordered list (displayed with a bullet instead of a number), as in the following example:

```
...
<steps>
  <step>
    <cmd>My single step</cmd>
  </step>
</steps>
...
```

Normally, the output will be rendered as:

```
1. The step
```

instead of:

```
o The step
```

To change the default rendering so that a single step will be rendered with a bullet instead of a number, use an *Oxygen Publishing Template* and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see [How to Create a Publishing Template \(on page 1476\)](#).
2. Link the folder associated with the publishing template to your current project in the **Project** view.
3. Using the **Project** view, create an `xslt` folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="3.0">
  <xsl:template match="*[contains(@class, ' task/step ')] [count(../*[contains
(@class, ' task/step ')] = 1)]">
    <xsl:copy>
      <xsl:copy-of select="@*" />
      <xsl:attribute name="outputclass" select="concat(@outputclass, ' single ')" />
    <xsl:apply-templates />
  </xsl:template>
</xsl:stylesheet>
```

```

</xsl:copy>

</xsl:template>

</xsl:stylesheet>

```

5. Open the *template descriptor file* (on page 1471) associated with your *publishing template* (the *.opt* file) and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.pdf.css.xsl.merged2html5` XSLT extension point:

```

<publishing-template>
...
<pdf>
...
<xslt>
  <extension
    id="com.oxygenxml.pdf.css.xsl.merged2html5"
    file="xslt/merged2html5Extension.xsl"/>
  </xslt>

```

6. Create a `css` folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the *glossary* structure. For example:

```

*[outputclass ~= "single"] {
  list-style-type:circle !important;
  margin-left:2em;
}

```

7. Open the *template descriptor file* (on page 1471) associated with your *publishing template* (the *.opt* file) and reference your custom CSS file in the `resources` element:

```

<publishing-template>
...
<pdf>
...
<resources>
  <css file="css/custom.css"/>
</resources>

```

8. Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
9. In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
10. Click **OK** to save the changes and run the transformation scenario.

How to Change the Critical Dates Format

By default, the dates are entered in a `YYYY-MM-DD` format (where `YYYY` is the year, `MM` is the number of the month, and `DD` is the number of the day). You can change the format (for example, to something like *January 1, 2020*) using an XSLT extension.

To add this functionality, use an *Oxygen Publishing Template* and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see [How to Create a Publishing Template \(on page 1476\)](#).
2. Link the folder associated with the publishing template to your current project in the **Project** view.
3. Using the **Project** view, create an **xslt** folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named `merged2mergedExtension.xsl`) with the following content:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="3.0">

  <xsl:template match="
    *[contains(@class, 'topic/created')]/@date |
    *[contains(@class, 'topic/revised')]/@modified">
    <xsl:attribute name="{name()}">
      <xsl:value-of select="format-date(., '[MNn] [D01], [Y0001]')"/>
    </xsl:attribute>
  </xsl:template>
</xsl:stylesheet>
```

5. Open the *template descriptor file (on page 1471)* associated with your *publishing template* (the `.opt` file) and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.pdf.css.xsl.merged2merged` XSLT extension point:

```
<publishing-template>
...
<pdf>
...
<xslt>
  <extension
    id="com.oxygenxml.pdf.css.xsl.merged2merged"
    file="xslt/merged2mergedExtension.xsl"/>
</xslt>
```

6. Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
7. In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes and run the transformation scenario.

How to Remove Links from Terms

Your topics might contain multiple references to the same `<term>`. These terms can further be explained in the glossary. In this case, you may want to only keep the first occurrence of this term to be a link to the glossary and display the other terms as text.

To add this functionality, use an *Oxygen Publishing Template* and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see [How to Create a Publishing Template \(on page 1476\)](#).
2. Link the folder associated with the publishing template to your current project in the **Project** view.
3. Using the **Project** view, create an `xslt` folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="3.0">

  <xsl:template match="*[contains(@class, ' topic/term ')]" name="topic.term">
    <!-- Save the current @href value -->
    <xsl:variable name="current-href" select="@href"/>
    <!-- Get the closest parent topic -->
    <xsl:variable name="closest-parent"
      select="ancestor::*[contains(@class, ' topic/topic ')] [1]"/>
    <!-- Get the first <term> having the same href -->
    <xsl:variable name="first-term-with-same-href" select="($closest-parent//
      *[contains(@class, ' topic/term ')][@href=$current-href])[1]"/>

    <!-- Call the HTML5 default template -->
    <xsl:variable name="result">
      <xsl:next-match/>
    </xsl:variable>

    <!-- Call the copy template that will remove the links -->
    <xsl:apply-templates select="$result" mode="remove-extra-links">
      <xsl:with-param name="is-first-term-with-same-href"
        select="generate-id(.) = generate-id($first-term-with-same-href)" tunnel="yes"/>
    </xsl:apply-templates>
  </xsl:template>

  <xsl:template match="node() | @" mode="remove-extra-links">
    <xsl:copy>
```

```

<xsl:apply-templates select="node() | @" mode="#current"/>
</xsl:copy>
</xsl:template>

<xsl:template match="a" mode="remove-extra-links">
  <xsl:param name="is-first-term-with-same-href" tunnel="yes"/>
  <xsl:choose>
    <!-- Process the first term as a link -->
    <xsl:when test="$is-first-term-with-same-href">
      <xsl:next-match/>
    </xsl:when>
    <xsl:otherwise>
      <!-- Process the other terms as text -->
      <xsl:copy-of select="child:*/>
    </xsl:otherwise>
  </xsl:choose>
</xsl:template>
</xsl:stylesheet>

```

5. Open the *template descriptor file* (on page 1471) associated with your *publishing template* (the *.opt* file) and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.pdf.css.xsl.merged2html5` XSLT extension point:

```

<publishing-template>
...
<pdf>
...
<xslt>
  <extension
    id="com.oxygenxml.pdf.css.xsl.merged2html5"
    file="xslt/merged2html5Extension.xsl"/>
</xslt>

```

6. Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
7. In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes and run the transformation scenario.

How to Display Glossary as a Table

Suppose you want to display the content of your Glossary as a table, to condense the information for one entry on a single line.

**Remember:**

Make sure all the glossary is contained within a single `<glossgroup>` element.

To add this functionality, use an *Oxygen Publishing Template* and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see [How to Create a Publishing Template \(on page 1476\)](#).
2. Link the folder associated with the publishing template to your current project in the **Project** view.
3. Using the **Project** view, create an `xslt` folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  xmlns:dita2html="http://dita-ot.sourceforge.net/ns/200801/dita2html"
  exclude-result-prefixes="xs dita2html" version="3.0">

  <!-- Create a table that will contain all the glossentries contained in the glossgroup. -->
  <xsl:template name="gen-topic">
    <xsl:param name="nestlevel" as="xs:integer">
      <xsl:choose>
        <!-- Limit depth for historical reasons, could allow any depth. -->
        <!-- Previously limit was 5. -->
        <xsl:when
          test="count(ancestor::*[contains(@class, ' topic/topic ')]) > 9"
        >9</xsl:when>
        <xsl:otherwise>
          <xsl:sequence
            select="count(ancestor::*[contains(@class, ' topic/topic ')])"/>
        </xsl:otherwise>
      </xsl:choose>
    </xsl:param>
    <xsl:choose>
      <xsl:when test="parent::dita and not(preceding-sibling::*)">
        <!-- Do not reset xml:lang if it is already set on <html> -->
        <!-- Moved outputclass to the body tag -->
        <!-- Keep ditaval based styling at this point -->
        <!-- (replace DITA-OT 1.6 and earlier call to gen-style) -->
        <xsl:apply-templates
          select="*[contains(@class, ' ditaot-d/ditaval-startprop ')]/@style"
          mode="add-ditaval-style"/>
      </xsl:when>
      <xsl:otherwise>
```

```

<xsl:call-template name="commonattributes">
  <xsl:with-param name="default-output-class"
    select="concat('nested', $nestlevel)"/>
</xsl:call-template>
</xsl:otherwise>
</xsl:choose>
<xsl:call-template name="gen-toc-id"/>
<xsl:call-template name="setidaname"/>
<xsl:choose>
  <xsl:when test="contains(@class, 'glossgroup/glossgroup')">
    <!-- Custom processing for glossgroup. -->
    <xsl:apply-templates select="*[contains(@class, 'topic/title')]" />
    <table class="- glossgroup/table table">
      <thead class="- glossgroup/thead thead">
        <tr class="- glossgroup/row row">
          <th class="- glossgroup/entry entry">Acronym</th>
          <th class="- glossgroup/entry entry">Term</th>
          <th class="- glossgroup/entry entry">Full Term</th>
          <xsl:if
            test="exists(//*[contains(@class, 'glossentry/glossdef')]">
            <th class="- glossgroup/entry entry">Definition</th>
          </xsl:if>
        </tr>
      </thead>
      <xsl:apply-templates
        select="*[contains(@class, 'glossentry/glossentry')]" />
    </table>
    <xsl:apply-templates select="
      * except (*[contains(@class, 'topic/title')]
        | *[contains(@class, 'glossentry/glossentry')]" />
  </xsl:when>
  <xsl:otherwise>
    <!-- Default processing. -->
    <xsl:apply-templates/>
  </xsl:otherwise>
</xsl:choose>
</xsl:template>

<!-- Create a row for each glossentry. -->
<xsl:template
  match="*[contains(@class, 'glossentry/glossentry')]
  [parent::*[contains(@class, 'glossgroup/glossgroup')]">

```

```

<xsl:variable name="glossentry" as="node()">
  <xsl:next-match/>
</xsl:variable>

<tr>

  <xsl:copy-of select="$glossentry/@*" />

  <xsl:copy-of
    select="$glossentry/*[contains(@class, 'glossentry/glossAlt')]"/>

  <xsl:copy-of
    select="$glossentry/*[contains(@class, 'glossentry/glossterm')]"/>

  <xsl:copy-of
    select="$glossentry/*[contains(@class, 'glossentry/glossSurfaceForm')]"/>

  <xsl:copy-of
    select="$glossentry/*[contains(@class, 'glossentry/glossdef')]"/>

  <xsl:copy-of select="
    $glossentry/* except $glossentry/*[contains(@class, 'glossentry/glossAlt')
    or contains(@class, 'glossentry/glossterm')
    or contains(@class, 'glossentry/glossSurfaceForm')
    or contains(@class, 'glossentry/glossdef')]"/>

</tr>

</xsl:template>

<!-- Process only glossBody's children nodes. -->

<xsl:template
  match="*[contains(@class, 'glossentry/glossBody')]"
  [ancestor::*[contains(@class, 'glossgroup/glossgroup')]]">
  <xsl:apply-templates/>
</xsl:template>

<!-- Create a cell for each glossterm, glossSurfaceForm and glossAlt. -->

<xsl:template match="
  *[contains(@class, 'glossentry/glossterm')]
  [ancestor::*[contains(@class, 'glossgroup/glossgroup')]] |
  *[contains(@class, 'glossentry/glossSurfaceForm')]
  [ancestor::*[contains(@class, 'glossgroup/glossgroup')]] |
  *[contains(@class, 'glossentry/glossAlt')]
  [ancestor::*[contains(@class, 'glossgroup/glossgroup')]]">
  <xsl:variable name="glossContent" as="node()">
    <xsl:next-match/>
  </xsl:variable>

  <td>

    <xsl:copy-of select="$glossContent/@*" />

    <xsl:copy-of select="normalize-space(string-join($glossContent//text()))"

```

```

    />
  </td>
</xsl:template>

<!-- Create a cell for each glossdef. -->
<xsl:template
  match="*[contains(@class, 'glossentry/glossdef')
  [ancestor::*[contains(@class, 'glossgroup/glossgroup')]]]">
  <td>
    <xsl:call-template name="commonattributes"/>
    <xsl:apply-templates/>
  </td>
</xsl:template>
</xsl:stylesheet>

```

5. Open the *template descriptor file* (on page 1471) associated with your *publishing template* (the *.opt* file) and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.pdf.css.xsl.merged2html5` XSLT extension point:

```

<publishing-template>
  ...
  <pdf>
    ...
    <xslt>
      <extension
        id="com.oxygenxml.pdf.css.xsl.merged2html5"
        file="xslt/merged2html5Extension.xsl"/>
    </xslt>
  </pdf>
</publishing-template>

```

6. Create a `css` folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the *glossary* structure. For example:

```

*[class ~=" glossgroup/table" ] {
  width: 100%;
  border: 1px solid black;
  border-collapse: collapse;
}

*[class ~=" glossgroup/table" ] th {
  background-color: lightgray;
}

*[class ~=" glossgroup/table" ] th,
*[class ~=" glossgroup/table" ] td {

```

```

border: 1px solid black;

padding: 0.3em !important;

vertical-align: inherit !important;
}

/* Remove glossSurfaceForm */
th:nth-of-type(3),
*[class ~="glossentry/glossSurfaceForm"] {

display: none;
}

/* Discard the default glossterm layout */
*[class ~="glossentry/glossterm"] {

font-size: unset;

font-weight: unset;
}

```

**Note:**

The `<glossSurfaceForm>` removal part is optional. It is present as an example of how to fully remove a column.

- Open the *template descriptor file* (on page 1471) associated with your *publishing template* (the `.opt` file) and reference your custom CSS file in the `resources` element:

```

<publishing-template>
...
<pdf>
...
<resources>
  <css file="css/custom.css"/>
</resources>

```

- Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
- In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
- Click **OK** to save the changes and run the transformation scenario.

How to Include Sections in the Mini TOC

By default, the *Mini TOC* only displays the child topics of a given chapter topic. To add the possibility of also displaying the child sections, use an *Oxygen Publishing Template* and follow these steps:

- If you have not already created a Publishing Template, you need to create one. For details, see [How to Create a Publishing Template \(on page 1476\)](#).
- Link the folder associated with the publishing template to your current project in the **Project** view.

3. Using the **Project** view, create an `xslt` folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named `merged2mergedExtension.xsl`) with the following content:

```

<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform" version="3.0"
  xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/"
  xmlns:opentopic-index="http://www.idiominc.com/opentopic/index"
  xmlns:opentopic="http://www.idiominc.com/opentopic"
  xmlns:oxy="http://www.oxygenxml.com/extensions/author" xmlns:saxon="http://saxon.sf.net/"
  xmlns:xs="http://www.w3.org/2001/XMLSchema" exclude-result-prefixes="#all">
  <xsl:template match="*[contains(@class, ' topic/topic ')]">
    <xsl:choose>
      <xsl:when test="
        ($args.chapter.layout = 'MINITOC' or
        $args.chapter.layout = 'MINITOC-BOTTOM-LINKS') and
        oxy:is-chapter(/, oxy:get-topicref-for-topic(/, @id)) and
        *[contains(@class, ' topic/topic ')]">
        <!-- Minitoc. -->
        <xsl:copy>
          <xsl:apply-templates select="@*" />
          <xsl:apply-templates select="*[contains(@class, ' topic/title ')]" />
          <xsl:apply-templates select="*[contains(@class, ' topic/prolog ')]" />
          <xsl:apply-templates select="*[contains(@class, ' topic/titlealts ')]" />
          <div>
            <xsl:choose>
              <xsl:when test="$args.chapter.layout = 'MINITOC'">
                <xsl:attribute name="class">- topic/div chapter/minitoc </xsl:attribute>
                <xsl:call-template name="generate-minitoc-links" />
                <xsl:call-template name="generate-minitoc-desc" />
              </xsl:when>
              <xsl:when test="$args.chapter.layout = 'MINITOC-BOTTOM-LINKS'">
                <xsl:attribute name="class">- topic/div chapter/minitoc chapter/minitoc-bottom </xsl:attribute>
                <xsl:call-template name="generate-minitoc-desc" />
                <xsl:call-template name="generate-minitoc-links" />
              </xsl:when>
            </xsl:choose>
          </div>
          <xsl:apply-templates select="*[contains(@class, ' topic/topic ')]" />
        </xsl:copy>
      </xsl:when>
      <xsl:otherwise>
        <!-- No minitoc. -->
        <xsl:next-match />
      </xsl:otherwise>
    </xsl:choose>
  </xsl:template>

```

```

</xsl:otherwise>

</xsl:choose>

</xsl:template>

<!--
  The chapter topic content. This has the role of describing the chapter.
-->

<xsl:template name="generate-minitoc-desc">

  <div class="- topic/div chapter/minitoc-desc ">

    <xsl:apply-templates select="

      *[not(contains(@class, ' topic/title ')) and

        not(contains(@class, ' topic/prolog ')) and

        not(contains(@class, ' topic/titlealts ')) and

        not(contains(@class, ' topic/topic ')) and

        not(contains(@class, ' topic/section '))

      ]"/>

    </div>

  </xsl:template>

  <!--
    Child links.
  -->

  <xsl:template name="generate-minitoc-links">

    <div class="- topic/div chapter/minitoc-links ">

      <related-links class="- topic/related-links ">

        <linklist class="- topic/linklist ">

          <desc class="- topic/desc ">

            <ph class="- topic/ph chapter/minitoc-label ">

              <xsl:call-template name="getVariable">

                <xsl:with-param name="id" select="'Mini Toc'"/>

              </xsl:call-template>

            </ph>

          </desc>

          <xsl:apply-templates select="

            *[contains(@class, ' topic/topic ')] |

            descendant-or-self::*[contains(@class, ' topic/section ')]"

            mode="in-this-chapter-list"/>

        </linklist>

      </related-links>

    </div>

  </xsl:template>

  <xsl:template match="

    *[contains(@class, ' topic/topic ')]

    or contains(@class, ' topic/section ')]" mode="in-this-chapter-list">

```

```

<xsl:variable name="link-type" select="
    if (contains(@class, ' topic/section ')) then
        'section'
    else
        'topic'"/>
<link class="- topic/link " href="#{@id}" type="{link-type}" role="child">
    <linktext class="- topic/linktext ">
        <xsl:value-of select="*[contains(@class, ' topic/title ')]"/>
    </linktext>
</link>
</xsl:template>
</xsl:stylesheet>

```

5. Open the *template descriptor file* (on page 1471) associated with your *publishing template* (the *.opt* file) and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.pdf.css.xsl.merged2merged` XSLT extension point:

```

<publishing-template>
    ...
    <pdf>
        ...
        <xslt>
            <extension
                id="com.oxygenxml.pdf.css.xsl.mergedmerged"
                file="xslt/merged2mergedExtension.xsl"/>
        </xslt>
        <parameters>
            <parameter name="args.chapter.layout" value="MINITOC"/>
        </parameters>
    </publishing-template>

```

**Note:**

This solution works also with `args.chapter.layout` set to `MINITOC-BOTTOM-LINKS`.

6. Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
7. In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes and run the transformation scenario.

How to Add a Link to the TOC

For making the navigation easier in the PDF, you may want to add a link that sends the reader back to the table of contents. To add this link, use an *Oxygen Publishing Template* and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see [How to Create a Publishing Template \(on page 1476\)](#).
2. Link the folder associated with the publishing template to your current project in the **Project** view.
3. Using the **Project** view, create an `xslt` folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="3.0">

  <!-- Add an anchor after the TOC title. -->

  <xsl:template match="*[contains(@class, 'toc/title')]" mode="div-it">

    <div>

      <xsl:attribute name="class" select="'- toc/anchor anchor'"/>

      <xsl:attribute name="id" select="'toc-anchor'"/>

    </div>

    <xsl:next-match/>

  </xsl:template>

</xsl:stylesheet>
```

5. Open the *template descriptor file (on page 1471)* associated with your *publishing template* (the `.opt` file) and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.pdf.css.xsl.merged2html5` XSLT extension point:

```
<publishing-template>
...
<pdf>
...
<xslt>
  <extension
    id="com.oxygenxml.pdf.css.xsl.merged2html5"
    file="xslt/merged2html5Extension.xsl"/>
</xslt>
```

6. Create a `css` folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the *glossary* structure. For example:

```
@page chapter:first:left:right {
  @top-right {
    content: "Back to Table of Contents";
    -oxy-link: "#toc-anchor";
    color: #337ab7;
```

```

}
}
@page chapter:left:right {
  @top-right {
    content: "Back to Table of Contents";
    -oxy-link: "#toc-anchor";
    color: #337ab7;
  }
}
}

```

7. Open the *template descriptor file* (on page 1471) associated with your *publishing template* (the `.opt` file) and reference your custom CSS file in the `resources` element:

```

<publishing-template>
...
<pdf>
...
<resources>
  <css file="css/custom.css"/>
</resources>

```

8. Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
9. In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
10. Click **OK** to save the changes and run the transformation scenario.

How to Repeat Note Titles After a Page Break

Suppose that you have large notes that split between pages or columns and you want the note icon and title to be displayed on the next page/column. To add this functionality, use an *Oxygen Publishing Template* and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see [How to Create a Publishing Template \(on page 1476\)](#).
2. Link the folder associated with the publishing template to your current project in the **Project** view.
3. Using the **Project** view, create an `xslt` folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```

<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="3.0">
  <!-- Display notes titles and content in table cells. -->
  <xsl:template match="*" mode="process.note.common-processing">

```

```

<xsl:param name="type" select="@type"/>

<xsl:param name="title">

  <xsl:call-template name="getVariable">

    <xsl:with-param name="id" select="concat(upper-case(substring($type, 1, 1)),
substring($type, 2))"/>

  </xsl:call-template>

</xsl:param>

<table>

  <xsl:call-template name="commonattributes">

    <xsl:with-param name="default-output-class"
select="string-join(($type, concat('note_', $type)), ' ')" />

  </xsl:call-template>

  <xsl:call-template name="setidaname"/>

  <!-- Normal flags go before the generated title; revision flags only go on the content. -->

  <xsl:apply-templates select="*[contains(@class, ' ditaot-d/ditaval-startprop ')]
/prop" mode="ditaval-outputflag"/>

  <thead>

    <tr>

      <th class="note__title">

        <xsl:copy-of select="$title"/>

        <xsl:call-template name="getVariable">

          <xsl:with-param name="id" select="'ColonSymbol'"/>

        </xsl:call-template>

      </th>

    </tr>

  </thead>

  <tbody>

    <tr>

      <td>

        <xsl:text> </xsl:text>

        <xsl:apply-templates select="*[contains(@class, ' ditaot-d/ditaval-startprop ')]
/revprop" mode="ditaval-outputflag"/>

        <xsl:apply-templates/>

        <!-- Normal end flags and revision end flags both go out after the content. -->

        <xsl:apply-templates select="*[contains(@class, ' ditaot-d/ditaval-endprop ')]"
mode="out-of-line"/>

      </td>

    </tr>

  </tbody>

</table>

</xsl:template>

```

```
</xsl:stylesheet>
```

5. Open the *template descriptor file* (on page 1471) associated with your *publishing template* (the *.opt* file) and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.pdf.css.xsl.merged2html5` XSLT extension point:

```
<publishing-template>
...
<pdf>
...
<xslt>
  <extension
    id="com.oxygenxml.pdf.css.xsl.merged2html5"
    file="xslt/merged2html5Extension.xsl"/>
</xslt>
```

6. Create a `css` folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the *glossary* structure. For example:

```
table.note th,
table.note td {
  text-align: left;
  padding: .75em .5em .75em 3em;
}

table.note {
  background-repeat: no-repeat;
  background-image: url("../img/note.svg");
  background-position: .5em .5em;
  border: 1px solid;
}

table.note.note_other { background-image: none; }
table.warning { background-image: url("../img/warning.svg"); }
table.caution { background-image: url("../img/caution.svg"); }
table.trouble { background-image: url("../img/troubleshooting.svg"); }
table.important { background-image: url("../img/important.svg"); }
table.attention { background-image: url("../img/attention.svg"); }
table.notice { background-image: url("../img/notice.svg"); }
table.remember { background-image: url("../img/remember.svg"); }
table.fastpath { background-image: url("../img/fastpath.svg"); }
table.restriction { background-image: url("../img/restriction.svg"); }
table.danger { background-image: url("../img/danger.svg"); }
table.tip { background-image: url("../img/tip.svg"); }
```

```

table.note {
    background-color: rgba(0, 120, 160, 0.09);
    border-color: #0078A0;
}
table.note_danger,
table.note_caution {
    background-color: rgba(255, 202, 45, 0.1);
    border-color: #606060;
}
table.note_warning,
table.note_attention,
table.note_important {
    background-color: rgba(255, 202, 45, 0.1);
    border-color: #FFCA2D;
}
table.note_restriction {
    background-color: rgba(255, 226, 225, 0.32);
    border-color: #FF342D;
}

```

7. Open the *template descriptor file* (on page 1471) associated with your *publishing template* (the `.opt` file) and reference your custom CSS file in the `resources` element:

```

<publishing-template>
...
<pdf>
...
<resources>
    <css file="css/custom.css"/>
</resources>

```

8. Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
9. In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
10. Click **OK** to save the changes and run the transformation scenario.

How to Create a Custom Code Block Highlighter

You may want to add additional highlighters in your `<codeblock>` elements (for example, to highlight method names or arguments). To add this functionality, use an *Oxygen Publishing Template* and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see [How to Create a Publishing Template \(on page 1476\)](#).
2. Link the folder associated with the publishing template to your current project in the **Project** view.
3. Using the **Project** view, create an `xslt` folder inside the project root folder.

4. In the newly created folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with a custom template matching the codeblock for a given language (based on the `@outputclass`):

```
<?xml version="1.0" encoding="UTF-8"?>

<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="3.0">

  <xsl:template match="*[contains(@class, 'pr-d/codeblock')]"
    [@outputclass='language-python']/text()>

    <xsl:analyze-string select="." regex="\s+>:">

      <xsl:matching-substring>

        <xsl:text></xsl:text>

        <span>

          <xsl:attribute name="class" select="'hl-arguments'"/>

          <xsl:value-of select="regex-group(1)"/>

        </span>

        <xsl:text>)</xsl:text>
      </xsl:matching-substring>

      <xsl:non-matching-substring>

        <xsl:next-match/>
      </xsl:non-matching-substring>

    </xsl:analyze-string>

  </xsl:template>

</xsl:stylesheet>
```

5. Open the *template descriptor file* (on page 1471) associated with your *publishing template* (the `.opt` file) and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.pdf.css.xsl.merged2html5` XSLT extension point:

```
<publishing-template>
  ...
  <pdf>
    ...
    <xslt>
      <extension
        id="com.oxygenxml.pdf.css.xsl.merged2html5"
        file="xslt/merged2html5Extension.xsl"/>
    </xslt>
  </pdf>
</publishing-template>
```

6. Create a `css` folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the highlight span. For example:

```
.hl-arguments {
  color: orange;
}
```

- Open the *template descriptor file* (on page 1471) associated with your *publishing template* (the `.opt` file) and reference your custom CSS file in the `resources` element:

```
<publishing-template>
...
<pdf>
...
<resources>
  <css file="css/custom.css"/>
</resources>
```

- Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
- In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
- Click **OK** to save the changes and run the transformation scenario.

How to Use XSLT Extension Points for PDF Output from a DITA-OT Plugin

The examples in this section demonstrate how to use XSLT extension points from a [DITA-OT plugin](#).

Instead of directly adding plugins inside the embedded DITA-OT, it is highly recommended to use an external [Oxygen Publishing Engine](#) so that you will not lose any of your customizations anytime you upgrade the product in the future.

You just need to follow these steps before starting your custom DITA-OT plugins:

- Download the [Oxygen Publishing Engine](#) and unzip it inside a folder where you have full write access.
- Create your custom plugin(s) inside the `DITA-OT-DIR\plugins\` folder.
- Go to **Options > Preferences > DITA**, set the **DITA Open Toolkit** option to **Custom**, and specify the path to the unzipped folder.

Warning:

The path must end with: `oxygen-publishing-engine`.

How to Style Codeblocks with a Zebra Effect

Suppose you want your *codeblocks* to have a particular background color for one line, and another color for the next line. One advantage of this coloring technique is that you can clearly see when text from the *codeblock* is wrapped.

This effect can be done by altering the HTML5 output, creating a `<div>` for each line from the code block, then styling them.

To add this functionality using a DITA-OT plugin, follow these steps:

1. In the `DITA-OT-DIR\plugins\` folder, create a folder for this plugin (for example, `com.oxygenxml.pdf.custom.codeblocks`).
2. Create a **plugin.xml** file (in the folder you created in step 1) that specifies the extension point and your customization stylesheet. For example:

```
<plugin id="com.oxygenxml.pdf.custom.codeblocks">
  <feature extension="com.oxygenxml.pdf.css.xsl.merged2html5"
    file="custom_codeblocks.xsl"/>
</plugin>
```

3. Create your customization stylesheet (for example, **custom_codeblocks.xsl**) with the following content:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="3.0">
  <xsl:template match="*[contains(@class, 'pr-d/codeblock ')]">
    <div class='zebra'>
      <xsl:analyze-string regex="\n" select=".">
        <xsl:matching-substring/>
        <xsl:non-matching-substring>
          <div><xsl:value-of select="."/></div>
        </xsl:non-matching-substring>
      </xsl:analyze-string>
    </div>
  </xsl:template>
</xsl:stylesheet>
```

4. Use the **Integrate/Install DITA-OT Plugins** transformation scenario (on page 1124) found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box.
5. Create a custom CSS file with rules that style the `codeblock` structure. For example:

```
div.zebra {
  font-family:courier, fixed, monospace;
  white-space:pre-wrap;
}

div.zebra > *:nth-of-type(odd){
  background-color: silver;
}
```

6. Edit a **DITA Map PDF - based on HTML5 & CSS** transformation scenario and reference your custom CSS file (using the `args.css` parameter).
7. Run the transformation scenario.

How to Remove the Related Links Section

Suppose you want the *related links* sections to be removed from the PDF output.

To add this functionality using a DITA-OT plugin, follow these steps:

1. In the `DITA-OT-DIR\plugins\` folder, create a folder for this plugin (for example, `com.oxygenxml.pdf.custom.codeblocks`).
2. Create a **plugin.xml** file (in the folder you created in step 1) that specifies the extension point and your customization stylesheet. For example:

```
<plugin id="com.oxygenxml.pdf.custom.related.links">
  <feature extension="com.oxygenxml.pdf.css.xsl.merged2merged"
    file="custom_related_links.xsl"/>
</plugin>
```

3. Create your customization stylesheet (for example, **custom_related_links.xsl**) with the following content:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="3.0">
  <xsl:template match="*[contains(@class, ' topic/related-links ')]">
    <!-- Remove. -->
  </xsl:template>
</xsl:stylesheet>
```

4. Use the **Integrate/Install DITA-OT Plugins** transformation scenario (on page 1124) found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box.
5. Run the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.

How to Use Custom Parameters in XSLT Stylesheets

Suppose you want to add an attribute with a custom value inside a `<div>` element.

To add this functionality using a DITA-OT plugin, follow these steps:

1. In the `DITA-OT-DIR\plugins\` folder, create a folder for this plugin (for example, `com.oxygenxml.pdf.css.param`).
2. Create a **plugin.xml** file (in the folder you created in step 1) that specifies the extension points, your parameter file, and your customization stylesheet. For example:

```
<plugin id="com.oxygenxml.pdf.css.param">
  <feature extension="com.oxygenxml.pdf.css.xsl.merged2html5.parameters" file="params.xml"/>
</plugin>
```

```
<feature extension="com.oxygenxml.pdf.css.xsl.merged2html5" file="custom.xsl"/>
</plugin>
```

**Note:**

The `com.oxygenxml.pdf.css.xsl.merged2html5` extension point can also be called from a Publishing Template.

3. Create a **params.xml** file that specifies the name of the custom attribute with the following content:

```
<dummy xmlns:if="ant:if">
  <param name="custom-param" expression="{custom.param}" if:set="custom.param"/>
</dummy>
```

4. Create your customization stylesheet (for example, **custom.xsl**) with the following content:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="3.0">
  <xsl:param name="custom-param"/>

  <xsl:template match="*[contains(@class, ' topic/div ')]">
    <div>
      <xsl:call-template name="commonattributes"/>
      <xsl:call-template name="setid"/>
      <xsl:if test="$custom-param">
        <xsl:attribute name="custom" select="$custom-param"/>
      </xsl:if>
      <xsl:apply-templates/>
    </div>
  </xsl:template>
</xsl:stylesheet>
```

5. Use the **Integrate/Install DITA-OT Plugins** transformation scenario (on page 1124) found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box.
6. Duplicate the **DITA Map PDF - based on HTML5 & CSS** transformation scenario, then in the **Parameters** tab click **New** to create a new parameter (e.g. named `custom.param` with the value of **customValue**).
7. Run the transformation scenario.

Related information

[Adding parameters to existing XSLT steps](#)

DITA-OT Extension Points

The **DITA-OT CSS-based PDF Publishing Plugin** supports DITA-OT extension points that can be used to expand the functionality of the transformation. The extension points are defined in the `plugin.xml` file. For more information, see [DITA Open Toolkit Extension Points](#).

Related Information:

[XSLT Extensions for PDF Transformations \(on page 1672\)](#)

How to Contribute a Custom CSS to the Transformation from a DITA-OT Plugin

This topic is intended for publishing architects/developers that need to deploy a customized DITA-OT.

Usually, the CSS styles can be passed to the transformation by referencing the CSS files using the `args.css` parameter. However, there are cases where you want to add some sort of "built-in" CSS that is applied in conjunction with the publishing template or CSS files referenced in the transformation.

For this, you need to use the **com.oxygenxml.pdf.css.init** extension point and set the value of the **extension.css** ANT property to the path of the custom CSS file:

1. In your **plugin.xml** file, add:

```
<feature extension="com.oxygenxml.pdf.css.init" file="init.xml"/>
```

2. Create a file named **init.xml** with the following ANT content:

```
<root>
  <property name="extension.css"
    value="${dita.plugin.[com.my.plugin.id].dir}/css/my-custom.css"/>
  <!-- add here more init stuff if needed -->
</root>
```

Note:

The name of the root element does not matter. The content of this element will be copied in an initialization template.

Important:

Make sure all file references begin with the ANT variable that is expanded to the base directory of your plugin.

Related Information:

[How to Use XSLT Extension Points for PDF Output from a DITA-OT Plugin \(on page 1704\)](#)

Localization

DITA-OT supports more than 40 languages. The full list of supported languages (and their codes) is available here: <https://www.dita-ot.org/dev/topics/globalization-languages>.

There are two ways to switch the labels to a specific language:

- Set the `@xml:lang` attribute on the DITA maps and/or topics root element with one of the supported values (e.g. `de`, `fr-FR`, `ru`, `zh-CN`).
- Set the `default.language` parameter in the transformation dialog box to the desired language code.

You can create language-dependent CSS rules in your *customization CSS (on page 1481)* by adding rules using the `:lang` pseudo-class (see <https://developer.mozilla.org/en-US/docs/Web/CSS/:lang>).

Tip:

It is recommended that you do this customization on a DITA-OT distribution deployed outside of the **Oxygen** installation. Otherwise, you will lose the customization when upgrading **Oxygen**. You can [contact the Oxygen support team](#) to ask for the **Oxygen Publishing Engine** package.

Related information

[Webinar: Transforming DITA documents to PDF using CSS, Part 4 – Advanced CSS Rules](#)

How to Customize CSS Strings

Some of the labels come from CSS files located in the `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/css/print/i18n` directory. These strings can be overridden directly from a custom CSS stylesheet. Simply identify (by debugging the CSS) and copy the rules that apply on your content and change their values. For example:

```
*[class ~= "toc/title"][empty]:before {
  content: "Agenda";
}

/* Title of the TOC page */
*[class ~= "toc/title"][empty]:lang(es):before {
  content: "Contenidos";
}
```

Note:

If you want to use a language without a corresponding `p-i18n-xx.css` stylesheet, follow these instructions:

1. Copy one of the available stylesheets (located in the `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/css/print/il8n` directory) into your CSS customization (other than the English one because it does not have the `:lang` pseudo-class since it is the default language).
2. For each rules, replace the `:lang(xx)` pseudo-class with your expected language code, then replace each property value with the expected label.

Related information

[Debugging the CSS \(on page 1483\)](#)

How to Modify Existing Strings

If the label you want to modify is not available from the CSS, you need to modify the XML strings. The default XML strings are available at the following three locations:

- `DITA-OT-DIR/plugins/org.dita.base/xsl/common`
- `DITA-OT-DIR/plugins/org.dita.pdf2/cfg/common/vars`
- `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/resources/localization`

To modify the generated text, you need to create a DITA-OT extension plugin that uses the `dita.xsl.strings` extension point. The following example uses English, but you can adapt it for any language:

1. In the `DITA-OT-DIR\plugins\` folder, create a folder for this plugin (for example, `com.oxygenxml.pdf.css.localization`).
2. Create a `plugin.xml` file (in the folder you created in step 1) that specifies the extension points, your parameter file, and your customization stylesheet. For example:

```
<plugin id="com.oxygenxml.pdf.css.localization">
  <require plugin="com.oxygenxml.pdf.css"/>

  <feature extension="dita.xsl.strings" file="pdf-extension-strings.xml"/>
</plugin>
```

3. Create a `pdf-extension-strings.xml` file with the following content:

```
<langlist>
  <lang xml:lang="en" filename="strings-en-us.xml"/>
  <lang xml:lang="en-us" filename="strings-en-us.xml"/>
</langlist>
```

4. Copy the strings you want to change from the default files to the `strings-en-us.xml` file, then replace their values:

```
<strings xml:lang="en-US">
  <str name="Figure">Fig</str>
```

```
<str name="Table">Array</str>
</strings>
```

**Warning:**

Make sure the string `@name` attribute remains the same, it is used by the process as a key to retrieve the strings text.

5. Use the **Integrate/Install DITA-OT Plugins** transformation scenario (on page 1124) found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box.
6. Run the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.

How to Add New Strings

Some strings are not translated in all languages. In this case, they will appear in English. To add a new language for a given string, you need to create a DITA-OT extension plugin that uses the `dita.xsl.strings` extension point. The following example uses Polish, but you can adapt it for any language:

1. In the `DITA-OT-DIR\plugins\` folder, create a folder for this plugin (for example, `com.oxygenxml.pdf.css.localization`).
2. Create a `plugin.xml` file (in the folder you created in step 1) that specifies the extension points, your parameter file, and your customization stylesheet. For example:

```
<plugin id="com.oxygenxml.pdf.css.localization">
  <require plugin="com.oxygenxml.pdf.css" />

  <feature extension="dita.xsl.strings" file="pdf-extension-strings.xml" />
</plugin>
```

3. Create a `pdf-extension-strings.xml` file with the following content:

```
<langlist>
  <lang xml:lang="pl" filename="strings-pl-pl.xml" />
  <lang xml:lang="pl-pl" filename="strings-pl-pl.xml" />
</langlist>
```

4. Copy the strings you want to change from the default files to the `strings-pl-pl.xml` file, then replace their values:

```
<strings xml:lang="pl-PL">
  <str name="Continued">(ciąg dalszy)</str>
</strings>
```

**Warning:**

Make sure the string `@name` attribute remains the same, it is used by the process as a key to retrieve the strings text.

5. Use the [Integrate/Install DITA-OT Plugins transformation scenario \(on page 1124\)](#) found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box.
6. Run the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.

Security

You can restrict the use of the PDF files by specifying a set of permissions. For example, you may want to set a password on the document, restrict the available actions inside the PDF reader, or encrypt the PDF content.

The `pdf.security.*` parameters listed in the [Transformation Parameters \(on page 1456\)](#) section can be used for this purpose.

You can also sign your PDF files to ensure their authenticity and integrity.

How to Protect PDF Files by Setting Security Permissions

For example, to permit only the users that have a password to access the document and also to restrict their printing and copying capability, you can use the following parameter combination:

Parameter	Value	Description
pdf.security.owner.password	<OWNER PASSWORD>	People using this password will be able to open the document, with full permissions.
pdf.security.user.password	<USER PASSWORD>	People using this password will be able to open the document, but they will not be able to print.
pdf.security.restrict.print	yes	Restricts users from printing.
pdf.security.restrict.copy	yes	Restricts users from copying content.

Important:

If you specify just the user password (without an owner password), then the people using it will be considered owners, and no restrictions will apply to them.

How to Sign a PDF

The following Bouncy Castle libraries must be downloaded (in their last available version):

- bcpkix-jdk18on
- bcprov-jdk18on
- bcutil-jdk18on

1. Install an external **Oxygen PDF Chemistry** processor.

Restriction:

A separate installation is required to include the additional libraries.

2. Copy the Bouncy Castle libraries to the `[CHEMISTRY_INSTALL_DIR]/lib` directory.
3. Create a keystore file (if you do not already have one). See [Oxygen PDF Chemistry User Guide: Signing](#) for information about how to create one.
4. Set the keystore file as the value for the `chemistry.sign.keystore` parameter.
5. **Optional:** If the keystore uses an export password, set it as the `chemistry.sign.password` value.
6. **Optional:** If you need to add more information (such as your company name), you can set the other `chemistry.sign.*` ([on page 1460](#)) parameters.
7. Set the external **Oxygen PDF Chemistry** path as the value for `css.processor.path.chemistry`.
8. Run the transformation scenario.

[Oxygen PDF Chemistry: Signing](#)

Troubleshooting

There are cases when the PDF CSS-based processing fails when trying to publish DITA content to a PDF file. This topic lists some of the common problems and possible solutions.

Damaged PDF File

Problem

It is possible to get a PDF that cannot be opened in the PDF viewer. In this case, you might get an error similar to:

```
Error: PDF file is damaged - attempting to reconstruct xref table...
Error: Couldn't find trailer dictionary
Error: Couldn't read xref table
```

Cause

This usually means that your PDF viewer does not support a PDF version greater than 1.4. The main difference with newer PDF versions is that the xref table is compressed in a stream and is not available as a table.

Solution

You need to re-run the PDF transformation with the `pdf.version` parameter set to `1.4`.

Glyph not available in font

Problem

A warning similar to the following one appear during the PDF transformation:

```
[CH] Glyph "?" (0x2192, arrowright) not available in font "Roboto-Bold".
```

Warning:

Even if the message is a warning, sometimes it can lead to a failed transformation. This usually occurs for really special characters (different from letters or common characters).

Cause

Some fonts lack specific characters, such as CJK characters or Greek symbols commonly used in scientific publications, those characters are replaced with the # symbol in the PDF output.

Solution

Specify one or more fallback font(s) in your customization CSS:

```
body{  
  
  font-family: Roboto, Symbol, Arial Unicode MS;  
  
}
```

Tip:

- It is possible to use a generic family name as fallback, like `serif`, `sans-serif` or `monospace`, like this you will call upon the processor default [fallback fonts system](#).
- To determine the needed font you can copy the text fragment from the DITA source document and paste it into any text editor (like MS Word). Make sure there are no licensing restrictions on that particular font.

Error Parsing CSS File - Caused by a Networking Problem

Problem

My custom styles are not applied and in the transformation results console, I get an error containing one of the following: `I/O exception`, `Unknown host`, `Error parsing`.

Cause

One of the CSS files contains references to resources from another website that is currently inaccessible. These resources may include:

- Fonts
- Images
- Other CSS files

**Note:**

If you exported one of the built-in publishing templates from the transformation scenario dialog, it is possible that the associated CSS files use an imported Google Font.

Remedy

1. Check your proxy settings (ask the system administrator for help).
2. If the server is still inaccessible from the transformation process, download the remote resources using a web browser, save them in the customization CSS file folder, and refer them directly from your CSS.

**Note:**

If the problem is caused by a remote font, see [Using Local Fonts](#).

Failed to Run Pipeline: The Entity Cannot Be Resolved Through Catalogs

Problem

You can get a *Failed to run pipeline* error message that looks something like this:

```
Failed to run pipeline: The entity SOME_ENTITY cannot not be resolved through catalogs.  
For security reasons files that are not listed in the DITA-OT catalogs and are not  
located in the DITA-OT directory are not read
```

Cause

This happens when the security checks that are implemented in the default transformation have blocked the reading of files that are not part of the DITA-OT (**Oxygen Publishing Engine**) installation directory and not part of the transformed DITA map.

Solution

If the origin of the transformed content is known and trusted, you can disable these checks by setting the `args.disable.security.checks` transformation parameter to **yes**.

Disappearing Thin Lines or Cell Borders

Problem

There are cases where thin lines disappear from the PDF viewer at certain zoom levels.

Cause

This is caused by the limited resolution of the display, while a printer has a superior resolution and there should be no problem printing thin lines on paper.

Solution

If the primary PDF target is the display, then you have to use thicker lines in your CSS customization (for example, avoid using 1px and use 1pt or larger instead).

If you are using Adobe Acrobat Reader, then you can enhance the display of thin lines. This behavior can be changed by going to **Edit > Preferences > Page Display > Enhance Thin Lines**. Deselecting this option makes thin lines displayed as a row of gray pixels (through antialiasing) and they do not disappear. You can experiment by selecting and deselecting the option.

Glossary Entries Referenced Using 'glossref' are not Displayed

Problem

I have a `<glossgroup>` that contains multiple `<glossentry>` elements and all the entries are referenced using `<glossref>` elements inside my map. When I add an `<abbreviated-form>` element linked to one of my `<glossentry>` elements (using a `@keyref`), the entry is not resolved in the PDF output.

Solution

Make sure every `<glossentry>` has an `@id`. Then, for each `<glossentry>`, declare a `<glossref>` element like this:

```
<glossref href="concepts/glossary.dita#flowers.genus" print="yes" keys="genus"/>
```

Important:

For bookmarks, the `<glossref>` elements should be declared in a separate ditamap.

The format-date() XPath Function Does Not Respect the Specified Locale

Problem

Formatting a date using another language code, as in this example:

```
title:before {
  content: oxy_xpath('format-date(current-date(), "[Mn] [Y]", "ru", (), ())');
}
```

results in an output like: `[Language: en]september 2019`, with the date being formatted in English.

Cause

The XPath expressions are evaluated using the Saxon HE processor. This processor does not support languages other than English.

Solution

As a solution, you can either switch to a more language-neutral format that avoids the months names:

```
title:before{
  content: oxy_xpath('format-date( current-date(), "[M] [Y]", "en", (), ())');
}
```

or you can use a more complex XPath expression like this:

```
title:before{
  content: oxy_xpath("let $cm:= format-date(current-date(), '[Mn]') \

return concat( \

if ($cm= 'January') then 'JAN' else \

if ($cm= 'February') then 'FEB' else \

if ($cm= 'March') then 'MAR' else \

if ($cm= 'April') then 'APR' else \

if ($cm= 'May') then 'MAY' else \

if ($cm= 'June') then 'JUNE' else \

if ($cm= 'July') then 'JUL' else \

if ($cm= 'August') then 'AUG' else \

if ($cm= 'September') then 'SEPT' else \

if ($cm= 'October') then 'OCT' else \

if ($cm= 'November') then 'NOV' else '' \

, \

' ', \

format-date(current-date(), '[Y0001]') \
```

```

) ";
}

```

Make sure the entire expression is rendered blue in the CSS editor. Replace the capitalized month names with the translation in the desired language.

Highlights Span Unexpectedly to the End of the Page

Problem

Tracked changes and highlights span beyond what is expected.

Cause

If the change tracking insertions, comments, or highlights span over an area that is larger than expected, the markup that signals their end is missing.

Solution

To fix this, open the topic where the highlights start and check if the XML processing instructions that define the end of the highlighted interval are correct (it is easiest to see them in **Text** mode). The intervals are defined as follows:

For highlights:

```

<?oxy_custom_start type="oxy_content_highlight" color="140,255,140"?>
<?oxy_custom_end?>

```

For comments:

```

<?oxy_comment_start author="dan" timestamp="20201102T092905+0200" comment="Test"?>
<?oxy_comment_end?>

```

For inserted text:

```

<?oxy_insert_start author="dan" timestamp="20201102T093034+0200"?>
<?oxy_insert_end?>

```

Make sure all the ending processing instructions are located before the root element end tag.

Unexpected Page Break Before or After an Element

Problem

A page break occurs before or after an element that has `page-break-before` or `page-break-after` (`break-before` or `break-after`) property set to *avoid*. For example, after a topic/section title (set by default):

```
*[class ~= "topic/title"] {
    page-break-after: avoid;
}
```

Cause

An empty element (for example, `<p>` or `<shortdesc>`) is present before or after the element with the break set to avoid. The page-break actually occurs at this element level.

Solution

Either remove the empty element from the DITA source topic (preferable) or set the display to *none* using the following CSS rule:

```
*[class ~= "topic/shortdesc"]:empty {
    display: none;
}
```

Error When Processing Topics With Chunk and Copy-To Attribute

Problem

A topic marked with both the `@chunk` and `@copy-to` attributes is missing from the PDF output and the following error appears in the **Results** view:

```
[DOTX008E] File 'file:/D:/path/to/file.dita' does not exist or cannot be loaded.
```

Cause

The chunk processing is skipped by default and must be enabled.

Solution

Set the `enable.chunk.processing` parameter to the value of **true** and re-run the transformation scenario.

XSL FO-based DITA to PDF Customization

Oxygen XML Developer comes bundled with the DITA Open Toolkit that provides a mechanism for converting *DITA maps (on page 2268)* to PDF output. Oxygen XML Developer includes a built-in **DITA Map PDF - based on XSL-FO transformation scenario (on page 1118)** that converts DITA maps to PDF using an *xsl:fo* processor.

There are several methods that can be used to customize DITA to PDF output:

- Create a customization directory that contains your customized files and reference that directory in the PDF transformation scenario (using the `customization.dir` parameter).
- Creating a DITA Open Toolkit plugin that adds extensions to the PDF output. More details can be found in the [DITA Open Toolkit Documentation](#).

**Tip:**

Some sample plugins are available on GitHub that could help you to get started with creating a plugin:

- [Sample Plugin: DITA-OT PDF Customization Plugin for Oxygen User Manual](#)
- [Sample Plugin: DITA-OT PDF2 - Generate Numbers Before Topic's Title](#)

Using a Customization Directory

One way to customize the PDF output generated by the [DITA Map PDF - based on XSL-FO transformation scenario \(on page 1118\)](#) is to create a dedicated folder to store customized files. With this approach, you will copy the contents of the built-in customization directory to a new directory where you can customize the files according to your needs and reference the new directory using the `customization.dir` parameter in the transformation scenario. The biggest advantage of this method is that the contents of your customization directory will remain unaffected when the DITA-OT is upgraded.

How to Create a Customization Directory

Follow this procedure to create a customization directory:

1. Copy all the entire `DITA-OT-DIR\plugins\org.dita.pdf2\Customization` directory to another location where you have write access.
2. Modify any of the files in whatever way necessary to achieve your specific goal. For inspiration, see [Embedding a Company Logo \(on page 1720\)](#) for a specific example of how you can modify contents of the directory to embed a logo in the output.

**Tip:**

For other specific examples, see [DITA-OT Documentation - PDF Customization Plugin](#).

3. Edit the [DITA Map PDF - based on XSL-FO transformation scenario \(on page 1118\)](#), go to the **Parameters** tab, and set the `customization.dir` parameter to point to the location of your customization directory.

Related information

[Automatic PDF plugin customization generator by Jarno Elovirta.](#)

[DITA-OT Documentation - PDF Customization Plugin](#)

Embedding a Company Logo

The following procedure explains how to embed a company logo image in the front matter of the book for the [DITA Map PDF - based on XSL-FO transformation scenario \(on page 1118\)](#).

1. Create a customization directory (*on page 1720*) (if you have not already done so).
2. Create a `common\artwork` directory structure in your customization directory and copy your logo in it (for example, `[C:\Customization\common\artwork\logo.png]`).
3. Rename `Customization\catalog.xml.orig` to: `Customization\catalog.xml`.
4. Open the `catalog.xml` in Oxygen XML Developer and *uncomment* this line:

```
<!--uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/-->
```

It now looks like this:

```
<uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/>
```

5. Rename the file `Customization\fo\xsl\custom.xsl.orig` to: `C:\Customization\fo\xsl\custom.xsl`
6. Open the `custom.xsl` file in Oxygen XML Developer and create the template called `createFrontCoverContents` for DITA-OT 4.2.3.

Tip:

You can copy the same template from `DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\front-matter.xsl` and modify it in whatever way necessary to achieve your specific goal. This new template in the `custom.xsl` file will override the same template from `DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\front-matter.xsl`.

Example:

For example, the `custom.xsl` could look like this:

```
<?xml version='1.0'?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:fo="http://www.w3.org/1999/XSL/Format"
  version="2.0">
<xsl:template name="createFrontCoverContents">
  <!-- set the title -->
  <fo:block xsl:use-attribute-sets="__frontmatter__title">
    <xsl:choose>
      <xsl:when test="$map/*[contains(@class,' topic/title ')]][1]">
        <xsl:apply-templates select="$map/*[contains(@class,' topic/title ')]][1]" />
      </xsl:when>
      <xsl:when test="$map//*[contains(@class,' bookmap/mainbooktitle ')]][1]">
        <xsl:apply-templates select="$map//*[contains
          (@class,' bookmap/mainbooktitle ')]][1]" />
      </xsl:when>
      <xsl:when test="//*[contains(@class,' map/map ')]/@title">
```

```

        <xsl:value-of select="//*[contains(@class, ' map/map ')]/@title"/>
    </xsl:when>
    <xsl:otherwise>
        <xsl:value-of select="/descendant::*[contains
            (@class, ' topic/topic ')]/[1]/*[contains(@class, ' topic/title ')]"/>
    </xsl:otherwise>
</xsl:choose>
</fo:block>

<!-- set the subtitle -->
<xsl:apply-templates select="$map//*[contains
    (@class, ' bookmap/booktitlealt ')]"/>
<fo:block xsl:use-attribute-sets="__frontmatter__owner">
    <xsl:apply-templates select="$map//*[contains(@class, ' bookmap/bookmeta ')]"/>
</fo:block>

<!-- Load the image logo -->
<fo:block text-align="center" width="100%">
    <fo:external-graphic
        src="url({concat($artworkPrefix,
            'Customization/OpenTopic/common/artwork/logo.png')})"
    />
</fo:block>
</xsl:template>
</xsl:stylesheet>

```

7. Edit the **DITA Map PDF - based on XSL-FO** transformation scenario (*on page 1118*), go to the **Parameters** tab, and set the `customization.dir` parameter to point to the location of your customization directory.

**Tip:**

For other specific examples, see [DITA-OT Documentation - Customizing PDF Output](#).

Related Information:

[Using a Customization Directory \(on page 1720\)](#)

Customizing the Header and Footer in PDF Output

This procedure should only be used for the **DITA Map PDF - based on XSL-FO** transformation scenario (*on page 1118*).

The XSLT stylesheet `DITA-OT-DIR/plugins/org.dita.pdf2/xsl/fo/static-content.xsl` contains templates that output the static header and footers for various parts of the PDF such as the prolog, table of contents, front matter, or body.

The templates for generating a footer for pages in the body are called `insertBodyOddFooter` or `insertBodyEvenFooter`.

These templates get the static content from resource files that depend on the language used for generating the PDF. The default resource file is `DITA-OT-DIR/plugins/org.dita.pdf2/cfg/common/vars/en.xml`. These resource files contain variables (such as *Body odd footer*) that can be set to specific user values.

Instead of modifying these resource files directly, they can be overwritten with modified versions of the resources in a PDF customization directory.

1. Create a customization directory (on page 1720) (if you have not already done so).
2. Locate the stylesheets and templates listed above in your customization directory and modify them in whatever way necessary to achieve your specific goal.

Tip:

For more information and examples, see the [Oxygen PDF Customization Plugin project on GitHub](#).

3. Edit the **DITA Map PDF - based on XSL-FO transformation scenario** (on page 1118), go to the **Parameters** tab, and set the **customization.dir** parameter to point to the location of your customization directory.

Related Information:

<https://github.com/oxygenxml/com.oxygenxml.pdf2.ug/wiki>

[Using a Customization Directory \(on page 1720\)](#)

Adding a Watermark to PDF Output

To add a watermark to the PDF output of a **DITA Map PDF - based on XSL-FO transformation scenario** (on page 1118), follow this procedure:

1. Create a customization directory (on page 1720) (if you have not already done so).
2. Create a `cfg\common\artwork` directory structure in your customization directory and copy your watermark image to that directory (for example, `C:\Customization\cfg\common\artwork\watermark.png`).
3. Rename the `Customization\catalog.xml.orig` file to: `Customization\catalog.xml`.
4. Open the `catalog.xml` in Oxygen XML Developer and *uncomment* this line:

```
<!--uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/-->
```

The uncommented line should look like this:

```
<uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/>
```

5. Rename the file: `Customization\fo\xsl\custom.xsl.orig` to: `Customization\fo\xsl\custom.xsl`.
6. Open the `Customization\fo\xsl\custom.xsl` file in Oxygen XML Developer to overwrite two XSLT templates:
 - The first template is located in the XSLT stylesheet `DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\static-content.xsl`. Override by copying the original template content in the `custom.xsl` and specifying a watermark image for every page in the PDF content, using a `block-container` element that references the watermark image file:

```
<fo:static-content flow-name="odd-body-header">
  <fo:block-container absolute-position="absolute"
    top="-2cm" left="-3cm" width="21cm" height="29.7cm"
    background-image="{concat($artworkPrefix,
'Configuration/OpenTopic/cfg/common/artwork/watermark.png')}">
    <fo:block/>
  </fo:block-container>
  <fo:block xsl:use-attribute-sets="__body__odd__header">
    <xsl:call-template name="insertVariable">
      <xsl:with-param name="theVariableID" select="'Body odd header'"/>
      <xsl:with-param name="theParameters">
        <prodname>
          <xsl:value-of select="$productName"/>
        </prodname>
        <heading>
          <fo:inline xsl:use-attribute-sets="__body__odd__header__heading">
            <fo:retrieve-marker retrieve-class-name="current-header"/>
          </fo:inline>
        </heading>
        <pagenum>
          <fo:inline xsl:use-attribute-sets="__body__odd__header__pagenum">
            <fo:page-number/>
          </fo:inline>
        </pagenum>
      </xsl:with-param>
    </xsl:call-template>
  </fo:block>
</fo:static-content>
</xsl:template>
```

- The second template to override is located in the XSLT stylesheet `DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\commons.xml` and is used for styling the first page of the output. Override it by copying the original template content in the `custom.xml` and adding the `block-container` element that references the watermark image file:

```

<xsl:template name="createFrontMatter_1.0">
    <fo:page-sequence master-reference="front-matter"
xsl:use-attribute-sets="__force__page__count">
        <xsl:call-template name="insertFrontMatterStaticContents"/>
        <fo:flow flow-name="xsl-region-body">
            <fo:block-container absolute-position="absolute"
                top="-2cm" left="-3cm" width="21cm" height="29.7cm"
                background-image="{concat($artworkPrefix,
'Configuration/OpenTopic/cfg/common/artwork/watermark.png')}">
                <fo:block/>
            </fo:block-container>
            <fo:block xsl:use-attribute-sets="__frontmatter">
                <!-- set the title -->
                <fo:block xsl:use-attribute-sets="__frontmatter__title">
                    <xsl:choose>
                        <xsl:when test="$map/*[contains(@class, ' topic/title ')] [1]">
                            <xsl:apply-templates select="$map/*[contains(@class, ' topic/title ')] [1]" />
                        </xsl:when>
                        <xsl:when test="$map/*[contains(@class, ' bookmap/mainbooktitle ')] [1]">
                            <xsl:apply-templates select="$map/*[contains
(@class, ' bookmap/mainbooktitle ')] [1]" />
                        </xsl:when>
                        <xsl:when test="//*[contains(@class, ' map/map ')]/@title">
                            <xsl:value-of select="//*[contains(@class, ' map/map ')]/@title" />
                        </xsl:when>
                        <xsl:otherwise>
                            <xsl:value-of select="/descendant::*[contains
(@class, ' topic/topic ')] [1]/*[contains(@class, ' topic/title ')]" />
                        </xsl:otherwise>
                    </xsl:choose>
                </fo:block>
                <!-- set the subtitle -->
                <xsl:apply-templates select="$map/*[contains
(@class, ' bookmap/booktitlealt ')]" />
                <fo:block xsl:use-attribute-sets="__frontmatter__owner">
                    <xsl:apply-templates select="$map/*[contains

```

```

(@class,' bookmap/bookmeta ')]"/>

</fo:block>

</fo:block>

<!--<xsl:call-template name="createPreface"/>-->

</fo:flow>

</fo:page-sequence>

<xsl:if test="not($retain-bookmap-order)">
    <xsl:call-template name="createNotices"/>
</xsl:if>

</xsl:template>

```

7. Edit the **DITA Map PDF - based on XSL-FO** transformation scenario (*on page 1118*), go to the **Parameters** tab, and set the **customization.dir** parameter to point to the location of your customization directory.

Adding an Edit Link in PDF Output to Launch Oxygen XML Web Author

You can embed *Edit* links in the **DITA Map PDF - based on XSL-FO** transformation scenario (*on page 1118*) output that will automatically launch a particular document in **Oxygen XML Web Author**. A reviewer can then simply click the link and they will be redirected to the Oxygen XML Web Author editing page with that particular file open and editable.

To embed an *Edit* link in the DITA Map PDF output, follow these steps:

1. Edit a **DITA Map PDF - based on XSL-FO** transformation scenario (*on page 1118*) and open the **Parameters** tab.
2. Set values for the following parameters:
 - **editlink.ditamap.edit.url** - The URL of the DITA map used to publish your content. The easiest way to obtain the URL is to open the map in Web Author or Content Fusion and copy the URL from the browser's address bar.
 - **editlink.additional.query.parameters** - Optional query parameters to be appended to each generated edit link. Each parameter must start with & (e.g. *&tags-mode=no-tags*).
3. Run the transformation scenario.

Result: In the PDF output, all topics will have an **Edit** link to the right side of the title and clicking the link will launch that particular document in Oxygen XML Web Author.

Force Page Breaks Between Two Block Elements in PDF Output

The following procedure works for the **DITA Map PDF - based on XSL-FO** transformation scenario (*on page 1118*).

Suppose that in your DITA content you have two *block elements (on page 2267)*, such as two paragraphs:

```
<p>First para</p>
<p>Second para</p>
```

and you want to force a page break between them in the PDF output.

Here is how you can implement a DITA Open Toolkit *plugin (on page 2271)* that would achieve this:

1. Define your custom processing instruction that marks the place where a page break should be inserted in the PDF, for example:

```
<p>First para</p>
<?pagebreak?>
<p>Second para</p>
```

2. Locate the **DITA Open Toolkit** distribution and in the `plugins` directory create a new *plugin* folder (for example, `DITA-OT-DIR/plugins/pdf-page-break`).
3. In this new folder, create a new `plugin.xml` file with the following content:

```
<plugin id="com.yourpackage.pagebreak">
  <feature extension="package.support.name" value="Force Page Break Plugin"/>
  <feature extension="package.support.email" value="support@youreemail.com"/>
  <feature extension="package.version" value="1.0.0"/>
  <feature extension="dita.xml.xslfo" value="pageBreak.xml" type="file"/>
</plugin>
```

The most important feature in the *plugin* is that it will add a new XSLT stylesheet to the XSL processing that produces the PDF content.

4. In the same folder, create an XSLT stylesheet named `pageBreak.xml` with the following content:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:fo="http://www.w3.org/1999/XSL/Format" version="1.0">
  <xsl:template match="processing-instruction('pagebreak')">
    <fo:block break-after="page"/>
  </xsl:template>
</xsl:stylesheet>
```

The source code for the plugin can be found on GitHub here: <https://github.com/dita-community/org.dita-community.pdf-page-break>.

Show Comments and Tracked Changes in PDF Output

To include comments and *tracked changes* (stored within your DITA topics) in the **DITA Map PDF - based on XSL-FO transformation scenario (on page 1118)** output, follow these steps:

1. Edit a **DITA Map PDF - based on XSL-FO** transformation scenario.
2. In the **Parameters** tab, set the value of the **show.changes.and.comments** parameter to `yes`. If you also want to display change bars for inserted or deleted content in the PDF, set the **show.changebars** parameter to `yes`. If you want to only show the *changebars*, without other styling of the changes, you should set both the **show.changes.and.comments** and **show.changes.and.comments.as.changebars.only** parameters to `yes`.
3. Optionally, you can configure any of these other parameters to adjust the colors of the comments and tracked changes:
 - **ct.insert.color** - Specifies the color for insertion type tracked changes, as a plain color (e.g. red, yellow, blue), or with a hexadecimal equivalent (e.g. #FFFFFF). The default value is 'blue'.
 - **ct.delete.color** - Specifies the color for deletion type tracked changes, as a plain color (e.g. red, yellow, blue), or with a hexadecimal equivalent (e.g. #FFFFFF). The default value is 'red'.
 - **ct.comment.bg.color** - Specifies the background color for comment type tracked changes, as a plain color (e.g. red, yellow, blue), or with a hexadecimal equivalent (e.g. #FFFFFF). The default value is 'yellow'.
4. Click **OK** and then the **Apply Associated** button to run the transformation scenario.

Result: Comment threads and tracked changes will now appear in the PDF output. Details about each comment or change will be available in the footer section for each page.

Set a Font for PDF Output Generated with FO Processor

When a *DITA map* (on page 2268) is transformed using the **DITA Map PDF - based on XSL-FO transformation scenario** (on page 1118) and it contains some Unicode characters that cannot be rendered by the default PDF fonts, a font that is capable of rendering these characters must be configured and embedded in the PDF result.

The settings that must be modified for configuring a font for the built-in FO processor are detailed in [Add a Font to the Built-in FO Processor - Advanced Version](#) (on page 1205).

DITA-OT PDF Font Mapping

The DITA-OT contains a file `DITA-OT-DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml` that maps logical fonts used in the XSLT stylesheets to physical fonts that will be used by the FO processor to generate the PDF output.

The XSLT stylesheets used to generate the XSL-FO output contain code like this:

```
<xsl:attribute name="font-family">monospace</xsl:attribute>
```

The font-family is defined to be *monospace*, but *monospace* is just an alias. It is not a physical font name. Therefore, another stage in the PDF generation takes this *monospace* alias and looks in the `font-mappings.xml`.

If it finds a mapping like this:

```
<aliases>
  <alias name="monospace">Monospaced</alias>
</aliases>
```

then it looks to see if the *monospace* has a *logical-font* definition and if so, it will use the *physical-font* specified there:

```
<logical-font name="Monospaced">
  <physical-font char-set="default">
    <font-face>Courier New, Courier</font-face>
  </physical-font>
  .....
</logical-font>
```

Important:

If no alias mapping is found for a font-family specified in the XSLT stylesheets, the processing defaults to **Helvetica**.

Related information

<http://www.elovirta.com/2016/02/18/font-configuration-in-pdf2.html>

Adding Libraries to the Built-in FO Processor (DITA-OT)

Adding Support for PDF Images

Starting with Oxygen XML Developer version 20.0, PDF image support is enabled by default in the built-in **DITA Map PDF - based on XSL-FO transformation scenario** (*on page 1118*). For older versions of Oxygen XML Developer, use the following procedures to enable this support:

1. Download the *fop-pdf-images* JAR libraries.
2. Edit the DITA-OT transformation scenario and switch to the **Advanced** tab.
3. Click the **Libraries** button and add the path to the libraries.

Adding Support for CGM Images

1. Go to the **JCGM page** and download the `jcgm-image-0.1.1.jar` and `jcgm-core-0.2.0.jar` libraries.
2. Edit the DITA-OT transformation scenario and switch to the **Advanced** tab.
3. Click the **Libraries** button and add the path to the libraries.

Adding Hyphenation Support for DITA-OT Transformation Scenarios

1. Download the pre-compiled *JAR* (on page 2270) from OFFO.
2. Edit the DITA-OT transformation scenario and switch to the **Advanced** tab.
3. Click the **Libraries** button and add the path to the `fop-hyph.jar` library.

Debugging DITA PDF Transformations

To debug the **DITA Map PDF - based on XSL-FO** transformation scenario (on page 1118), follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114), go to **XML > XML Catalog**, click **Add**, and select the file located at `DITA-OT-DIR\plugins\org.dita.pdf2\cfg\catalog.xml`. If there are other custom DITA-OT PDF customization plugins that contain XML catalogs, references to those XML catalogs might need to be added as well.
2. Open the map and create a **DITA Map PDF - based on XSL-FO** transformation scenario.
3. Edit the scenario, go to the **Parameters** tab and change the value of the `clean.temp` parameter to **no**.
4. Run the transformation scenario.
5. Open the `stage1.xml` file located in the temporary directory and **format and indent** (on page 510) it.
6. Create a transformation scenario for this XML file by associating the `topic2fo_shell_fop.xsl` stylesheet located at `DITA-OT-DIR\plugins\org.dita.pdf2.fop\xsl\fo\topic2fo_shell_fop.xsl`. If you are specifically using the RenderX XEP or Antenna House FO processors to build the PDF output, you should use the XSL stylesheets `topic2fo_shell_xep.xsl` or `topic2fo_shell_axf.xsl` located in the corresponding plugin folders.

Note:

For validation purposes, you need to add the main debugged stylesheet (usually `topic2fo_shell_fop.xsl`) to the **Main Files folder** (on page 384) in the **Project** view.

7. In the transformer drop-down menu, select the Saxon EE XSLT processor (the same processor used when the DITA-OT transformation is executed).
8. Click the **Parameters** button:
 - a. Set the `locale` parameter (e.g. with the value of `en_GB`).
 - b. Set the `work.dir.url` parameter with the value `${cfdu}`.
 - c. Set the `customizationDir.url` parameter to point to either your customization directory or to the default DITA-OT customization directory. Its value should have a URL syntax like this:

```
file:///c:/path/to/<term keyref="glossentry_dita_ot_dir"/>/plugins/org.dita.pdf2/cfg
```

9. You need to reference the extra commonly used JAR libraries by clicking the **Extensions** button and using wildcards to add a reference to all libraries in this folder: `DITA-OT\plugins\com.oxygenxml.common\lib*`.

10. Apply the transformation to continue the debugging process.

Note:

For externally configured DITA Open Toolkit installations or when using custom plugins based on the base PDF2 plugin, the paths to resources described above may need to be adjusted accordingly.

[Debugging XSLT Stylesheets and XQuery Documents \(on page 1832\)](#)

[How to Enable Debugging for FO Processor Transformations \(on page 1207\)](#)

DocBook to PDF Output Customization

When the default layout and output of the DocBook to PDF transformation needs to be customized, follow these steps:

1. Create a custom version of the DocBook title spec file.

You could start from a copy of the file `[DocBook XSL directory]/fo/titlepage.templates.xml` (for example, `[OXYGEN-INSTALL-DIR]/frameworks/docbook/xsl/fo/titlepage.templates.xml`) and customize it. More information about the spec file can be found [here](#).

2. Generate a new XSLT stylesheet from the title spec file from the previous step.

Apply `[DocBook XSL directory]/template/titlepage.xsl` to the title spec file. The result is an XSLT stylesheet (for example, `mytitlepages.xsl`).

3. Import `mytitlepages.xsl` in a [DocBook customization layer](#).

The customization layer is the stylesheet that will be applied to the XML document. The `mytitlepages.xsl` should be imported with an element like this:

```
<xsl:import href="dir-name/mytitlepages.xsl"/>
```

4. Insert a logo image in the XML document.

The path to the logo image must be inserted in the `book/info/mediaobject` structure of the XML document.

5. Apply the customization layer to the XML document.

A quick way is to duplicate the transformation scenario **DocBook PDF** that is included with Oxygen XML Developer and set the customization layer in the **XSL URL** property of the scenario ([on page 1130](#)).

Related Information:

The book [DocBook XSL: The Complete Guide](#) by Bob Stayton contains more details about customizing the PDF output.

12.

Working with XPath Expressions

XPath is a language for addressing specific parts of a document. XPath models an XML document as a tree of nodes. An XPath expression is a mechanism for navigating through and selecting nodes from the document. An XPath expression is, in a way, analogous to an SQL query used to select records from a database.

Note:

If an XPath expression is run over a JSON document, it is converted to XML and the XPath is executed over the converted XML document.

There are various types of nodes, including element nodes, attribute nodes, and text nodes. XPath defines a way to compute a string-value for each type of node.

XPath defines a library of standard functions for working with strings, numbers and boolean expressions.

Examples:

- **child::*** - Selects all children of the root node.
- **./name** - Selects all `<name>` elements and descendants of the current node.
- **/catalog/cd[price>10.80]** - Selects all the `<cd>` elements that have a `<price>` element with a value larger than 10.80.
- **//prolog** - Finds all `<prolog>` elements.
- **//prolog[@platform='mac']** - Finds all `<prolog>` elements that have the `@platform` attribute value set to **mac**.
- **//child::prolog** - Selects all `@prolog` elements and the child content.
- **/*[count(//accountNumber) > 5]** - Searches for instances where more than 5 `<accountNumber>` elements are found.
- **collection('file:/C:/path/to/folder/?select=*.xml')/*[not(//prolog)]** - Finds a list of all XML files that do not contain any `<prolog>` elements.

To find out more about XPath, see <http://www.w3.org/TR/xpath>.

[Find/Replace Dialog Box \(on page 394\)](#)

XPath Toolbar

XPath is a query language for selecting nodes from an XML document. To use XPath expressions effectively, you need a good understanding of [the XPath Core Function Library](#).

XPath Toolbar

Oxygen XML Developer provides an XPath toolbar to let you query XML documents fast and easy using XPath expressions.

Figure 414. XPath Toolbar

The XPath toolbar includes the following features:

XPath version chooser drop-down menu

You can choose the XPath version from the drop-down menu available in the left side of the toolbar. Available options include **XPath 1.0**, **XPath 2.0**, **XPath 2.0 SA**, **XPath 3.1**, **XPath 3.1 SA**.

Note:

The **XPath 2.0 SA** and **XPath 3.1 SA** options have some limitations. These options only offer information about the beginning part of the matching result. For example, if you search for an element, it will only highlight the start tag.

Warning:

Oxygen XML Developer uses Saxon to execute XPath 3.1 expressions, but implements a part of the 3.1 functions. When using a function that is not implemented, Oxygen XML Developer can return a compilation error.

XPath scope menu

Oxygen XML Developer allows you to define a scope for the XPath operation to be executed. You can choose where the XPath expression will be executed:

-  **Current file** - Currently selected file only.
-  **Project** - All the files in the project.
-  **Selected project resources** - The files selected in the project.
-  **All opened files** - All files that are opened in the application.
-  **Opened archive** - Files that are opened in the [Archive Browser view \(on page 1741\)](#).
-  **Working sets** - The selected [working sets \(on page 2273\)](#).

At the bottom of the scope menu the following scope configuration actions are available:

-  **Configure XPath working sets** - Allows you to configure and manage collections of files and folders, encapsulated in logical containers called *working sets (on page 2273)*.
-  **XPath file filter** - You can filter the files from the selected scope that will have the XPath expression executed. By default, the XPath expression will be executed only on XML or JSON files, but you can also define a set of patterns that will filter out files from the current scope. If you select the **Include archive** option, the XPath expression will be also executed on the files in any archive (including EPUB and DocX) found at the current scope.

History drop-down list

The XPath combo box keeps a history of the last 15 expressions that were used so that you can easily choose them again.

Settings menu

The following actions are available in this drop-down menu:

XPath update on cursor move

When selected and you navigate through a document, the XPath expression corresponding to the XML node at the current cursor position is displayed. For JSON documents, it displays the XPath expression for the current property.

Evaluate XPath as you type

When you select this option, the XPath expression you are composing is evaluated in real time.

Note:

This option and the automatic validation are disabled when you edit [huge documents \(on page 428\)](#) or when the scope is other than **Current file**.

XPath Options

Opens the Preferences page of the currently selected processing engine.

Switch to XPath Builder View

Opens the *XPath Builder view (on page 1735)*.

Note:

During the execution of an XPath expression, the XPath toolbar displays a  **Stop** button. Use this button to stop the XPath execution.

When you type expressions longer than 60 characters, a dialog box opens that offers you the possibility to switch to the **XPath Builder view (on page 1735)**.

Related Information:[XPath Expression Results View \(on page 1738\)](#)

XPath Builder View

The **XPath/XQuery Builder** view allows you to compose complex XPath expressions and execute them over the currently edited XML document. For XPath 2.0 / 3.1, you can use the `doc()` function to specify the source file that will have the expressions executed. When you connect to a database, the expressions are executed over that database. If you are using the **XPath/XQuery Builder** view and the current file is an XSLT document, Oxygen XML Developer executes the expressions over the XML document in the associated scenario.

**Note:**

If an XPath expression is run over a JSON document, it is converted to XML and the XPath is executed over the converted XML document.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu. You can also open it simply by pressing the **Switch to XPath Builder View** button that is located on the **XPath toolbar** (on page 1733).

The upper part of the view contains the following actions:

XPath version chooser drop-down menu

A drop-down menu that allows you to select the type of the expression you want to execute. You can choose between:

- XPath 1.0 (Xerces-driven)
- XPath 2.0, XPath 2.0 SA, XPath 3.1, XPath 3.1 SA, Saxon-HE XQuery, Saxon-PE XQuery, or Saxon-EE XQuery (all of them are Saxon-driven)
- Custom connection to XML databases that can execute XQuery expressions

**Note:**

The results returned by XPath 2.0 SA and XPath 3.1 SA have a location limited to the line number of the start element (there are no column information and no end specified).

**Note:**

Oxygen XML Developer uses Saxon to execute XPath 3.1 expressions. Since Saxon implements a part of the 3.1 functions, when using a function that is not implemented, Oxygen XML Developer returns a compilation error.

**Execute XPath button**

Use this button to start the execution of the XPath or XQuery expression you are editing. The result of the execution is displayed in the **Results view** ([on page 503](#)) view.

★ Favorites button

Allows you to save certain expressions that you can later reuse. To add an expression as a favorite, click this button and enter a name for it. The star turns yellow to confirm that the expression was saved. Expand the drop-down menu next to the star button to see all your favorites. Oxygen XML Developer automatically groups favorites in folders named after the method of execution.

🕒 History drop-down menu

Keeps a list of the last 15 executed XPath expressions. Use the ✖ **Clear history** action from the bottom of the list to remove them.

⚙️ Settings drop-down menu

Contains the following three options:

🔄 Update on cursor move

When selected and you navigate through a document, the XPath expression corresponding to the XML node at the current cursor position is displayed. For JSON documents, it displays the XPath expression for the current property.

▶ Evaluate as you type

When you select this option, the XPath expression you are composing is evaluated in real time.

Note:

This option and the automatic validation are disabled when you edit [huge documents](#) ([on page 428](#)) or when the scope is other than **Current file**.

⚙️ Options

Opens the Preferences page of the currently selected processing engine.

XPath scope menu

Oxygen XML Developer allows you to define a scope for the XPath operation to be executed. You can choose where the XPath expression will be executed:

- 📄 **Current file** - Currently selected file only.
- 📁 **Project** - All the files in the project.
- 📁 **Selected project resources** - The files selected in the project.
- 📄 **All opened files** - All files that are opened in the application.

-  **Opened archive** - Files that are opened in the **Archive Browser** view (*on page 1741*).
-  **Working sets** - The selected *working sets* (*on page 2273*).

At the bottom of the scope menu the following scope configuration actions are available:

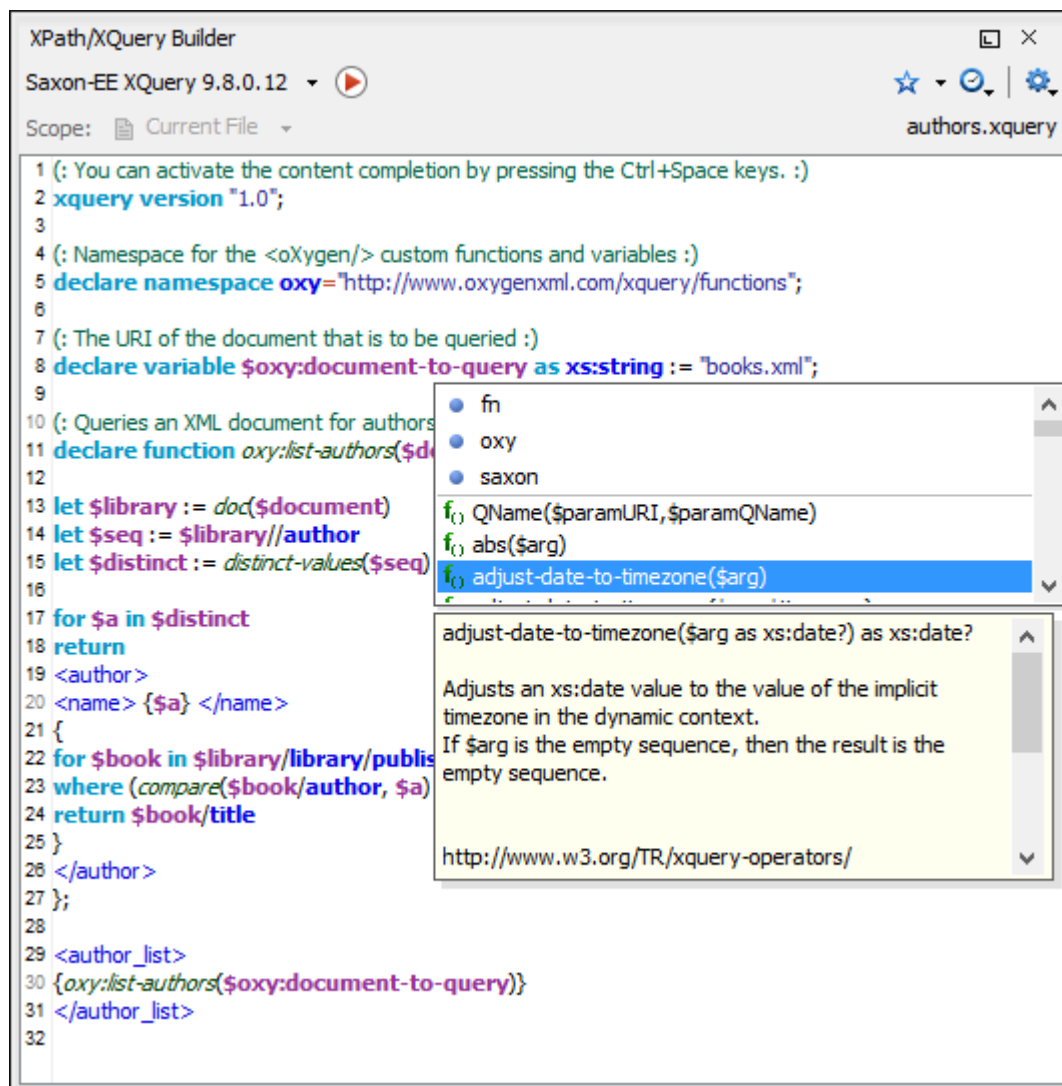

-  **Configure XPath working sets** - Allows you to configure and manage collections of files and folders, encapsulated in logical containers called *working sets* (*on page 2273*).
-  **XPath file filter** - You can filter the files from the selected scope that will have the XPath expression executed. By default, the XPath expression will be executed only on XML or JSON files, but you can also define a set of patterns that will filter out files from the current scope. If you select the **Include archive** option, the XPath expression will be also executed on the files in any archive (including EPUB and DocX) found at the current scope.

Figure 415. XPath/XQuery Builder View

While you edit an XPath or XQuery expression, Oxygen XML Developer assists you with the following features:

- **Content Completion Assistant** (on page 2267) - It offers context-dependent proposals and takes into account the cursor position in the document you are editing. The set of functions proposed by the **Content Completion Assistant** also depends on the engine version. Select the engine version from the drop-down menu available in the toolbar.
- **Syntax Highlighting** - Allows you to identify the components of an expression. To customize the colors of the components of the expression, open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Editor > Syntax Highlight** (on page 193).
- Automatic validation of the expression as you type.

**Note:**

When you type invalid syntax, a red serrated line underlines the invalid fragments.

- Function signature and documentation balloon, when the cursor is located inside a function.

The usual edit actions ( **Cut**,  **Copy**,  **Paste**, **Select All**,  **Undo**,  **Redo**) are available in the contextual menu of the top editable part of the view.

Related Information:

[XPath Expression Results View](#) (on page 1738)

XPath Expression Results View

When you run an XPath expression, Oxygen XML Developer displays the results of its execution in the **Results** view.

This view contains the following columns:

- **Description** - The result that Oxygen XML Developer displays when you run an XPath expression.
- **XPath location** - The path to the matched node.
- **Resource** - The name of the document that you run the XPath expression on.
- **System ID** - The path to the document itself.
- **Location** - The location of the result in the document.

To arrange the results depending on a column, click its header. To group the results by their resource, or by their system ID, right-click the header of any column in the **Results** view and select **Group by "Resource"** or **Group by "System ID"**. If no information regarding location is available, Oxygen XML Developer displays **Not available** in the **Location** column. Oxygen XML Developer displays the results in a valid XPath expression format.

```
- /node[value]/node[value]/node[value] -
```

The **Results** view also includes various toolbar and contextual menu actions. For more information, see [Results View](#) (on page 503).

Example:

The following snippets are taken from a DocBook book based on the DocBook XML DTD. The book contains a number of chapters. To return all the chapter nodes of the book, enter `//chapter` in the XPath expression field and press **Enter**. This action returns all the `chapter` nodes of the DocBook book in the **Results View**. Click a record in the **Results View** to locate and highlight its corresponding chapter element and all its children nodes in the document you are editing.

To find all `example` nodes contained in the `sect2` nodes of a DocBook XML document, use the following XPath expression: `//chapter/sect1/sect2/example`. Oxygen XML Developer adds a result in the **Results View** for each `example` node found in any `sect2` node.

For example, if the result of the above XPath expression is:

```
- /chapter[1]/sect1[3]/sect2[7]/example[1]
```

it means that in the edited file, the `example` node is located in the first chapter, third section level one, seventh section level 2.

Figure 416. XPath Results Highlighted in Editor Panel with Character Precision

The screenshot shows the Oxygen XML Developer interface. At the top, the XPath 2.0 expression `/personnel/person/name` is entered. Below the editor, the XML document `personal.xml` is displayed with the following content:

```

22     <family>Worker</family>
23     <given>Two</given>
24   </name>
25   <email>two@oxygenxml.com</email>
26   <link manager="Big.Boss"/>
27 </person>
28 <person id="three.worker">
29   <name>
30     <family>Worker</family>
31     <given>Three</given>
32   </name>

```

Below the XML editor, a table displays the results of the XPath query. The table has four columns: Description, XPath location, Resource, and Location. The results are as follows:

Description - 6 items	XPath location	Resource	Location
Boss	<code>/personnel[1]/person[1]/name[1]/family[1]</code>	personal.xml	6:13
Worker	<code>/personnel[1]/person[2]/name[1]/family[1]</code>	personal.xml	14:13
Worker	<code>/personnel[1]/person[3]/name[1]/family[1]</code>	personal.xml	22:13
Worker	<code>/personnel[1]/person[4]/name[1]/family[1]</code>	personal.xml	30:13
Worker	<code>/personnel[1]/person[5]/name[1]/family[1]</code>	personal.xml	38:13
Worker	<code>/personnel[1]/person[6]/name[1]/family[1]</code>	personal.xml	46:13

XPath and XML Catalogs

The evaluation of the XPath expression tries to resolve the locations of documents referenced in the expression through *XML Catalogs* (on page 2273). These catalogs are configured in the **XML Catalog preferences** (on page 203) pages and the **XML Parser preferences** (on page 205).

Example:

As an example, consider the evaluation of the `collection(URIofCollection)` function (XPath 2.0). To resolve the references from the files returned by the `collection()` function with an *XML catalog*, specify the class name of the catalog-enabled parser for parsing these collection files. The class name is `ro.sync.xml.parser.CatalogEnabledXMLReader`. Specify it as it follows:

```
let $docs := collection(iri-to-uri(  
  "file:///D:/temp/test/XQuery-catalog/mydocsdir?recurse=yes;select=*.xml;  
  parser=ro.sync.xml.parser.CatalogEnabledXMLReader"))
```

XPath Prefix Mapping

To define default mappings between prefixes (that you can use in the *XPath toolbar* (on page 1733)) and namespace URIs go to the [XPath preferences page](#) (on page 227) and enter the mappings in the **Default prefix-namespace mappings** table. The same preferences panel allows you to configure the default namespace used in XPath 2.0 expressions.

**Important:**

If you define a default namespace, Oxygen XML Developer binds this namespace to the first free prefix from the list: `default`, `default1`, `default2`, and so on. For example, if you define the default namespace `xmlns="something"` and the prefix `default` is not associated with another namespace, you can match tags without prefix in an XPath expression typed in the XPath toolbar by using the prefix `default`. To find all the `<level>` elements when you define a default namespace in the root element, use this expression: `//default:level` in the XPath toolbar.

13.

Working with Archives

Oxygen XML Developer includes a useful **Archive Browser view** (*on page 1741*) that offers the means to work with files directly from various types of archives (for example, opening and saving files directly in archives, or browsing and modifying archive structures). The archive support is available for all ZIP-type archives, including:

- ZIP archives
- EPUB books
- *JAR archives (on page 2270)*
- Office Open XML (OOXML) files
- Open Document Format (ODF) files
- *IDML files (on page 2270)*

You can transform, validate, and perform many other operations on files directly from an archive. For instance, you can transform, or validate files directly from OOXML or ODF packages, and the structure and content of the ZIP archives can be opened, edited, and saved, similar to any other ZIP archive browsing tool. Also, when browsing for a URL in various dialog boxes, you can use the  **Browse for archived file** action to browse and select files from a particular archive.

Resources

For more information about working with an EPUB archive in Oxygen XML Developer, watch our video demonstration:

<https://www.youtube.com/embed/OIGTNQwOCi8>

Browsing Archives

Oxygen XML Developer includes a helper view called the **Archive Browser** that allows you to view the contents and structure of an archive, and it offers a variety of toolbar and contextual menu actions. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

To open an archive in the **Archive Browser** view, use one of the following methods:

- Open an archive from the **Project view** (*on page 365*).
- Select an archive in one of the file chooser dialog boxes in Oxygen XML Developer (such as the **Open** dialog box).
- Drag an archive from a system file explorer and drop it in the **Archives Browser** view.

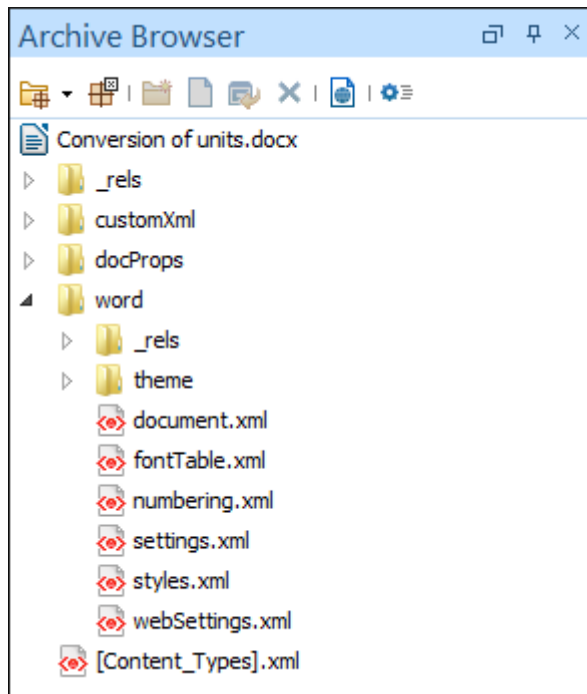

When displaying an archive, the **Archive Browser** view locks the archive file. It is then automatically unlocked when the **Archive Browser** view is closed.

Tip:

If a file is not recognized by Oxygen XML Developer as a supported archive type, you can add it in the [Archive preferences page](#) (on page 256).

Figure 417. Archive Browser

Archive Browser Toolbar Actions

The following actions are available on the **Archive Browser** toolbar:

Open Archive menu

Provides access to the **Open Archive** action that opens a new archive in the browser. If the extension is not known as an archive extension, you will be directed to the [Archive preferences page](#) (on page 256) to add a new extension. The submenu keeps a list of recently open archive files and a **Clear history** action that allows you to delete the list.

Close

Closes the browsed archive and unlocks the archive file.

Validate (available for EPUB archives only)

Checks the EPUB archive to see if its content and structure is valid.

New folder

Creates a folder as child of the selected folder in the browsed archive.

 **New file**

Creates a file as child of the selected folder in the browsed archive.

 **Add files**

Adds existing files as children of the selected folder in the browsed archive.

**Note:**

You can also add files in the archive by dragging them from the file browser or the [Project view \(on page 365\)](#) and dropping them in the **Archive Browser** view.

 **Delete**

Deletes the selected resource in the browsed archive.

 **Open in System Application**

Opens the selected resource in the default system application that is associated with that type of file.

 **Archive Options**

Opens the [Archive preferences page \(on page 256\)](#).

Archive Browser Contextual Menu Actions

The following additional actions are available from the contextual menu for resources in the **Archive Browser** view:

 **Open**

Opens a resource from the archive in the editor.

Extract

Extracts a resource from the archive in a specified folder.

 **New folder**

Creates a folder as child of the selected folder in the browsed archive.

 **New file**

Creates a file as child of the selected folder in the browsed archive.

 **Add files**

Adds existing files as children of the selected folder in the browsed archive.

**Note:**

On macOS, the **Add file** action is also available and it allows you to add one file at a time.

Rename

Renames a resource in the archive.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box (*on page 399*) that allows you to search for and replace specific pieces of text inside the archive.

Cut

Cuts the selected archive resource.

Copy

Copies the selected archive resource.

Paste

Pastes a file or folder into the archive.

Delete

Removes a file or folder from archive.

Preview

Previews an image contained in the archive. See the [Image Preview \(on page 428\)](#) topic for more details.

Copy location

Copies the URL location of the selected resource.

Refresh

Refreshes the selected resource.

Properties

Shows the properties of the selected resource.

Resources

For more information, watch our video demonstration about working with an EPUB in the **Archive Browser** view:

<https://www.youtube.com/embed/OIGTNQwOCi8>

Working with Archive Files

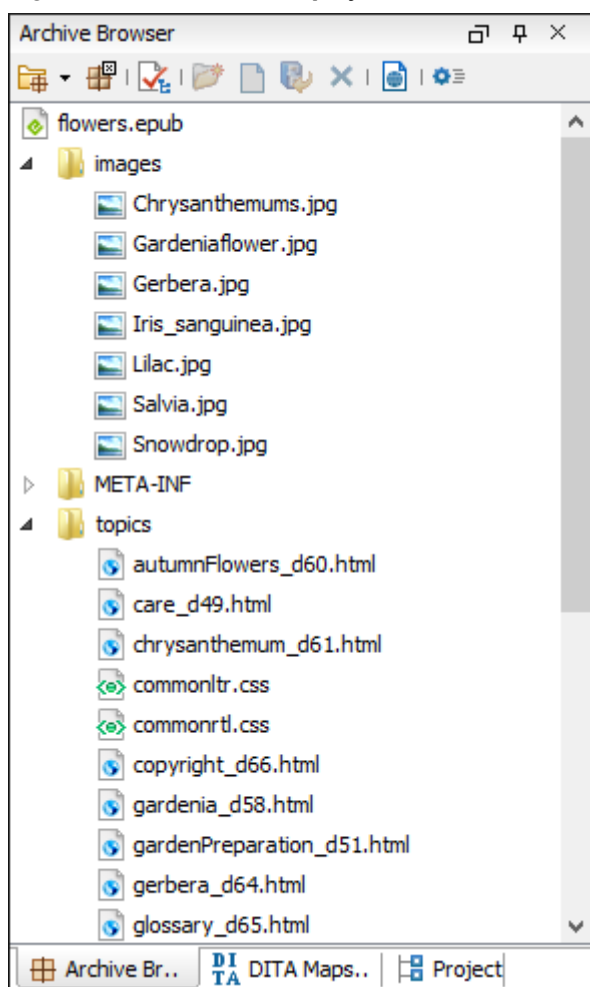

Oxygen XML Developer includes support for working with various types of archives, including the following:

- **EPUB** - An e-book file format that can be used on many types of devices, such as smart phones, tablets, e-readers, or computers.
- **OOXML** - An XML-based file format for representing spreadsheets, charts, presentations, and word processing documents.
- **ODF** - An free and open-source XML-based file format for electronic office documents, such as spreadsheets, charts, presentations, and word processing documents.

When these types of files are opened in the **Archive Browser view** (on page 1741), their internal components are expanded:

- Document content (XHTML and image files).
- Packaging files.
- Container files.

Figure 418. EPUB File Displayed in the Archive Browser View

When an archive is expanded in the **Archive Browser view** (on page 1741), you can add or delete files that compose the archive structure. All changes made to the structure of an archive are saved immediately. You can open files from within the archive to edit them in the main editing pane and save changes back to the archive. You can also use the  **Open in System Application** action to open the archive in the default system application that is associated with that type of file.

EPUB-Specific Validation

When working with EPUB archives, the **Archive Browser** (*on page 1741*) includes a  **Validate** action on the toolbar that checks the EPUB archive to make sure the structure and content are valid. Oxygen XML Developer uses the open-source *EpubCheck* validator to perform the validation. This validator detects many types of errors, including OCF container structure, OPF and OPS mark-up, as well as internal reference consistency.

Resources

For more information about working with an EPUB archive in Oxygen XML Developer, watch our video demonstration:

<https://www.youtube.com/embed/OIGTNQwOCi8>

Related information

[The Archive Browser View \(on page 1741\)](#)

[EPUB Document Type \(Framework\) \(on page 1090\)](#)

Creating an Archive

To create an archive from scratch, follow these steps:

1. Go to **File > New** or click  **New** on the main toolbar.
2. Choose your particular type of archive template. For example, select one of the **ODF**, **OOXML**, or **EPUB** templates.
3. Click **Create** and choose the name and location of the file.
4. Click **Save**.

A skeleton archive is saved on disk and open in the **Archive Browser view** (*on page 1741*).

Tip:

Use toolbar and contextual menu actions to edit, add, and remove resources from the archive. For EPUB archives, you can use the  **Validate** action to verify the integrity of the EPUB archive.

Editing and Saving Files Inside an Archive

You can open files directly from an archive in the **Archive Browser view** (*on page 1741*) and then edit them in the main editor pane. To open a file, simply double-click it or select  **Open** from the contextual menu.

When saving the file back to the archive, you are prompted to choose if you want the application to make a backup copy of the archive before saving the new content. If you choose **Never ask me again**, you will not be asked again to make backup copies. You can re-enable the pop-up message from the [Messages preferences page](#) (*on page 272*).

Migrating Archives to DITA or TEI

Certain types of archives can be converted to DITA or TEI. For example, OOXML (Office Open XML) archive files with the DOCX file extension can be migrated to DITA or TEI.

To migrate DOCX files to DITA or TEI, follow these steps:

1. Open and expand the archive in the **Archive Browser** (*on page 1741*).
2. Open the **document.xml** file contained in the archive.
3. Run one of the following built-in transformation scenarios:
 - a. **DOCX DITA** to migrate to DITA.
 - b. **DOCX TEI P5** to migrate to TEI.
4. You may need to do some manual reconfiguring to map DOCX styles to DITA or TEI content.

**Tip:**

Oxygen XML Developer also includes a built-in transformation scenario called **ODT TEI P5** for converting ODF archive files with the ODT file extension to TEI and a similar process can be used to migrate ODT files to TEI.

14.

Databases and SharePoint

Oxygen XML Developer provides support for connecting and integrating with various databases and Microsoft SharePoint. This section includes information about the database-related features in Oxygen XML Developer. It explains how to connect with the supported databases, presents the actions that are available for each type, and includes information about SharePoint integration.

Working with Databases

XML is a storage and interchange format for structured data and is supported by all major database systems. Oxygen XML Developer offers the means for managing the interaction with some of the most commonly used databases (both *Relational* and *Native XML* databases). Through this interaction, Oxygen XML Developer helps users with browsing, content editing, importing from databases, using XQuery with databases, SQL execution, and generating XML Schema from a database structure.

The types of connections that are supported in Oxygen XML Developer include:

- [IBM DB2 \(Deprecated\) \(on page 1790\)](#)
- [Microsoft SQL Server \(Deprecated\) \(on page 1754\)](#)
- [Oracle Database \(Deprecated\) \(on page 1758\)](#)
- [PostgreSQL \(Deprecated\) \(on page 1763\)](#)
- [eXist \(on page 1766\)](#)
- [MarkLogic \(Deprecated\) \(on page 1771\)](#)
- [MySQL \(Deprecated\) \(on page 1781\)](#)
- [Generic JDBC \(on page 1783\)](#)
- [JDBC-ODBC \(on page 1784\)](#)
- [BaseX \(on page 1785\)](#)
- [WebDAV \(on page 1795\)](#)
- [Microsoft SharePoint \(on page 1808\)](#)

Related information

[Integration with Microsoft SharePoint \(on page 1808\)](#)

Data Source Explorer View

The **Data Source Explorer** view displays your database connections. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

You can connect to a database simply by expanding the connection node (click the  connection). The database structure can be expanded to resource level, or even all the way to column level for tables inside

relational databases. Oxygen XML Developer supports multiple simultaneous database connections and the connection tree in the **Data Source Explorer** view provides an easy method for browsing them.

Figure 419. Data Source Explorer View

The objects (nodes) that are displayed in the **Data Source Explorer** view depend on the connection type and structure of the database. Various contextual menu actions are available for each hierarchical level and for some connections you can add or move resources in a container by simply dragging them from the **Project view** (on page 365), a file browsing application, or another database.

Toolbar Actions

The following actions are available in the toolbar of this view:

Filters

Opens the **Data Sources / Table Filters preferences page** (on page 246), allowing you to decide which table types are displayed in the **Data Source Explorer** view.

Configure Database Sources

Opens the **Data Sources preferences page** (on page 242) where you can configure both data sources and connections.

Database-Specific Contextual Menu Actions

Each specific type of database will also include its own specific contextual menu actions in the **Data Source Explorer** view. The actions depend on the type of database, the type of node, or the hierarchical level of the node where the contextual menu is invoked.

For more information on the specific actions that are available, see the topics in this section for each specific type of database.

Related Information:

[Data Sources Preferences \(on page 242\)](#)

Table Explorer View

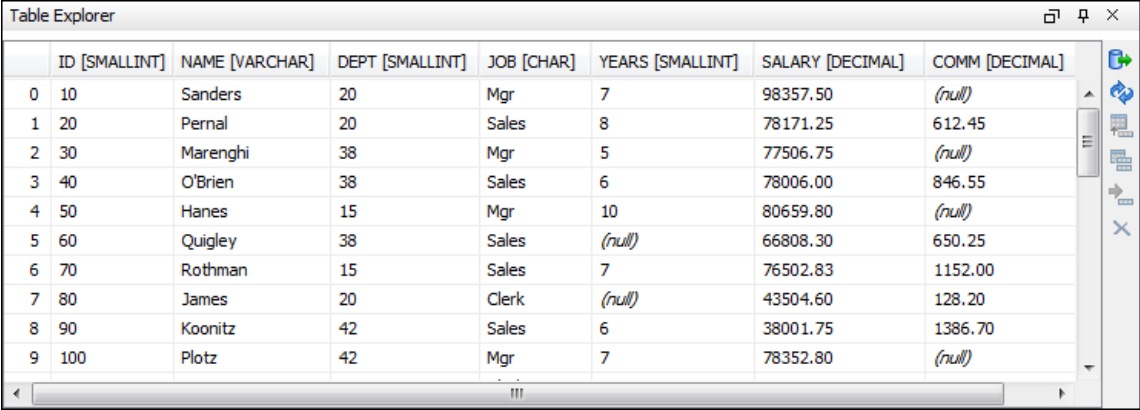

Relational databases tables in the **Data Source Explorer view (on page 1748)** can be displayed and edited in the **Table Explorer** view by selecting the **Edit** action from the contextual menu of a  **Table** node or by double-clicking one of its fields. To modify the content of a cell, double-click it and start typing. When editing is complete, Oxygen XML Developer attempts to update the database with the new cell content.

Figure 420. Table Explorer View

	ID [SMALLINT]	NAME [VARCHAR]	DEPT [SMALLINT]	JOB [CHAR]	YEARS [SMALLINT]	SALARY [DECIMAL]	COMM [DECIMAL]
0	10	Sanders	20	Mgr	7	98357.50	(null)
1	20	Pernal	20	Sales	8	78171.25	612.45
2	30	Marenghi	38	Mgr	5	77506.75	(null)
3	40	O'Brien	38	Sales	6	78006.00	846.55
4	50	Hanes	15	Mgr	10	80659.80	(null)
5	60	Quigley	38	Sales	(null)	66808.30	650.25
6	70	Rothman	15	Sales	7	76502.83	1152.00
7	80	James	20	Clerk	(null)	43504.60	128.20
8	90	Koonitz	42	Sales	6	38001.75	1386.70
9	100	Plotz	42	Mgr	7	78352.80	(null)

You can sort the content of a table by one of its columns by clicking its column header.

Note the following:

- The first column is an index (not part of the table structure).
- Every column header contains the field name and its data type.
- The primary key columns are marked with this symbol:  .
- Multiple tables are presented in a tabbed manner.

For performance issues, you can set the maximum number of cells that are displayed in the **Table Explorer** view (using the **Limit the number of cells** option in the **Data Sources Preferences page (on page 246)**). If a table that has more cells than the value set in the options is displayed in the **Table Explorer** view, a warning dialog box informs you that the table is only partially shown.

You are notified if the value you have entered in a cell is not valid (and thus cannot be updated).

- If the content of the edited cell does not belong to the data type of the column, the cell is marked by a red square and remains in an editing state until a correct value is inserted. For example, in the following figure `propID` contains `LONG` values. If a character or string is inserted, the cell will look like this:

Figure 421. Cell Containing an Invalid Value

	propID [LONG]	setting [VARCHAR]	value [VARCHAR]
0	8	imagePath	/home/bogdan/projects/camera/public_html/Camera/img
1	abc	maxBadPass	3
2	3	pageRefresh	5
3	4	lastUpdate	June 7th, 2002
4	5	adminEmail	bogdan@oxygenxml.com
5	7	moviePath	/home/bogdan/projects/camera/public_html/Camera/movie
6	6	timeoutReceivingData	300
7	13	firmwareUploadPort	3002
8	11	internalFirmwareUploadHost	10.0.0.16
9	9	uploadPath	/home/bogdan/projects/camera/public_html/Camera/tsk
10	10	imageStreamPath	/home/bogdan/projects/camera/public_html/Camera/imgStream

- If the constraints of the database are not met (for instance, primary key constraints), an information dialog box will appear, notifying you of the reason the database has not been updated. For example, in the table below, trying to set the second record in the primary key `propID` column to 8, results in a duplicate entry error since that value has already been used in the first record:

Figure 422. Duplicate Entry for Primary Key

	propID [LONG]	setting [VARCHAR]	value [VARCHAR]
0	8	imagePath	/home/bogdan/projects/camera/public_html/Camera/img
1	8	maxBadPass	3
2	3	pageRefresh	5
3	4	lastUpdate	June 7th, 2002
4	5	adminEmail	bogdan@oxygenxml.com
5	7	moviePath	/home/bogdan/projects/camera/public_html/Camera/movie
6	6	timeoutReceivingData	300
7	13	firmwareUploadPort	3002
8	11	internalFirmwareUploadHost	10.0.0.16
9	9	uploadPath	/home/bogdan/projects/camera/public_html/Camera/tsk
10	10	imageStreamPath	/home/bogdan/projects/camera/public_html/Camera/imgStream

Table Explorer Contextual Menu Actions

Common editing actions (✂ **Cut**, 📄 **Copy**, 📄 **Paste**, **Select All**, ↶ **Undo**, ↷ **Redo**) are available in the contextual menu of an edited cell.

The contextual menu, available on every cell in the **Table Explorer** view, also includes the following actions:

Set NULL

Sets the content of the cell to **null**. This action is not available for columns that cannot have a value of **null**.

 **Insert row**

Inserts an empty row in the table.

 **Duplicate row**

Makes a copy of the selected row and adds it in the **Table Explorer** view. Note that the new row will not be inserted in the database table until all conflicts are resolved.

 **Commit row**

Commits the selected row.

 **Delete row**

Deletes the selected row.

 **Copy**

Copies the content of the cell.

 **Paste**

Pastes copied content into the selected cell.

Table Explorer Toolbar Actions

The toolbar of the **Table Explorer** view also includes the following actions:

 **Export to XML**

Opens the **Export Criteria** dialog box (a thorough description of this dialog box can be found in the [Import from database \(on page 1825\)](#) chapter).

 **Refresh**

Performs a refresh for the sub-tree of the selected node.

 **Insert row**

Inserts an empty row in the table.

 **Duplicate row**

Makes a copy of the selected row and adds it in the **Table Explorer** view. Note that the new row will not be inserted in the database table until all conflicts are resolved.

 **Commit row**

Commits the selected row.

 **Delete row**

Deletes the selected row.

Related Information:

[Data Source Explorer View \(on page 1748\)](#)

Database Connection Support

Oxygen XML Developer offers support for a variety of *Relational* and *Native XML* database connections. The database drivers and connections for various types of database are configured in the [Data Sources preferences page \(on page 242\)](#) and once configured, the database connections can be viewed and managed in the [Data Source Explorer view \(on page 1748\)](#). Oxygen XML Developer also includes a [Database perspective \(on page 313\)](#) that helps you to manage databases.

The database support in Oxygen XML Developer offers a variety of capabilities, including:

- Browsing the structure of databases in the [Data Source Explorer view \(on page 1748\)](#).
- Viewing relational tables in the [Table Explorer view \(on page 1750\)](#).
- Executing SQL queries against databases.
- Calling stored procedures with input and output parameters.
- XQuery execution with databases.
- Exporting data from databases to XML.

Relational Database Support

Relational databases use a relational model and are based on tables linked by a common key. Oxygen XML Developer offers support for the most commonly used relational databases, including:

- IBM DB2 (Deprecated)
- Oracle 11g (Deprecated)
- Microsoft SQL Server (Deprecated)
- PostgreSQL (Deprecated)
- MySQL (Deprecated)

Oxygen XML Developer also offers generic support (table browsing and execution of SQL queries) for any JDBC-compliant database (for example, *MariaDB*).

Native XML Database Support

Native XML databases have an XML-based internal model and their fundamental unit of storage is XML. They use XML as an interface to specify documents as tree structured data that may contain unstructured text, but on disk the data is stored as optimized binary files. This makes query and retrieval processes faster. Oxygen XML Developer offers support for the most commonly used native XML databases, including:

- eXist
- MarkLogic (Deprecated)
- Oracle XML DB (Deprecated)
- Base X

Related information[WebDAV Connections \(on page 1795\)](#)[Integration with Microsoft SharePoint \(on page 1808\)](#)

Microsoft SQL Server Database Connections (Deprecated)

Oxygen XML Developer includes support for Microsoft SQL Server database connections. Oxygen XML Developer allows you to browse the structure of a SQL Server database in the **Data Source Explorer view** ([on page 1748](#)), open tables in the **Table Explorer view** ([on page 1750](#)), and perform various operations on the resources in the repository.

Configuring a Microsoft SQL Server Connection

To configure the support for a Microsoft SQL Server database, follow this procedure:

1. Download the appropriate MS SQL JDBC driver from the Microsoft website: <https://docs.microsoft.com/en-us/sql/connect/jdbc/release-notes-for-the-jdbc-driver?view=sql-server-ver16#102>.
2. Configure MS SQL Server *Data Source* drivers ([on page 1754](#)).
3. Configure a MS SQL Server *Connection* ([on page 1755](#)).
4. To view your connection, go to the **Data Source Explorer view** ([on page 1748](#)) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** ([on page 2271](#)).

How to Configure Microsoft SQL Server Data Source Drivers

**Note:**

Available in the Enterprise edition only.

To configure a data source for connecting to a Microsoft SQL server, follow these steps:

1. Download the appropriate MS SQL JDBC driver from the Microsoft website: <https://docs.microsoft.com/en-us/sql/connect/jdbc/release-notes-for-the-jdbc-driver?view=sql-server-ver16#102>.
2. Open the **Preferences** dialog box (**Options > Preferences**) ([on page 114](#)) and go to **Data Sources**.
3. Click the **+ New** button in the **Data Sources** panel.

The dialog box for configuring a data source is opened.

Figure 423. Data Source Drivers Configuration Dialog Box

4. Enter a unique name for the data source.
5. Select **SQLServer** in the driver **Type** drop-down menu.
6. Click the **Add Files** button and select the Microsoft SQL Server driver file that you downloaded.
The SQL Server driver file is called `sqljdbc.jar`.
7. Select the most appropriate **Driver class**.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to [configure your Microsoft SQL Server connection \(on page 1755\)](#).

How to Configure a Microsoft SQL Server Connection

Note:

The support to configure a Microsoft SQL Server connection is available in the Enterprise edition only.

To configure a connection to a Microsoft SQL Server, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Data Sources**.
2. Click the **+ New** button in the **Connections** panel.

The dialog box for configuring a database connection is displayed.

Figure 424. Connection Configuration Dialog Box

3. Enter a unique name for the connection.
4. Select the *SQL Server* data source in the **Data Source** drop-down menu.
5. Enter the connection details.

- a. Enter the URL of the SQL Server server.

If you want to connect to the server using Windows integrated authentication, you must add **;integratedSecurity=true** to the end of the URL. The URL will look like this:

```
jdbc:sqlserver://localhost;instanceName=SQLEXPRESS;integratedSecurity=true;
```

**Note:**

For integrated authentication, leave the **User** and **Password** fields empty.

- b. Enter the user name for the connection to the SQL Server.
 - c. Enter the password for the connection to the SQL Server.
6. Click the **OK** button to finish the connection configuration.
 7. To view your connection, go to the **Data Source Explorer** view (*on page 1748*) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (*on page 2271*).

Microsoft SQL Server Contextual Menu Actions

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the **Data Source Explorer view** (*on page 1748*), depending on the node where it is invoked:

Refresh

Performs a refresh on the selected node.

Disconnect (available on **Connection nodes**)

Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

Configure Database Sources (available on **Connection nodes**)

Opens the **Data Sources preferences page** (*on page 242*) where you can configure both data sources and connections.

Edit (available on **Table nodes**)

Opens the selected table in the **Table Explorer view** (*on page 1750*).

Export to XML (available on **Table nodes**)

Opens the **Export Criteria** dialog box (a thorough description of this dialog box can be found in the **Import from Database** (*on page 1825*) chapter).

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the **Data Source Explorer view** (*on page 1748*), the resource level nodes in Microsoft SQL Server connections include the following additional contextual menu action:

XML Schema Repository Level Nodes

Register

Opens a dialog box for adding a new schema file in the DB XML repository. In this dialog box, you enter a collection name and the necessary schema files. Schema dependencies management can be done by using the **Add** and **Remove** buttons.

Schema Level Nodes

Add

Adds a new schema to the XML Schema files.

Unregister

Removes the selected schema from the XML Schema Repository.

View

Opens the selected schema in Oxygen XML Developer.

Oracle Database Connections (Deprecated)

The Oracle database is a common relational type of database system. Oxygen XML Developer comes with built-in support for the 11g version of the database system. The Oracle database also includes a Oracle XML DB component that adds native XML support. Oxygen XML Developer allows you to browse Oracle repositories in the **Data Source Explorer** view (*on page 1748*), open tables in the **Table Explorer** view (*on page 1750*), and perform various operations on the resources in the repository.

Figure 425. Oracle Database Connection

Related Information:

[Using XQuery with Oracle XML DB](#)

Configuring an Oracle 11g Database Connection

To configure the support for a Oracle 11g database, follow this procedure:

1. Go to <http://www.oracle.com/technetwork/database/enterprise-edition/jdbc-112010-090769.html> and download the Oracle 11g JDBC driver called `ojdbc6.jar`.
2. [Configure Oracle 11g Data Source drivers](#) (*on page 1759*).
3. [Configure an Oracle 11g Connection](#) (*on page 1760*).
4. To view your connection, go to the **Data Source Explorer** view (*on page 1748*) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (*on page 2271*).

How to Configure Oracle 11g Data Source Drivers

Note:

Available in the Enterprise edition only.

To configure a data source for connecting to an Oracle 11g server, follow these steps:

1. Go to <http://www.oracle.com/technetwork/database/enterprise-edition/jdbc-112010-090769.html> and download the Oracle 11g JDBC driver called `ojdbc6.jar`.
2. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Data Sources**.
3. Click the **+** **New** button in the **Data Sources** panel.

The dialog box for configuring a data source is opened.

Figure 426. Data Source Drivers Configuration Dialog Box

4. Enter a unique name for the data source.
5. Select *Oracle* in the driver **Type** drop-down menu.
6. Click the **Add Files** button and select the Oracle driver file that you downloaded.
The Oracle driver file is called `ojdbc5.jar`.
7. Select the most appropriate **Driver class**.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to [configure your Oracle connection \(on page 1760\)](#).

How to Configure an Oracle 11g Connection

**Note:**

Available in the Enterprise edition only.

To configure a connection to an Oracle 11g server, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Data Sources**.
2. Click the **+** **New** button in the **Connections** panel.

The dialog box for configuring a database connection is displayed.

Figure 427. Connection Configuration Dialog Box

3. Enter a unique name for the connection.
4. Select the *Oracle 11g* data source in the **Data Source** drop-down menu.
5. Enter the connection details.
 - a. Enter the URL of the Oracle server.
 - b. Enter the user name for the connection to the Oracle server.
 - c. Enter the password for the connection to the Oracle server.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view (on page 1748) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (on page 2271).

Oracle Database Contextual Menu Actions

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the **Data Source Explorer view** (*on page 1748*), depending on the node where it is invoked:

Refresh

Performs a refresh on the selected node.

Disconnect (available on **Connection nodes**)

Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

Configure Database Sources (available on **Connection nodes**)

Opens the **Data Sources preferences page** (*on page 242*) where you can configure both data sources and connections.

Edit (available on **Table nodes**)

Opens the selected table in the **Table Explorer view** (*on page 1750*).

Export to XML (available on **Table nodes**)

Opens the **Export Criteria** dialog box (a thorough description of this dialog box can be found in the *Import from Database* (*on page 1825*) chapter).

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the **Data Source Explorer view** (*on page 1748*), the various nodes in Oracle database connections include the following additional contextual menu actions:

XML Schema Repository Level Nodes

Register

Opens a dialog box for adding a new schema file in the XML repository. To add an XML Schema, enter the schema URI and location on your file system. *Local* scope means that the schema is visible only to the user who registers it. *Global* scope means that the schema is public.

Note:

Registering a schema may involve dropping/creating types. Hence you need type-related privileges such as DROP TYPE, CREATE TYPE, and ALTER TYPE. You need privileges to delete and register the XML schemas involved in the registering process. You need all privileges on XMLType tables that conform to the registered schemas. For XMLType columns, the ALTER TABLE privilege is needed on corresponding tables. If there are

schema-based XMLType tables or columns in other database schemas, you need privileges such as the following:

- **CREATE ANY TABLE**
- **CREATE ANY INDEX**
- **SELECT ANY TABLE**
- **UPDATE ANY TABLE**
- **INSERT ANY TABLE**
- **DELETE ANY TABLE**
- **DROP ANY TABLE**
- **ALTER ANY TABLE**
- **DROP ANY INDEX**

To avoid having to grant all these privileges to the schema owner, Oracle recommends that the registration be performed by a DBA if there are XML schema-based XMLType table or columns in other user database schemas.

XML Repository Level Nodes

Add container

Adds a new child container to the current one.

Add resource

Adds a new resource to the folder.

Container Level Nodes

Add container

Adds a new child container to the current one.

Add resource

Adds a new resource to the folder.

Delete

Deletes the current container.

Properties

Shows various properties of the current container.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Developer downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view, Oxygen XML Developer will detect that there was a change and will ask if you want to upload the edited resource to the server.

Rename

Renames the current resource

Move

Moves the current resource to a new container (also available through drag and drop).

 **Delete**

Deletes the current container.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

 **Properties**

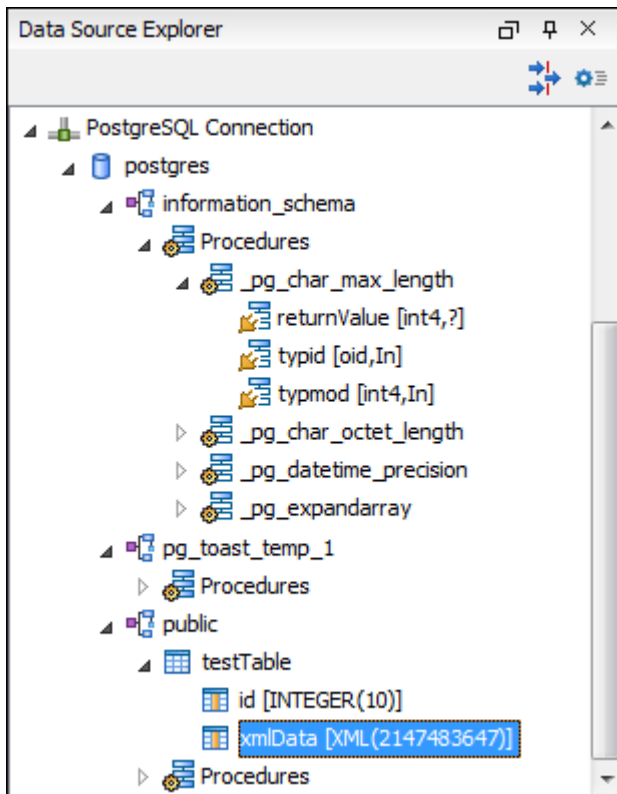

Shows various properties of the current container.

Compare

Compares two selected resources using the **Compare Files** tool (*on page 433*).

PostgreSQL Database Connections (Deprecated)

Oxygen XML Developer includes support for PostgreSQL database connections. Oxygen XML Developer allows you to browse the structure of a PostgreSQL database in the **Data Source Explorer** view (*on page 1748*), open tables in the **Table Explorer** view (*on page 1750*), and perform various operations on the resources in the repository.

Figure 428. PostgreSQL Database Connection

Configuring a PostgreSQL Database Connection

To configure the support for a PostgreSQL database, follow this procedure:

1. Go to <https://jdbc.postgresql.org/download/> and download the PostgreSQL JDBC driver specific for your server version.
2. *Configure PostgreSQL Data Source drivers (on page 1764).*
3. *Configure a PostgreSQL Connection (on page 1765).*
4. To view your connection, go to the **Data Source Explorer** view (*on page 1748*) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective (on page 2271)**.

How to Configure PostgreSQL Data Source Drivers

To configure a data source for connecting to a PostgreSQL server, follow these steps:

1. Go to <https://jdbc.postgresql.org/download/> and download the PostgreSQL JDBC3 driver specific for your server version.
2. Open the **Preferences** dialog box (**Options > Preferences**) (*on page 114*) and go to **Data Sources**.
3. Click the **+ New** button in the **Data Sources** panel.

The dialog box for configuring a data source is opened.

4. Enter a unique name for the data source.

5. Select *PostgreSQL* in the driver **Type** drop-down list.
6. Click the **Add Files** button and select the PostgreSQL driver file that you downloaded.
7. Select the most appropriate **Driver class**.
8. Click the **OK** button to finish the data source configuration.
9. Continue to [configure your PostgreSQL connection \(on page 1765\)](#).

How to Configure a PostgreSQL Connection

To configure a connection to a PostgreSQL server, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Data Sources**.
2. Click the **+ New** button in the **Connections** panel.

The dialog box for configuring a database connection is displayed.

Figure 429. Connection Configuration Dialog Box

3. Enter a unique name for the connection.
4. Select the *PostgreSQL* data source in the **Data Source** drop-down menu.
5. Enter the connection details.
 - a. Enter the URL of the PostgreSQL server.
 - b. Enter the user name for the connection to the PostgreSQL server.
 - c. Enter the password for the connection to the PostgreSQL server.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view (on page 1748) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (on page 2271).

PostgreSQL Contextual Menu Actions

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the **Data Source Explorer view** (*on page 1748*), depending on the node where it is invoked:

Refresh

Performs a refresh on the selected node.

Disconnect (available on **Connection nodes**)

Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

Configure Database Sources (available on **Connection nodes**)

Opens the **Data Sources preferences page** (*on page 242*) where you can configure both data sources and connections.

Edit (available on **Table nodes**)

Opens the selected table in the **Table Explorer view** (*on page 1750*).

Export to XML (available on **Table nodes**)

Opens the **Export Criteria** dialog box (a thorough description of this dialog box can be found in the **Import from Database** (*on page 1825*) chapter).

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the **Data Source Explorer view** (*on page 1748*), the resource level nodes in PostgreSQL connections include the following additional contextual menu action:

Resource Level Nodes

Compare

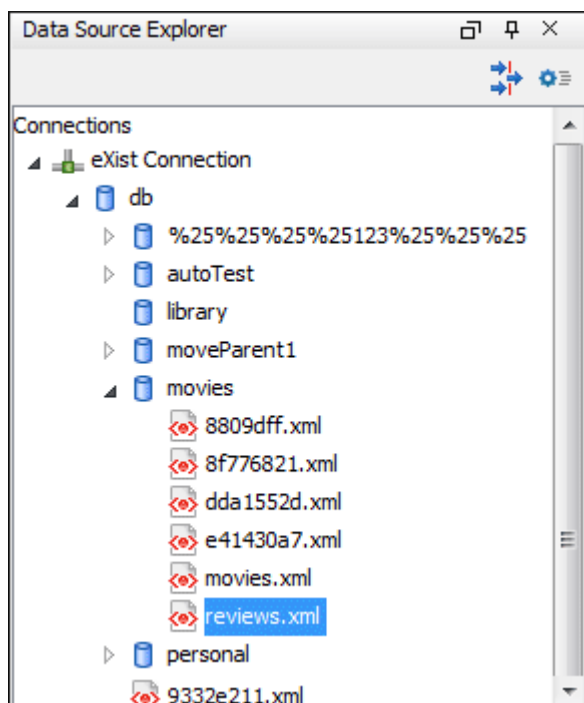

Compares two selected resources using the **Compare Files tool** (*on page 433*).

eXist Database Connections

Attention:

Oxygen XML Developer has been tested to work with the latest stable *eXist* version (version 6). It might work with previous *eXist* versions, but they have not been tested and cannot be guaranteed to be compatible.

Oxygen XML Developer includes support for *eXist* database connections. Oxygen XML Developer allows you to browse the structure of a *eXist* database in the **Data Source Explorer view** (*on page 1748*) and perform various operations on the resources in the repository.

Figure 430. eXist Database Connection

Configuring an eXist Database Connection

There are two ways to configure the support for an *eXist* database:

- Use the dedicated **Create eXist-db XML connection** wizard.
- Use the **Data Sources** preferences page to manually configure your connection.

How to Configure an eXist Connection Using the Built-in Wizard

To configure a connection for an *eXist* database using the dedicated **Create eXist-db XML connection** wizard, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114), go to **Data Sources** and click the **Create eXist-db XML connection** link.
2. Enter your connection details in the connection wizard and click **OK**.

Important:

To create an *eXist* connection using this wizard, Oxygen XML Developer expects the `exist/webstart/exist.jnlp` path to be accessible at the provided **Host** and **Port**.

Attention:

The connection details dialog box has a **Libraries** path where it will download JAR libraries from the *eXist* server. If you are using Oxygen XML Developer version 25.0 or older with *eXist* version 6.2.0 or newer and the final connection to the server does not work, you need to remove

! all libraries with the pattern `log4j-*.jar` from the folder of downloaded libraries because they may interfere with the logging in Oxygen XML Developer.

- To view your connection, go to the **Data Source Explorer view** (*on page 1748*) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (*on page 2271*).

! **Attention:**

Oxygen XML Developer has been tested to work with the latest stable *eXist* version (version 6). It might work with previous *eXist* versions, but they have not been tested and cannot be guaranteed to be compatible.

How to Configure an eXist Connection Manually

! **Attention:**

For this manual procedure, you need to already have an *eXist* database server installed. Also, Oxygen XML Developer has been tested to work with the latest stable *eXist* version (version 6). It might work with previous *eXist* versions, but they have not been tested and cannot be guaranteed to be compatible.

i **Tip:**

There is an easier way to configure an *eXist* database connection using a built-in wizard. For more information, see [How to Configure an eXist Connection Using the Built-in Wizard](#) (*on page 1767*).

Step 1: Configure eXist Data Source Drivers

Oxygen XML Developer supports *eXist* database server versions up to and including version 5.0. To configure a data source for an *eXist* database, follow these steps:

- Open the **Preferences** dialog box (**Options > Preferences**) (*on page 114*) and go to **Data Sources**.
- Click the **+ New** button in the **Data Sources** panel.
- Enter a unique name for the data source.
- Select *eXist* from the driver **Type** drop-down menu.
- Click the **Add Files** button to add the *eXist* driver files. The following driver files should be added and they are found in the installation directory of the *eXist* database server. Make sure you copy the files from the installation of the *eXist* server where you want to connect from Oxygen XML Developer.
 - The `exist.jar` file located in the base directory (if present, depending on the server version).
 - All JAR files in the `lib/core/` directory (if present) or all JAR files located in the `lib` directory except for the JAR libraries with the pattern `log4j-*.jar`, which may interfere with the logging in Oxygen XML Developer.
- Click the **OK** button to finish the data source configuration.

Step 2: Configure an eXist Connection

To configure a connection to an *eXist* database, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (*on page 114*) and go to **Data Sources**.
2. Click the **+** **New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select a previously configured *eXist* data source from the **Data Source** drop-down menu.
5. Enter the connection details:
 - a. Set the URI to the installed *eXist* engine in the **XML DB URI** field.
 - b. Set the user name in the **User** field.
 - c. Set the password in the **Password** field.
 - d. Enter the start collection in the **Collection** field.

eXist organizes all documents in hierarchical collections. Collections are like directories. They are used to group related documents together. This text field allows the user to set the default collection name.

6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer view** (*on page 1748*) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (*on page 2271*).

Resources

For more information about running XQuery against an *eXist* XML database, watch our video demonstration:

<https://www.youtube.com/embed/Yoc5h1zSddA>

eXist Contextual Menu Actions

While browsing *eXist* database connections in the **Data Source Explorer view** (*on page 1748*), the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources

Opens the **Data Sources preferences page** (*on page 242*) where you can configure both data sources and connections.

Disconnect (when connected)

Stops the connection.

Refresh

Performs a refresh on the selected node.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box (*on page 399*) that allows you to find and replace text in multiple files from the connection.

Container Level Nodes

New File or New Document

Creates a new file on the connection, in the current folder.

New Collection

Creates a new collection on the connection.

Import Folders

Imports folders on the server.

Import Files

Allows you to add a new file on the connection, in the current folder.

Export

Allows you to export the folder on the remote connection to a local folder.

Cut

Removes the current selection and places it in the clipboard.

Paste

Pastes the copied selection.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box (*on page 399*) that allows you to find and replace text in multiple files from the connection.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Developer downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the

focus back to the **Data Source Explorer** view, Oxygen XML Developer will detect that there was a change and will ask if you want to upload the edited resource to the server.

Save As

Allows you to save the selected resource as a file on disk.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box (*on page 399*) that allows you to find and replace text in multiple files from the connection.

Compare

Compares two selected resources using the **Compare Files** tool (*on page 433*).

MarkLogic Database Connections (Deprecated)

Oxygen XML Developer Enterprise edition includes support for MarkLogic database connections. Once you [configure a MarkLogic connection \(on page 1773\)](#), you can use the **Data Source Explorer** view (*on page 1748*) to display all the application servers that are configured on the MarkLogic server. You can expand each application server and view all of its configured modules, and the **Data Source Explorer** view (*on page 1748*) allows you to open and edit these modules.

**Note:**

To browse modules located in a database, directory properties must be associated with them. These directory properties are generated automatically if the *directory creation* property of the database is set to automatic. If this property is set to **manual** or **manual-enforced**, add the directory properties of the modules manually, using the XQuery function `xdrm:directory-create()`. For example, for two documents with the `/code/modules/main.xqy` and `/code/modules/imports/import.xqy` IDs, run the following query:

```
(xdrm:directory-create('/code/modules/'), xdrm:directory-create('/code/modules/imports/'))
```

For more information about directory properties, go to: <http://blakeley.com/blogfile/2012/03/19/directory-assistance/>.

MarkLogic and XQuery

MarkLogic connections can be used in conjunction with XQuery scripts to debug and solve problems with XQuery transformations. XQuery modules can also be validated using a MarkLogic server to allow you to spot possible issues without the need of actually executing the XQuery script.

When [debugging XQuery files with MarkLogic \(on page 1776\)](#), you can use the **Data Source Explorer view (on page 1748)** to open the files from the application server that is involved in the debugging process. By using the **Data Source Explorer view (on page 1748)**, any imported modules are better identified by the MarkLogic server. You can also [use step actions and breakpoints \(on page 1778\)](#) in the modules to help identify problems.

Modules Container

For each Application server (for example: *Bill (HTTP port:8060)*), you have access to the XQuery modules that are visible to that server. When editing, executing, or debugging XQuery it is recommended to open the XQuery files from this  **Modules** container.

**Note:**

You can also manage resources for a MarkLogic database through a WebDAV connection, although it is not recommended if you work with XQuery files since imported modules may not be resolved correctly.

Requests Container

Each MarkLogic application server includes a  **Requests** container. In this container, Oxygen XML Developer displays both queries that are stopped for debugging purposes and queries that are still running. To clean up the entire **Requests** container at the end of your session, right-click it and use the **Cancel all requests action (on page 1780)**.

Figure 431. MarkLogic Connection in Data Source Explorer

Configuring a MarkLogic Database Connection

Note that this feature is available in Oxygen XML Developer Enterprise edition only.

Follow this procedure to configure the support for a MarkLogic database connection:

1. Download the MarkLogic driver from [MarkLogic Community site](#).
2. [Configure MarkLogic Data Source drivers \(on page 1773\)](#).
3. [Configure a MarkLogic Connection \(on page 1774\)](#).
4. To view your connection, go to the **Data Source Explorer** view [\(on page 1748\)](#) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective (on page 2271)**.

Related Information:

[MarkLogic Development in Oxygen XML Developer \(on page 1775\)](#)

How to Configure MarkLogic Data Source Drivers

Notes:

- Available in the Enterprise edition only.
- Oxygen XML Developer supports MarkLogic version 4.0 or later.

To configure a data source for MarkLogic, follow this procedure:

1. Download the **XCC Java distribution** zip file from: <http://developer.marklogic.com/products/xcc>.
2. Unzip the downloaded archive.

3. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Data Sources**.
4. Click the **+ New** button in the **Data Sources** panel.
5. Enter a unique name for the data source.
6. Select *MarkLogic* from the driver **Type** drop-down list.
7. Click the **Add Files** button and select the MarkLogic driver file from the **lib** folder of the archive that you downloaded and unzipped. The driver file name is `marklogic-xcc-{server_version}.jar`, where *{server_version}* is the MarkLogic server version.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to [configure your MarkLogic Connection](#) (on page 1774).

How to Configure a MarkLogic Connection

Notes:

- Available in the Enterprise edition only.
- Oxygen XML Developer supports MarkLogic version 4.0 or later.

To configure a connection to a MarkLogic database, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Data Sources**.
2. Click the **+ New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select a previously configured MarkLogic data source from the **Data Source** drop-down menu.
5. Enter the connection details.
 - a. The host name or IP address of the installed MarkLogic engine in the **XDBC Host** field.
Oxygen XML Developer uses XCC connector to interact with MarkLogic XDBC server and requires the basic authentication schema to be set. Starting with version MarkLogic 4.0 the default authentication method when you create an HTTP or WebDAV Server is *digest*, so make sure to change it to *basic*.
 - b. Set the port number of the MarkLogic engine in the **Port** field. A MarkLogic XDBC application server must be configured on the server on this port. This XDBC server will be used to process XQuery expressions against the server. Later, if you want to change the XDBC server, instead of editing the configuration just use the **Use it to execute queries** action (on page 1779) from Data Source Explorer.
 - c. Set the user name to access the MarkLogic engine in the **User** field.
 - d. Set the password to access the MarkLogic engine in the **Password** field.

- e. Optionally, in the **WebDAV URL** field, set the URL used for browsing the MarkLogic database in the **Data Source Explorer view** ([on page 1748](#)).

The **Database** field specifies the database that will have the XQuery expressions executed. If you set this option to default, the database associated to the application server of the configured port is used.

6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer view** ([on page 1748](#)) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** ([on page 2271](#)).

MarkLogic Development in Oxygen XML Developer

The Oxygen XML Developer support for MarkLogic includes features designed for developers, such as debugging XQuery transformations, remote and collaborative debugging, XQuery editing and validation, and an [XQuery builder](#) ([on page 807](#)) that helps to improve productivity.

Working with XQuery Files

MarkLogic supports working with XQuery files to create queries over stored XML content. You can open an XQuery file, configure a transformation scenario to match your MarkLogic connection, write the XQuery, and then execute it.

When editing XQuery modules stored on the MarkLogic server, the [Outline view](#) ([on page 806](#)) collects and displays all the functions from all imported modules. The [Content Completion Assistant](#) ([on page 2267](#)) also presents all of these functions along with the latest built-in XQuery functions in accordance with the server version.

When developing queries for MarkLogic, it is best to open the resources from the [Data Source Explorer view](#) ([on page 1748](#)). When you execute or debug XQuery files opened from this view, imported modules can be resolved better by the MarkLogic server. Another advantage is that validation is automatically performed on the MarkLogic server, including any imported modules.

XQuery Debugging

Oxygen XML Developer allows you to use MarkLogic connections to debug real applications that use XQuery (for example, web applications that trigger XQuery executions). By setting the server in debug mode, you can intercept all the XQuery scripts that run on that server. Oxygen XML Developer connects to the MarkLogic server, shows you the running XQuery scripts, and allows you to debug them. The remote debugging support also allows you to debug collaboratively. Multiple users can participate in the same debugging session. You can start a debugging session and another user can continue it, and vice versa.

Working with Modules

MarkLogic has a concept of two types of XQuery modules, *library* and *main* modules. A *library* module is used to define functions. Library modules cannot be evaluated directly. They are imported, either from other library

modules or from main modules. A *main* module is used as an entry point that can be executed as an XQuery program. For more information on these types of modules, see [XQuery Library Modules and Main Modules](#).

When working with *library* modules, you need to create a validation scenario and associate it with the module. In the validation scenario you need to specify a main module as the entry point for validation. The modules need to be deployed on a MarkLogic server because Oxygen XML Developer will request the server to validate the modules.

To validate *library* modules stored on a MarkLogic server, follow these steps:

1. [Configure a MarkLogic database connection \(on page 1773\)](#).
2. Expand the MarkLogic connection in the **Data Source Explorer** view ([on page 1748](#)) and open the *library* modules. The *main* module must also be opened from the **Data Source Explorer** view ([on page 1748](#)).
3. [Configure a validation scenario \(on page 555\)](#) for each *library* module. Specify the *main* module in the **URL of the file to validate** field.

Result: Validation is done on the server that contains the *main* module. The *main* module and all other *library* modules involved in the validation must be saved. Otherwise, the server will validate what was saved on the server, without the uncommitted changes. Also, the [Content Completion Assistant \(on page 2267\)](#) and the **Outline** view ([on page 806](#)) should now present the functions from all the modules.

Related Information:

[Debugging with MarkLogic \(on page 1776\)](#)

[Configuring a MarkLogic Database Connection \(on page 1773\)](#)

Debugging with MarkLogic

Oxygen XML Developer includes support for debugging XQuery transformations that are executed against a MarkLogic database.

To use a debugging session against the MarkLogic engine, follow these steps:

1. Configure a [MarkLogic data source \(on page 1773\)](#) and a [MarkLogic connection \(on page 1774\)](#).
2. Make sure that the debugging support is enabled in the MarkLogic server that Oxygen XML Developer accesses. On the server side, debugging must be activated in the XDBC server and in the *Task Server* section of the server control console (the switch *debug allow*). If the debugging is not activated, the MarkLogic server reports a **DBG-TASKDEBUGALLOW** error.

Note:

An XDBC application server must be running to connect to the MarkLogic server and this XDBC server will be used to process XQuery expressions against the server. You can change the XDBC application server that Oxygen XML Developer uses to process XQuery expressions by

selecting the **Use it to execute queries** action ([on page 1779](#)) from the contextual menu in the **Data Source Explorer** view ([on page 1748](#)).

3. Open the XQuery file and start the debugging process.

- If you want to debug an XQuery file stored on the MarkLogic server, it is recommended to use the **Data Source Explorer** view ([on page 1748](#)) and open the file from the application server that is involved in the debugging process. This improves the resolving of any imported modules.
- The MarkLogic XQuery debugger integrates seamlessly into the *XQuery Debugger perspective* ([on page 312](#)). If you have a MarkLogic validation scenario configured for the XQuery file, you can choose to *debug the scenario* ([on page 1851](#)) directly.
- Otherwise, switch to the **XQuery Debugger perspective** ([on page 2271](#)), open the XQuery file in the editor, and select the MarkLogic connection in the XQuery engine selector from the **debug control toolbar** ([on page 1834](#)).

For general information about how a debugging session is started and controlled, see the *Working with the Debugger* ([on page 1851](#)) section.

In a MarkLogic debugging session, you can use step actions and *breakpoints* ([on page 1855](#)) to help identify problems. When you *add a breakpoint* ([on page 1856](#)) on a line where the debugger never stops, Oxygen XML Developer displays a warning message. These warnings are displayed for *breakpoints* you add either in the main XQuery (which you can open locally or from the server) or for *breakpoints* you add in any XQuery that is opened from the connection that participates in the debugging session. For more information, see *Using Breakpoints for Debugging Queries that Import Modules with MarkLogic* ([on page 1778](#)).

Remote Debugging with MarkLogic

Oxygen XML Developer allows you to debug remote applications that use XQuery (for example, web applications that trigger XQuery executions). Oxygen XML Developer connects to a MarkLogic server, shows you the running XQuery scripts and allows you to debug them. You can even pause the scripts so that you can start the debugging queries in the exact context of the application. You can also switch a server to debug mode to intercept all XQuery scripts.

Oxygen XML Developer also supports collaborative debugging. This feature allows multiple users to participate in the same debugging session. You can start a debugging session and at a certain point, another user can continue it.

Important:

When using the remote debugging feature, the HTTP and the XDBC servers involved in the debugging session must have the same module configuration.

Resources

For more information about the XQuery debugger for MarkLogic, watch our video demonstration:

<https://www.youtube.com/embed/eQ4ThDZq1bk>

Related Information:

[MarkLogic Development in Oxygen XML Developer \(on page 1775\)](#)

[Configuring a MarkLogic Database Connection \(on page 1773\)](#)

Using Breakpoints for Debugging Queries that Import Modules with MarkLogic

When debugging queries that imports modules stored in the database, it is recommended to place *breakpoints* ([on page 1855](#)) in the modules. When starting a new debugging session, make sure that the modules that you will debug are already opened in the editor. This is necessary so that the *breakpoints* in all the modules will be considered. Also, make sure that there are no other open modules that are not involved in the current debugging session.

To place *breakpoints* in the modules, use the following procedure:

1. In the **Data Source Explorer** view ([on page 1748](#)), open all the modules from the  **Modules** container of the XDBC application server ([on page 1774](#)) that performs the debugging.
2. *Set breakpoints* ([on page 1856](#)) in the module as needed.
3. *Continue debugging* ([on page 1851](#)) the query.

If you get a warning that the *breakpoints* failed to initialize, try the following solutions:

- Check the **Breakpoints** view ([on page 1839](#)) and make sure there are no older *breakpoints* (set on resources that are not part of the current debugging context).
- Make sure you open the modules from the context of the application server that does the debugging and place *breakpoints* there.

[MarkLogic Database Connections \(Deprecated\) \(on page 1771\)](#)

[MarkLogic Development in Oxygen XML Developer \(on page 1775\)](#)

Peculiarities and Limitations of the MarkLogic Debugger

MarkLogic debugger has the following peculiarities and limitations:

- Debugging support is only available for MarkLogic server versions 4.0 or newer.
- For MarkLogic server versions 4.0 or newer, there are three XQuery syntaxes that are supported: '0.9-ml' (*inherited from MarkLogic 3.2*), '1.0-ml', and '1.0'.
- All declared variables are presented as strings. The **Value** column of the **Variables** view contains the expression from the variable declaration. It can be evaluated by copying the expression with the **Copy value** action from the contextual menu of the **Variables** view ([on page 1849](#)) and pasting it in the **XWatch** view ([on page 1841](#)).

- There is no support for [output to source mapping \(on page 1852\)](#).
- There is no support for [showing the trace \(on page 1846\)](#).
- You can only set [breakpoints \(on page 1839\)](#) in imported modules in one of the following cases:
 - When you open the module from the context of the application server involved in the debugging, using the **Data Source Explorer view (on page 1748)**.
 - When the debugger automatically opens the modules in the Editor.
- No [breakpoints \(on page 1855\)](#) are set in modules from the same server that are not involved in the current debugging session.
- No support for [profiling \(on page 1856\)](#) when an XQuery transformation is executed in the debugger.

MarkLogic Contextual Menu Actions

While browsing MarkLogic connections in the **Data Source Explorer view (on page 1748)**, the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources

Opens the **Data Sources preferences page (on page 242)** where you can configure both data sources and connections.

Disconnect (when connected)

Stops the connection.

Refresh

Performs a refresh on the selected node.

Find/Replace in Files

Opens the **Find/Replace in Files dialog box (on page 399)** that allows you to find and replace text in multiple files from the connection.

Container Level Nodes

Enable Debug Mode

Switches the server to a debugging mode. For more information, see [MarkLogic debugging sessions \(on page 1776\)](#).

Use it to Execute Queries

The server will be used to process XQuery expressions against it.

Refresh

Performs a refresh on the selected node.

Module or Folder Level Nodes

Export

Allows you to export the folder on the remote connection to a local folder.

 **Refresh**

Performs a refresh on the selected node.

 **Requests Level Nodes**

 **Refresh**

Performs a refresh on the selected node.

Cancel all requests

Cancels all queries that are either running or stopped on the application server. You can use this action to clean up the entire **Requests** container at the end of your sessions.

 **Resource Level Nodes**

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Developer downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view, Oxygen XML Developer will detect that there was a change and will ask if you want to upload the edited resource to the server.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

 **Refresh**

Performs a refresh on the selected node.

Compare

Compares two selected resources using the **Compare Files** tool (*on page 433*).

[Configuring a MarkLogic Database Connection](#) (*on page 1773*)

[MarkLogic Development in Oxygen XML Developer](#) (*on page 1775*)

[Debugging with MarkLogic](#) (*on page 1776*)

MySQL Database Connections (Deprecated)

Oxygen XML Developer includes support for MySQL database connections. Oxygen XML Developer allows you to browse the structure of a SQL Server database in the **Data Source Explorer** view (*on page 1748*), open tables in the **Table Explorer** view (*on page 1750*), and perform various operations on the resources in the repository.

Configuring a MySQL Database Connection

To configure the support for a MySQL database, follow this procedure:

1. Configure *MySQL Data Source* drivers (*on page 1781*).
2. Configure a *MySQL Connection*. (*on page 1782*)
3. To view your connection, go to the **Data Source Explorer** view (*on page 1748*) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (*on page 2271*).

How to Configure MySQL Data Source Drivers

To connect to a MySQL server, you need to create a generic JDBC type data source based on [the MySQL JDBC driver available on the MySQL website](#).

To configure this data source, follow these steps:

1. Go to https://www.oxygenxml.com/database_drivers.html and download the appropriate MySQL driver.
2. Open the **Preferences** dialog box (**Options > Preferences**) (*on page 114*) and go to **Data Sources**.
3. Click the **+ New** button in the **Data Sources** panel.

The dialog box for configuring a data source is opened.

Figure 432. Data Source Drivers Configuration Dialog Box

4. Enter a unique name for the data source.
5. Select *Generic JDBC* in the driver **Type** drop-down list.
6. Click the **Add Files** button and select the MySQL driver file that you downloaded.
The driver file for the MySQL server is called `mysql-com.jar`.
7. Select the most appropriate **Driver class**.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to [configure your MySQL connection \(on page 1782\)](#).

How to Configure a MySQL Connection

To configure a connection to a MySQL server, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Data Sources**.
2. Click the **+ New** button in the **Connections** panel.

The dialog box for configuring a database connection is displayed.

Figure 433. Connection Configuration Dialog Box

3. Enter a unique name for the connection.
4. Select the *MySQL* data source in the **Data Source** drop-down list.
5. Enter the connection details.
 - a. Enter the URL of the MySQL server.
 - b. Enter the user name for the connection to the MySQL server.
 - c. Enter the password for the connection to the MySQL server.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view (*on page 1748*) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (*on page 2271*).

Generic JDBC Database Connections

Oxygen XML Developer includes support for Generic JDBC database connections.

Configuring a Generic JDBC Database Connection

To configure the support for a generic JDBC database, follow this procedure:

1. *Configure Generic JDBC Data Source drivers* (*on page 1784*).
2. *Configure a Generic JDBC Connection* (*on page 1784*).
3. To view your connection, go to the **Data Source Explorer** view (*on page 1748*) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (*on page 2271*).

How to Configure Generic JDBC Data Source Drivers

Starting with version 17, Oxygen XML Developer comes bundled with Java 11, which does not provide built-in access to JDBC-ODBC data sources. To access such sources, you need to find an alternative JDBC-ODBC bridge or use a platform-independent distribution of Oxygen XML Developer along with a Java VM version 7 or 6.

To configure a generic JDBC data source, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Data Sources**.
2. Click the **+ New** button in the **Data Sources** panel.
3. Enter a unique name for the data source.
4. Select *Generic JDBC* in the driver **Type** drop-down list.
5. Add the driver file(s) using the **Add Files** button.
6. Select the most appropriate **Driver class**.
7. Click the **OK** button to finish the data source configuration.
8. Continue on to [configure a generic JDBC connection \(on page 1784\)](#).

How to Configure a Generic JDBC Connection

To configure a connection to a generic JDBC database, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Data Sources**.
2. Click the **+ New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select the *Generic JDBC* data source in the **Data Source** drop-down menu.
5. Enter the connection details.
 - a. Enter the URL of the generic JDBC database, with the following format: `jdbc: <subprotocol>: <subname>`.
 - b. Enter the user name for the connection to the generic JDBC database.
 - c. Enter the password for the connection to the generic JDBC database.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer view (on page 1748)** (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective (on page 2271)**.

JDBC-ODBC Database Connections

Oxygen XML Developer includes support for JDBC-ODBC database connections.

How to Configure a JDBC-ODBC Connection

Starting with version 17, Oxygen XML Developer comes bundled with Java 11, which does not provide built-in access to JDBC-ODBC data sources. To access such sources, you need to find an alternative JDBC-ODBC

bridge or use a platform-independent distribution of Oxygen XML Developer along with a Java VM version 7 or 6.

To configure a connection to an ODBC data source, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Data Sources**.
2. Click the **+ New** button in the **Connections** panel.

The dialog box for configuring a database connection is displayed.

Figure 434. Connection Configuration Dialog Box

3. Enter a unique name for the connection.
4. Select *JDBC-ODBC Bridge* in the **Data Source** drop-down list.
5. Enter the connection details.
 - a. Enter the URL of the ODBC source.
 - b. Enter the user name of the ODBC source.
 - c. Enter the password of the ODBC source.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view (on page 1748) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (on page 2271).

BaseX Database Connections

Oxygen XML Developer includes support for BaseX database connections using a WebDAV connection. BaseX is a light-weight XML database engine and XQuery processor. Oxygen XML Developer allows you to browse

the structure of a BaseX database in the [Data Source Explorer view \(on page 1748\)](#) and perform XQuery executions.

How to Configure a BaseX Connection

To configure a BaseX connection, follow these steps:

1. First of all, make sure the BaseX HTTP Server is started. For details about starting the BaseX HTTP server, go to http://docs.basex.org/wiki/Startup#BaseX_HTTP_Server. The configuration file for the HTTP server is named `.basex` and is located in the BaseX installation directory. This file helps you to find out which port the HTTP server using. The default port for BaseX WebDAV is 8984.
2. To ensure that everything is functioning, open a WebDAV URL inside a browser and check to see if it works. For example, the following URL retrieves a document from a database named TEST: `http://localhost:8984/webdav/TEST/etc/factbook.xml`.
3. Once you are sure that the BaseX WebDAV service is working, you can configure the WebDAV connection in Oxygen XML Developer as described in [How to Configure a WebDAV Connection \(on page 1795\)](#). The WebDAV URL should resemble this: `http://{hostname}:{port}/webdav/`. If the BaseX server is running on your own machine and it has the default configuration, the data required by the WebDAV connection is:
 - WebDAV URL: `http://localhost:8984/webdav`
 - User: `admin`
 - Password: `admin`
4. Once the WebDAV connection is created, to view your connection, go to the [Data Source Explorer view \(on page 1748\)](#) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the [Database perspective \(on page 2271\)](#).

BaseX Contextual Menu Actions

While browsing BaseX connections in the [Data Source Explorer view \(on page 1748\)](#), the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources

Opens the [Data Sources preferences page \(on page 242\)](#) where you can configure both data sources and connections.

Disconnect (when connected)

Stops the connection.

New Folder

Creates a new folder on the connection.

Import Files

Allows you to add a new file on the connection, in the current folder.

 **Refresh**

Performs a refresh on the selected node.

 **Find/Replace in Files**

Opens the **Find/Replace in Files** dialog box (*on page 399*) that allows you to find and replace text in multiple files from the connection.

 **Folder Level Nodes****New File or New Document**

Creates a new file on the connection, in the current folder.

New Folder

Creates a new folder on the connection.

Import Folders

Imports folders on the server.

Import Files

Allows you to add a new file on the connection, in the current folder.

Export

Allows you to export the folder on the remote connection to a local folder.

 **Cut**

Removes the current selection and places it in the clipboard.

 **Copy**

Copies the current selection into the clipboard.

 **Paste**

Pastes the copied selection.

Rename

Renames the current resource

 **Delete**

Deletes the current container.

 **Refresh**

Performs a refresh on the selected node.

 **Find/Replace in Files**

Opens the **Find/Replace in Files** dialog box (*on page 399*) that allows you to find and replace text in multiple files from the connection.

 **Resource Level Nodes**

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Developer downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view, Oxygen XML Developer will detect that there was a change and will ask if you want to upload the edited resource to the server.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box (*on page 399*) that allows you to find and replace text in multiple files from the connection.

Compare

Compares two selected resources using the **Compare Files** tool (*on page 433*).

Base X XQJ Connection

XQuery execution is possible in a BaseX connection through an XQJ connection.

**Important:**

The XQJ connector is only capable of running XQuery 1.0 scrips, therefore XQuery 3.0 and 3.1 scrips are not supported.

BaseX XQJ Data Source

First of all, create an XQJ data source as described in [How to Configure an XQJ Data Source \(on page 1789\)](#).

The BaseX XQJ API-specific files that must be added in the configuration dialog box are `xqj-api-1.0.jar`, `xqj2-0.1.0.jar` and `basex-xqj-1.2.3.jar` (the version names of the *JAR* file may differ). These libraries can be downloaded from xqj.net/basex/basex-xqj-1.2.3.zip. As an alternative, you can also find the libraries in the BaseX installation directory, in the **lib** sub-directory.

BaseX XQJ Connection

The next step is to create an [XQJ connection \(on page 1790\)](#).

For a default BaseX configuration, the following connection details apply (you can modify them when necessary):

- **Port:** 1984
- **serverName:** localhost
- **user:** admin
- **password:** admin

XQuery Execution

Now that the XQJ connection is configured, open the XQuery file you want to execute in Oxygen XML Developer and create an [XQuery Transformation on XML \(on page 1220\)](#). In the **Transformer** drop-down menu, select the name of the XQJ connection you created. Apply the transformation scenario and the XQuery will be executed.

How to Configure an XQJ Data Source

Any transformer that offers an XQJ API implementation can be used when validating XQuery or transforming XML documents. An example of an XQuery engine that implements the XQJ API is [Zorba](#).

1. If your XQJ Implementation is native, make sure the directory containing the native libraries of the engine is added to your system environment variables: to **PATH** - on Windows, to **LD_LIBRARY_PATH** - on Linux, or to **DYLD_LIBRARY_PATH** - on macOS. Restart Oxygen XML Developer after configuring the environment variables.
2. Open the [Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **Data Sources**.
3. Click the **+** **New** button in the **Data Sources** panel.
4. Enter a unique name for the data source.
5. Select **XQuery API for Java (XQJ)** in the **Type** combo box.
6. Click the **Add** button to add XQJ API-specific files.

You can manage the driver files using the **Add**, **Remove**, **Detect**, and **Stop** buttons.

Oxygen XML Developer detects any implementation of *javax.xml.xquery.XQDataSource* and presents it in **Driver class** field.

7. Select the most suited driver in the **Driver class** combo box.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to [configure the XQJ connection \(on page 1790\)](#).

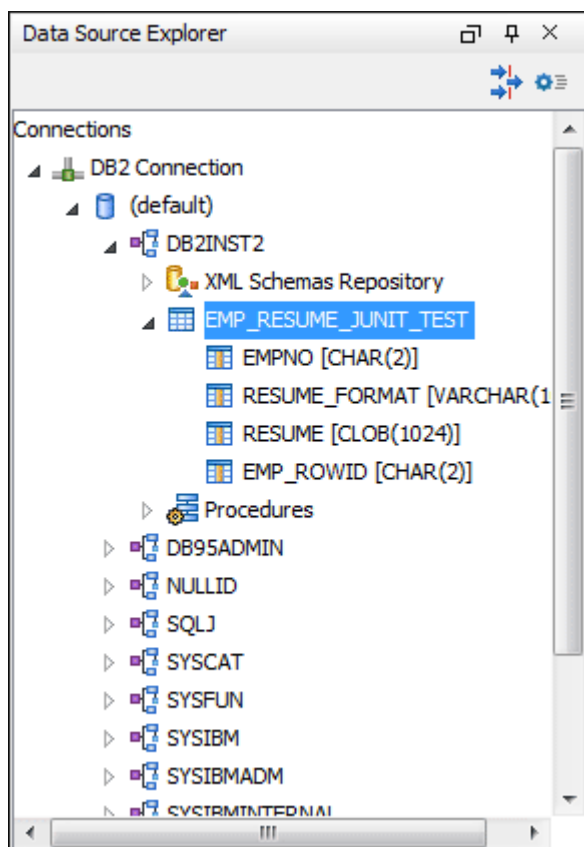

How to Configure an XQJ Connection

The steps for configuring an XQJ connection are the following:

1. Open the **Preferences** dialog box (**Options > Preferences**) ([on page 114](#)) and go to **Data Sources**.
2. Click the **+ New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select one of the previously configured **XQJ data sources** ([on page 1789](#)) in the **Data Source** combo box.
5. Fill-in the connection details.
The properties presented in the connection details table are automatically detected depending on the selected data source.
6. Click the **OK** button to finish the connection configuration.

IBM DB2 Database Connections (Deprecated)

Oxygen XML Developer includes support for IBM DB2 database connections. Oxygen XML Developer allows you to browse the structure of an IBM DB2 database in the **Data Source Explorer** view ([on page 1748](#)), open tables in the **Table Explorer** view ([on page 1750](#)), and perform various operations on the resources in the repository.

Figure 435. IBM DB2 Database Connection

Configuring an IBM DB2 Database Connection (Deprecated)

To configure the support for the IBM DB2 database, follow this procedure:

1. Go to the [IBM website](#) and in the *DB2 Clients and Development Tools* category select the *DB2 Driver for JDBC and SQLJ* download link. Fill out the download form and download the zip file. Unzip the zip file and use the `db2jcc.jar` and `db2jcc_license_cu.jar` files in Oxygen XML Developer for configuring a DB2 data source (on page 1791).
2. Configure IBM DB2 Data Source drivers (on page 1791).
3. Configure an IBM DB2 Server Connection (on page 1793).
4. To view your connection, go to the **Data Source Explorer** view (on page 1748) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (on page 2271).

How to Configure IBM DB2 Data Source Drivers (Deprecated)

Note:

Available in the Enterprise edition only.

To configure a data source for connecting to an IBM DB2 server, follow these steps:

1. Go to the [IBM website](#) and in the *DB2 Clients and Development Tools* category select the *DB2 Driver for JDBC and SQLJ* download link. Fill out the download form and download the zip file.
2. Unzip the downloaded archive.
3. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Data Sources**.
4. Click the **+** **New** button in the **Data Sources** panel.

The dialog box for configuring a data source is opened.

Figure 436. Data Source Drivers Configuration Dialog Box

5. Enter a unique name for the data source.
6. Select *DB2* in the driver **Type** drop-down menu.
7. Click the **Add Files** button and select the IBM DB2 driver files from the archive that you downloaded and unzipped.

The IBM DB2 driver files are:

- `db2jcc.jar`
- `db2jcc_license_cisuz.jar`
- `db2jcc_license_cu.jar`

8. Select the most appropriate **Driver class**.
9. Click the **OK** button to finish the data source configuration.
10. Continue on to [configure your IBM DB2 connection](#) (on page 1793).

How to Configure an IBM DB2 Connection (Deprecated)

Note:

The support to create an IBM DB2 connection is available in the Enterprise edition only.

To configure a connection to an IBM DB2 server, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Data Sources**.
2. Click the **+ New** button in the **Connections** panel.

The dialog box for configuring a database connection is displayed.

Figure 437. Connection Configuration Dialog Box

3. Enter a unique name for the connection.
4. Select an *IBM DB2* data source in the **Data Source** drop-down menu.
5. Enter the connection details.
 - a. Enter the URL to the installed IBM DB2 engine.
 - b. Enter the user name to access the IBM DB2 engine.
 - c. Enter the password to access the IBM DB2 engine.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view (on page 1748) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (on page 2271).

IBM DB2 Contextual Menu Actions (Deprecated)

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the **Data Source Explorer view** (*on page 1748*), depending on the node where it is invoked:

Refresh

Performs a refresh on the selected node.

Disconnect (available on Connection nodes)

Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

Configure Database Sources (available on Connection nodes)

Opens the **Data Sources preferences page** (*on page 242*) where you can configure both data sources and connections.

Edit (available on Table nodes)

Opens the selected table in the **Table Explorer view** (*on page 1750*).

Export to XML (available on Table nodes)

Opens the **Export Criteria** dialog box (a thorough description of this dialog box can be found in the **Import from Database** (*on page 1825*) chapter).

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the **Data Source Explorer view** (*on page 1748*), the various nodes in IBM DB2 connections include the following additional contextual menu actions:

XML Schema Repository Level Nodes

Register

Opens a dialog box for adding a new schema file in the DB XML repository. In this dialog box, you enter a collection name and the necessary schema files. Schema dependencies management can be done by using the **Add** and **Remove** buttons.

Schema Level Nodes

Unregister

Removes the selected schema from the XML Schema Repository.

View

Opens the selected schema in Oxygen XML Developer.

WebDAV Connections

Oxygen XML Developer includes support for WebDAV server connections. Oxygen XML Developer allows you to browse the structure of a WebDAV connection in the **Data Source Explorer** view (*on page 1748*) and perform various operations on the resources in the repository.

How to Configure a WebDAV Connection

By default, Oxygen XML Developer contains built-in data source drivers for **WebDAV** connections. Based on this data source, you can create a WebDAV connection for browsing and editing data from a database that provides a WebDAV interface. The connection is available in the **Data Source Explorer** view (*on page 1748*).

To configure a WebDAV connection, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) (*on page 114*) and go to **Data Sources**.
2. Click the **+** **New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select one of the WebDAV data sources in the **Data Source** drop-down menu.
5. Enter the connection details:
 - a. Set the URL to the WebDAV repository in the field **WebDAV URL**.
 - b. Set the user name that is used to access the WebDAV repository in the **User** field.
 - c. Set the password that is used to access the WebDAV repository in the **Password** field.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view (*on page 1748*) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (*on page 2271*).

For more information about the WebDAV support in Oxygen XML Developer, watch our video demonstration:

<https://www.youtube.com/embed/vDX036CqbvM>

WebDAV Contextual Menu Actions

While browsing WebDAV connections in the **Data Source Explorer** view (*on page 1748*), the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources

Opens the **Data Sources preferences page** (*on page 242*) where you can configure both data sources and connections.

Disconnect (when connected)

Stops the connection.

New Folder

Creates a new folder on the connection.

Import Files

Allows you to add a new file on the connection, in the current folder.

Refresh

Performs a refresh on the selected node.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box (*on page 399*) that allows you to find and replace text in multiple files from the connection.

Folder Level Nodes

New File or New Document

Creates a new file on the connection, in the current folder.

New Folder

Creates a new folder on the connection.

Import Folders

Imports folders on the server.

Import Files

Allows you to add a new file on the connection, in the current folder.

Export

Allows you to export the folder on the remote connection to a local folder.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Paste

Pastes the copied selection.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box (*on page 399*) that allows you to find and replace text in multiple files from the connection.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Developer downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view, Oxygen XML Developer will detect that there was a change and will ask if you want to upload the edited resource to the server.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box (*on page 399*) that allows you to find and replace text in multiple files from the connection.

Compare

Compares two selected resources using the **Compare Files** tool (*on page 433*).

SQL Execution Support

The database support in Oxygen XML Developer includes support for writing SQL statements, syntax highlighting, *folding* ([on page 2269](#)), and dragging and dropping from the **Data Source Explorer** view ([on page 1748](#)). It also includes transformation scenarios for executing the statements, and the results are displayed in the **Table Explorer** view ([on page 1750](#)).

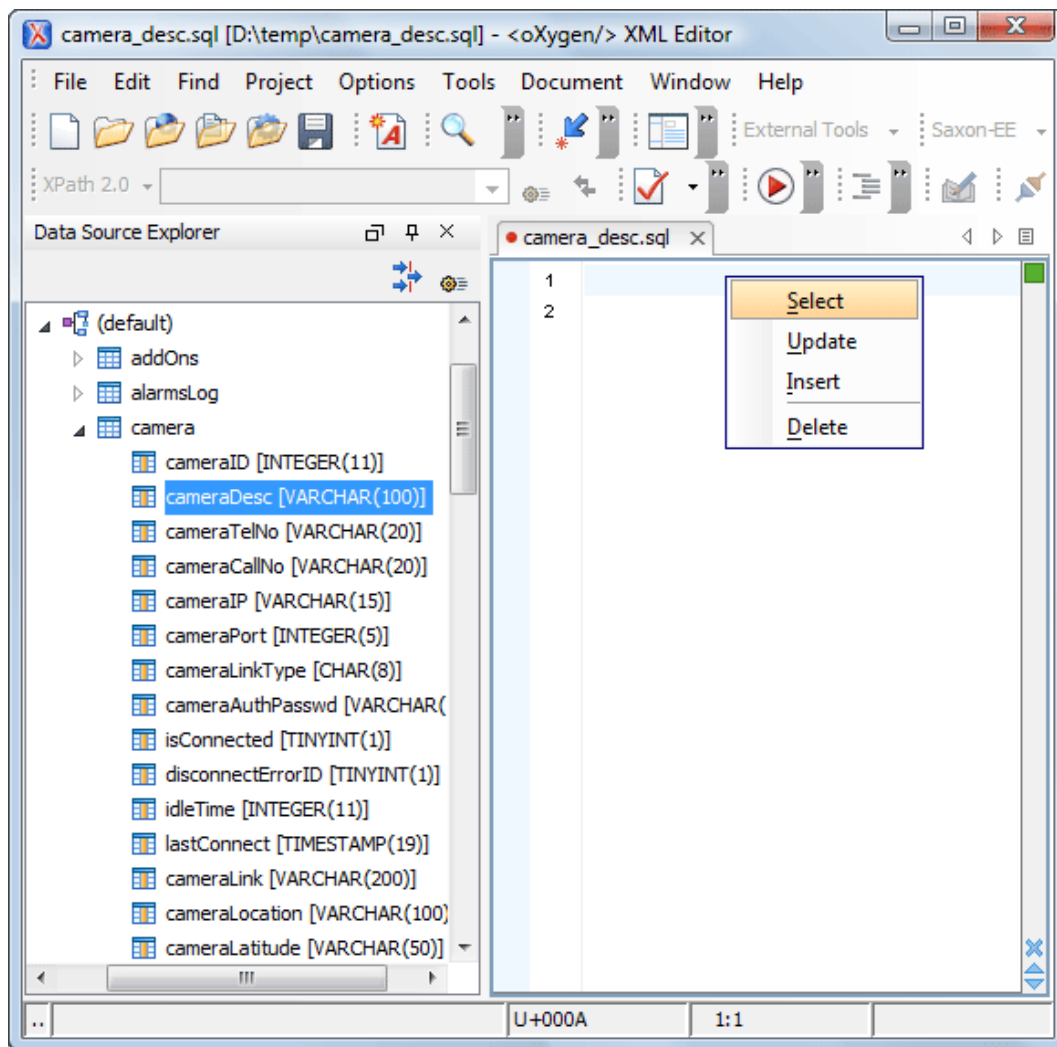

Drag and Drop from Data Source Explorer View

Dragging operations from the **Data Source Explorer** view ([on page 1748](#)) and dropping them in the SQL Editor allows you to create SQL statements quickly by inserting the names of tables and columns in the SQL statements.

1. Configure a database connection (see the specific procedure for your database server in the [Database Connection Support](#) ([on page 1753](#)) section).
2. Browse to the table you will use in your statement.
3. Drag the table or a column of the table into the editor where a SQL file is open.

Drag and drop actions are available both on the table and on its fields. A pop-up menu is displayed in the SQL editor.

Figure 438. SQL Statement Editing with Drag and Drop

4. Select the type of statement from the pop-up menu.

Depending on your choice, dragging a table results in one of the following statements being inserted into the document:

- **SELECT** ``field1`,`field2`, FROM `catalog`.`table`` (for example: `SELECT `DEPT`,`DEPTNAME`,`LOCATION` FROM `camera`.`cameraDesc``)
- **UPDATE** ``catalog`.`table` SET `field1`=, `field2`=,....` (for example: `UPDATE `camera`.`cameraDesc` SET `DEPT`=, `DEPTNAME`=, `LOCATION`=`)
- **INSERT INTO** ``catalog`.`table` (`field1`,`field2`,) VALUES (, ,)` (for example: `INSERT INTO `camera`.`cameraDesc` (`DEPT`,`DEPTNAME`,`LOCATION`) VALUES (, ,)`)
- **DELETE FROM** ``catalog`.`table`` (for example: `DELETE FROM `camera`.`cameraDesc``)

Depending on your choice, dragging a column results in one of the following statements being inserted into the document:

- **SELECT** ``field` FROM `catalog`.`table`` (for example: `SELECT `DEPT` FROM `camera`.`cameraDesc``)
- **UPDATE** ``catalog`.`table` SET `field` =` (for example: `UPDATE `camera`.`cameraDesc` SET `DEPT` =`)
- **INSERT INTO** ``catalog`.`table` (`field1) VALUES ()` (for example: `INSERT INTO `camera`.`cameraDesc` (`DEPT`) VALUES ()`)
- **DELETE FROM** ``catalog`.`table`` (for example: `DELETE FROM `camera`.`cameraDesc` WHERE `DEPT` =`)

SQL Validation

SQL validation support is offered for IBM DB2. Note that if you choose a connection that does not support SQL validation, you will receive a warning when trying to validate. The SQL document is validated using the connection from the associated transformation scenario.

Executing SQL Statements

The steps for executing an SQL statement on a relational database are as follows:

1. Configure a [transformation scenario \(on page 1098\)](#) using the  **Configure Transformation Scenario(s)** action from the toolbar or the **Document > Transformation** menu.
A SQL transformation scenario needs a database connection. You can configure a connection using the  **Preferences** button from the SQL transformation dialog box.
The dialog box contains the list of existing scenarios that apply to SQL documents.
2. Set parameter values for SQL placeholders using the **Parameters** button from the SQL transformation dialog box.

For example, in `SELECT * FROM `test`.`department` where DEPT = ? or DEPTNAME = ?` the two parameters can be configured for the place holders (?) in the transformation scenario.

When the SQL statement is executed, the first placeholder is replaced with the value set for the first parameter in the scenario, the second placeholder is replaced by the second parameter value, and so on.

Restriction:

When a stored procedure is called in an SQL statement executed on an SQL Server database, mixing inline parameter values with values specified using the **Parameters** button of the scenario dialog box is not recommended. This is due to a limitation of the SQL Server driver for Java applications. An example of stored procedure that is not recommended: `call dbo.Test (22, ?).`

3. Execute the SQL scenario by clicking the **OK** or **Apply associated** button.

The result of a SQL transformation is [displayed in a view \(on page 503\)](#) at the bottom of the Oxygen XML Developer window.

4. View more complex return values of the SQL transformation in a separate editor panel.

A more complex value returned by the SQL query (for example, an *XMLTYPE* or *CLOB* value) cannot be displayed entirely in the result table.

a. Right-click the cell containing the complex value.

b. Select the action **Copy cell** from the contextual menu.

The action copies the value in the clipboard.

c. Paste the value into an appropriate editor.

For example, you can paste the value in an opened XQuery editor panel of Oxygen XML Developer.

XQuery and Databases

XQuery is a native XML query language that is useful for querying XML views of relational data to create XML results. It also provides the mechanism to efficiently and easily extract information from Native XML Databases (NXD) and relational data. The following database systems supported in Oxygen XML Developer offer XQuery support:

- *Native XML Databases:*
 - eXist
 - MarkLogic (validation support available starting with version 5)
- *Relational Databases:*
 - IBM DB2
 - Microsoft SQL Server (validation support not available)
 - Oracle (validation support not available)

Related information

[Editing XQuery Documents \(on page 802\)](#)

Build Queries with Drag and Drop from the Data Source Explorer View

When a query is edited in the XQuery editor, the XPath expressions can be composed quickly by dragging them from the **Data Source Explorer** view ([on page 1748](#)) and dropping them into the editor panel.

1. [Configure the data source drivers \(on page 1753\)](#) for the particular relational database in the **Data Sources** preferences page ([on page 242](#)).
2. [Configure the connection \(on page 1753\)](#) for the particular relational database in the **Data Sources** preferences page ([on page 242](#)).
3. Browse the connection in the **Data Source Explorer** view ([on page 1748](#)), expanded to the table or column that you want to insert in the query.
4. Drag the table or column name to the XQuery editor panel.
5. Drop the table or column name where the XPath expression is needed.

An XPath expression that selects the dragged name is inserted in the XQuery document at the cursor position.

XQuery Validation When Connected to a Database

With Oxygen XML Developer, you can validate your XQuery documents when connected to a database. When you open an XQuery document from a connection that supports validation (for example, MarkLogic, or eXist), by default Oxygen XML Developer uses this connection for validation. If you open an XQuery file using a MarkLogic connection, the validation resolves imports better.

Related Information:

[XQuery Validation \(on page 802\)](#)

XQuery Transformation for Databases

XQuery is designed to retrieve and interpret XML data from any source, whether it is a database or document. Data is stored in relational databases but it is often required that the data be extracted and transformed as XML when interfacing to other components and services. Also, it is an XPath-based querying language supported by most NXD vendors. To perform a query, you need an XQuery transformation scenario.

1. [Configure the data source drivers and the connection \(on page 1753\)](#) for the particular database.
2. Configure an XQuery transformation scenario.

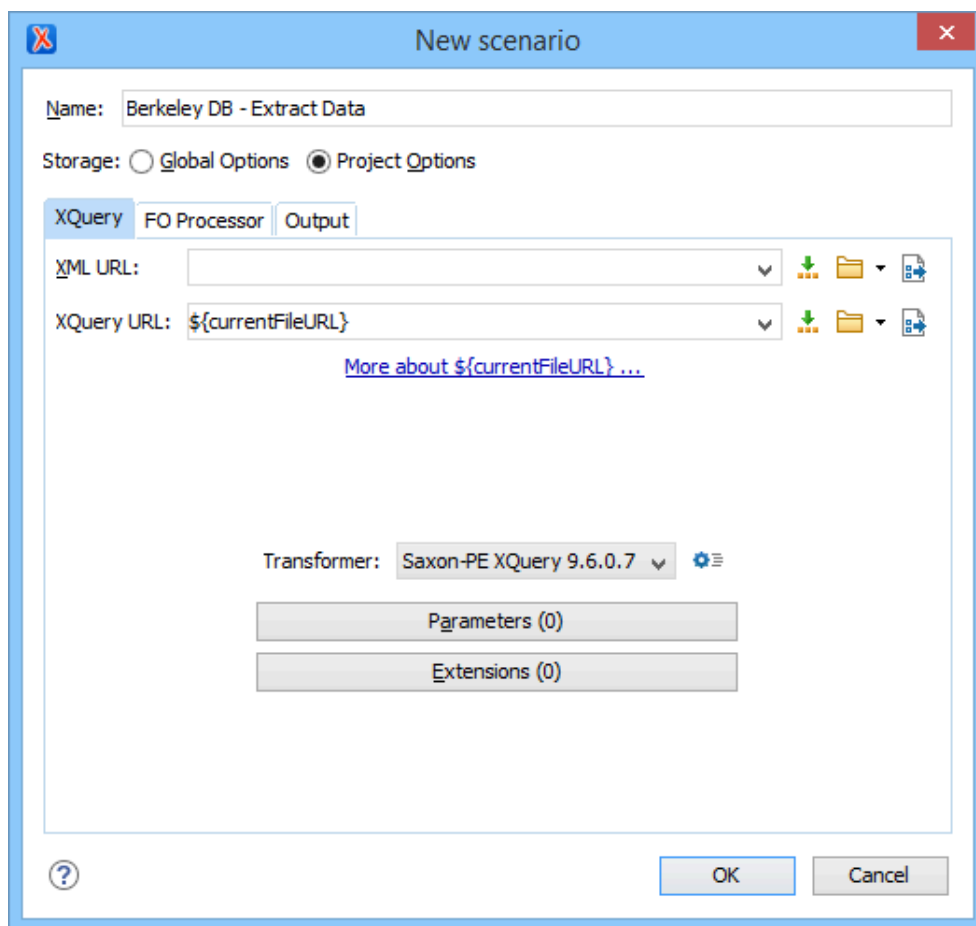

- a. Click the  **Configure Transformation Scenario** toolbar button or go to menu **Document > Transformation > Configure Transformation Scenario**.

The **Configure Transformation Scenario** dialog box [\(on page 1240\)](#) is opened.

- b. Click the **New** button toward the bottom of the dialog box.
- c. Select **XML Transformation with XQUERY** [\(on page 1146\)](#).

The **New Scenario** dialog box for configuring an XQuery scenario is opened.

Figure 439. New Scenario Dialog Box

- d. Insert the scenario name in the dialog box for editing the scenario.
- e. Choose the database connection in the **Transformer** drop-down list.
- f. Configure any other parameters as needed.

For an XQuery transformation, the output tab has an option called **Sequence** that allows you to run an XQuery in lazy mode. The amount of data extracted from the database is controlled from the **Size limit on Sequence view option** (on page 222) in the **XQuery** preferences page. If you choose **Perform FO Processing** in the **FO Processor** tab, the **Sequence** option is ignored.

- g. Click the **OK** button to finish editing the scenario.

Once the scenario is associated with the XQuery file, the query can include calls to specific XQuery functions that are implemented by that engine. The available functions depend on the target database engine selected in the scenario. For example, for eXist, the *Content Completion Assistant* (on page 2267) lists the functions supported by that database engine. This is useful for only inserting calls to the supported functions (standard XQuery functions or extension ones) into the query .

3. Run the transformation scenario.

To view a more complex value returned by the query that cannot be entirely displayed in the XQuery query result table at the bottom of the Oxygen XML Developer window (for example, an XMLTYPE or CLOB value), do the following:

- Right-click that table cell.
- Select the **Copy cell** action from the contextual menu to copy the value into the clipboard.
- Paste the value wherever you need it (for example, in an open XQuery editor panel of Oxygen XML Developer).

Related information

[XML Transformation with XQuery \(on page 1146\)](#)

[XQuery XQJ Transformation \(on page 1804\)](#)

XQuery XQJ Transformation

XQuery API for Java (XQJ) refers to the common Java API for the XQuery 1.0 specification. The XQJ API enables you to execute XQuery against an XML data source.

Important:

The XQJ connector is only capable of running XQuery 1.0 scrips, therefore XQuery 3.0 and 3.1 scripts are not supported.

Oxygen XML Developer supports any transformer that offers an XQJ API implementation and it be used for validating XQuery or transforming XML documents.

To configure the support for XQJ, do the following:

1. [Configure an XQJ Data Source \(on page 1789\)](#).
2. [Configure an XQJ Connection \(on page 1790\)](#).
3. To view your connection, go to the **Data Source Explorer view (on page 1748)** (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective (on page 2271)**.

How to Configure an XQJ Data Source

Any transformer that offers an XQJ API implementation can be used when validating XQuery or transforming XML documents. An example of an XQuery engine that implements the XQJ API is [Zorba](#).

1. If your XQJ Implementation is native, make sure the directory containing the native libraries of the engine is added to your system environment variables: to **PATH** - on Windows, to **LD_LIBRARY_PATH** - on Linux, or to **DYLD_LIBRARY_PATH** - on macOS. Restart Oxygen XML Developer after configuring the environment variables.
2. Open the **Preferences dialog box (Options > Preferences) (on page 114)** and go to **Data Sources**.
3. Click the **+ New** button in the **Data Sources** panel.
4. Enter a unique name for the data source.
5. Select **XQuery API for Java (XQJ)** in the **Type** combo box.
6. Click the **Add** button to add XQJ API-specific files.

You can manage the driver files using the **Add, Remove, Detect,** and **Stop** buttons.

Oxygen XML Developer detects any implementation of `javax.xml.xquery.XQDataSource` and presents it in **Driver class** field.

7. Select the most suited driver in the **Driver class** combo box.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to [configure the XQJ connection \(on page 1790\)](#).

How to Configure an XQJ Connection

The steps for configuring an XQJ connection are the following:

1. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **Data Sources**.
2. Click the **+ New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select one of the previously configured **XQJ data sources** (on page 1789) in the **Data Source** combo box.
5. Fill-in the connection details.

The properties presented in the connection details table are automatically detected depending on the selected data source.
6. Click the **OK** button to finish the connection configuration.

XQuery Database Debugging

Oxygen XML Developer includes a debugging interface that helps you to detect and solve problems with XQuery transformations that are executed against MarkLogic databases.

For more information about the debugging support in Oxygen XML Developer, see [Debugging XSLT Stylesheets and XQuery Documents \(on page 1832\)](#).

Debugging with MarkLogic

Oxygen XML Developer includes support for debugging XQuery transformations that are executed against a MarkLogic database.

To use a debugging session against the MarkLogic engine, follow these steps:

1. Configure a **MarkLogic data source** (on page 1773) and a **MarkLogic connection** (on page 1774).
2. Make sure that the debugging support is enabled in the MarkLogic server that Oxygen XML Developer accesses. On the server side, debugging must be activated in the XDBC server and in the *Task Server* section of the server control console (the switch *debug allow*). If the debugging is not activated, the MarkLogic server reports a **DBG-TASKDEBUGALLOW** error.

Note:

An XDBC application server must be running to connect to the MarkLogic server and this XDBC server will be used to process XQuery expressions against the server. You can change the XDBC application server that Oxygen XML Developer uses to process XQuery expressions by

selecting the **Use it to execute queries** action ([on page 1779](#)) from the contextual menu in the **Data Source Explorer** view ([on page 1748](#)).

3. Open the XQuery file and start the debugging process.

- If you want to debug an XQuery file stored on the MarkLogic server, it is recommended to use the **Data Source Explorer** view ([on page 1748](#)) and open the file from the application server that is involved in the debugging process. This improves the resolving of any imported modules.
- The MarkLogic XQuery debugger integrates seamlessly into the *XQuery Debugger perspective* ([on page 312](#)). If you have a MarkLogic validation scenario configured for the XQuery file, you can choose to [debug the scenario](#) ([on page 1851](#)) directly.
- Otherwise, switch to the **XQuery Debugger perspective** ([on page 2271](#)), open the XQuery file in the editor, and select the MarkLogic connection in the XQuery engine selector from the [debug control toolbar](#) ([on page 1834](#)).

For general information about how a debugging session is started and controlled, see the [Working with the Debugger](#) ([on page 1851](#)) section.

In a MarkLogic debugging session, you can use step actions and [breakpoints](#) ([on page 1855](#)) to help identify problems. When you [add a breakpoint](#) ([on page 1856](#)) on a line where the debugger never stops, Oxygen XML Developer displays a warning message. These warnings are displayed for [breakpoints](#) you add either in the main XQuery (which you can open locally or from the server) or for [breakpoints](#) you add in any XQuery that is opened from the connection that participates in the debugging session. For more information, see [Using Breakpoints for Debugging Queries that Import Modules with MarkLogic](#) ([on page 1778](#)).

Remote Debugging with MarkLogic

Oxygen XML Developer allows you to debug remote applications that use XQuery (for example, web applications that trigger XQuery executions). Oxygen XML Developer connects to a MarkLogic server, shows you the running XQuery scripts and allows you to debug them. You can even pause the scripts so that you can start the debugging queries in the exact context of the application. You can also switch a server to debug mode to intercept all XQuery scripts.

Oxygen XML Developer also supports collaborative debugging. This feature allows multiple users to participate in the same debugging session. You can start a debugging session and at a certain point, another user can continue it.

Important:

When using the remote debugging feature, the HTTP and the XDBC servers involved in the debugging session must have the same module configuration.

Resources

For more information about the XQuery debugger for MarkLogic, watch our video demonstration:

<https://www.youtube.com/embed/eQ4ThDZq1bk>

Related Information:

[MarkLogic Development in Oxygen XML Developer \(on page 1775\)](#)

[Configuring a MarkLogic Database Connection \(on page 1773\)](#)

Using Breakpoints for Debugging Queries that Import Modules with MarkLogic

When debugging queries that imports modules stored in the database, it is recommended to place *breakpoints* ([on page 1855](#)) in the modules. When starting a new debugging session, make sure that the modules that you will debug are already opened in the editor. This is necessary so that the *breakpoints* in all the modules will be considered. Also, make sure that there are no other open modules that are not involved in the current debugging session.

To place *breakpoints* in the modules, use the following procedure:

1. In the **Data Source Explorer** view ([on page 1748](#)), open all the modules from the  **Modules** container of the XDBC application server ([on page 1774](#)) that performs the debugging.
2. *Set breakpoints* ([on page 1856](#)) in the module as needed.
3. *Continue debugging* ([on page 1851](#)) the query.

If you get a warning that the *breakpoints* failed to initialize, try the following solutions:

- Check the **Breakpoints** view ([on page 1839](#)) and make sure there are no older *breakpoints* (set on resources that are not part of the current debugging context).
- Make sure you open the modules from the context of the application server that does the debugging and place *breakpoints* there.

Related Information:

[MarkLogic Database Connections \(Deprecated\) \(on page 1771\)](#)

[MarkLogic Development in Oxygen XML Developer \(on page 1775\)](#)

Peculiarities and Limitations of the MarkLogic Debugger

MarkLogic debugger has the following peculiarities and limitations:

- Debugging support is only available for MarkLogic server versions 4.0 or newer.
- For MarkLogic server versions 4.0 or newer, there are three XQuery syntaxes that are supported: '0.9-ml' (*inherited from MarkLogic 3.2*), '1.0-ml', and '1.0'.
- All declared variables are presented as strings. The **Value** column of the **Variables** view contains the expression from the variable declaration. It can be evaluated by copying the expression with the **Copy value** action from the contextual menu of [the Variables view \(on page 1849\)](#) and pasting it in [the XWatch view \(on page 1841\)](#).

- There is no support for [output to source mapping \(on page 1852\)](#).
- There is no support for [showing the trace \(on page 1846\)](#).
- You can only set [breakpoints \(on page 1839\)](#) in imported modules in one of the following cases:
 - When you open the module from the context of the application server involved in the debugging, using the **Data Source Explorer view (on page 1748)**.
 - When the debugger automatically opens the modules in the Editor.
- No [breakpoints \(on page 1855\)](#) are set in modules from the same server that are not involved in the current debugging session.
- No support for [profiling \(on page 1856\)](#) when an XQuery transformation is executed in the debugger.

Integration with Microsoft SharePoint

Restriction:

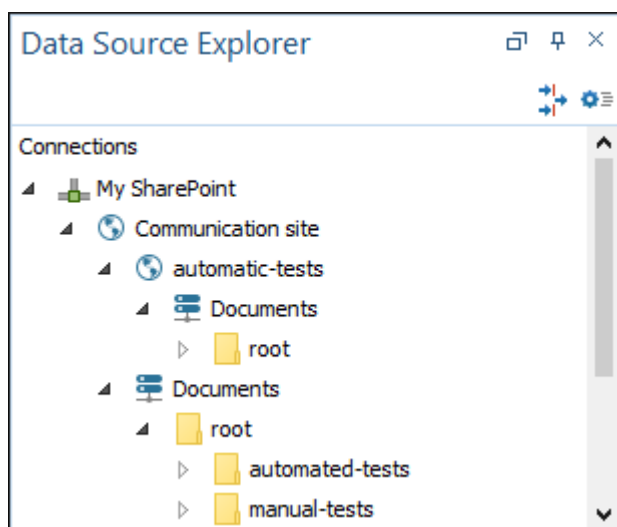

The SharePoint integration is only available in the Enterprise edition of Oxygen XML Developer.

Oxygen XML Developer provides support for browsing and managing SharePoint connections in the **Data Source Explorer view (on page 1748)** and there is also a [specialized SharePoint Browser view \(on page 1813\)](#). You can easily create new resources on the repository, copy and move them using contextual actions or the drag and drop support, or edit and transform the documents in the editor.

There are two types of integrations that are possible:

- **SharePoint Online** - A new implementation that uses the [SharePoint REST API v.2](#) and it supports OAuth credentials (access tokens). If you need authentication, you must use this type of integration.
- **SharePoint** - The older implementation that was implemented using SharePoint Web Services (now deprecated) and it does NOT support OAuth credentials (access tokens).

Figure 440. SharePoint Connection in Data Source Explorer View

Related Information:

[Working with Databases \(on page 1748\)](#)

How to Configure a SharePoint Connection

By default, Oxygen XML Developer contains built-in data source drivers for **SharePoint**. Use this data source to create a connection to a SharePoint server that will be available in the **Data Source Explorer** view or **SharePoint Browser** view (*on page 1813*).

There are two types of possible SharePoint connections:

- **SharePoint Online** - A new implementation that uses the [SharePoint REST API v.2](#) and it supports OAuth credentials (access tokens). If you need authentication, you must use this type of integration.
- **SharePoint** - The older implementation that was implemented using SharePoint Web Services (now deprecated) and it does NOT support OAuth credentials (access tokens).

SharePoint Online Connection

To configure a SharePoint connection, follow these steps:

1. Open the **Connection** dialog box using one of these methods:
 - Select **New SharePoint Online Connection** from the  **Settings** drop-down menu in the **SharePoint Browser** view (or using the [quick action \(on page 1813\)](#)).
 - Open the **Preferences** dialog box (**Options > Preferences**) (*on page 114*), go to **Data Sources**. Select **SharePoint Online** in the **Data Sources** pane and in the **Connections** pane, click the  **New** button.
2. Enter a unique name for the connection.
3. Make sure **SharePoint Online** is selected in the **Data Source** combo box.
4. Enter the **Tenant URL** for your SharePoint repository and click **OK**.

In the **SharePoint Browser** view (*on page 1813*), you can select your connection using the **Site** drop-down menu. Then select **Log in with Microsoft account** from the left pane (or user drop-down menu on the right side of the view) to open Microsoft's log in page in your default browser. Once authenticated, your repository content should be displayed in the view. If you have problems with the log-in process, see [Troubleshooting SharePoint Online Connections \(on page 1810\)](#).

Note:

If you are still logged in when you close Oxygen XML Developer, the authentication persists the next time the application is started. If, for some reason, the authentication fails to recover the access token, an error is displayed in the **Results** pane at the bottom of the application. If this happens, you need to re-authenticate Oxygen XML Developer by using the **Log in with Microsoft account** action.

SharePoint Connection (Older Version)

To configure a SharePoint connection, follow these steps:

1. Open the **Connection** dialog box using one of these methods:
 - Select **New SharePoint Connection** from the  **Settings** drop-down menu in the **SharePoint Browser** view (or using the [quick action \(on page 1813\)](#)).
 - Open the **Preferences** dialog box (**Options > Preferences**) ([on page 114](#)), go to **Data Sources**. Select **SharePoint** in the **Data Sources** pane and in the **Connections** pane, click the  **New** button.
2. Enter a unique name for the connection.
3. Make sure **SharePoint** is selected in the **Data Source** combo box.
4. Fill-in the connection details:
 - a. Enter the **SharePoint URL** for your SharePoint repository.
 - b. Set the server domain in the **Domain** field. If you are using a SharePoint 365 account, leave this field empty.
 - c. Set the user name to access the SharePoint repository in the **User** field.
 - d. Set the password to access the SharePoint repository in the **Password** field.
5. Click **OK**.

Troubleshooting SharePoint Online Connections

Allowed SharePoint Online Sites

SharePoint Online sites supported by Oxygen XML Developer have the following syntax:

- `https://tenant.SharePoint.com`
- `https://tenant.SharePoint.com/sites/siteName`
- `https://tenant.SharePoint.com/sites/siteName/subsiteName1/.../subsiteNameK`
- `https://tenant.SharePoint.com/teams/siteName`
- `https://tenant.SharePoint.com/teams/siteName/subsiteName1/.../subsiteNameK`

Authentication Workflow Problems

Once you configure the [SharePoint Online Connection \(on page 1809\)](#) and use the *Log in with Microsoft account* action, the action will open the default browser for authentication. If this is the first time you access this SharePoint site, you will have to [Grant Permissions to Oxygen XML Developer \(on page 1811\)](#).

If the authentication is successful, the browser should display the **Authentication complete** page:

**Attention:**

If you cannot get past the *This page isn't working* response while using *Google Chrome*, try using a different browser.

Once you go back to Oxygen XML Developer, in the *SharePoint Browser* you should see your username details and be able to browse the repository.

Grant Permissions to Oxygen XML Developer

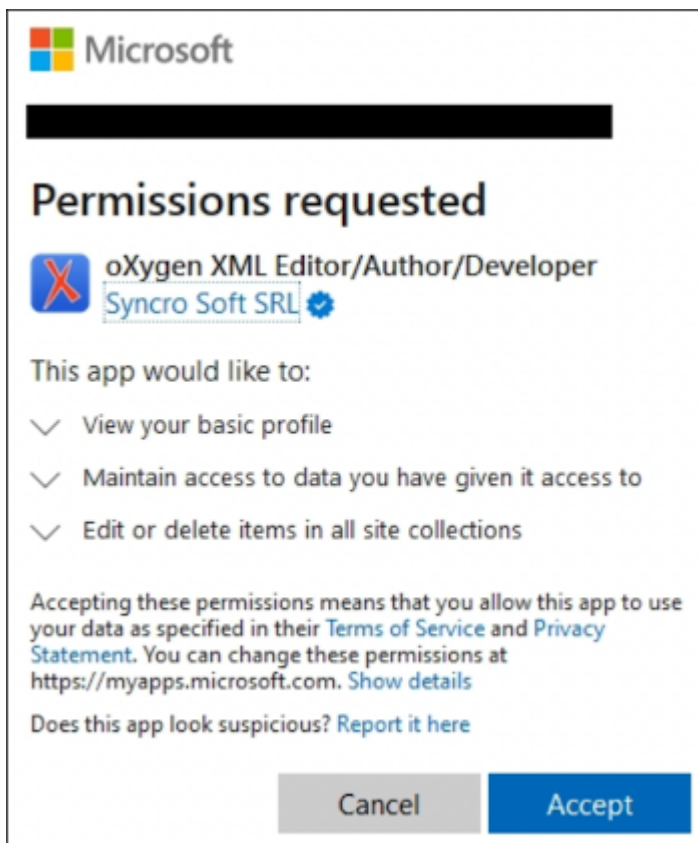

When you first **Log in** and access your **SharePoint** server, you may need to grant **SharePoint Enterprise Application** permissions for the Oxygen XML Developer application to:

- View your basic profile.
- Maintain access to data you have given access to.
- Edit or delete items in all site collections.

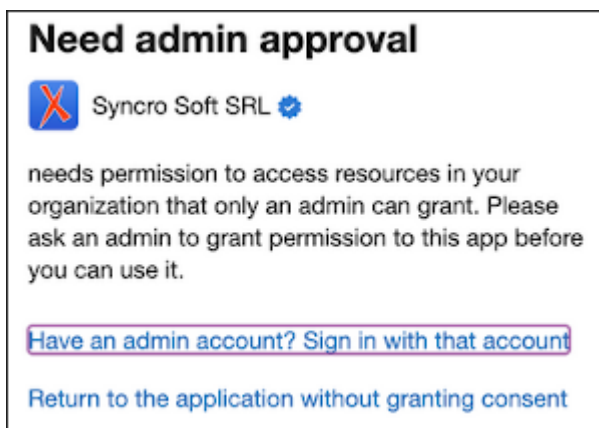

The **Permissions requested** form will appear when you first authenticate to your **SharePoint** server from Oxygen XML Developer.

If you have administrative privileges, you are able to grant permissions directly from the form:

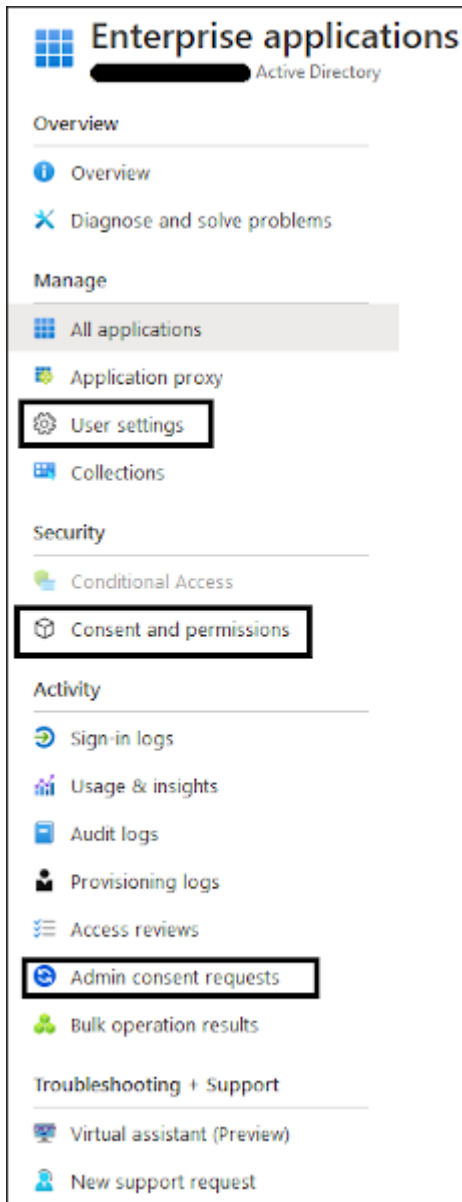

Figure 441. Permissions Requested Form

If you do not have admin rights to give Oxygen XML Developer permissions to access the **SharePoint** server, the **Permissions requested** form will suggest that you contact the administrator for your **SharePoint** account so that they can grant the permissions.

The **SharePoint** global administrator should log in to <https://portal.azure.com/>, navigate to **Manage Azure Active Directory > Enterprise applications**, and approve the request under the **Admin consent requests** category.

The administrator can also check the **User settings** category and configure the **Users can request admin consent to apps they are unable to consent to** options and policies.

More consent settings can be configured by the admin under the **User consent settings** category.

SharePoint Browser View

The **SharePoint Browser** view allows you to connect to a SharePoint repository and perform SharePoint-specific actions on the available resources. To display this view, go to **Window > Show View > SharePoint Browser**.

Getting Started

When you first open the view, it includes some quick actions to help you [get connected to your SharePoint repository](#) (*on page 1809*) (these actions are also available in the  **Settings** drop-down menu).

Figure 442. SharePoint Browser View Quick Actions

The SharePoint Browser View Interface

The header stripe of the **SharePoint Browser** view includes:

Site drop-down menu

Use this drop-down to select and connect to an already [defined SharePoint connection \(on page 1809\)](#).

User drop-down menu

This drop-down includes

- **Log in with Microsoft account** (if logged out) - Opens the Microsoft login page in your default browser and authenticates Oxygen XML Developer.
- **Log out** (if logged in) - Logs out of your Microsoft account and the authorization between Oxygen XML Developer and Microsoft is revoked.
- **Help** - Opens the online user guide to a topic relevant to the current context.

Settings drop-down menu

This drop-down includes

- **New SharePoint Online Connection** - Opens the **Connection** dialog box with the SharePoint Online data source automatically selected.
- **New SharePoint Connection** - Opens the **Connection** dialog box with the SharePoint (older version) data source automatically selected.
- **Configure Database Sources** - Opens the **Database Sources** preferences page where you can configure your SharePoint connection.
- **Layout** - Use this option to choose the layout for the view. You can choose between: **Automatic**, **Vertical**, and **Horizontal**.

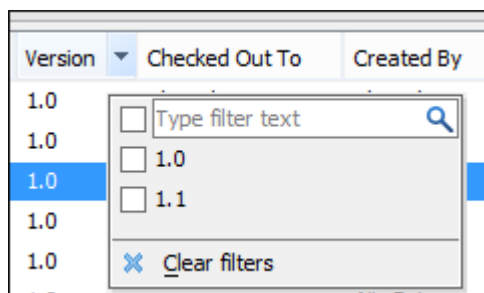

Once you are connected, the view is separated into two panes. The left pane is a navigation area that presents the SharePoint site structure in a tree-like fashion with the following node types:

-  **Site**
-  **Sub-site**
-  **Folders**

When a folder node is selected in the left pane, the right pane displays the contents of the folder (either folders or files).

You can filter and sort the displayed items. To display the available filters of a column, click the filter widget located on the column header. You can apply multiple filters at the same time.

Figure 443. Column Filter

Checking Documents In and Out

To check out a document from the server, right-click the file and select **Check Out**. You can discard the previous checkout operation, making the file available for editing to other users, by selecting **Discard Check Out**.

To check in a document that has been checked out, right-click the file and select **Check In**. For SharePoint Online connections, you only have the option to enter a comment and click the **Check In** button to process it. For SharePoint (older version), you can also choose the check in type (**Minor Version**, **Major Version**, or **Overwrite**).

Related Information:

[How to Configure a SharePoint Connection \(on page 1809\)](#)

SharePoint Contextual Menu Actions

While browsing SharePoint connections in the [Data Source Explorer view \(on page 1748\)](#) or the [SharePoint Browser view \(on page 1813\)](#), the following contextual menu actions are available, depending on the type of node:

Connection Nodes (Data Source Explorer view only)

Configure Database Sources

Opens the [Data Sources preferences page \(on page 242\)](#) where you can configure both data sources and connections.

Log in with Microsoft Account (when not connected)

Opens the Microsoft login page in your default browser and authenticates Oxygen XML Developer.

Disconnect (when connected)

Stops the connection.

Refresh

Performs a refresh on the selected node.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box (*on page 399*) that allows you to find and replace text in multiple files from the connection.

Site Nodes / **Sub-site Nodes**

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Refresh

Performs a refresh on the selected node.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box (*on page 399*) that allows you to find and replace text in multiple files from the connection.

Folder Level Nodes

New File or New Document

Creates a new file on the connection, in the current folder.

New Folder

Creates a new folder on the connection.

Import Folders

Imports folders on the server.

Import Files

Allows you to add a new file on the connection, in the current folder.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Find/Replace in Files (Data Source Explorer view only)

Opens the **Find/Replace in Files** dialog box (*on page 399*) that allows you to find and replace text in multiple files from the connection.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application (Data Source Explorer view only)

When you use this action, Oxygen XML Developer downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view, Oxygen XML Developer will detect that there was a change and will ask if you want to upload the edited resource to the server.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Check Out

Checks out the selected document on the server.

Check In

Checks in the selected document on the server. This action opens the **Check In** dialog box. For SharePoint Online connections, you only have the option to enter a comment and click the **Check In** button to process it.

For SharePoint (older version), the following options are available:

- **Minor Version** - Increments the minor version of the file on the server.
- **Major Version** - Increments the major version of the file on the server.
- **Overwrite** - Overwrites the latest version of the file on the server.
- **Comment** - Allows you to add a comment for a file that you check in.

Discard Check Out

Discards the previous checkout operation, making the file available to other users.

! **Important:**
Due to some API restrictions, the *Discard Checkout* action may not work when SharePoint Online connections are made directly to a sub-site.

Rename

Renames the current resource

✕ Delete

Deletes the current container.

↻ Refresh

Performs a refresh on the selected node.

Compare

Compares two selected resources using the **Compare Files** tool (on page 433).

Browsing for Remote Files with SharePoint Online

The **Open URL** dialog box (used for browsing remote files) includes support for connecting to a SharePoint Online server, with controls similar to the **SharePoint Browser** view (on page 1813). To open this dialog box, go to **File > Open URL** (or click the **Open URL** toolbar button), then choose the **Browse for remote file** option from the drop-down menu.

Figure 444. Open URL Dialog Box for SharePoint Online

The displayed dialog box is composed of the following:

Server Type

Specifies the type of server (**SharePoint Online** in this case).

Note:

If you select **SharePoint On-Premises**, the controls are similar to those for WebDav and other servers (on page 349).

Server URL

Specifies the protocol and the host name or IP of the server.

User drop-down menu

This drop-down includes:

- **Log in with Microsoft account** (if logged out) - Opens the Microsoft login page in your default browser and authenticates Oxygen XML Developer.
- **Log out** (if logged in) - Logs out of your Microsoft account and the authorization between Oxygen XML Developer and Microsoft is revoked.
- **Help** - Opens the online user guide to a topic relevant to the current context.

Browse

Use this button to retrieve the data from the server. Once the authentication completes, the files from the server will be available in the dialog box.

File URL

You can use this combo box to directly specify the URL to be opened or saved. This combo box also displays the current selection when the user changes selection by browsing the tree of folders and files on the server.

MS Azure Active Directory Authentication

It is possible to use your MS Azure Active Directory credentials for SharePoint authentication. To configure the application to use your *client ID* and *client secret*, set the following **Oxygen system properties** (on page 298):

- `com.oxygenxml.azure.active.directory.client.id` - Specifies a custom *client ID*.
- `com.oxygenxml.azure.active.directory.client.secret` - Specifies a custom *client secret*.

Your application should allow the following API permissions:

Table 40. API Permissions - Microsoft Graph

Microsoft Graph			
Name	Type	Description	Admin consent
<i>email</i>	Delegated	View users' email address	No

Table 40. API Permissions - Microsoft Graph (continued)

Microsoft Graph			
<i>Files.ReadWrite.All</i>	Delegated	Have full access to all files user can access	No
<i>offline_access</i>	Delegated	Maintain access to data you have given it access to	No
<i>openid</i>	Delegated	Sign users in	No
<i>profile</i>	Delegated	View users' basic profile	No
<i>Sites.ReadWrite.All</i>	Delegated	Edit or delete items in all site collections	No
<i>User.Read</i>	Delegated	Sign in and read user profile	No

Table 41. API Permissions - SharePoint

SharePoint			
Name	Type	Description	Admin consent
<i>AllSites.Read</i>	Delegated	Read items in all site collections	No
<i>AllSites.Write</i>	Delegated	Read and write items in all site collections	No

Notice:

The *Redirect URI* should be set to: `http://localhost/oauth/redirect`

15.

Importing Data

Computer systems and databases contain data in incompatible formats and exchanging data between these systems can be very time consuming. Converting the data to XML can greatly reduce the complexity and create data that can be read by various types of applications.

Oxygen XML Developer offers support for importing text files, MS Excel files, Database Data, and HTML files into XML documents. The XML documents can be further converted into other formats using the [Transform features](#) (on page 1098).

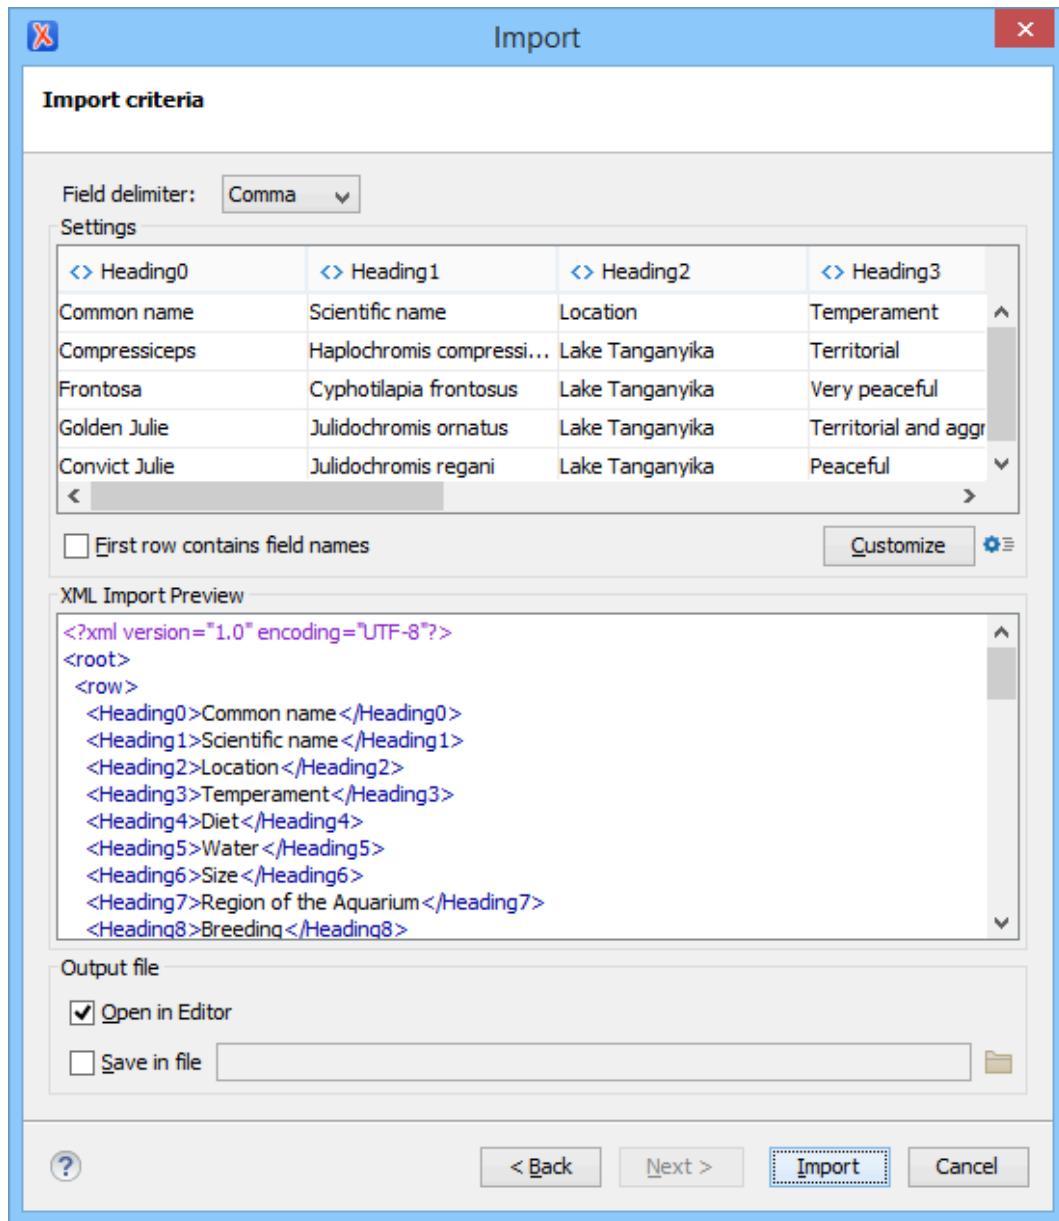

Import from Text Files

Oxygen XML Developer includes the possibility of importing text files (`txt` or `csv` file extensions) as XML documents.

To import a text file into an XML file, follow these steps:

1. Go to **File > Import/Convert > Text File to XML**.
A **Select text file** dialog box is displayed.
2. Select the URL of the text file (`txt` or `csv` file extensions).
3. Select the encoding of the text file.
4. Click the **Next** button.
The **Import Criteria** dialog box is displayed.

Figure 445. Import Criteria Dialog Box

5. Configure the settings for the conversion.

- a. Select the **Field delimiter** for the import settings. You can choose between the following: Comma, Semicolon, Tab, Space, Or Pipe.
- b. The **Import settings** section presents the input data in a tabular form. By default, all data items are converted to element content (<> symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values (= symbol). Clicking a second time causes the column data to be ignored (x symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.
- c. **First row contains field names** - If this option is selected, the default column headers are replaced (where such information is available) by the content of the first row. In other words, the first row is interpreted as containing the field names. The changes are also visible in the preview panel.

- d. **Customize** - This button opens a **Presentation Names** dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following options in the drop-down menu: `ELEMENT`, `ATTRIBUTE`, or `SKIPPED`.
 - e.  **Import Settings** - Clicking this button opens the [Import preferences page \(on page 234\)](#) that allows you to configure more import options.
 - f. The **XML Import Preview** panel contains an example of what the generated XML document looks like.
 - g. **Open in editor** - If selected, the new XML document created from the imported text file is opened in the editor.
 - h. **Save in file** - If selected, the new XML document is saved in the specified path.
6. Click **Import** to generate the XML document.

Import from MS Excel Files

Oxygen XML Developer provides several methods for importing MS Excel files into an XML file. You can copy data from Excel and paste it into inserted cells in **Grid** mode. If you want to import an entire Excel file, Oxygen XML Developer also offers a configurable import wizard that works with any type of XML document.

Grid Mode Method

The **Grid** mode in Oxygen XML Developer displays all content in an XML document as a structured grid of nested tables and you can work with the cells in those tables much like you would with any spreadsheet application. When importing Excel data into **Grid** mode, you first need to insert new cells in the particular nested table and then you can paste data from Excel the same as you would in any table or spreadsheet.

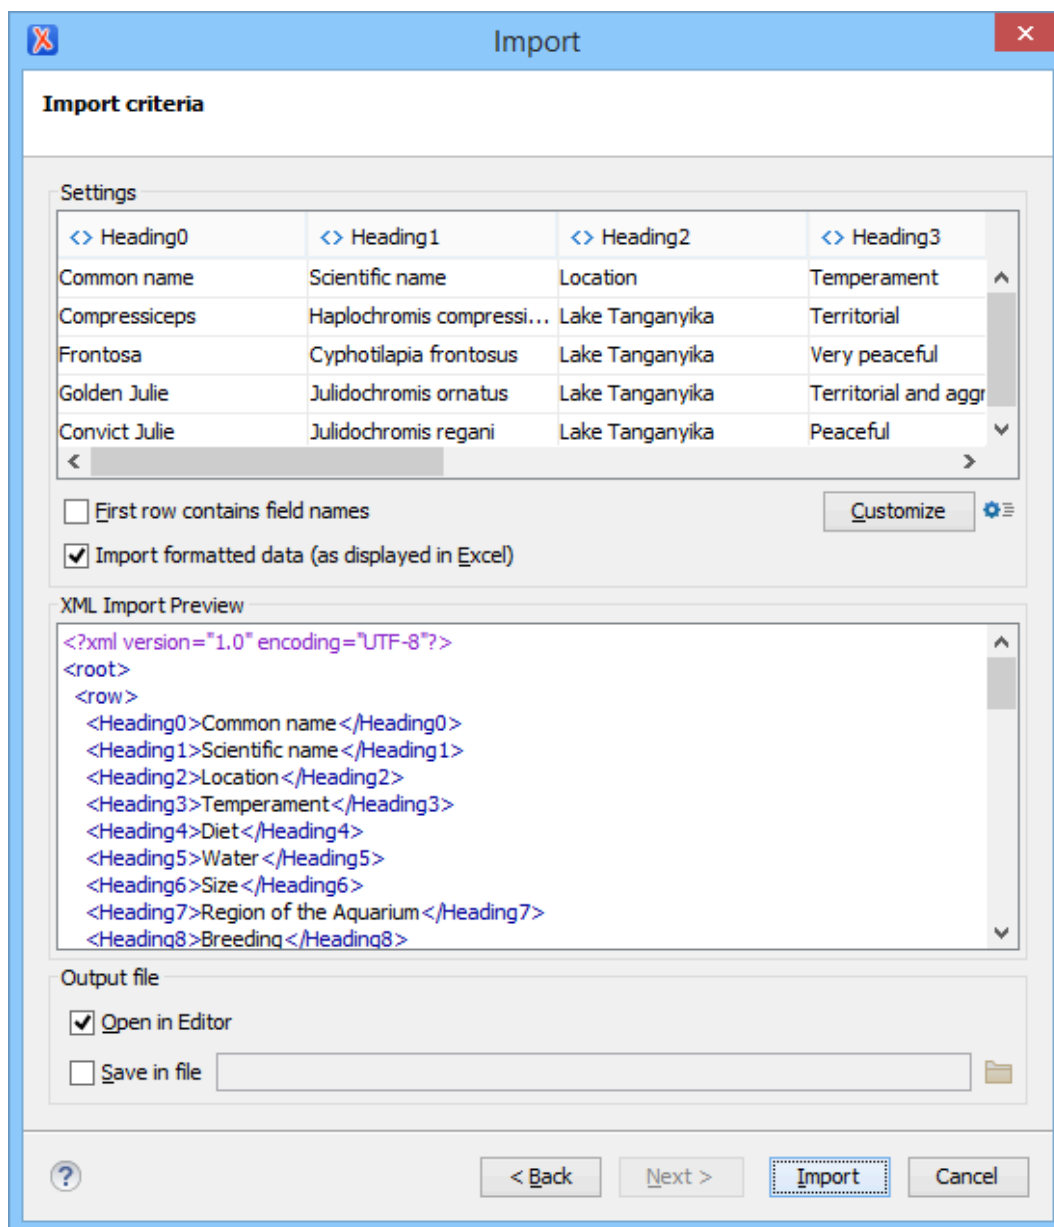

1. Copy the particular cells from your Excel spreadsheet that you want to import into an XML file.
2. Switch to **Grid** mode in Oxygen XML Developer.
3. Expand the particular nodes and locate the nested table where you want to insert the copied cells.
4. Right-click a particular row or column where you want to insert the data and select  **Insert row** or  **Insert column**, depending on the structure of the copied cells.
5. Paste the copied cells from the clipboard into the newly inserted cells in **Grid** mode.
6. You may need to make some manual adjustments. For example, if the selection of copied cells contained an empty cell, Oxygen XML Developer might ignore that cell.

Import Wizard Method

To use the **Import** wizard to import an Excel file into an XML file, follow these steps:

1. Go to **File > Import/Convert > MS Excel file to XML**.
2. Select the URL of the Excel file. The sheets of the document you are importing are presented in the **Available Sheets** section of this dialog box.
3. Click the **Next** button to proceed to the next stage of the wizard.

Figure 446. Import Wizard

4. Configure the settings for the conversion. This stage of the wizard offers the following options:

Import settings section

Presents the input data in a tabular form. By default, all data items are converted to element content (<> symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values (= symbol). Clicking a second time causes the column data to be ignored (x symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.

First row contains field names

If this option is selected, the default column headers are replaced (where such information is available) by the content of the first row. In other words, the first row is

interpreted as containing the field names. The changes are also visible in the preview panel.

Customize

This button opens a **Presentation Names** dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: `ELEMENT`, `ATTRIBUTE`, or `SKIPPED`.

Import Settings

Clicking this button opens the **Import preferences page** (*on page 234*) that allows you to configure more import options.

Import formatted data (as displayed in Excel)

If this option is selected, the imported data retains the Excel data formatting (such as the representation of numeric values or dates). If deselected, the data formatting is not imported.

XML Import Preview panel

Contains an example of what the generated XML document will look like.

Open in editor

If selected, the new XML document created from the imported file is opened in the editor.

Save in file

If selected, the new XML document is saved in the specified path.

5. Click **Import** to generate the XML document.

Resources

For more information about exchanging data between Oxygen XML Developer and spreadsheet applications, watch our video demonstration:

<https://www.youtube.com/embed/8VwsF58zLkU>

Related information

[Exporting XML Content to Excel](#) (*on page 542*)

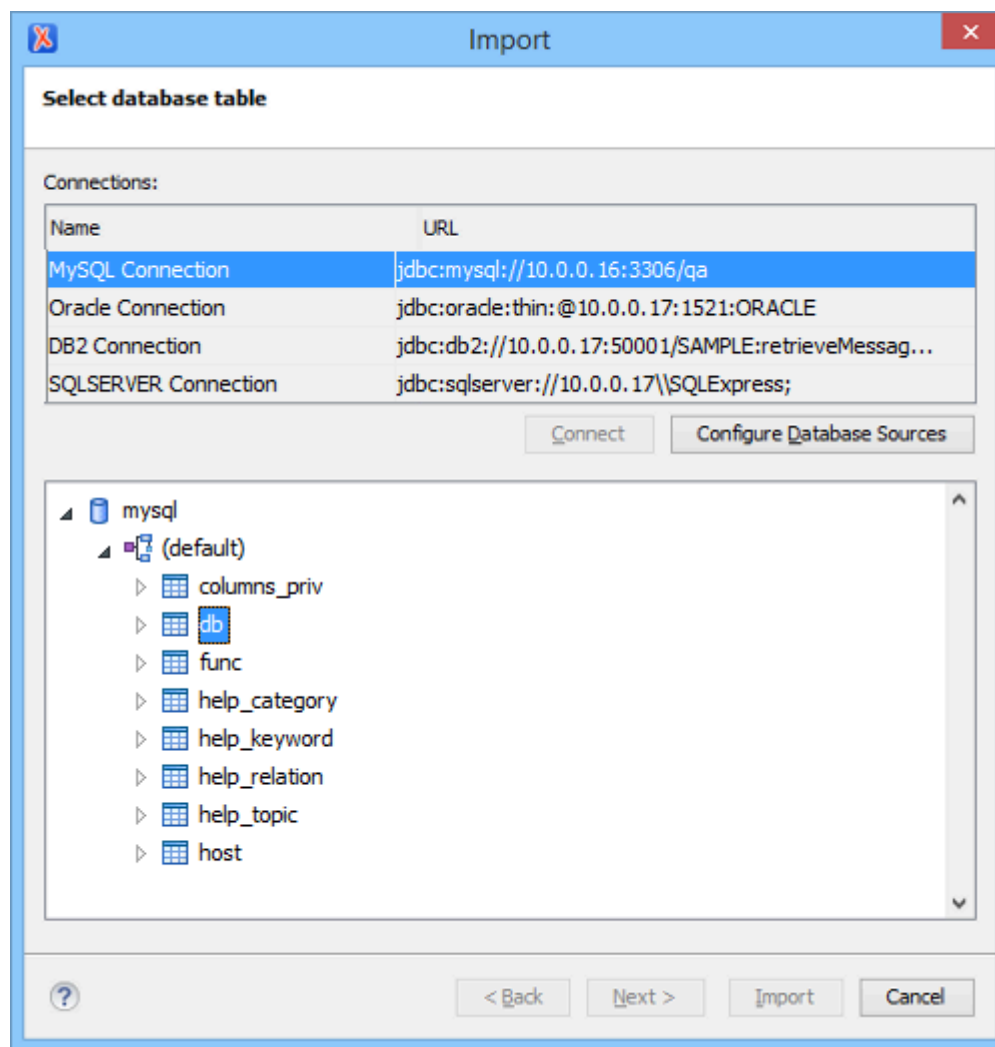

Import Database Data as an XML Document

To import the data from a relational database table as an XML document, follow these steps:

1. Go to **File > Import/Convert > Database Data to XML** to start the **Import** wizard.

This opens a **Select database table** dialog box that lists all the defined database connections:

Figure 447. Select Database Table Dialog Box

2. Select the connection to the database that contains the appropriate data.
Only connections configured in relational data sources can be used to import data.
3. If you want to edit, delete, or add a data source or connection, click the **Configure Database Sources** button.
The **Preferences/Data Sources** option page is opened.
4. Click **Connect**.
5. In the list of sources, expand a schema and choose the required table.
6. Click the **Next** button.

The **Import Criteria** dialog box is opened with a default query string in the **SQL Query** pane.

Figure 448. Import from Database Criteria Dialog Box

Import criteria

SQL Query

```
SELECT `Country`, `VAT_rate` FROM `oxygenxml`.`EU_VAT_Rates`
```

SQL Preview

Settings

<> Country	<> VAT_rate
Austria	20
Belgium	21
Bulgaria	20

Customize

XML Import Preview

```
<?xml version="1.0" encoding="UTF-8"?>
<root>
  <row>
    <Country>Austria</Country>
    <VAT_rate>20</VAT_rate>
  </row>
```

Output file

Open in Editor

Save in file D:\temp\importTest.xml

Generate XML Schema D:\temp\generateSchema.xsd

< Back Next > Import Cancel

7. Configure the settings for the conversion.

- a. **SQL Preview** - If this button is pressed, the **Settings** pane displays the labels that are used in the XML document and the first five lines from the database. By default, all data items are converted to element content (<> symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values (= symbol). Clicking a second time causes the column data to be ignored (x symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.
- b. **Customize** - This button opens a **Presentation Names** dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: ELEMENT, ATTRIBUTE, OR SKIPPED.

- c.  **Import Settings** - Clicking this button opens the [Import preferences page \(on page 234\)](#) that allows you to configure more import options.
 - d. The **XML Import Preview** panel contains an example of what the generated XML document looks like.
 - e. **Open in editor** - If selected, the new XML document created from the imported file is opened in the editor.
 - f. **Save in file** - If selected, the new XML document is saved in the specified path.
 - g. **Generate XML Schema** - Allows you to specify the path of the generated XML Schema file.
8. Click **Import** to generate the XML document.

Import from HTML Files

Oxygen XML Developer offers support for importing HTML files into an XML document.

Import Wizard Method

To use the **Import** wizard to import from HTML files, follow these steps:

1. Go to **File > Import/Convert > HTML File to XHTML**. The **Import HTML to XHTML** wizard is displayed.
2. Enter the URL of the HTML document.
3. Select the type of the resulting XHTML document:
 - XHTML5
 - XHTML 1.0 Transitional
 - XHTML 1.0 Strict
4. Click the **OK** button.

Result: The resulting document is an XHTML file containing a DOCTYPE declaration that references the XHTML DTD definition on the Web. The parsed content of the imported file is transformed to XHTML5, XHTML Transitional, or XHTML Strict depending on the option you chose.

Import Content Dynamically

Along with the built-in support for various useful URL protocols (such as HTTPS or SFTP), Oxygen XML Developer also provides special support for a *convert* protocol that can be used to chain predefined processors to dynamically import content from various sources.

Important:

Starting with version 26, the dynamic conversion protocol is disabled by default. To enable it, you must set the `com.oxygenxml.enable.convert.url.protocol` [system property \(on page 305\)](#) to the value of `true`.

A *dynamic conversion URL* chains various processors that can be applied, in sequence, on a target resource and has the following general syntax:

```
convert:/processor=xslt;ss=urn:processors:excel2d.xsl/processor=excel!/urn:files:my.xls
```

The previous example first applies a processor (`excel`) on a target identified by the identifier (`urn:files:sample.xls`) and converts the Excel™ resource to XML. The second applied processor (`xslt`) applies an XSLT stylesheet identified using the identifier (`urn:processors:excel2d.xsl`) over the resulting content from the first applied processor. These identifiers are all mapped to real resources on disk via an *XML catalog* that is configured in the application, as in the following example:

```
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
  <rewriteURI uriStartString="urn:files:" rewritePrefix="./resources/" />
  <rewriteURI uriStartString="urn:processors:" rewritePrefix="./processors/" />
</catalog>
```

The target resource part of the conversion URL must always follow the `! /` pattern. It can be any of the following:

- An absolute URL that points to a resource.
- An identifier that will be resolved to an actual resource via the *XML Catalog (on page 2273)* support in the application. In the example above, the `urn:files:sample.xls` target resource is resolved via the *XML catalog*.
- A relative location. This location can only be resolved to an actual resource URL when the application has enough information about the location where the URL is referenced.

For example, for a *DITA map (on page 2268)* with a `<topicref>` such as:

```
<topicref href="convert:/.../processor=excel!/resources/sample.xls" />
```

the `resources/sample.xls` path will be resolved relative to the *DITA map* location.

This type of URL can be opened in the application by using the **Open URL** action from the **File** menu. It can also be referenced from existing XML resources via `xi:include` or as a topic reference from a *DITA map*.

A *GitHub* project that contains various dynamic conversion samples for producing DITA content from various sources (and then publishing it) can be found here: <https://github.com/oxygenxml/dita-glass>.

Conversion Processors

A set of predefined conversion processors is provided in Oxygen XML Developer. Each processor has its own parameters that can be set to control the behavior of the conversion process. All parameters that are resolved to resources are passed through the *XML catalog* mapping.

The following predefined conversion processors are included:

- **xslt Processor** - Converts an XML input using the Saxon EE XSLT processor. The `ss` parameter indicates the stylesheet resource to be loaded. All other specified parameters will be set as parameters to the XSLT transformation.

```
convert:/processor=xslt;ss=urn:processors:convert.xsl;pl=v1!/urn:files:sample.xml
```

- **xquery Processor** - Converts an XML input using the Saxon EE XQuery processor. The `ss` parameter indicates the XQuery script to be loaded. All other specified parameters will be set as parameters to the XSLT transformation.

```
convert:/processor=xquery;ss=urn:processors:convert.xquery;p1=v1!/urn:files:sample.xml
```

- **excel Processor** - Converts an Excel™ input to an XML format that can later be converted by other piped processors. It has a single parameter `sn`, which indicates the name of the sheet that needs to be converted. If this parameter is missing, the XML will contain the combined content of all sheets included in the Excel™ document.

```
convert:/processor=excel;sn=test!/urn:files:sample.xls
```

- **java Processor** - Converts an input to another format by applying a specific Java method. The `jars` parameter is a comma-separated list of *JAR (on page 2270)* libraries, or folders that libraries will be loaded from. The `ccn` parameter is the fully qualified name of the conversion class that will be instantiated. The conversion class needs to have a method with the following signature:

```
public void convert(String systemID, String originalSourceSystemID,
    InputStream is, OutputStream os, LinkedHashMap<String, String> properties)
    throws IOException
```

```
convert:/processor=java;jars=libs;ccn=test.JavaToXML!/
urn:files:java/WSEditorBase.java
```

- **js Processor** - Converts an input to another format by applying a JavaScript method. The `js` parameter indicates the script that will be used. The `fn` parameter is the name of the method that will be called from the script. The method must take a string as an argument and return a string. If any of the parameters are missing, an error is thrown and the conversion stops.

```
convert:/processor=js;js=urn:processors:md.js;fn=convertExternal!/urn:files:sample.md
```

- **json Processor** - Converts a JSON input to XML. It has no parameters.

```
convert:/processor=json!/urn:files:personal.json
```

- **xhtml Processor** - Converts HTML content to well-formed XHTML. It has no parameters.

```
convert:/processor=xhtml!/urn:files:test.html
```

- **wrap Processor** - Wraps content in a tag name making it well-formed XML. The `rn` parameter indicates the name of the root tag to use. By default, it is `wrapper`. The `encoding` parameter specifies the encoding that should be used to read the content. By default, it is `UTF8`. As an example, this processor can be used if you want to process a comma-separated values file with an XSLT stylesheet to produce XML content. The CSV file is first wrapped as well-formed XML, which is then processed with an `xslt` processor.

```
convert:/processor=wrap!/urn:files:test.csv
```

- **cache Processor** - Caches the converted content obtained from the original document to a temporary file. The cache will be used on subsequent uses of the same URL, thus increasing the speed for the application returning the converted content. If the original URL points to the local disk, the cache will

be automatically invalidated when the original file content gets modified. Otherwise, if the original URL points to a remote resource, the cache will need to be invalidated by reloading ( **Reload (F5)** from the toolbar) the URL content that is opened in the editor.

```
convert:/processor=cache/processor=xslt;...!/urn:files:test.csv
```

Reverse Conversion Processors

All processors defined above can also be used for saving content back to the target resource if they are defined in the URL as reverse processors. Reverse processors are evaluated right to left. These reverse processors allow *round-tripping* content to and from the target resource.

As an example, the following URL converts HTML to DITA when the URL is opened using the `h2d.xsl` stylesheet and converts DITA to HTML when the content is saved in the application using the `d2h.xsl` stylesheet.

```
convert:/processor=xslt;ss=h2d.xsl/rprocessor=xslt;ss=d2h.xsl!/urn:files:sample.html
```

Important:

If you are publishing a *DITA map* that has such conversion URL references inside, you need to edit the transformation scenario and set the value of the parameter `fix.external.refs.com.oxygenxml` to **true**. This will instruct Oxygen XML Developer to resolve such references during a special pre-processing stage. Depending on the conversion, you may also require additional libraries to be added using the **Libraries** button in the **Advanced** tab of the transformation scenario.

16.

Debugging XSLT Stylesheets and XQuery Documents

Oxygen XML Developer includes a powerful debugging interface that helps you to detect and solve problems with XSLT and XQuery transformations.

XSLT Debugger Perspective

The **XSLT Debugger perspective** ([on page 2271](#)) allows you to detect problems in an XSLT transformation by executing the process step by step. To switch the focus to this *perspective*, select the  **XSLT Debugger** button in the top-right corner of the interface or **Window > Open perspective > XSLT Debugger**.

XQuery Debugger Perspective

The **XQuery Debugger perspective** ([on page 2271](#)) allows you to detect problems in an XQuery transformation process by executing the process step by step in a controlled environment and inspecting the information provided in the special views. To switch the focus to this *perspective*, select the  **XQuery Debugger** button in the top-right corner of the interface or **Window > Open perspective > XQuery Debugger**.

XSLT/XQuery Debugging Overview

The **XSLT Debugger** and **XQuery Debugger perspectives** ([on page 2271](#)) allows you to test and debug XSLT 1.0 / 2.0 / 3.0 stylesheets and XQuery 1.0 / 3.0 documents including complex XPath 2.0 / 3.0 expressions. The interface presents simultaneous views of the source XML document, the XSLT/XQuery document and the result document. As you go step by step through the XSLT/XQuery document the corresponding output is generated step by step, and the corresponding position in the XML file is highlighted. At the same time, special views provide various types of debugging information and events useful to understand the transformation process.

The following set of features allow you to test and solve XSLT/XQuery problems:

- Support for XSLT 1.0 stylesheets (using Saxon 6.5.5 and Xalan XSLT engines), XSLT 2.0 / 3.0 stylesheets and XPath 2.0 / 3.0 expressions that are included in the stylesheets (using Saxon 12.5 XSLT engine) and XQuery 1.0 / 3.0 (using Saxon 12.5 XQuery engine).
- Stepping capabilities: step in, step over, step out, run, run to cursor, run to end, pause, stop.
- Output to source mapping between every line of output and the instruction element / source context that generated it.
- [Breakpoints](#) ([on page 1855](#)) on both source and XSLT/XQuery documents.
- Call stack on both source and XSLT/XQuery documents.
- Trace history on both source and XSLT/XQuery documents.
- Support for XPath expression evaluation during debugging.
- Step into imported/included stylesheets as well as included source entities.

- Available templates and hits count.
- Variables view.
- Dynamic output generation.

Resources

For even more information, watch our video demonstration:

<https://www.youtube.com/embed/m9d8c4V-LJw>

Debugger Layout

The XML and XSL files are displayed in **Text mode** (*on page 471*). The **Grid mode** (*on page 316*) is available only in the *Editor perspective* (*on page 309*).

The **XSLT/XQuery Debugger perspective** (*on page 2271*) contains the following components:

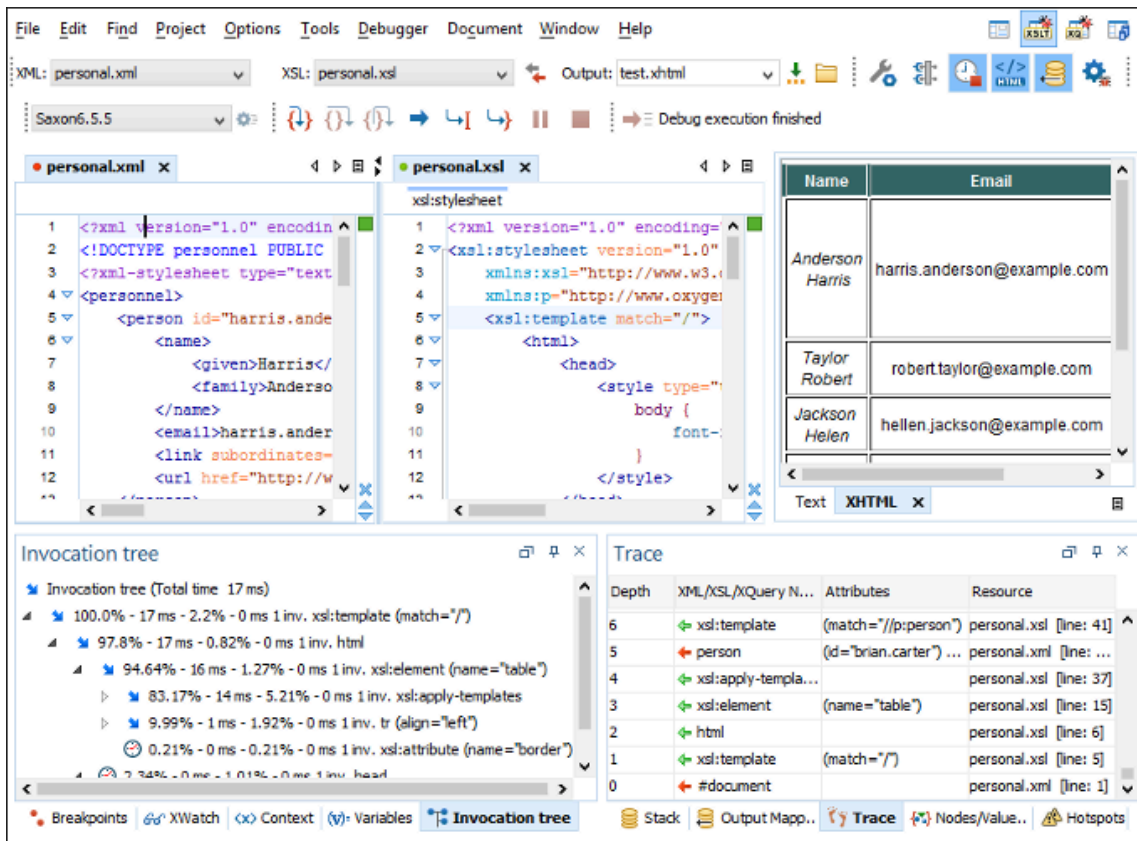

- **Source Document View (XML)** - Displays and allows the editing of XML files (documents).
- **XSLT/XQuery Document View (XSLT/XQuery)** - Displays and allows the editing of XSL files (stylesheets) or XQuery documents.
- **Output View** - Displays the output that results from inputting a document (XML) and a stylesheet (XSL) or XQuery document in the transformer. The transformation result is written dynamically while the transformation is processed (using the [➔ Run button on the Control toolbar](#) (*on page 1837*)). Several actions are available in the contextual menu for this view, including **Find/Replace**,  **Copy**, and  **Format and Indent**. There are two types of output views: a **Text** view (with XML syntax highlights) and **XHTML** view. For large outputs, the XHTML view can be disabled (see [Debugger Settings](#) (*on page 225*)).
- **Control Toolbar** (*on page 1834*) - Contains a variety of actions to help you configure and control the debugging process.
- **Information Views** (*on page 1838*) - The information views at the bottom of the editor display various types of information to help you understand the transformation process.

Tip:

The **Output** view and the various other information views are **dockable** (*on page 2268*) so that you can configure the workspace according to your preferences.

Figure 449. Debugger Interface

XML documents and XSL stylesheets or XQuery documents that were opened in the **Editor perspective** (on page 2271) are automatically sorted into the first two panes. When multiple files of each type are opened, the individual documents and stylesheets are separated using the familiar tab management system that you are used to in the **Editor perspective**. Selecting a tab brings the document or styleshet into focus and enables editing without the need to go back to the **Editor perspective**.

In Debugger mode, the normal editor toolbar is not available. However, functions are still accessible from the **Document** menu and the contextual menus.

Bookmarks (on page 474) are replaced in the **Debugger perspective** by **breakpoints** (on page 1855).

During debugging, the current execution node is highlighted in both document (XML) and XSLT/XQuery views.

Related Information:

- [Steps in a Typical Debugging Process \(on page 1851\)](#)
- [Identify the XSLT / XQuery Expression that Generated Particular Output \(on page 1852\)](#)
- [Supported Processors for XSLT / XQuery Debugging \(on page 1862\)](#)
- [Performance Profiling of XSLT Stylesheets and XQuery Documents \(on page 1856\)](#)

Control Toolbar

The **Control** toolbar contains all the actions that you need to configure and control the debugging process. The following actions are described as they appear in the toolbar from left to right.

Figure 450. Control Toolbar**XML source selector**

The current selection represents the source document used as input by the transformation engine. The selection list contains all open files (XML files being emphasized). This option allows you to use other file types also as source documents. In an XQuery debugging session this selection field can be set to the default value `NONE`, because usually XQuery documents do not require an input source.

XSL / XQuery selector

The current selection represents the stylesheet or XQuery document to be used by the transformation engine. The selection list contains all open files (XSLT / XQuery files being emphasized).

Link with editor

When selected, the XML and XSLT/XQuery selectors display the names of the files open in the central editor panels. This button is toggled off by default.

Output selector

The selection represents the output file specified in the associated transformation scenario. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 289) button, or the  **Browse** button.

Configure parameters

Opens a dialog box that allows you to configure the XSLT / XQuery parameters to be used by the transformation.

Edit extensions

Allows you to add and remove the Java classes and *JARS* (on page 2270) used as XSLT extensions.

Turn on/off profiling

Enables / Disables current transformation profiling.

Enable XHTML output

Enables the rendering of the output in the **XHTML output view** (on page 1833) during the transformation process. For performance issues, disable XHTML output when working with very large files. Note that only XHTML conformant documents can be rendered by this view. To view the output result of other formats, such as HTML, save the **Text output** area to a file and use an external browser for viewing.

When starting a debug session from the **Editor perspective (on page 2271)** by using the **Debug Scenario** action, the state of this toolbar button reflects the state of the **Show as XHTML** output option from the scenario.

Turn on/off output to source mapping

Enables or disables the output to source mapping between every line of output and the instruction element / source context that generated it.

Debugger preferences

Quick link to [Debugger preferences page \(on page 225\)](#).

XSLT / XQuery engine selector

Lists the [processors available for debugging XSLT and XQuery transformations \(on page 1862\)](#).

XSLT / XQuery engine advanced options

If Saxon HE/PE/EE is selected, you can click this button to open the [Advanced Saxon Transformation Options page \(on page 1134\)](#).

Step into

Starts the debugging process and runs until the next instruction is encountered.

Step over

Run until the current instruction and its sub-instructions are over. Usually this will advance to the next sibling instruction.

Figure 451. Step over

```

12 <xsl:template match="CCC" priority="4">
13   <h3 style="color:blue">
14     <xsl:value-of select="name0"/>
15     <xsl:text> (id=</xsl:text>
16     <xsl:value-of select="@id"/>
17     <xsl:text>)</xsl:text>
18   </h3>
19   <xsl:message>Step over goes here</xsl:message>
20 </xsl:template>

```

Step out

Run until the parent of the current instruction is over. Usually this will advance to the next sibling of the parent instruction.

Figure 452. Step out

```

12 <xsl:template match="CCC" priority="4">
13 <h3 style="color:blue">
14 <xsl:value-of select="name()">
15 <xsl:text> (id=</xsl:text>
16 <xsl:value-of select="@id">
17 <xsl:text></xsl:text>
18 </h3>
19 <xsl:message>Step out goes here</xsl:message>
20 </xsl:template>

```

→ Run Shift + F5

Starts the debugging process. The execution of the process is paused when a *breakpoint (on page 1839)* is encountered or the transformation ends.

↵ Run to cursor

Starts the debugging process and runs until one of the following conditions occur: the line of cursor is reached, a valid *breakpoint (on page 1855)* is reached or the execution ends.

↵ Run to end

Runs the transformation until the end, without taking into account enabled *breakpoints (on page 1855)*, if any.

|| Pause

Request to pause the current transformation as soon as possible.

■ Stop

Request to stop the current transformation without completing its execution.

Show current execution nodes

Reveals the current debugger context showing both the current instruction and the current node in the XML source. Possible displayed states:

- Entering (→) or leaving (←) an XML execution node.
- Entering (→) or leaving (←) an XSL execution node.
- Entering (→) or leaving (←) an XPath execution node.

**Note:**

When you set a MarkLogic server as a processor, the **Show current execution nodes** button is named **Refresh current session context from server**. Click this button to refresh the information in all the views.

**Note:**

For some XSLT processors (Saxon-HE/PE/EE), the debugger could be configured to step into the XPath expressions affecting the behavior of the following debugger actions: **Step into**, **Step over** or **Step Out**.

Related information

[Advanced Saxon HE/PE/EE XQuery Transformation Options \(on page 1149\)](#)

Debugging Information Views

The information views at the bottom of the editor is comprised of two panes that are used to display various types of information used to understand the transformation process. For each information type there is a corresponding tab. While running a transformation, relevant events are displayed in the various information views. This enables the developer to obtain a clear view of the transformation progress. By using the debug controls, developers can easily isolate parts of stylesheet. Therefore, they may be more easily understood and modified.

The information types include the following:

Left side information views

- **Breakpoints** view (on page 1839)
- **XWatch** view (on page 1841)
- **Context** view (on page 1840)
- **Messages** view (on page 1842) (XSLT only)
- **Variables** view (on page 1849)
- **Invocation Tree** view (on page 1858)

Right side information views

- **Stack** view (on page 1843)
- **Output Mapping Stack** view (on page 1844)
- **Trace** view (on page 1846)
- **Templates** view (on page 1847) (XSLT only)
- **Nodes/Values Set** view (on page 1848)
- **Hotspots** view (on page 1859)

**Tip:**

The information views are **dockable** (on page 2268) so that you can configure the workspace according to your preferences.

Breakpoints View

The **Breakpoints** view lists all *breakpoints* (on page 1855) that are set on open documents. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu. *Breakpoints can be inserted* (on page 1856) in the XML source document or the XSLT/XQuery document in debugging sessions.

Once you insert a *breakpoint*, it is automatically added to the list in the **Breakpoints** view and you can edit its associated *condition*. A *breakpoint* can have an associated break condition that represents an XPath expression evaluated in the current debugger context. For them to be processed, their evaluation result should be a boolean value. A *breakpoint* with an associated condition only stops the execution of the Debugger if the *breakpoint condition* is evaluated as **true**.

Figure 453. Breakpoints View

Enabled	Resource	Condition
<input checked="" type="checkbox"/>	(conditional only)	count(preceding::person)=2
<input checked="" type="checkbox"/>	personal.xml [line:16]	local-name()='person'
<input checked="" type="checkbox"/>	personal.xml [line:22]	position()>=
<input checked="" type="checkbox"/>	personal.xml [line:34]	(no condition)
<input checked="" type="checkbox"/>	personal.xml [line:44]	(no condition)
<input checked="" type="checkbox"/>	personal.xml [line:50]	(no condition)

The **Breakpoints** view contains the following columns:

- **Enabled** - If selected, the current condition is evaluated and taken into account.
- **Resource** - Resource file and number of the line where the *breakpoint* is set. The Entire path of resource file is available as tooltip.
- **Condition** - XSLT/XQuery expression to be evaluated during debugging. The expression will be evaluated at every debug step.

Clicking a record highlights the *breakpoint* line in the document.

Note:

The *breakpoints* list is not deleted at the end of a transformation (it is preserved between debugging sessions).

The following actions are available in the contextual menu of the table:

Go to

Moves the cursor to the source of the *breakpoint*.

Run to Breakpoint

Runs the debugger up to the point of this particular *breakpoint* and ignores the others (regardless of whether they were previously enabled or disabled).

Enable

Enables the *breakpoint*.

Disable

Disables the *breakpoint*. A disabled *breakpoint* will not be evaluated by the Debugger.

Add

Allows you to add a new *breakpoint* and *breakpoint condition*.

Edit

Allows you to edit an existing *breakpoint*.

Remove

Deletes the selected *breakpoint*.

Enable all

Enables all *breakpoints*.

Disable all

Disables all *breakpoints*.

Remove all

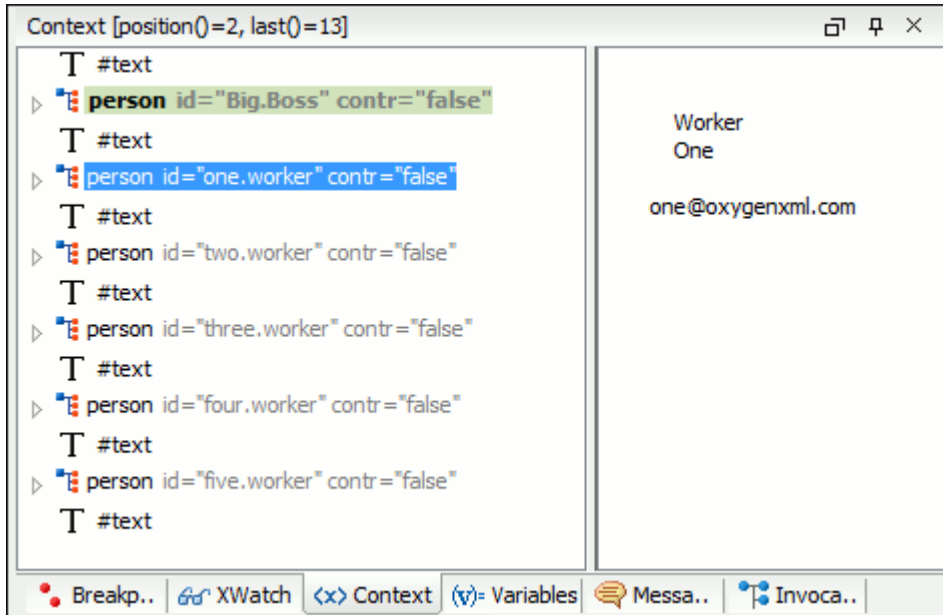

Removes all *breakpoints*.

Related Information:

[Using Breakpoints \(on page 1855\)](#)

Context View

The context node is valid only for XSLT debugging sessions and is a source node corresponding to the XSL expression that is evaluated. It is also called the context of execution. The context node implicitly changes as the processor hits various steps (at the point where XPath expressions are evaluated). This node has the same value as evaluating '.' (dot) XPath expression in **XWatch view** (on page 1841). The value of the context node is presented as a tree in the **Context** view. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 454. Context node view

The context nodes are presented in a tree-like fashion. Nodes from a defined namespace bound to a prefix are displayed using the qualified name. If the namespace is not bound to a prefix, the namespace URI is presented before the node name. The value of the selected attribute or node is displayed in the right side panel. The **Context** view also presents the current mode of the XSLT processor if this mode differs from the default one.

The title bar displays the current element index and the number of elements that compose the current context (this information is not available if you choose Xalan or Saxon 6 as processing engine).

XPath Watch (XWatch) View

The **XWatch** view shows XPath expressions evaluated during the debugging process. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Expressions are evaluated dynamically as the processor changes its source context. When you type an XPath expression in the **Expression** column, Oxygen XML Developer supports you with syntax highlight and **content completion assistance** (on page 663).

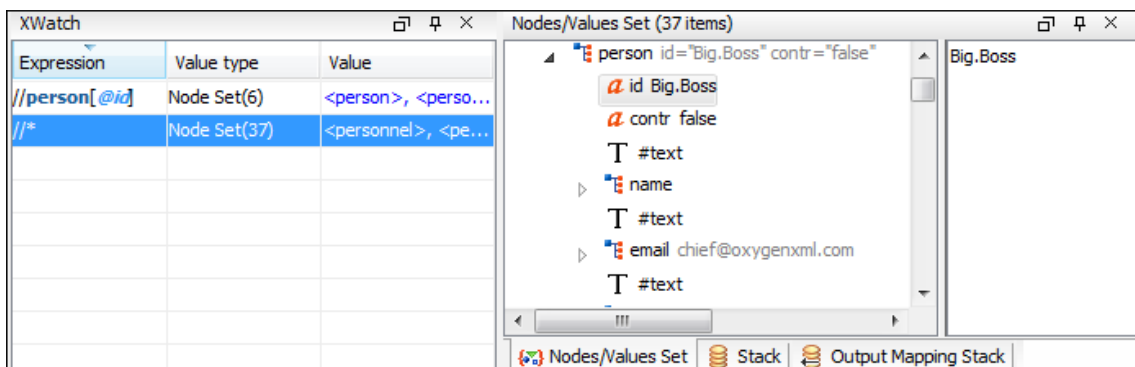

Figure 455. XPath Watch View

Table 42. XWatch columns

Col- umn	Description
Ex- pres- sion	XPath expression to be evaluated (XPath 1.0 or 2.0 / 3.0 compliant).
Val- ue	Result of XPath expression evaluation. Value has a type (see the possible values (on page 1849) in the Variables View (on page 1849)) section. For <i>Node Set</i> results, the number of nodes in the set is shown in parenthesis.

**Important:**

Notes about working with the **XWatch** view:

- Expressions that reference variable names are not evaluated.
- The expression list is not deleted at the end of the transformation (it is preserved between debugging sessions).
- To insert a new expression, click the first empty line of the **Expression** column and start typing. As an alternative, right-click and select the **Add** action. Press **Enter** on the cell to add and evaluate.
- To delete an expression, click its **Expression** column and delete its content. As an alternative, right-click and select the **Remove** action. Press **Enter** on the cell to commit changes.
- If the expression result type is a *Node Set*, click it (**Value** column) and its value is displayed in the [Nodes/Values Set view \(on page 1848\)](#).
- The **Copy**, **Add**, **Remove** and **Remove All** actions are available in every row's contextual menu.

Messages View

Using an `xsl:message` instruction is one way to signal special situations encountered during transformation as well as a raw way of doing the debugging. The **Messages** view is available only for XSLT debugging sessions and shows all `xsl:message` calls executed by the XSLT processor during transformation. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 456. Messages View

Message	Terminate	Resource
Message 1	no	personal.xml [line: 8]
Message 2	no	personal.xml [line: 12]
Message 3	no	personal.xml [line: 29]

Table 43. Messages columns

Col- umn	Description
Mes- sage	Message content.
Termi- nate	Signals whether or not the processor terminates the transformation once it encounters the mes- sage (yes/no respectively).
Re- source	Resource file where <i>xsl:message</i> instruction is defined and the message line number. The complete path of the resource is available as tooltip.

The following actions are available in the contextual menu:

Go to

Highlight the XSL fragment that generated the message.

Copy

Copies to clipboard message details (system ID, severity info, description, start location, terminate state).

✖ Clear all

Removes all messages from the view.

**Important:**

- Clicking a record from the table highlights the `xsl:message` declaration line.
- Message table values can be sorted by clicking the corresponding column header. Clicking the column header switches the sorting order between: ascending, descending, no sort.

Stack View

The **Stack** view shows the current execution stack of both source and XSLT/XQuery nodes. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

During the transformation, two stacks are managed. One for source nodes being processed and the other for XSLT/XQuery nodes being processed. Oxygen XML Developer shows both node types in one common stack. The source (XML) nodes are preceded by a red color icon while XSLT/XQuery nodes are preceded by a green color icon. The advantage of this approach is that you can always see the source scope on which an XSLT/XQuery instruction is executed (the last red color node on the stack). The stack is oriented upside down.

Figure 457. Stack View

#	XML/XSL/XQuery Node	Attributes	Resource
4	xsl:message		personal.xsl
3	xsl:element	(name="table")	personal.xsl
2	html		personal.xsl
1	xsl:template	(match="/*")	personal.xsl
0	#document		personal.xml

The contextual menu contains one action: **Go to**, which moves the selection in the editor panel to the line containing the XSLT element that is displayed on the selected line from the view.

Table 44. Stack Columns

Column	Description
#	Order number, represents the depth of the node (0 is the stack base).
XML/XSLT/XQuery Node	Node from source or stylesheet document currently being processed. One particular stack node is the document root, noted as #document .
Attributes	Attributes of the node (a list of <i>id="value"</i> pairs).
Resource	Resource file where the node is located. The entire path is available as tooltip.

**Important:**

Remarks:

- Clicking a record from the stack highlights that node's location inside resource.
- Using Saxon, the stylesheet elements are qualified with XSL proxy, while using Xalan you only see their names. (example: `xsl:template` using Saxon and `template` using Xalan).
- Only the Saxon processor shows element attributes.
- The Xalan processor shows also the built-in rules.

Output Mapping Stack View

The **Output Mapping Stack** view displays [context data \(on page 1852\)](#) and presents the XSLT templates/XQuery elements that generated specific areas of the output. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 458. Output Mapping Stack view

#	XML/XSL/XQuery Node	Attributes	Resource
8	xsl:value-of	(select="./link/@manager")	personal.xml
7	font	(color="black") (name="verdana") (size="3")	personal.xml
6	xsl:element	(name="td")	personal.xml
5	xsl:element	(name="tr")	personal.xml
4	xsl:template	(match="//person")	personal.xml
3	xsl:apply-templates		personal.xml
2	xsl:element	(name="table")	personal.xml
1	html		personal.xml
0	xsl:template	(match="/")	personal.xml

The **Go to** action of the contextual menu takes you to the line that contains the XSLT element displayed in the **Output Mapping Stack** view.

Table 45. Output Mapping Stack Columns

Column	Description
#	The order number in the stack of XSLT templates/XQuery elements. Number 0 corresponds to the bottom of the stack in the status of the XSLT/XQuery processor. The highest number corresponds to the top of the stack.
XSL/XQuery Node	The name of an XSLT template/XQuery element that participated in the generation of the selected output area.
Attributes	The attributes of the XSLT template/XQuery node.
Resource	The name of the file containing the XSLT template/XQuery element.

**Important:**

Remarks:

- Clicking a record highlights that XSLT template definition/XQuery element inside the resource (XSLT stylesheet file/XQuery file).
- Saxon only shows the applied XSLT templates having at least one hit from the processor. Xalan shows all defined XSLT templates, with or without hits.
- The table can be sorted by clicking the corresponding column header. When clicking a column header the sorting order switches between: ascending, descending, no sort.
- Xalan shows also the built-in XSLT rules.

Related Information:

Identify the XSLT / XQuery Expression that Generated Particular Output (*on page 1852*)

Stack View (*on page 1843*)

Trace View (*on page 1846*)

Templates View (*on page 1847*)

Trace View

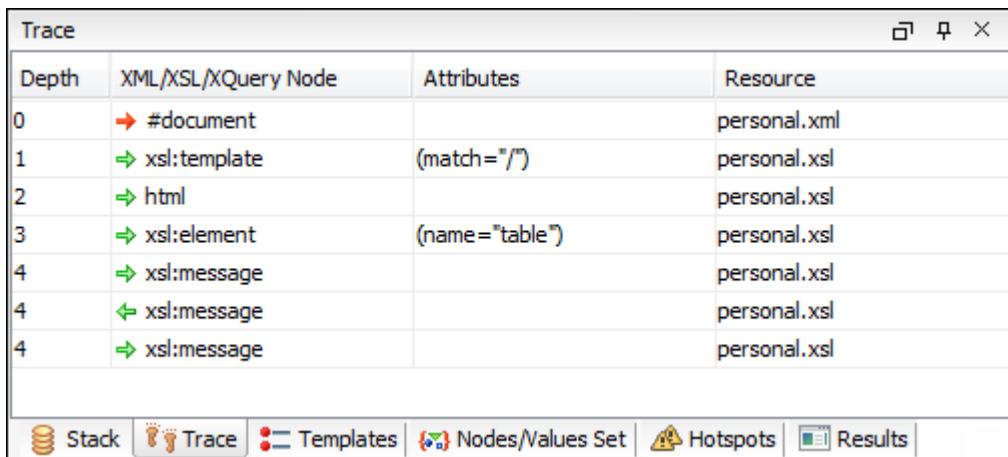

Usually, the XSLT/XQuery processors signal the following events during transformation:

-  - Entering a source (XML) node.
-  - Leaving a source (XML) node.
-  - Entering an XSLT/XQuery node.
-  - Leaving an XSLT/XQuery node.

The **Trace** view catches all of these events, so you can see how the process evolved. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The red icon lines denote source nodes while the green icon lines denote XSLT/XQuery nodes. It is possible to save the element trace in a structured XML document (using the **Export to XML** action in the contextual menu). Thus, you have the possibility of comparing the trace results from multiple debug sessions.

Figure 459. Trace History View

Depth	XML/XSL/XQuery Node	Attributes	Resource
0	 #document		personal.xml
1	 xsl:template	(match="/")	personal.xsl
2	 html		personal.xsl
3	 xsl:element	(name="table")	personal.xsl
4	 xsl:message		personal.xsl
4	 xsl:message		personal.xsl
4	 xsl:message		personal.xsl

The screenshot shows a window titled "Trace" with a table of events. The table has four columns: Depth, XML/XSL/XQuery Node, Attributes, and Resource. The events are listed in descending order of depth. The first event is a red arrow pointing right for "#document" at depth 0. Subsequent events are green arrows pointing right for "xsl:template", "html", "xsl:element", and "xsl:message". There is one green arrow pointing left for "xsl:message" at depth 4. The resource for all events is "personal.xml" or "personal.xsl". Below the table is a toolbar with icons for Stack, Trace, Templates, Nodes/Values Set, Hotspots, and Results.

The contextual menu contains the following actions:

Go to

Moves the selection in the editor panel to the line containing the XSLT element or XML element that is displayed on the selected line from the view;

Export to XML

Saves the entire trace list in XML format.

Table 46. Trace History Columns

Column	Description
Depth	Shows you how deep the node is nested in the XML or stylesheet structure. The bigger the number, the more nested the node is. A depth 0 node is the document root.
XML/XSLT/XQuery Node	Represents the node from the processed source or stylesheet document. One particular node is the document root, noted as <i>#document</i> . Every node is preceded by an arrow that represents what action was performed on it (entering or leaving the node).
Attributes	Attributes of the node (a list of <i>id="value"</i> pairs).
Resource	Resource file where the node is located. The complete path of the resource file is provided as tooltip.

**Important:**

Remarks:

- Clicking a record highlights that node's location inside the resource.
- Only the Saxon processor shows the element attributes.
- The Xalan processor shows also the built-in rules.

Templates View

The **xsl:template** is the basic element for stylesheets transformation. The **Templates** view is only available during XSLT debugging sessions and shows all *xsl:template* instructions used by the transformation. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Being able to see the number of *hits* for each of the templates allows you to get an idea of the stylesheet coverage by template rules with respect to the input source.

Figure 460. Templates view

Match	Hits	Priority	Mode	Name	Resource
//person	6				personal.xml
/	1				personal.xml

The contextual menu contains one action: **Go to**, which moves the selection in the editor panel to the line that contains the XSLT template displayed on the selected line from the view.

Table 47. Templates columns

Col- umn	Description
Match	The <i>match</i> attribute of the <i>xsl:template</i> .
Hits	The number of hits for the <i>xsl:template</i> . Shows how many times the XSLT processor used this particular template.
Priori- ty	The template priority as established by XSLT processor.
Mode	The <i>mode</i> attribute of the <i>xsl:template</i> .
Name	The <i>name</i> attribute of the <i>xsl:template</i> .
Re- source	The resource file where the template is located. The complete path of the resource file is available as tooltip.

**Important:**

Remarks:

- Clicking a record highlights that template definition inside the resource.
- Saxon only shows the applied templates having at least one hit from the processor. Xalan shows all defined templates, with or without hits.
- Template table values can be sorted by clicking the corresponding column header. When clicking a column header the sorting order switches between: ascending, descending, no sort.
- Xalan shows also the built-in rules.

Nodes/Values Set View

The **Nodes/Values Set** view is always used in relation with the **Variables** view (on page 1849) and **XWatch** view (on page 1841). If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu. It shows an XSLT node set value in a tree form. This view is updated as a response to the following events:

- You click a variable that has a node set value in the **Variables** (on page 1849) or **XWatch** view (on page 1841).
- You click a tree fragment in the **Variables** (on page 1849) or **XWatch** view (on page 1841).
- You click an XPath expression evaluated to a node set in the **Variables** (on page 1849) or **XWatch** view (on page 1841).

Figure 461. Node Set view

The nodes / values set is presented in a tree-like fashion. The total number of items is presented in the title bar. Nodes from a defined namespace bound to a prefix are displayed using the qualified name. If the namespace is not bound to a prefix, the namespace URI is presented before the node name. The value of the selected attribute or node is displayed in the right side panel.

**Important:**

Remarks:

- For longer values in the right side panel, the interface displays it with an ellipsis (...) at the end. A more detailed value is available as a tooltip when hovering over it.
- Clicking a record highlights the location of that node in the source or stylesheet view.

Variables View

The **Variables** view displays variables and parameters (local and global), along with their values. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Variables and parameters play an important role during an XSLT/XQuery transformation. Oxygen XML Developer uses the following icons to differentiate variables and parameters:

- **V** - Global variable.
- **{V}** - Local variable.
- **P** - Global parameter.
- **{P}** - Local parameter.

The following value types are available:

- **Boolean**
- **String**
- **Date** - XSLT 2.0 / 3.0 only.
- **Number**

- **Set**
- **Object**
- **Fragment** - Tree fragment.
- **Any**
- **Undefined** - The value was not yet set, or it is not accessible.

Note:

When Saxon 6.5 is used, if the value is unavailable, then the following message is displayed in the **Value** field: "The variable value is unavailable".

When Saxon 9 is used:

- If the variable is not used, the **Value** field displays "The variable is declared but never used".
- If the variable value cannot be evaluated, the **Value** field displays "The variable value is unavailable".

- **Document**
- **Element**
- **Attribute**
- **ProcessingInstruction**
- **Comment**
- **Text**
- **Namespace**
- **Evaluating** - Value under evaluation.
- **Not Known** - Unknown types.

Figure 462. Variables View

	Name	Value type	Value
{V}	val	String	
{P}	rowval	String	1,2
V	trans	String	
P	level	String	1,2
P	image-path	String	Images/

Table 48. Variables Columns

Column	Description
Name	Name of variable / parameter.

Table 48. Variables Columns (continued)

Column	Description
Value Type	Type of variable/parameter.
Value	Current value of variable / parameter.

The value of a variable (the **Value** column) can be copied to the clipboard for pasting it to other editor areas with the **Copy value** action from the contextual menu. This is useful if you have long and complex values that cannot be easily remembered just by looking at them once.

**Important:**

Remarks:

- Local variables and parameters are the first entries presented in the table.
- Clicking a record highlights the variable definition line.
- Variable values could differ depending on the transformation engine used or stylesheet version set.
- If the value of the variable is a node set or a tree fragment, clicking it causes the **Node Set view** (on page 1848) to be shown with the corresponding set of values.
- Variable table values can be sorted by clicking the corresponding column header. Clicking the column header switches between the orders: ascending, descending, no sort.

Multiple Output Documents in XSLT 2.0 and XSLT 3.0

For XSLT 2.0 and XSLT 3.0 stylesheets that store the output in multiple files by using the `xsl:result-document` instruction, the content of the file created in this way is displayed in an output view after the transformation is finished. There is one view for each `xsl:result-document` instruction so that the output is not mixed while still being presented in multiple views.

Steps in a Typical Debugging Process

Depending on your situation and needs, the debugging process might be more complex, but the following procedure is an example of a typical debugging process:

1. Open the source XML document (on page 344) and the XSLT/XQuery document. (on page 344)
2. If you are in the **Editor perspective** (on page 2271), switch to the **XSLT Debugger** or **XQuery Debugger perspective** (on page 2271) with one of the following actions:
 - Select **Window > Open perspective > XSLT Debugger/XQuery Debugger** or the  **XSLT Debugger**/ **XQuery Debugger** button in the top-right corner of the interface.
 - Select **Document > XML Document > Debug scenario** or use the  **Debug scenario** action on the toolbar.. This action initializes the Debugger *perspective* (on page 2271) with the

parameters of the transformation scenario. Any modification applied to the scenario parameters (the transformer engine, XSLT parameters, transformer extensions, etc.) will be saved back in the scenario when exiting from the Debugger *perspective*.

3. Select the source XML document in the **XML source selector of the Control toolbar** (*on page 1835*). In the case of XQuery debugging, if your XQuery document has no implicit source, set the source selector value to **NONE**.
4. Select the XSLT/XQuery document in the **XSL/XQuery selector of the Control toolbar** (*on page 1835*).
5. Set XSLT/XQuery parameters using the **Configure parameters** button on the Control toolbar (*on page 1835*).
6. Set one or more breakpoints (*on page 1855*).
7. Step through the stylesheet using the following buttons available on the Control toolbar (*on page 1836*):
 -  **Step into**
 -  **Step over**
 -  **Step out**
 -  **Run**
 -  **Run to cursor**
 -  **Run to end**
 -  **Pause**
 -  **Stop**
8. Examine the data in the information views to find the bug in the transformation process.
For more information about fixing bugs in the transformation, see: [Identify the XSLT / XQuery Expression that Generated Particular Output](#) (*on page 1852*).

Related Information:

[Identify the XSLT / XQuery Expression that Generated Particular Output](#) (*on page 1852*)

Identify the XSLT / XQuery Expression that Generated Particular Output

To quickly spot the XSLT templates or XQuery expressions with problems, it is important to know what XSLT template in the XSLT stylesheet (or XQuery expression in the XQuery document) and what element in the source XML document generated a specified area in the output.

Some of the debugging capabilities (for example, **Step in**) can be used for this purpose. Using **Step in**, you can see how output is generated and link it with the XSLT/XQuery element being executed in the current source context. However, this can become difficult on complex XSLT stylesheets or XQuery documents that generate a large output.

You can click particular text in the **Output** view or **XHTML** output view and the editor will select the XML source context and the XSLT template/XQuery element that generated that text. Also, inspecting the whole

stack of XSLT templates/XQuery elements that determined the state of the XSLT/XQuery processor at the moment of generating the specified output area speeds up the debugging process.

This is an example of a typical procedure for identifying an expression that generated particular output:

1. Switch to the **XSLT Debugger** or **XQuery Debugger** *perspective* (on page 2271) with one of the following actions:
 - Select **Window > Open perspective > XSLT Debugger/XQuery Debugger** or the  **XSLT Debugger**/ **XQuery Debugger** button in the top-right corner of the interface.
 - Select **Document > XML Document > Debug scenario** or use the  **Debug scenario** action on the toolbar.. This action initializes the Debugger *perspective* (on page 2271) with the parameters of the transformation scenario. Any modification applied to the scenario parameters (the transformer engine, XSLT parameters, transformer extensions, etc.) will be saved back in the scenario when exiting from the Debugger *perspective*.
2. Select the source XML document in the **XML source selector of the Control toolbar** (on page 1835). In the case of XQuery debugging, if your XQuery document has no implicit source, set the source selector value to **NONE**.
3. Select the XSLT/XQuery document in the **XSL/XQuery selector of the Control toolbar** (on page 1835).
4. Select the appropriate engine in the **XSLT/XQuery engine selector of the Control toolbar** (on page 1836).
5. Set XSLT/XQuery parameters using the **Configure parameters** button on the Control toolbar (on page 1835).
6. Apply the XSLT stylesheet or XQuery transformation using the  **Run to end** button that is available on the Control toolbar (on page 1837).
7. Inspect the mapping by clicking a section of the output in either the **Text** tab or **XHTML** tab of the Output view (on page 311).

Figure 463. XHTML Output to Source Mapping

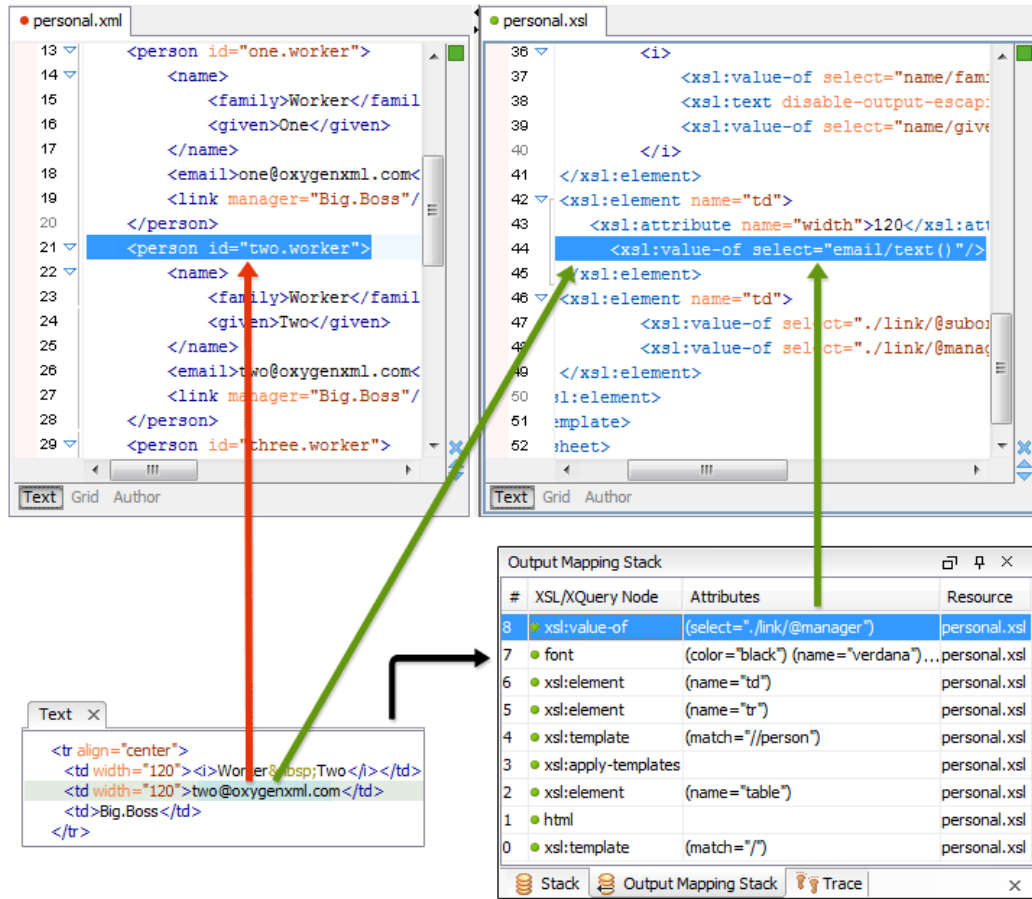

The figure illustrates the source mapping process in Oxygen XML Developer. It consists of three main components:

- XML Editor (personal.xml):** Shows three person entries. The second entry, `<person id="two.worker">`, is highlighted in blue. A red arrow points from this entry to the corresponding row in the XHTML table.
- XSL Editor (personal.xsl):** Shows a table template. The XSLT node `<xsl:value-of select="./link/@manager"/>` is highlighted in blue. A green arrow points from this node to the 'Link' column of the XHTML table.
- XHTML Editor:** Shows the resulting XHTML table. The 'Link' column contains the value 'Big Boss' for the second row, which is highlighted in blue. A green arrow points from this value back to the XSLT node.
- Output Mapping Stack:** A table showing the mapping between XSL/XQuery nodes and the XHTML output. The selected node is `xsl:value-of` with the attribute `(select="./link/@manager")`.

Name	Email	Link
Boss Big	chief@oxygenxml.com	one.worker two.worker three.worker four.worker five.worker
Worker One	one@oxygenxml.com	Big Boss
Worker Two	two@oxygenxml.com	Big Boss

#	XSL/XQuery Node	Attributes	Resource
8	xsl:value-of	(select="./link/@manager")	personal.xml
7	font	(color="black") (name="verdana")...	personal.xml
6	xsl:element	(name="td")	personal.xml
5	xsl:element	(name="tr")	personal.xml
4	xsl:template	(match="//person")	personal.xml
3	xsl:apply-templates		personal.xml
2	xsl:element	(name="table")	personal.xml
1	html		personal.xml
0	xsl:template	(match="/")	personal.xml

Figure 464. Text Output to Source Mapping

This action will highlight the XSLT / XQuery element and the XML source context. This XSLT template/XQuery element that is highlighted in the XSLT/XQuery editor represents only the top of the stack of XSLT templates/XQuery elements that determined the state of the XSLT/XQuery processor at the moment of generating the clicked output section. In the case of complex transformations, inspecting the whole stack of XSLT templates/XQuery elements speeds up the debugging process. This stack is available in the **Output Mapping Stack** view (on page 1844).

Related Information:

[Templates View \(on page 1847\)](#)

Using Breakpoints

The Oxygen XML Developer XSLT/XQuery Debugger allows you to interrupt XSLT/XQuery processing to gather information about variables and processor execution at particular points. To ensure *breakpoints* are persistent between work sessions, they are saved at project level. You can set a maximum of 100 *breakpoints* per project.

Inserting Breakpoints

To insert a *breakpoint*, follow these steps:

1. Click the line where you want to insert the *breakpoint* in the XML source document or the XSLT/XQuery document. *Breakpoints* are automatically created on the ending line of a start tag, even if you click a different line.
2. Click the vertical stripe on the left side of the editor panel or use **Shift+F7**.

Result:

Once you insert a *breakpoint*, it is automatically added to the list in the **Breakpoints** view and you can edit its associated *condition*. A *breakpoint* can have an associated break condition that represents an XPath expression evaluated in the current debugger context. For them to be processed, their evaluation result should be a boolean value. A *breakpoint* with an associated condition only stops the execution of the Debugger if the *breakpoint condition* is evaluated as **true**.

Figure 465. Example: Breakpoints

Removing Breakpoints

To remove a *breakpoint*, click its icon (●) in the vertical stripe on the left side of the editor panel or right-click the *breakpoint* and select **Remove** or **Remove all**.

Related Information:

[Breakpoints View \(on page 1839\)](#)

Performance Profiling of XSLT Stylesheets and XQuery Documents

Whether you are trying to identify a performance issue that is causing your production XSLT/XQuery transformation to not meet customer expectations or you are trying to proactively identify issues prior to deploying your XSLT/XQuery transformation, using the XSLT/XQuery profiler feature is essential to helping you save time and ultimately ensure a better performing, more scalable XSLT/XQuery transformation.

The XSLT/XQuery profiling feature can use any available XSLT/XQuery processor that can be used for debugging and it is available from the debugging *perspective* (on page 2271).

Enabling the Profiler

Enabling and disabling the profiler is controlled by the  **Profiler** button from the debugger Control toolbar (on page 1835). The XSLT/XQuery profiler is off by default. This option is not available during a debugger session so you need to set it before starting the transformation. For information about a common debugging procedure, see [Steps in a Typical Debugging Process](#) (on page 1851).

Profiling Information Views

Immediately after enabling the profiler, two new information views are added to the current debugger information views (on page 1838):

- **Invocation tree** view (on page 1858) on left side
- **Hotspots** view (on page 1859) on right side

Profiling data is available only after the transformation ends successfully.

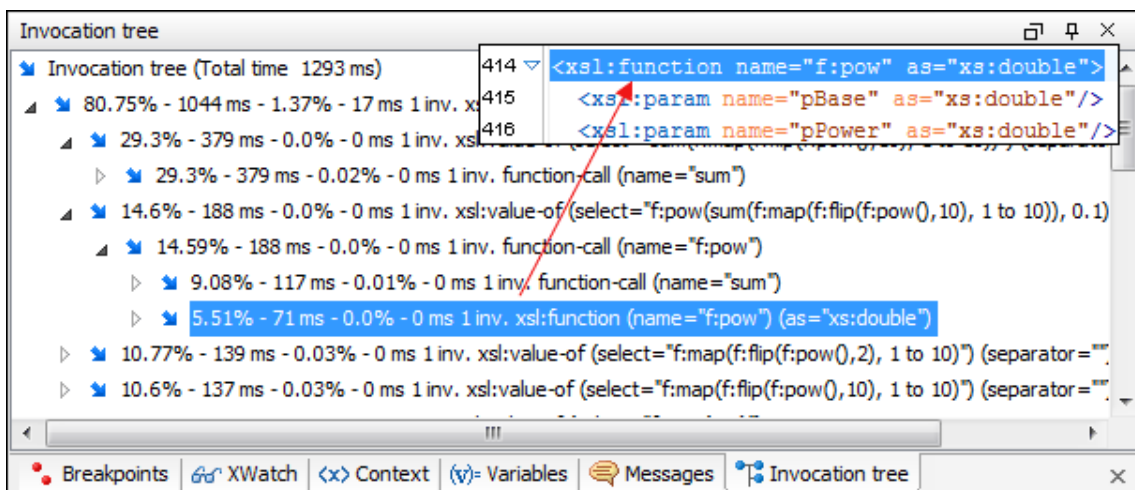

On the left side (**Invocation tree** view (on page 1858)), you can examine how style instructions are processed. This result view is also named call-tree, as it represents the order of style processing. The profiling result shows the duration time for each of the style-instruction including the time needed for its called children.

On the right side (**Hotspots** view (on page 1859)), you can immediately spot the time the processor spent in each instruction. As an instruction usually calls other instructions, the used time of the called instruction is extracted from the duration time of the caller (the hotspot only presents the inherent time of the instruction).

Source Backmapping

In either the **Invocation tree** (on page 1858) or **Hotspots** view (on page 1859), you can use the backmapping feature to find the XSLT stylesheet or XQuery expression definition. Clicking the selected item causes Oxygen XML Developer to highlight the XSLT stylesheet or XQuery expression source line where the instruction is defined.

Figure 466. Source Backmapping

Saving and Customizing Profiling Data

The profiling data can be saved (exported) into XML and HTML format. In either the **Invocation tree** ([on page 1858](#)) or **Hotspots view** ([on page 1859](#)), right-click anywhere in the view and select **Export to XML** or **Export to HTML**. The HTML report can be customized based upon the profiling raw data. When you select **Export to HTML**, Oxygen XML Developer will save it as XML and apply an XSLT stylesheet to render the report as HTML. You can customize these stylesheets to suit your needs. By default, they are located in: `[OXYGEN_INSTALL_DIR]/frameworks/profiler/`.

Other Profiling Notes

- If you want to change the **XSLT/XQuery profiler settings** ([on page 226](#)), use the contextual menu and choose the corresponding **View settings** entry.
- Profiling exhaustive transformations may run into an **OutOfMemory** error due to the large amount of information being collected. If this is the case, you can close unused projects when running the profiling or use high values for Java VM options `-Xms` and `-Xmx`. If this does not help you can shorten your source XML file and try again.

Resources

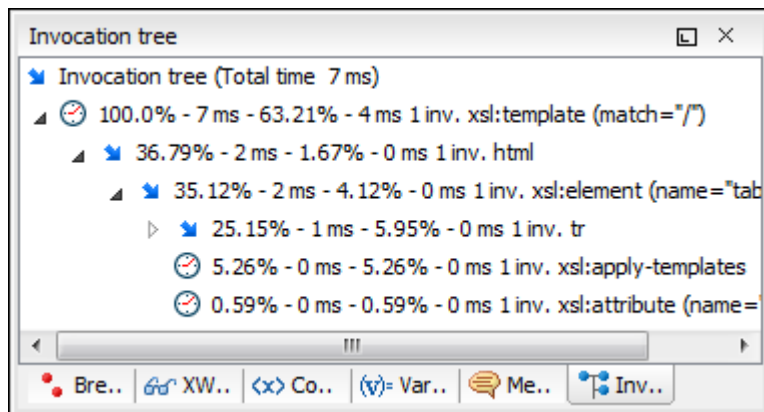

For more information about the XSLT/XQuery Profiler, watch our video demonstration:

<https://www.youtube.com/embed/4ftHschjLqA>

Invocation Tree View

The **Invocation Tree** view shows a top-down call tree that represents how XSLT instructions or XQuery expressions are processed. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 467. Invocation Tree View

-  - Points to a call whose inherent time is insignificant compared to its total time.
-  - Points to a call whose inherent time is significant compared to its total time (greater than 1/3rd of its total time).

Every entry in the invocation tree includes textual information that depends on the **XSLT/XQuery profiler settings** (*on page 226*):

- A percentage number of the total time that is calculated with respect to either the root of the tree or the calling instruction.
- A total time measurement in milliseconds or microseconds. This is the total execution time that includes calls into other instructions.
- A percentage number of the inherent time that is calculated with respect to either the root of the tree or the calling instruction.
- An inherent time measurement in milliseconds or microseconds. This is the inherent execution time of the instruction.
- An invocation count that shows how often the instruction has been invoked on this call-path.
- An instruction name that contains also the attributes description.

The **Invocation Tree** view also includes the following contextual menu actions:

Export to HTML

Selecting this option will save the profiling data as XML and then apply an XSLT stylesheet to render the report as HTML. These stylesheets are included in the subfolder: `[OXYGEN_INSTALL_DIR]/frameworks/profiler/`. You can use them to customize your own report based on the profiling raw data.

Export to XML

Use this option to save the profiling data as an XML file in a specified location.

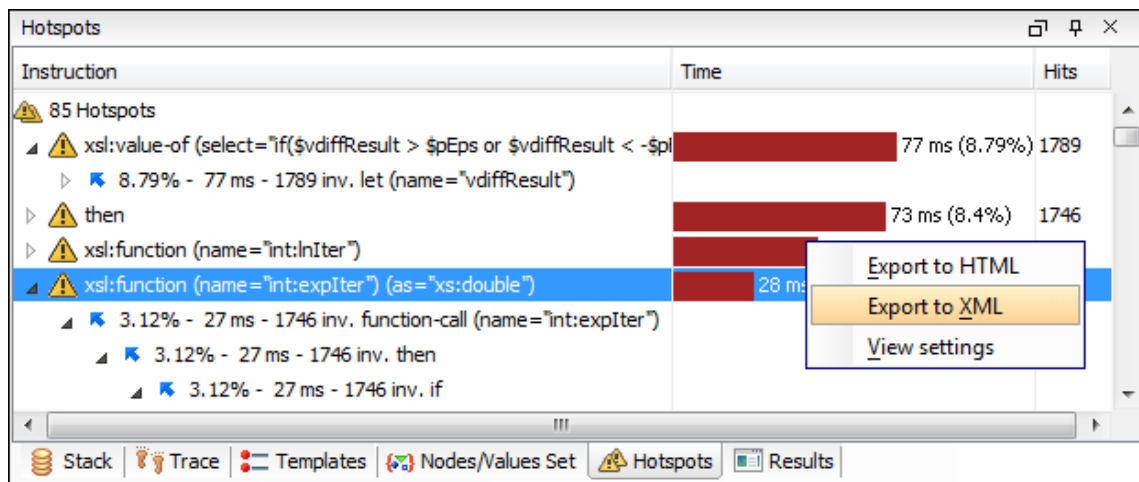

View settings

Opens the **XSLT/XQuery Profiler preferences page** (*on page 226*) that allows you to configure various profiling settings.

Hotspots View

The **Hotspots** view displays a list of all instruction calls that lie above the threshold defined in the **XSLT/XQuery profiler settings** (*on page 226*). If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 468. Hotspots View

By opening a hotspot instruction entry, the tree of back-traces leading to that instruction call are calculated and shown.

Every hotspot is described by the values from the following columns:

- **Instruction** - The name of the instruction.
- **Time** - The inherent time in milliseconds or microseconds of how much time has been spent in the hotspot, along with a bar whose length is proportional to this value. All calls into this instruction are summed up regardless of the particular call sequence.
- **Hits** - The invocation count of the hotspot entry.

If you click the ⚠️ handle on the left side of a hotspot, a tree of back-traces will be shown.

Every entry in the backtrace tree has textual information attached to it that depends on the **XSLT/XQuery profiler settings** (on page 226):

- A percentage number that is calculated with respect to either the total time or the called instruction.
- A time measured in milliseconds or microseconds of how much time has been contributed to the parent hotspot on this call-path.
- An invocation count that shows how often the hotspot has been invoked on this call-path.

 **Note:**
This is not the number of invocations of this instruction.

- An instruction name that also contains its attributes.

The **Hotspots** view also includes the following contextual menu actions:

Export to HTML

Selecting this option will save the profiling data as XML and then apply an XSLT stylesheet to render the report as HTML. These stylesheets are included in the subfolder:

`[OXYGEN_INSTALL_DIR]/frameworks/profiler/`. You can use them to customize your own report based on the profiling raw data.

Export to XML

Use this option to save the profiling data as an XML file in a specified location.

View settings

Opens the [XSLT/XQuery Profiler preferences page \(on page 226\)](#) that allows you to configure various profiling settings.

Debugging XSLT that Call Java Extensions

It is possible to debug an XSLT that calls Java extensions. This is achieved through a transformation scenario where the Java extensions are specified, and the debugging can be done based upon the same scenario.

To debug XSLT with Java extensions, follow this procedure:

1. Create an [XSLT transformation on XML scenario \(on page 1188\)](#) for your XSLT document (select  **Configure Transformation Scenario(s)** action from the toolbar, then click **New**, and select **XSLT transformation on XML**).
2. In the **New scenario** dialog box, click the **Extensions** button (in the **XSLT** tab), specify the Java extensions (JAR libraries) that are needed, and click **OK**.
3. Once you are finished configuring the transformation scenario, click **OK**, then select **Save and close**.
4. Use the  **Debug scenario** action on the toolbar and the debugging will be based upon the same transformation scenario you just configured and saved.

Tip:

You could achieve this during a [typical debugging process \(on page 1851\)](#) by specifying the Java extensions using the  **Edit extensions** button on the debugger control toolbar [\(on page 1835\)](#).

Related Information:

[Validating XSLT Stylesheets that Call Java Extensions \(on page 658\)](#)

Debugging Java Extensions

The XSLT/XQuery debugger does not step into Java classes that are configured as XSLT/XQuery extensions of the transformation. To step into Java classes, inspect variable values, and set [breakpoints \(on page 1855\)](#) in Java methods, you can set up a Java debug configuration in an IDE (such as the Eclipse SDK) as described in the following steps:

1. Create a debug configuration.

- a. Make sure the `[OXYGEN_INSTALL_DIR]/lib/oxygen.jar` file and your Java extension classes are on the Java classpath.

The Java extension classes should be the same classes that were [set as an extension \(on page 1835\)](#) of the XSLT/XQuery transformation in the debugging [perspective \(on page 2271\)](#).

- b. Set the class `ro.sync.exml.Oxygen` as the main Java class of the configuration.

The main Java class `ro.sync.exml.Oxygen` is located in the `oxygen.jar` file.

2. Start the debug configuration.

Now you can set *breakpoints* and inspect Java variables as in any Java debugging process executed in the selected IDE (Eclipse SDK, and so on.).

Supported Processors for XSLT / XQuery Debugging

The following built-in XSLT processors are integrated in the debugger and can be selected in the [Control Toolbar \(on page 1834\)](#):

- **Saxon 12.5 HE (Home Edition)** - a limited version of the Saxon 9 processor, capable of running XSLT 1.0, XSLT 2.0 / 3.0 basic and XQuery 1.0 transformations, available in both the XSLT debugger and the XQuery one,
- **Saxon 12.5 PE (Professional Edition)** - capable of running XSLT 1.0 transformations, XSLT 2.0 basic ones and XQuery 1.0 ones, available in both the XSLT debugger and the XQuery one,
- **Saxon 12.5 EE (Enterprise Edition)** - a schema-aware processor, capable of running XSLT 1.0 transformations, XSLT 2.0 / 3.0 basic ones, XSLT 2.0 / 3.0 schema-aware ones and XQuery 1.0 / 3.0 ones, available in both the XSLT debugger and the XQuery debugger,
- **Saxon 6.5.5** - capable of running only XSLT 1.0 transformations, available only in the XSLT debugger,
- **Xalan 2.7.2 (Deprecated)** - capable of running only XSLT 1.0 transformations, available only in the XSLT debugger.

17.

Extending Oxygen With the SDK

Oxygen XML Developer has an SDK that can be used as a base to develop *frameworks* (on page 2269) and *plugins* (on page 2271). The SDK is a Java library available under the [Oxygen XML SDK licensing terms](#) and is delivered with a set of examples that demonstrate how to extend Oxygen XML functionality through API calls. The SDK is available at https://www.oxygenxml.com/oxygen_sdk.html.

Important:

From a legal standpoint, you can freely develop and share extensions using the **Oxygen SDK** ONLY if you have a legal, active license to use Oxygen XML Developer and ONLY if such extensions are used from inside Oxygen XML Developer. To use such extensions outside of Oxygen XML Developer (for example, a 3rd-party application that has Oxygen XML Developer built in to it), an additional license must be purchased to use the SDK according to the [Oxygen XML SDK Licensing Policy](#).

Extending Oxygen XML Developer with Plugins

A *plugin* (on page 2271) is a software component that adds extra functionality to the standalone version of the application using a series of application-provided extension points.

This chapter explains how to write and install a *plugin* for the standalone version of Oxygen XML Developer. The [Plugins Development Kit](#) contains sample *plugins* (source and compiled Java code) and the Javadoc API necessary for developing custom *plugins*.

If you want to customize the Oxygen XML Developer Eclipse plugin you can look at the [Eclipse IDE Integration Sample Project](#) to see how an Eclipse plugin can interact with the Oxygen XML Developer APIs.

General Configuration of an Oxygen XML Developer Plugin

The Oxygen XML Developer functionality can be extended with *plugins* (on page 2271) that implement a clearly specified API. On the Oxygen XML Developer website, there is an [SDK](#) with sample *plugins* (source and compiled Java code) and the Javadoc API necessary for developing custom *plugins*.

The minimal implementation of a *plugin* must provide:

- A Java class that extends the `ro.sync.xml.plugin.Plugin` class.
- A Java class that implements the `ro.sync.xml.plugin.PluginExtension` interface.
- A *plugin* descriptor file called `plugin.xml`.

A `ro.sync.xml.plugin.PluginDescriptor` object is passed to the constructor of the subclass of the `ro.sync.xml.plugin.Plugin` class. It contains the following data items about the *plugin*:

- **basedir** (*File* object) - The base directory of the *plugin*.
- **description** (*String* object) - The description of the *plugin*.
- **name** (*String* object) - The name of the *plugin*.
- **vendor** (*String* object) - The vendor name of the *plugin*.
- **version** (*String* object) - The *plugin* version. The allowed format is: `MAJOR.MINOR.PATCH` (for example, `1.0.2`).
- **id** (*String* object) - A unique identifier.
- **classLoaderType** - You can choose between `preferOxygenResources` (default value) and `preferReferencedResources`. When choosing `preferOxygenResources`, the libraries that are referenced in the Oxygen XML Developer `lib` directory will have precedence over those referenced in the `plugin.xml` configuration file, if they have the same package names. When choosing `preferReferencedResources`, the libraries that are referenced in the `plugin.xml` configuration file will have precedence over those found in the Oxygen XML Developer `lib` directory, if they have the same package names.

The *plugin* descriptor is an XML file that defines how the *plugin* is integrated in Oxygen XML Developer and what libraries are loaded. The structure of the *plugin* descriptor file is fully described in a DTD grammar located in `[OXYGEN_INSTALL_DIR]/plugins/plugin.dtd`. Here is a sample *plugin* descriptor used by the *Capitalize Lines* sample *plugin*:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin
  name="Capitalize Lines"
  description="Capitalize the first character on each line"
  version="1.0.0"
  vendor="SyncRO"
  class="ro.sync.sample.plugin.caplignes.CapLinesPlugin">
  <runtime>
    <library name="lib/caplignes.jar"/>
  </runtime>
  <extension type="selectionProcessor"
    class="ro.sync.sample.plugin.caplignes.CapLinesPluginExtension"
    keyboardShortcut="ctrl shift EQUALS"/>
</plugin>
```

If your *plugin* is of the **Selection**, **Document** or **General** types, and thus contributes an action either to the contextual menu or to the main menu of the **Text** editing mode, then you can assign a keyboard shortcut for it. You can use the `@keyboardShortcut` attribute for each `<extension>` element to specify the desired shortcut.

**Tip:**

To compose string representations of the desired shortcut keys you can go to **Options > Menu Shortcut Keys**, select an action, and click **Edit**. Then choose the desired key sequence and use the representation that appears in the resulting dialog box.

Referencing Libraries

To reference libraries, use either of the following elements:

- `<library name="path/libraryName">` - To point to specific libraries. Notice that the value of `library name` includes the path (relative or absolute) to the library.

**Note:**

You can use the `#{oxygenInstallDir}` editor variable (on page 296) as part of the value of the `@name` attribute. You can also use a system variable (`#{system(var.name)}`) or environment variable (`#{env(VAR_NAME)}`).

- `<librariesFolder name="path/libraryFolderPath">` - To point to multiple libraries located in the specified folder. Notice that the value of `libraryFolder name` includes the path (relative or absolute) to the library folder.

Both elements support the `@scope` attribute that defines the loading priority. It can have one of the following two values:

- **local** - The library is loaded in the *plugin's* own class loader. This is the default behavior.
- **global** - The library is loaded in the main application class loader as the last library in the list (as if it would be present in the application `lib` directory).

Dependency Injection for Plugins

If you want to share a single instance of a certain class between plugin extensions and custom operations (to prevent instances from being repeated), you can declare a `<context>` element in your `plugin.xml` file:

```
<context class="my.package.ContextClass"/>
```

**Important:**

The `my.package.ContextClass` class should have a no-arguments constructor that will be called when the class is instantiated.

This will result in an instance being automatically generated. You can access this instance in an extension class by defining a field of that type and annotated with the `ro.sync.exml.plugin.PluginContext` annotation:

```
@PluginContext
ContextClass contextInstance;
```

The defined field is automatically populated with the single instance.

Tip:

By default, an instance of the `PluginDescriptor` class is also injectable.

Installing an Oxygen XML Developer Plugin

Choose one of the following methods to install a *plugin* (on page 2271) in Oxygen XML Developer:

Manual Method

To manually install a *plugin* in Oxygen XML Developer, follow these steps:

1. Go to the Oxygen XML Developer installation directory and locate the `plugins` directory.

Note:

The `plugins` directory contains all the *plugins* available to Oxygen XML Developer.

2. In the `plugins` directory, create a subfolder to store the *plugin* files (for example, `[OXYGEN_INSTALL_DIR]/plugins/myPlugin`).
3. In the new folder, place the *plugin* descriptor file (`plugin.xml`), the Java classes of the *plugin*, and the other files that are referenced in the descriptor file.
4. Restart Oxygen XML Developer.

Automatic Method

To install an add-on that is hosted on a remote update site, follow these steps:

1. Go to **Help > Install new add-ons**.
2. In the displayed dialog box, enter or paste the update site that hosts the add-on in the **Show add-ons from** field (or select it from the drop-down menu, if applicable). The default add-ons are hosted on <https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml>. If you want to see a list of all the default and sample add-ons that are available on the *Oxygen* remote update sites, choose **ALL AVAILABLE SITES** from the drop-down menu. The add-ons list contains the name, status, update version, Oxygen XML Developer version, and the type of the add-on (either **framework**, or **plugin**). A short description of each add-on is presented under the add-ons list.

Note:

To see all the versions of the add-ons, deselect **Show only compatible add-ons** and **Show only the latest version of the add-ons**. Incompatible add-ons are shown only to acknowledge their presence on the remote update site, but you cannot install an incompatible add-on.

3. Choose the add-ons you want to install, click the **Next** button, then follow the on-screen instructions.

**Note:**

Accepting the license agreement of the add-on is a mandatory step in the installation process.

**DANGER:**

Installing from update sites other than the official **Oxygen** sites may cause security risks. Please verify that all your installed third-party add-ons come from companies or individuals that you have verified and that you implicitly trust. As a way to help with identifying possible add-on security problems, Oxygen XML Developer issues warnings for unsigned plugins.

**Note:**

All add-ons are installed in the `extensions` directory inside the Oxygen XML Developer preferences directory (on page 115).

**Tip:**

As an alternate approach, you can add an **Install** button to a web page that links to a URL that has the syntax `https://host/path/to/updateSite.xml?oxygenAddonId=addOnIDValue` and drop the button into the application's main editing area.

Types of Plugin Extensions Available with the SDK

A *plugin* (on page 2271) can have one or more defined *plugin extensions* that provide functionality to the application. This section presents the *plugin extensions* that are available.

Workspace Access Plugin Extension

This type of *plugin* (on page 2271) allows you to contribute actions to the main menu and toolbars, create custom views, interact with the application workspace, make modifications to opened documents, and add listeners for various events.

Many complex integrations (such as integrations with Content Management Systems) usually requires access to some workspace resources such as toolbars, menus, views, and editors. This type of *plugin* is also useful because it allows you to make modifications to the XML content of an open editor.

The *plugin* must implement the *WorkspaceAccessPluginExtension* interface. The callback method *applicationStarted* of this interface allows access to a parameter of the *StandalonePluginWorkspace* type (allows for API access to the application workspace).

**Important:**

For security reasons, if a plugin's *applicationStarted* callback delays the startup of the entire application by more than 15 seconds, it will continue to be loaded on a separate thread and may no longer properly contribute UI customizations.

The *StandalonePluginWorkspace* interface has three methods that can be called to customize toolbars, menus, and views:

addToolbarComponentsCustomizer

Contributes to or modifies existing toolbars. You can specify additional toolbar IDs in the associated `plugin.xml` descriptor file using the following construct:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin name="CustomWorkspaceAccess" .....>
  <runtime>
    .....
  </runtime>

  <extension type="WorkspaceAccess" ...../>
  .....

  <toolbar id="SampleID" initialSide="NORTH" initialRow="1"/>
</plugin>
```

The `<toolbar>` element adds a toolbar in the Oxygen XML Developer interface and allows you to contribute your own *plugin*-specific actions. The following attributes are supported:

- **id** - Unique identifier for the toolbar.
- **initialSide** - Specifies the place where the toolbar is initially displayed. The allowed values are `NORTH` and `SOUTH`.
- **initialRow** - Specifies the initial row on the specified side where the toolbar is displayed. For example, the first toolbar has an initial row of `0` and the next toolbar has an initial row of `1`.

The `ro.sync.exml.workspace.api.standalone.ToolbarInfo` toolbar component information with the specified ID will be provided to you by the customizer interface. Therefore, you will be able to provide Swing components that will appear on the toolbar when the application starts.

addViewComponentCustomizer

Contributes to or modifies existing views, or contributes to the reserved custom view. You can specify additional view IDs in the associated `plugin.xml` descriptor using the following construct:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin name="CustomWorkspaceAccess" .....>
  <runtime>
    .....
  </runtime>
```

```

<extension type="WorkspaceAccess" ...../>
.....
<view id="SampleID" initialSide="WEST" initialRow="0"/>
</plugin>

```

The `<view>` element adds a view in the Oxygen XML Developer interface and allows you to contribute your own *plugin*-specific UI components. The following attributes are supported:

- **id** - Unique identifier of the view component.
- **initialSide** - Specifies the place where the view is initially displayed. The allowed values are: `NORTH`, `SOUTH`, `EAST`, and `WEST`.
- **initialRow** - Specifies the initial row on the specified side where the view is displayed. For example, in Oxygen XML Developer, the **Project view** (on page 365) has an initial row of 0 and the **Outline view** (on page 494) has an initial row of 1. Both views are in the WEST part of the workbench.
- **initialState** - Specifies the initial state of the view. The allowed values are: `hidden`, `docked`, `autohide`, and `floating`. By default, the view is visible and docked.

The `<view>` element also supports an optional `<perspective>` child element so that you can show or hide a certain view for a specified perspective. The `<perspective>` element supports the following attributes:

- **id** (required) - Unique identifier for the perspective. The possible values are: `editor`, `dita`, `xslt_debugger`, `xquery_debugger`, and `database`.
- **initState** (optional) - Specifies the initial state of the perspective. The allowed values are: `hidden`, `docked`, `autohide`, and `floating`. By default, the view is visible and docked.

The `ro.sync.exml.workspace.api.standalone.ViewInfo` view component information with the specified ID will be provided to you by the customizer interface. Therefore, you will be able to provide Swing components that will appear on the view when the application starts.

addMenuBarCustomizer

Contributes to or modifies existing menu components.

Access to the open editors can be done by first getting access to all URLs opened in the workspace using the `StandalonePluginWorkspace.getAllEditorLocations(int editingArea)` API method. Using the URL of an open resource, you can gain access to it using the `StandalonePluginWorkspace.getEditorAccess(URL location, int editingArea)` API method. A `ro.sync.exml.workspace.api.editor.WSEditor` then allows access to the current editing page.

A special editing API is supported for the **Text** mode (`ro.sync.exml.workspace.api.editor.page.text.WSTextEditorPage`).

To be notified when editors are opened, selected, and closed, you can use the `StandalonePluginWorkspace.addEditorChangeListener` API method to add a listener.

Examples:

- A simple Maven-based sample of a workspace access plugin is available here: <https://github.com/oxygenxml/sample-plugin-workspace-access>.
- A more complex sample of a workspace access plugin mimicking a CMS integration is available in the Author SDK: https://www.oxygenxml.com/oxygen_sdk.html.

Example: Adding a Custom View in Oxygen XML Developer

To add a custom view in Oxygen XML Developer, follow this procedure:

1. Locate the `plugin.xml` descriptor file for your plugin (should be located inside the **plugins** folder, for example, `[OXYGEN_INSTALL_DIR]/plugins/myPlugin`). Define the ID of the view you want to add and specify the location where it will be placed:

```
<view id="SampleWorkspaceAccessID" initialSide="WEST" initialRow="0"/>
```

2. In your **Workspace Access Plugin Extension** (on page 1867) implementation, where the `applicationStarted` callback is received, add a view component customizer like this:

```
pluginWorkspaceAccess.addViewComponentCustomizer(new ViewComponentCustomizer() {
    public void customizeView(ViewInfo viewInfo) {
        if(
            //The view ID defined in the "plugin.xml"
            "SampleWorkspaceAccessID".equals(viewInfo.getViewID()) {
            cmsMessagesArea = new JTextArea("CMS Session History:");
            viewInfo.setComponent(new JScrollPane(cmsMessagesArea));
            viewInfo.setTitle("CMS Messages");
            viewInfo.setIcon(Icons.getIcon(Icons.CMS_MESSAGES_CUSTOM_VIEW_STRING));
        }
    }
});
```

3. Define the `cmsMessagesArea` as a *static* field (if you can access the messages area from anywhere in your code).

https://www.oxygenxml.com/oxygen_sdk/oxygen_standalone_plugins.html

Workspace Access Plugin Extension (JavaScript-Based)

This is a JavaScript-based *plugin* (on page 2271) extension that allows you to contribute actions to the main menu and toolbars, create custom views, interact with the application workspace, make modifications to opened documents, and add listeners for various events.

This extension can use the same API as the [Workspace Access plugin extension \(on page 1867\)](#), but the implementation is JavaScript-based and uses the bundled [Rhino](#) library to create and work with Java API from the JavaScript code.

First, you need to create a custom plugin folder inside the **plugins** folder (for example, `[OXYGEN_INSTALL_DIR]/plugins/myPlugin`). This folder will contain your custom *plugin* descriptor file (`plugin.xml`) and all other resources for the plugin.

The *plugin* descriptor file (named `plugin.xml`) needs to reference a JavaScript file, as in the following example:

```
<!DOCTYPE plugin PUBLIC "-//Oxygen Plugin" "../plugin.dtd">
<plugin
  id="unique.id.value"
  name="Add Action To DITA Maps Manager popup-menu"
  description="Plugin adds action to DITA Maps Manager contextual menu."
  version="1.0"
  vendor="Syncro Soft"
  class="ro.sync.exml.plugin.Plugin"
  classLoaderType="preferReferencedResources">
  <extension type="WorkspaceAccessJS" href="wsAccess.js"/>
</plugin>
```

In the example above, the JavaScript file `wsAccess.js` (located in your custom plugin folder (on page 1871)) will be called. This JavaScript file needs to have two JavaScript methods defined inside. Methods that will be called when the application starts and when it ends:

```
function applicationStarted(pluginWorkspaceAccess) {
  .....
}

function applicationClosing(pluginWorkspaceAccess) {
  .....
}
```

With regard to the `applicationStarted` callback, besides using the [StandalonePluginWorkspace](#) API with the `pluginWorkspaceAccess` parameter, you can also use a globally defined field called `jsDirURL` that points to the folder where the JavaScript file is located.

Important:

For security reasons, if a plugin's *applicationStarted* callback delays the startup of the entire application by more than 15 seconds, it will continue to be loaded on a separate thread and may no longer properly contribute UI customizations.

Below is a much larger example with a JavaScript Workspace Access *plugin* extension implementation that adds a new action in the contextual menu. The action starts the `notepad.exe` application and passes the reference to the currently selected `<topicref>` to it.

```
function applicationStarted(pluginWorkspaceAccess) {
    Packages.java.lang.System.err.println("Application started "
        + pluginWorkspaceAccess);
    edChangeListener = {
        /*Called when a DITA Map is opened*/
        editorOpened: function (editorLocation) {
            Packages.java.lang.System.err.println("\nrunning " + editorLocation);
            /*Get the opened DITA Map*/
            editor = pluginWorkspaceAccess.getEditorAccess(editorLocation,
                Packages.ro.sync.exml.workspace.api.PluginWorkspace.DITA_MAPS_EDITING_AREA);
            ditaMapPage = editor.getCurrentPage();
            /*Add listener called when right-click is done in the DITA Maps manager*/
            customizerObj = {
                customizePopUpMenu: function (popUp, ditaMapDocumentController) {
                    Packages.java.lang.System.err.println("RIGHT CLICK" + popUp);
                    tree = ditaMapPage.getDITAMapTreeComponent();
                    /*Selected tree path*/
                    sel = tree.getSelectionPath();
                    if (sel != null) {
                        selectedElement = sel.getLastPathComponent();
                        /*Reference attribute*/
                        href = selectedElement.getAttribute("href");
                        if (href != null) {
                            try {
                                /*Create absolute reference*/
                                absoluteRef = new Packages.java.net.URL(selectedElement.getXMLBaseURL(),
                                    href.getValue());
                                Packages.java.lang.System.err.println("Computed absolute reference "
                                    + absoluteRef);
                                mi = new Packages.java.awt.swing.JMenuItem("Run notepad");
                                popUp.add(mi);
                                actionPerfObj = {
                                    actionPerformed: function (e) {
                                        try {
                                            Packages.java.lang.Runtime.getRuntime().exec("notepad.exe "
                                                + pluginWorkspaceAccess.getUtilAccess().locateFile(absoluteRef));
                                        }
                                        catch (e1) {
                                            e1.printStackTrace();
                                        }
                                    }
                                };
                            }
                        }
                    }
                }
            };
        }
    };
}
```

```

    }
}
}

mi.addActionListener(new JavaAdapter(Packages.java.awt.event.ActionListener,
    actionPerfObj));
}

catch (e1) {
    Packages.java.lang.System.err.println(e1);
}
}
}
}

ditaMapPage.setPopupMenuCustomizer(new Packages.ro.sync.exml.workspace.api.
editor.page.ditamap.DITAMapPopupMenuCustomizer(customizerObj));
}
}

edChangeListener = new JavaAdapter(Packages.ro.sync.exml.workspace.api.
listeners.WSEditorChangeListener, edChangeListener);

pluginWorkspaceAccess.addEditorChangeListener(
    edChangeListener,
    Packages.ro.sync.exml.workspace.api.PluginWorkspace.DITA_MAPS_EDITING_AREA);
}

function applicationClosing(pluginWorkspaceAccess) {
    Packages.java.lang.System.err.println("Application closing "
        + pluginWorkspaceAccess);
}
}

```

Declaring Multiple Modules

JavaScript-based plugins can include multiple modules of JavaScript files in the plugin. In those files, you can declare functions that can be used in the main *WorkspaceAccessJS* JavaScript file. Thus, you can use those external script files as a library of functions. The modules must be declared in the plugin descriptor file (*plugin.xml*).

For example:

```

<!DOCTYPE plugin PUBLIC "-//Oxygen Plugin" "../plugin.dtd">
<plugin
    id="unique.id.value"
    name="Add Action To DITA Maps Manager popup-menu"
    description="Plugin adds action to DITA Maps Manager contextual menu."

```

```

version="1.0"

vendor="Syncro Soft"

class="ro.sync.exml.plugin.Plugin"

classLoaderType="preferReferencedResources">

<extension type="WorkspaceAccessJS" href="wsAccess.js"/>

<extension type="WorkspaceAccessJSModule" href="wsAccessModule1.js"/>

<extension type="WorkspaceAccessJSModule" href="wsAccessModule2.js"/>

</plugin>

```

For more information and some samples, see [GitHub Project with Multiple Workspace Access JavaScript-Based Plugin Samples](#).

Trusted Hosts Plugin Extension

This type of *plugin* ([on page 2271](#)) can be used by developers to automatically allow or reject remote connections that Oxygen XML Developer would normally ask the user for confirmation.

The name of the *plugin* extension is **TrustedHosts**. For security reasons, Oxygen XML Developer intercepts all connections to remote hosts and displays a dialog box that asks the user for confirmation. By implementing this plugin extension, the application will automatically allow or deny connections from websites you consider and configure as trusted or untrusted.

To develop an integration project, follow this steps:

- Copy the `oxygen.jar` file from `[OXYGEN_INSTALL_DIR]/lib` to the `lib` folder of your project.
- Implement the `ro.sync.exml.plugin.workspace.security.TrustedHostsProviderExtension` extension point.
- In the *plugin* descriptor file, define the `<extension>` element that points to the implementation of your classes:

```
<extension type="TrustedHosts" class="my.trusted.hosts.provider.class.qualified.name"/>
```

Detailed information regarding the accepted or rejected connections from plugins are logged in the [Information view](#) ([on page 467](#)).

Example implementation:

```

import ro.sync.exml.plugin.workspace.security.Response;

import ro.sync.exml.plugin.workspace.security.TrustedHostsProviderExtension;

public class DummyTrustedHostsProviderImpl implements
    TrustedHostsProviderExtension {

    @Override
    public Response isTrusted(String hostName) {

        // Connections from this website will always be
        // considered safe and always accepted.

```

```

    if ("trusted.website:80".equals(hostName)) {

        return TRUSTED;

    } else if ("malicious.website:80".equals(hostName)) {

        // Always reject connections from malicious website

        return UNTRUSTED;

    }

    // All other connections are unknown, so a dialog will
    // appear and ask user's confirmation
    // to allow or deny the connection to this website.

    return UNKNOWN;

}
}

```

Additional Framework Plugin Extension

This type of *plugin* (on page 2271) allows you to add a new framework straight from the *plugin*.

To specify additional frameworks, edit the *plugin* descriptor and add `<extension>` elements that point to them, as in the following example:

```
<extension type="AdditionalFrameworks" path="framework_directory"/>
```

The path attribute should be a sub-directory of the plugin. If the *plugin* is installed as an add-on (on page 108), the new framework will be set as read-only and editing it will only be possible if you *duplicate* it (on page 129). If the *plugin* is installed in the `[OXYGEN_INSTALL_DIR]/plugins` directory, the new frameworks will be editable.

Additional XProc Engine Plugin Extension

This type of *plugin* (on page 2271) contributes a folder that contains an external XProc engine.

The name of the *plugin* extension is **AdditionalXprocEngine** and it makes it easier to *integrate an external XProc engine* (on page 1218). After the plugin is installed, when you run an XProc transformation scenario, your external XProc engine can be selected from the **Processor** drop-down menu in the **XProc** tab.

An example of the `plugin.xml` file looks like this:

```

<plugin

  id="morgana.xproc.addon"

  name="Contribute Morgana XProc"

  description="Contribute Morgana XProc"

  version="1.0"

  vendor="Syncro Soft"

  class="ro.sync.exml.plugin.Plugin"

  classLoaderType="preferReferencedResources">

  <extension type="AdditionalXProcEngine" path="MorganaXProcEngine/"></extension>

</plugin>

```

The `@path` attribute points to the XProc engine folder that contains the `engine.xml` and all the libraries necessary to run it.

Components Validation Plugin Extension

This type of *plugin* (on page 2271) allows you to customize the menus, toolbars, and other components by enabling or filtering them from the user interface.

This *plugin* provides the following API:

ComponentsValidatorPluginExtension interface

There is one method that must be implemented:

getComponentsValidator()

Returns a *ro.sync.exml.ComponentsValidator* implementation class used for validating the menus, toolbars, and their actions.

ComponentsValidator interface

Provides methods to filter various features from being added to the GUI of Oxygen XML Developer:

validateMenuOrTaggedAction(String[] menuOrActionPath)

Checks if a menu or a tag action from a menu is allowed and returns a `boolean` value. A tag is used to uniquely identifying an action. The *String[]* argument is the tag of the menu / action and the tags of its parent menus if any.

validateToolbarTaggedAction(String[] toolbarOrAction)

Checks if an action from a toolbar is allowed and returns a *boolean* value. The *String[]* argument is the tag of the action from a toolbar and the tag of its parent toolbar if any.

validateComponent(String key)

Checks if the given component is allowed and returns a `boolean` value. The *String* argument is the tag identifying the component. You can remove toolbars entirely using this callback.

validateAccelAction(String category, String tag)

Checks if the given accelerator action is allowed to appear in the GUI and returns a `boolean` value. An accelerator action can be uniquely identified so it will be removed both from toolbars or menus. The first argument represents the action category, the second is the tag of the action.

validateContentType(String contentType)

Checks if the given content type is allowed and returns a `boolean` value. The `String` argument represents the content type. You can instruct Oxygen XML Developer to ignore content types such as `text / xsl` or `text / xquery`.

validateOptionPane(String optionPaneKey)

Checks if the given options page can be added in the preferences option tree and returns a `boolean` value. The `String` argument is the option pane key.

validateOption(String optionKey)

Checks if the given option can be added in the option page and returns a `boolean` value. The `String` argument is the option key. This method is mostly used for internal use and it is not called for each option in a preferences page.

validateLibrary(String library)

Checks if the given library is allowed to appear listed in the **About** dialog box and returns a `boolean` value. The `String` argument is the library. This method is mostly for internal use.

validateNewEditorTemplate(EditorTemplate editorTemplate)

Checks if the given template for a new editor is allowed and returns a `boolean` value. The `EditorTemplate` argument is the editor template. An `EditorTemplate` is used to create an editor for a given extension. You can thus filter what appears in the list of the **New** dialog box.

isDebuggerperspectiveAllowed()

Checks if the debugger *perspective* (on page 2271) is allowed and returns a `boolean` value.

validateSHMarker(String marker)

Checks if the given marker is allowed and returns a `boolean` value. The `String` argument represents the syntax highlight marker to be checked. If you decide to filter certain content types, you can also filter the syntax highlight options so that the content type is no longer present in the Preferences options tree.

validateToolbarComposite(String toolbarCompositeTag)

Checks if the toolbar composite is available. A toolbar composite is a toolbar component such as a drop-down menu.

Tip:

The best way to decide what to filter is to observe the values that Oxygen XML Developer passes when these callbacks are called. You have to create an implementation for this interface that lists in the console all values received by each function. Then you can decide on the values to filter and act accordingly.

Contribute Additional Languages Plugin Extension

This type of *plugin (on page 2271)* allows you to contribute new translation languages to the Oxygen XML Developer UI.

The ***AdditionalUITranslation*** *plugin* extension provides the ability to contribute new translation languages to the interface in Oxygen XML Developer.

A sample `plugin.xml` file looks like this:

```
<plugin
  id="romanian.il8n.provider"
  name="Add Romanian as an user interface language"
  description="Add Romanian as an user interface language"
  version="1.0"
  vendor="Syncro Soft"
  class="ro.sync.exml.plugin.Plugin">
  <extension type="AdditionalUITranslation" href="translation.xml"/>
</plugin>
```

where the `translation.xml` has a structure like this:

```
<translation>
  <languageList>
    <language description="Romanian" lang="ro_RO" localeDescription="Romana"/>
  </languageList>
  <key value="Error">
    <val lang="ro_RO">Eroare</val>
  </key>
  .....
</translation>
```

If all error keys are not translated in the custom `translation.xml` contributed by the plugin, the fallback is the default English translation. Once this plugin is installed, the **Languages** drop-down menu in the **Options > Preferences > Global (on page 116)** will be updated to include the newly added languages. The end-user will still need to select that language in the drop-down menu to use it.

Contribute External DITA-OT Distribution Plugin Extension

This type of *plugin (on page 2271)* allows you to contribute an external DITA-OT distribution to Oxygen XML Developer.

Oxygen XML Developer comes bundled with DITA-OT version 4.2.3. If you want to use a different DITA-OT version, the `AdditionalDITAOT` *plugin* extension provides the ability to contribute an external distribution of the *DITA Open Toolkit* to Oxygen XML Developer.

Example

For instance, if you wanted to use a DITA-OT version 1.8, your `plugin.xml` file might look like this:

```
<plugin
  id="dita-ot-18"
  name="Contribute DITA-OT 1.8"
  description="Contributes DITA-OT 1.8"
  version="1.0"
  vendor="Syncro Soft"
  class="ro.sync.exml.plugin.Plugin">
  <extension type="AdditionalDITAOT" path="DITA-OT1.8.5" description="DITA-OT 1.8"/>
</plugin>
```

The `@path` attribute points to a folder located relative to the `plugin.xml` file and this folder is where the additional distribution of DITA-OT would be located.

When Oxygen XML Developer is started with this plugin enabled, that additional DITA-OT version can now be selected in the **DITA Open Toolkit** option in the **DITA** preferences page (*on page 237*).

Custom Protocol Plugin Extension

This type of *plugin* (*on page 2271*) allows you to work with a custom designed protocol for retrieving and storing files.

It provides the following API:

URLStreamHandlerPluginExtension interface

There is one method that must be implemented:

getURLStreamHandler(String protocol)

It takes as an argument the name of the protocol and returns a `URLStreamHandler` object, or null if there is no URL handler for the specified protocol.

This type of *plugin* extension can be usually combined with a [Workspace Access plugin extension](#) (*on page 1867*) that can add a custom toolbar with custom actions for opening documents from a certain source.

As an alternative, two older *plugin* extensions can also be used to add a toolbar action for showing a custom URL chooser:

URLChooserPluginExtension2 interface

Makes it possible to create your own dialog box that works with the custom protocol. This interface provides two methods:

chooseURLs(StandalonePluginWorkspace workspaceAccess)

Returns a `URL[]` object that contains the URLs the user decided to open with the custom protocol. You can invoke your own URL chooser dialog box here and then

return the chosen URLs having your own custom protocol. You have access to the workspace of Oxygen XML Developer.

getMenuName()

Returns a `String` object that is the name of the entry added in the **File** menu.

***URLChooserToolBarExtension* interface**

Makes it possible to provide a toolbar entry that is used for launching the custom URLs chooser from the *URLChooserPluginExtension* implementation. This interface provides two methods:

getToolBarIcon()

Returns the `javax.swing.Icon` image used on the toolbar.

getToolBarTooltip()

Returns a `String` that is the tooltip used on the toolbar button.

Lock Handler Plugin Extension

This type of *plugin extension (on page 2271)* is used for locking resources from a specific protocol.

It provides the following API:

***LockHandlerFactoryPluginExtension* interface**

You need to implement the following two methods:

LockHandler getLockHandler()

Gets the lock handler for the current handled protocol. Might be `null` if not supported.

boolean isLockingSupported(String protocol)

Checks if a lock handler can be provided for a specific protocol.

To use this type of extension in your *plugin*, create an extension of *LockHandlerFactory* type in your `plugin.xml` file and specify the class implementing *LockHandlerFactoryPluginExtension*:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin name="CustomLockHandler" .....>
  <runtime>
    .....
  </runtime>

  <extension type="LockHandlerFactory"
    class="LockHandlerFactoryPluginExtensionImpl"/>
  .....
</plugin>
```

```
</plugin>
```

Open Redirect Plugin Extension

This type of *plugin* ([on page 2271](#)) is useful for opening multiple files with only one open action.

For example, when a zip archive or an ODF file or an OOXML file is open in the **Archive Browser view** ([on page 1741](#)) a *plugin* of this type can decide to open a file also from the archive in an XML editor panel. This file can be the `document.xml` main file from an OOXML file archive or a specific XML file from a zip archive.

The *plugin* must implement the interface *OpenRedirectExtension*. It only has one callback: `redirect(URL)` that receives the URL of the file opened by the Oxygen XML Developer user. If the *plugin* decides to open also other files it must return an array of information objects (*OpenRedirectInformation[]*) that correspond to these files. Such an information object must contain the URL that is opened in a new editor panel and the content type (for example, `text/xml`). The content type is used for determining the type of editor panel. A `null` content type allows auto-detection of the file type.

Option Page Plugin Extension

This type of *plugin extension* ([on page 2271](#)) allows you to add custom **Preferences** pages.

The extension must implement the `ro.sync.xml.plugin.option.OptionPagePluginExtension` class. The provided callbacks allows you to create a custom *Swing* component that will be added to the page and to react to various calls to persistently save the page settings using the `OptionsStorage` API.

All preferences pages that are contributed by a *plugin* are listed in the **Preferences** dialog box in the **Plugins** category. As long as the added preferences page has the same name as its *plugin*, it will be promoted to the first level of the hierarchy within the **Plugins** category.

The `plugin.xml` configuration file can specify one or more such extensions using constructs like this:

```
<extension type="OptionPage" class="my.pack.CustomOptionPagePluginExtension" />
```

Sharing Options Through Project Files

To share options that are configured in certain plugin preferences pages, you can store them in a project file (`.xpr` file extension) that can easily be shared with others. To do this, perform these steps:

1. Override `ro.sync.xml.plugin.option.OptionPagePluginExtension.getProjectLevelOptionKeys()` and return a set of options that need to be saved inside the project.
2. Install the plugin in an Oxygen XML Developer instance ([on page 1866](#)).
3. In the **Project view** ([on page 365](#)), create a project or open an existing one.
4. Open the **Preferences** dialog box (**Options > Preferences**) ([on page 114](#)).
5. Configure the options in each preferences page that you want to be included in the project file and switch the storage preference to **Project Options** ([on page 2272](#)) in each page.

**Note:**

Some pages do not have the **Project Options** button, since the options they host might contain sensitive data (such as passwords, for example) that is unsuitable for sharing with other users.

6. Click **OK** and close the **Preferences** dialog box.

All explicitly set values are now saved in the project file. You can then share the project file so that your team will have the same option configuration that you stored in the project file.

**Note:**

The project file extension (`.xpr`) must be preserved when the file is distributed to others.

**Notice:**

When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

Option Page Group Plugin Extension

This type of *plugin extension* ([on page 2271](#)) allows you to add a group of custom **Preferences** pages from a plugin.

The extension must implement the `ro.sync.exml.plugin.OptionsPageGroupPluginExtension` class. The base method `OptionsPageGroupPluginExtension.addOptionPagePluginExtension(...)` allows adding multiple implementations of the `OptionPagePluginExtension` ([on page 1881](#)) base class.

All preferences pages that are contributed by this extension are listed as descendents of the plugin specific preferences page in the **Preferences** dialog box in the **Plugins** category.

The `plugin.xml` configuration file can specify one or more such extensions using constructs like this:

```
<extension type="OptionPageGroup" class="my.pack.CustomOptionPageGroupPluginExtension"/>
```

Resource Locking Custom Protocol Plugin Extension

This type of *plugin* ([on page 2271](#)) allows you to work with a custom designed protocol for retrieving and storing files and it can lock a resource when opening it in Oxygen XML Developer.

This type of *plugin* extends the custom protocol *plugin* type with resource locking support and provides the following API:

URLStreamHandlerWithLockPluginExtension interface

The *plugin* receives callbacks following the simple protocol for resource locking and unlocking imposed by Oxygen XML Developer.

There are two additional methods that must be implemented:

getLockHandler()

Returns a `LockHandler` implementation class with the implementation of the lock specific methods from the *plugin*.

isLockingSupported(String protocol)

Returns a `boolean` that is `true` if the *plugin* accepts to manage locking for a certain URL protocol scheme (such as `sftp`, `http`, `https`, or `customName`).

Targeted URL Stream Handler Plugin Extension

This type of *plugin* (on page 2271) can be used when it is necessary to impose custom URL stream handlers for specific URLs.

This *plugin* extension can handle the following protocols: `http`, `https`, or `sftp`. Oxygen XML Developer usually provides specific fixed URL stream handlers. If it is set to handle connections for a specific protocol, this extension prompts for the URL stream handler for each open connection of a URL that has that protocol.

To use this type of *plugin*, you have to implement the *ro.sync.xml.plugin.urlstreamhandler.TargetedURLStreamHandlerPluginExtension* interface that provides the following methods:

boolean canHandleProtocol(String protocol)

This method checks if the *plugin* can handle a specific protocol. If this method returns `true` for a specific protocol, the *getURLStreamHandler(URL)* method will be called for each open connection of a URL having this protocol.

URLStreamHandler getURLStreamHandler(URL url)

This method provides the URL handler for the specified URL and it is called for each open connection of a URL with a protocol that has the *canHandleProtocol(String)* method return `true`.

If this method returns `null`, the default Oxygen XML Developer *URLStreamHandler* is used.

To use this type of extension in your *plugin*, create an extension of *TargetedURLHandler* type in your `plugin.xml` file and specify the class that implements *TargetedURLStreamHandlerPluginExtension*:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin name="CustomTargetedURLStreamHandlerPlugin" .....>
  <runtime>
    .....
  </runtime>

  <extension type="TargetedURLHandler"
    class="CustomTargetedURLStreamHandlerPluginExtension" />
  .....
</plugin>
```

```
</plugin>
```

This extension can be useful in situations when connections opened from a specific host must be handled in a particular way. For example, the Oxygen XML Developer *HTTP URLStreamHandler* may not be compatible for sending and receiving SOAP using the SUN Web Services implementation. In this case, you can override the stream handler (set by Oxygen XML Developer) to use the default SUN *URLStreamHandler*, since it is more compatible with sending and receiving SOAP requests.

```
public class CustomTargetedURLStreamHandlerPluginExtension
    implements TargetedURLStreamHandlerPluginExtension {

    @Override
    public boolean canHandleProtocol(String protocol) {

        boolean handleProtocol = false;

        if ("http".equals(protocol) || "https".equals(protocol)) {

            // This extension handles both HTTP and HTTPS protocols

            handleProtocol = true;

        }

        return handleProtocol;

    }

    @Override
    public URLStreamHandler getURLStreamHandler(URL url) {

        // This method is called only for the URLs with a protocol
        // where canHandleProtocol(String) method returns true (HTTP and HTTPS)

        URLStreamHandler handler = null;

        String host = url.getHost();

        String protocol = url.getProtocol();

        if ("some_host".equals(host)) {

            // When there are connections opened from some_host, the SUN HTTP(S)
            // handlers are used

            if ("http".equals(protocol)) {

                handler = (URLStreamHandler) Class.forName("sun.net.www.protocol.http.Handler")
                    .getConstructor(new Class[0]).newInstance(new Object[0]);

            } else {

                handler = (URLStreamHandler) Class.forName("sun.net.www.protocol.https.Handler")
                    .getConstructor(new Class[0]).newInstance(new Object[0]);

            }

        }

        return handler;

    }

}
```

```
}
}
```

XML Refactoring Operations Plugin Extension

This type of *plugin* ([on page 2271](#)) allows you to specify one or more directories where the XML Refactoring operation resources are loaded.

The `RefactoringOperationsProvider` extension can be used to specify the location where custom XML Refactoring operation resources (XQuery Update script or XSLT stylesheet and Operation Descriptor files) are stored. Oxygen XML Developer will scan the specified locations to load the custom operations when the XML Refactoring tool is opened, and allows you to share your custom refactoring operations.

Example: XML Refactoring Operations Plugin Extension

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin PUBLIC "-//Oxygen Plugin" "../plugin.dtd">

<plugin
  id="refactoring.operations"
  name="Refactoring operations plugin"
  description="Contains operation descriptors and related scripts"
  version="1.0">
  <extension type="RefactoringOperationsProvider">
    <folder path="customDir"/>
    <folder path="customDir2"/>
  </extension>
</plugin>
```

XSLT Transformer Plugin Extension

This type of *plugin* ([on page 2271](#)) allows you to add an external XSLT transformer *plugin*.

The name of the *plugin* is **Transformer** and it makes it easier to contribute your own implementation of the *XSLT Processor*. After the plugin is installed, you can create a new [XML transformation with XSLT scenario](#) ([on page 1130](#)) and select your external XSLT engine from **Transformer** drop-down menu in the **XSLT** tab.

To create an XSLT integration project, follow these steps:

- Copy the `oxygen.jar` file from `[OXYGEN_INSTALL_DIR]/lib` to the `lib` folder of your project.
- Copy the jars of your transformer to the `lib` folder of your project.
- Implement the `ro.sync.exml.plugin.transform.XSLTTransformerPluginExtension` interface.
- In the *plugin* descriptor file, define the `<extension>` element that points to the implementation of your classes:

```
<extension type="Transformer" class="my.xslt.plugin.extension"/>
```

Validator Plugin Extension

This type of *plugin* ([on page 2271](#)) allows you to add an external validation engine from a *plugin*.

The name of the *plugin* extension is *DocumentValidator* and it makes it possible to contribute your own implementation of a validation engine. After the plugin is installed, if you create a new validation scenario or edit an existing validation scenario to add a validation stage, you will find the name of the new engine contributed by the plugin in the **Validation Engine** combo box.

To create a plugin that implements the validator extension:

1. Implement the *ro.sync.exml.plugin.validator.ValidatorPluginExtension* interface in your plugin's libraries.
2. In the *plugin* descriptor file, define the `<extension>` element that points to the implementation of your classes:

```
<extension type="DocumentValidator" class="my.validator.plugin.extension"/>
```

Saxon XSLT Transformer Plugin Extension

This type of *plugin* ([on page 2271](#)) allows you to add an external Saxon XSLT transformer *plugin*.

The name of the *plugin* is **Transformer** and it makes it easier to contribute your own implementation of the *Saxon XSLT Processor*. After the plugin is installed, you can create a new [XML transformation with XSLT scenario](#) ([on page 1130](#)) and select your external Saxon engine from **Transformer** drop-down menu in the **XSLT** tab.

To create an XSLT integration project, follow these steps:

- Copy the `oxygen.jar` file from `[OXYGEN_INSTALL_DIR]/lib` to the `lib` folder of your project.
- Copy the Saxon jars to the `lib` folder of your project.
- Implement the *ro.sync.exml.plugin.transform.SaxonXSLTTransformerPluginExtension* interface.
- In the *plugin* descriptor file, define the `<extension>` element that points to the implementation of your classes, following example:

```
<extension type="Transformer" class="my.saxon.xslt.plugin.extension"/>
```

An add-on that implements the Saxon XSLT transformer can be found here: [Saxon Transformer Add-on](#). For more information, see the [Oxygen XML SDK Add-on Repositories web page](#).

XQuery Transformer Plugin Extension

This type of *plugin* ([on page 2271](#)) allows you to add an external XQuery transformer *plugin*.

The name of the *plugin* is **XQueryTransformer** and it makes it easier to contribute your own implementation of the *XQuery Processor*. After the plugin is installed, you can create a new [XQuery transformation scenario](#) ([on page 1220](#)) and select your external XQuery engine from **Transformer** drop-down menu in the **XQuery** tab.

To create an XQuery integration project, follow these steps:

- Copy the `oxygen.jar` file from `[OXYGEN_INSTALL_DIR]/lib` to the `lib` folder of your project.
- Copy the jars of your transformer to the `lib` folder of your project.
- Implement the `ro.sync.exml.plugin.transform.XQueryTransformerPluginExtension` interface.
- In the `plugin` descriptor file, define the `<extension>` element that points to the implementation of your classes:

```
<extension type="XQueryTransformer" class="my.xquery.plugin.extension" />
```

Saxon XQuery Transformer Plugin Extension

This type of *plugin* (on page 2271) allows you to add the Saxon external XQuery transformer *plugin*.

The name of the *plugin* is **XQueryTransformer** and it makes it easier to contribute your own implementation of the *Saxon XQuery Processor*. After the plugin is installed, you can create a new **XQuery transformation scenario** (on page 1220) and select your Saxon external XQuery engine from **Transformer** drop-down menu in the **XQuery** tab.

To create an XQuery integration project, follow these steps:

- Copy the `oxygen.jar` file from `[OXYGEN_INSTALL_DIR]/lib` to the `lib` folder of your project.
- Copy the Saxon jars to the `lib` folder of your project.
- Implement the `ro.sync.exml.plugin.transform.SaxonXQueryTransformerPluginExtension` interface.
- In the `plugin` descriptor file, define the `<extension>` element that points to the implementation of your classes:

```
<extension type="XQueryTransformer" class="my.saxon.xquery.plugin.extension" />
```

An add-on that implements the Saxon XQuery transformer can be found here: [Saxon Transformer add-on](#). For more information, see the [Oxygen XML SDK Add-on Repositories web page](#).

Plugin Extensions Designed to Work only in the Text Editing Mode

These *plugin* (on page 2271) extensions operate only when editing documents in the **Text** mode. They are mounted automatically by the application on the contextual menu in the **Plugins** submenu.

The [Workspace Access Plugin Extension](#) (on page 1867) offers an API that can be used to implement similar functionality for both **Text** and **Author** mode.

General Plugin Extension

This type of *plugin* (on page 2271) allows you to invoke custom code to interact with the workspace in **Text** mode.

This *plugin* is the most general *plugin* type and provides a limited API:

GeneralPluginExtension interface

Intended for general-purpose *plugins*, kind of external tools but triggered from the **Plugins** menu.

The implementing classes must provide the method `process(GeneralPluginContext)`, which

must provide the *plugin* processing. This method takes as a parameter a *GeneralPluginContext* object.

GeneralPluginContext class

Represents the context in which the general *plugin* extension does its processing. The *getPluginWorkspace()* method allows you access to the workspace of Oxygen XML Developer.

Selection Plugin Extension

This type of *plugin* ([on page 2271](#)) allows you to manage selections of text.

A **selection plugin** can be applied to both XML and non-XML documents. The *plugin* is started by making a selection in the editor, then selecting the corresponding menu item from the **Plugins** submenu in the contextual menu of **Text** mode.

This *plugin* type provides the following API:

SelectionPluginExtension interface

The context containing the selected text is passed to the extension and the processed result is going to replace the initial selection. The `process(GeneralPluginContext)` method must return a `SelectionPluginResult` object that contains the result of the processing. The *String* value returned by the `SelectionPluginResult` object can include [editor variables \(on page 289\)](#) such as `#{caret}` and `#{selection}`.

SelectionPluginContext object

Represents the context and provides four methods:

- `getSelection()` - Returns a `String` that is the current selection of text.
- `getFrame()` - Returns a `Frame` that is the editing frame.
- `getPluginWorkspace()` - Returns access to the workspace of Oxygen XML Developer.
- `getDocumentURL()` - Returns the URL of the currently edited document.

Related information

[Editor Variables \(on page 289\)](#)

Example - Uppercase Plugin

The following *plugin* ([on page 2271](#)) is called **UppercasePlugin** and is an example of a *Selection plugin*. ([on page 1888](#)). It is used in Oxygen XML Developer for capitalizing the characters in the current selection. This example consists of two Java classes and the *plugin* descriptor file (`plugin.xml`):

• UppercasePlugin.java:

```
package ro.sync.sample.plugin.uppercase;
```

```

import ro.sync.exml.plugin.Plugin;

import ro.sync.exml.plugin.PluginDescriptor;

public class UppercasePlugin extends Plugin {

    /**
     * Plugin instance.
     */

    private static UppercasePlugin instance = null;

    /**
     * UppercasePlugin constructor.
     *
     * @param descriptor Plugin descriptor object.
     */

    public UppercasePlugin(PluginDescriptor descriptor) {

        super(descriptor);

        if (instance != null) {

            throw new IllegalStateException("Already instantiated !");

        }

        instance = this;

    }

    /**
     * Get the plugin instance.
     *
     * @return the shared plugin instance.
     */

    public static UppercasePlugin getInstance() {

        return instance;

    }

}

```

- **UppercasePluginExtension.java:**

```

package ro.sync.sample.plugin.uppercase;

import ro.sync.exml.plugin.selection.SelectionPluginContext;
import ro.sync.exml.plugin.selection.SelectionPluginExtension;
import ro.sync.exml.plugin.selection.SelectionPluginResult;
import ro.sync.exml.plugin.selection.SelectionPluginResultImpl;

public class UppercasePluginExtension implements SelectionPluginExtension {

```

```

/**
 * Convert the text to uppercase.
 *
 * @param context Selection context.
 * @return Uppercase plugin result.
 */
public SelectionPluginResult process(SelectionPluginContext context) {
    return new SelectionPluginResultImpl(
        context.getSelection().toUpperCase());
}
}

```

- **plugin.xml:**

```

<!DOCTYPE plugin SYSTEM "../plugin.dtd">

<plugin
    name="UpperCase"
    description="Convert the selection to uppercase"
    version="1.0.0"
    vendor="SyncRO"
    class="ro.sync.sample.plugin.uppercase.UppercasePlugin">
    <runtime>
        <library name="lib/uppercase.jar" />
    </runtime>
    <extension type="selectionProcessor"
        class="ro.sync.sample.plugin.uppercase.UppercasePluginExtension"/>
</plugin>

```

Document Plugin Extension

This type of *plugin* (on page 2271) allows you to manage the current document.

The **document plugin** type can only be applied to an XML document. It can modify the current document that is received as a callback parameter.

The *plugin* is started by selecting the corresponding menu item from the **Plugins** submenu in the contextual menu of **Text** mode. It provides the following API:

***DocumentPluginExtension* interface**

Receives the context object containing the current document. The *process(GeneralPluginContext)* method can return a *DocumentPluginResult* object containing a new document.

***DocumentPluginContext* object**

Represents the context and provides three methods:

- **getDocument()** - Returns a `javax.swing.text.Document` object that represents the current document.
- **getFrame()** - Returns a `java.awt.Frame` object that represents the editing frame.
- **getPluginWorkspace()** - Returns access to the workspace of Oxygen XML Developer.

How to Write a CMS Integration Plugin

To have a complete integration between Oxygen XML Developer and a CMS, you usually have to write a *plugin* (on page 2271) that combines the following two available *plugin* extensions:

- [Workspace Access \(on page 1867\)](#)
- [Custom protocol \(on page 1896\)](#)

The usual set of requirements for an integration between Oxygen XML Developer and the CMS are as follows:

1. Contribute to the Oxygen XML Developer toolbars and main menu with your custom **Check Out** and **Check In** actions:
 - **Check Out** triggers your custom dialog boxes that allow you to browse the remote CMS and choose the resources you want to open.
 - **Check In** allows you to send the modified content back to the server.

You can use the **Workspace Access plugin extension** (and provided sample Java code) for all these operations.

2. When **Check Out** is called, use the Oxygen XML Developer API to open your custom URLs (URLs created using your custom protocol). It is important to implement and use a **Custom Protocol** extension to be notified when the files are opened and saved and to be able to provide the content for the relative references the files may contain to Oxygen XML Developer. Your custom `java.net.URLStreamHandler` implementation checks out the resource content from the server, stores it locally and provides its content. Sample **Check Out** implementation:

```
/**
 * Sample implementation for the "Check Out" method.
 *
 * @param pluginWorkspaceAccess (Workspace Access plugin).
 * @throws MalformedURLException
 */
private void checkOut(StandalonePluginWorkspace pluginWorkspaceAccess)
throws MalformedURLException {
    //TODO Show the user a custom dialog box for browsing the CMS
    //TODO after user selected the resource create a URL with a custom protocol
    //which will uniquely map to the resource on the CMS using the URLHandler
    //something like:
    URL customURL = new URL("mycms://host/path/to/file.xml");
    //Ask Oxygen to open the URL
}
```

```

pluginWorkspaceAccess.open(customURL);

//Oxygen will then your custom protocol handler to provide the contents for
//the resource "mycms://host/path/to/file.xml"

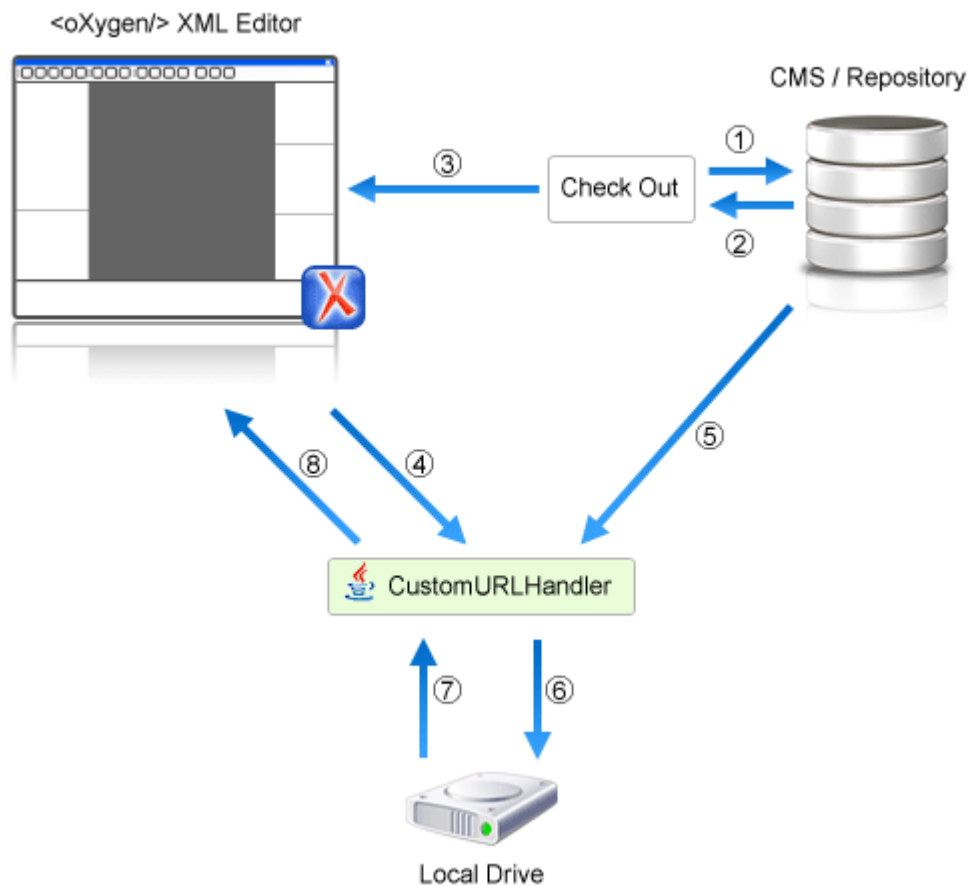

//Your custom protocol handler will check out the file in a temporary
//directory, for example, and provide the content from it.

//Oxygen will also pass through your URLHandler if you have any relative
//references which need to be opened/obtained.

}

```

Figure 469. Check Out Process Diagram

The phases are:

- 1 - Browse CMS repository
- 2 - User chooses a resource
- 3 - Use API to open custom URL: `mycms://path/to/file.xml`
- 4 - Get content of URL: `mycms://path/to/file.xml`
- 5 - Get content of resource
- 6 - Store on disk for faster access
- 7 - Retrieve content from disk if already checked out
- 8 - Retrieved content

3. Contribute a special **Browse CMS** action to every dialog box in Oxygen XML Developer where a URL can be chosen to perform a special action (such as the **Reuse Content** or **Insert Image** action). Sample code:

```

//Add an additional browse action to all dialog boxes/places

//where Oxygen allows selecting a URL.

pluginWorkspaceAccess.addInputURLChooserCustomizer

(new InputURLChooserCustomizer() {

    public void customizeBrowseActions

(List<Action> existingBrowseActions, final InputURLChooser chooser) {

    //IMPORTANT, you also need to set a custom icon on the action

    //for situations when its text is not used for display.

    Action browseCMS = new AbstractAction("CMS") {

        public void actionPerformed(ActionEvent e) {

            URL chosenResource = browseCMSAndChooseResource();

            if (chosenResource != null) {

                try {

                    //Set the chosen resource in the combo box chooser.

                    chooser.urlChosen(chosenResource);

                } catch (MalformedURLException e1) {

                    //

                }

            }

        }

    };

    existingBrowseActions.add(browseCMS);

}

});

...

```

When inserting references to other resources using the actions already implemented in Oxygen XML Developer, the reference to the resource is made by default relative to the absolute location of the edited XML file. You can gain control over the way that the reference is made relative for a specific protocol like this:

```

//Add a custom relative reference resolver for your custom protocol.

//Usually when inserting references from one URL to another Oxygen

//makes the inserted path relative.

//If your custom protocol needs special relativization techniques then

//it should set up a custom relative

//references resolver to be notified when resolving needs to be done.

pluginWorkspaceAccess.addRelativeReferencesResolver(

    //Your custom URL protocol that you already have a

    //custom URLStreamHandlerPluginExtension set up.

```

```

    "mycms",

    //The relative references resolver
    new RelativeReferenceResolver() {

    public String makeRelative(URL baseUrl, URL childURL) {

        //Return the referenced path as absolute for example.
        //return childURL.toString();

        //Or return null for the default behavior.

        return null;
    }
    });
...

```

4. Write the `plugin.xml` descriptor file. Your *plugin* combines the two extensions using a single set of libraries. The descriptor would look like this:

```

<!DOCTYPE plugin SYSTEM "../plugin.dtd">

<plugin
  name="CustomCMSAccess"
  description="Test"
  version="1.0.0"
  vendor="ACME"
  class="custom.cms.CMSAccessPlugin">

  <runtime>

    <library name="lib/cmsaccess.jar"/>

  </runtime>

  <!--Access to add actions to the main menu and toolbars or to add custom views.-->
  <!--See the "CustomWorkspaceAccessPluginExtension" Java sample for more details-->
  <extension type="WorkspaceAccess"

    class="custom.cms.CustomWorkspaceAccessPluginExtension"/>

  <!--The custom URL handler that will communicate with the CMS implementation-->
  <!--See the "CustomProtocolURLHandlerExtension" Java sample for more details-->
  <extension type="URLHandler"

    class="custom.cms.CustomProtocolURLHandlerExtension"/>

</plugin>

```

5. Create a `cmsaccess.jar` JAR (on page 2270) archive containing your implementation classes.
6. Copy your new *plugin* directory in the `plugins` subfolder of the Oxygen XML Developer install folder (for example, `[OXYGEN_INSTALL_DIR]/plugins/myPlugin`) and start Oxygen XML Developer.

Related Information:

<https://github.com/oxygenxml/oxygen-cmis-plugin>

<https://github.com/axxepa/project-argon>

Class Loading Issues

It is possible that the Java libraries you have specified in the *plugin* libraries list conflict with the ones already loaded by Oxygen XML Developer. To instruct the *plugin* to prefer its libraries over the ones used by Oxygen XML Developer, you can add the following attribute on the `<plugin>` root element:

`classLoaderType="preferReferencedResources"` from the `plugin.xml` descriptor file.

A **Late Delegation Class Loader** (the main class loader in Oxygen XML Developer) is a `java.net.URLClassLoader` extension that prefers to search classes in its own libraries list and only if a class is not found there to delegate to the parent class loader.

The main Oxygen XML Developer Class Loader uses as libraries all *JARS* specified in the `[OXYGEN_INSTALL_DIR]\lib` directory. Its parent class loader is the default JVM Class loader. For each *plugin* instance, a separate class loader is created having as parent the Oxygen XML Developer Class Loader.

The *plugin* class loader can be either a standard `java.net.URLClassLoader` or a `LateDelegationClassLoader` (depending on the attribute `classLoaderType` in the `plugin.xml`). Its parent class loader is always the Oxygen XML Developer `LateDelegationClassLoader`.

If you experience additional problems, such as:

```
java.lang.LinkageError: ClassCastException:
attempting to cast
jar:file:/C:/jdk1.6.0_06/jre/lib/rt.jar!/
javax.xml.ws.spi.Provider.class
tojar:file:/D:/Program
Files/Oxygen XML Editor
12/plugins/wspcaccess/../../xdocs/lib/jaxws/
jaxws-api.jar!/javax.xml.ws.spi.Provider.class
at javax.xml.ws.spi.Provider.provider(
Provider.java:94) at
javax.xml.ws.Service.<init>(Service.java:56)
.....
```

The cause could be the fact that some classes are instantiated using the context class loader of the current thread. The most straightforward fix is to write your code in a *try/finally* statement:

```
ClassLoader oldClassLoader =
    Thread.currentThread().getContextClassLoader();
try {
    //This is the implementation of the
    //WorkspaceAccessPluginExtension plugin interface.
    Thread.currentThread().setContextClassLoader(
        CustomWorkspaceAccessPluginExtension.
            this.getClass().getClassLoader());
    //WRITE YOUR CODE HERE
```

```

} finally {

    Thread.currentThread().

        setContextClassLoader(oldClassLoader);

}

```

How to Write A Custom Protocol Plugin

To create a custom protocol *plugin* ([on page 2271](#)), follow these steps:

1. Write the handler class for your protocol that implements the *java.net.URLStreamHandler* interface. Be careful to provide ways to encode and decode the URLs of your files.
2. Write the *plugin* class by extending *ro.sync.xml.plugin.Plugin*.
3. Write the *plugin* extension class that implements the *ro.sync.xml.plugin.urlstreamhandler.URLStreamHandlerPluginExtension* interface.

It is necessary that the *plugin* extension for the custom protocol implements the *URLStreamHandlerPluginExtension* interface. Without it, you cannot use your *plugin*, because Oxygen XML Developer is not able to find the protocol handler.

You can choose also to implement the *URLChooserPluginExtension* interface. It allows you to write and display your own customized dialog box for selecting resources that are loaded with the custom protocol.

An implementation of the extension *URLHandlerReadOnlyCheckerExtension* allows you to:

- Mark a resource as read-only when it is opened.
- Switch between marking the resource as read-only and read-write while it is edited.

It is useful when opening and editing CMS resources.

4. Write the *plugin.xml* descriptor file. Remember to set the name of the *plugin* class to the one from the second step and the *plugin* extension class name with the one you have chosen at step 3.
5. Create a *JAR* ([on page 2270](#)) archive with all these files.
6. Create a custom plugin folder inside the **plugins** folder (for example, `[OXYGEN_INSTALL_DIR]/plugins/myPlugin`) that contains your new *plugin*.

How to Share a Class Loader Between a Framework and Plugin

In some cases you may need to extend the functionality of Oxygen XML Developer both through a *framework* ([on page 2269](#)) and through a *plugin* ([on page 2271](#)). Normally, a *framework* and a *plugin* both run in their own private classloader. If the *framework* and the *plugin* use the same JAVA extensions/classes, it is recommended that they share the same classloader. This way, the common classes are loaded by only one *Class Loader* and they will both use the same static objects and have the ability to cast objects between one another.

To do this, open the **Preferences** dialog box (**Options > Preferences**) (on page 114), go to **Document Type Association**, select the document type, go to the **Classpath** tab, and in the **Use parent classloader from plugin with ID** fields introduce the ID of the *plugin*. This ID is declared in the *configuration file of the plugin* (on page 1864).

If you have created the framework using a *Framework Extension Script*, then edit the script and specify the plugin ID on the classpath.

Important:

The shared classes must be specified only in the configuration files of the *plugin*, and not in the configuration file and the document type class path at the same time.

Packing and Deploying Plugins as Add-ons

In Oxygen XML Developer, a *plugin* can be packed and deployed as an *add-on* to provide additional functionality to the application.

Packing a Plugin as an Add-on

This procedure is suitable for developers who want a better control over the *add-on* (on page 2271) package or those who want to automate some of the steps:

1. Pack the *plugin* (on page 2271) as a ZIP file or a *Java Archive* (on page 2270). Note that you should pack the entire root directory not just its contents.
2. **[Optional]** If you created a *Java Archive* at the previous step, digitally sign the package. You will need a certificate signed by a trusted authority. To sign the *JAR*, you can either use the *jarsigner* command-line tool inside Oracle's Java Development Kit (`[JDK_DIR]/bin/jarsigner.exe`) or if you are working with *Apache Ant* (on page 2267), you can use the *signjar* task (a front for the *jarsigner* command-line tool). The benefit of having a signed add-on is that you can verify the integrity of the add-on issuer. If you do not have such a certificate, you can generate one yourself using the *keytool* command-line utility.

Note:

This approach is recommended for tests since anyone can create a self-signed certificate.

3. Create a descriptor file. You can use a template that Oxygen XML Developer provides by going to **File > New** and selecting the **Oxygen add-ons update site** template. The products the add-on is compatible with can be specified in the template. Once deployed, this descriptor file is referenced as *update site*.

Deploying an Add-on

To deploy an add-on, copy the `ZIP` or *Java Archive* (on page 2270) file and the descriptor file to an HTTP server. The URL to this location serves as the *Update Site URL*.

Related Information:[Oxygen XML Add-on Repositories](#)

Testing Plugins and Java Extensions

In the various procedures for creating a *plugin* (on page 2271), you are usually instructed to copy your plugin folder to the `[OXYGEN_INSTALL_DIR]/plugins/` directory. If you want to test the code in your plugin without copying it to that folder, follow this procedure:

1. Close the Oxygen XML Developer application if it is running.
2. Create in the folder `[OXYGEN_INSTALL_DIR]/plugins/` a subfolder named for example `myPlugin` (but it can have any other name).
3. In the `myPlugin` subfolder create a new text file named `plugin.redirect` that contains the full file path references to your project (for example, `C:\Users\john_doe\Documents\sample-plugin-folder`).

Step Result: Oxygen XML Developer will automatically load the plugin from your project location when it starts.

4. Now you can modify the Java code, the IDE will automatically compile it, and if the `plugin.xml` file has a classpath reference to the compiled classes folder, you can restart Oxygen XML Developer and test your changes.

Creating and Running Automated Tests

If you have developed complex custom *plugins* (on page 2271) or *frameworks* (on page 2269) (document types), the best way to test your implementation and ensure that further changes will not interfere with the current behavior is to make automated tests for your customization.

An Oxygen XML Developer standalone installation includes a main `oxygen.jar` library located in the `[OXYGEN_INSTALL_DIR]`. That *JAR* (on page 2270) library contains a base class for testing developer customizations named: `ro.sync.exml.workspace.api.PluginWorkspaceTCBase`.

To develop *JUnit* tests for your customizations using the Eclipse workbench, follow these steps:

1. Create a new Eclipse Java project and copy the entire contents of the `[OXYGEN_INSTALL_DIR]` folder to the new project under the `oxygen` sub-directory.
2. Add all *JAR* libraries present in the `./oxygen/lib` directory to the **Java Build Path->Libraries** tab. Make sure that the main *JAR* library `oxygen.jar` or `oxygenAuthor.jar` is the first one in the Java classpath by moving it up in the **Order and Export** tab.
3. Click **Add Library** and add the *JUnit* and *JFCUnit* libraries.
4. Create a new Java class that extends `ro.sync.exml.workspace.api.PluginWorkspaceTCBase`.
5. Pass the following parameters to the constructor of the super class:

- **File installationFolder** - The file path to the main application installation directory. If not specified, it defaults to the folder where the test is started. According to step 1, it should be `oxygen`.
- **File frameworksFolder** - The file path to the `frameworks` directory. It can point to a custom `framework` directory where it resides. According to step 1, it should be `oxygen/frameworks`.
- **File pluginsFolder** - The file path to the `plugins` directory. It can point to a custom `plugin` directory where it resides. According to step 1, it should be `oxygen/plugins`.
- **File optionsFolder** - The folder that contains the application options. If not specified, the application will auto-detect the location based on the started product ID.
- **String licenseKey** - The license key used to license the test class.
- **int productID** - The ID of the product and should be one of the following:

```
PluginWorkspaceTCBase.XML_AUTHOR_PRODUCT, PluginWorkspaceTCBase.XML_EDITOR_PRODUCT, OR
PluginWorkspaceTCBase.XML_DEVELOPER_PRODUCT.
```

6. Create test methods that use the API in the base class to open XML files and perform various actions on them. Your test class could look something like this:

```
public class MyTestClass extends PluginWorkspaceTCBase {

    /**
     * Constructor.
     */
    public MyTestClass() throws Exception {
        super(null, new File("frameworks"), new File("plugins"), null,
            "-----START-LICENSE-KEY-----\n" +
            "\n" +
            "Registration_Name=Developer\n" +
            "\n" +
            "Company=\n" +
            "\n" +
            "Category=Enterprise\n" +
            "\n" +
            "Component=XML-Editor, XSLT-Debugger, Saxon-SA\n" +
            "\n" +
            "Version=14\n" +
            "\n" +
            "Number_of_Licenses=1\n" +
            "\n" +
            "Date=09-04-2012\n" +
            "\n" +
            "Trial=31\n" +
            "\n" +
            "SGN=MCwCFGNoEGJSeic3XCyIyalvjzHhGhhqAhRNRDpEu8RIWb8icCJO7HqfVP4++A\\=\n" +
            "\n" +
```

```

"-----END-LICENSE-KEY-----",

    PluginWorkspaceTCBase.XML_AUTHOR_PRODUCT);
}

/**
 * <p><b>Description:</b> TC for opening a file and using a bold operation</p>
 * <p><b>Bug ID:</b> EXM-20417</p>
 *
 * @author radu_coravu
 *
 * @throws Exception
 */
public void testOpenFileAndBoldEXM_20417() throws Exception {
    WSEditor ed = open(new File
("D:/projects/eXml/test/authorExtensions/dita/sampleSmall.xml").toURL());

    //Move caret
    moveCaretRelativeTo("Context", 1, false);

    //Insert <b>
    invokeAuthorExtensionActionForID("bold");
    assertEquals("<?xml version=\"1.0\" encoding=\"utf-8\"?>\n" +
        "<!DOCTYPE task PUBLIC \"-//OASIS//DTD DITA Task//EN\" \"task.dtd\">\n" +
        "<task id=\"taskId\">\n" +
        "  <title>Task <b>title</b></title>\n" +
        "  <prolog/>\n" +
        "  <taskbody>\n" +
        "    <context>\n" +
        "      <p>Context for the current task</p>\n" +
        "    </context>\n" +
        "    <steps>\n" +
        "      <step>\n" +
        "        <cmd>Task step.</cmd>\n" +
        "      </step>\n" +
        "    </steps>\n" +
        "  </taskbody>\n" +
        "</task>\n" +
        "", getCurrentEditorXMLContent());
}
}

```

Debugging a Plugin Using IntelliJ IDEA

To use *IntelliJ IDEA* to debug problems in the code of a *plugin* (on page 2271) without having to re-bundle the plugin's Java classes in a *JAR* (on page 2270) library, follow these steps:

1. [Download](#) and install Oxygen XML Developer.
2. Set up the *Oxygen SDK* following [this set of instructions](#).
3. Create a Java Project (for example, `MyPluginProject`) from one of the sample plugins (for example, the Workspace Access plugin).
4. In the `MyPluginProject` folder, create a folder called `myPlugin`. In this new folder, copy the `plugin.xml` file from the sample plugin. Modify the added `plugin.xml` to add a library reference to the directory where IntelliJ IDEA copies the compiled output. To find out where this directory is located, go to **File > Project Structure**. Then select the **Modules** category and inspect the value of the **Output path** text box from the **Path** tab.

Example: If the output path is `C:/Users/myUser/Documents/MyPluginProject/target/classes`, then in the `plugin.xml`, you need to add the following library reference in the *runtime* element:

```
<library name="../../target/classes"/>
```

5. Copy the `plugin.dtd` from the `[OXYGEN_INSTALL_DIR]/plugins` folder in the root `MyPluginProject` folder.
6. In the `MyPluginProject` dependencies (**File > Project Structure > Modules > Dependencies**), add external *JAR* references to all the *JAR* libraries in the `[OXYGEN_INSTALL_DIR]/lib` folder. Now your `MyPluginProject` should compile successfully.
7. In IntelliJ IDEA, create a new *Java Application* configuration for debugging (**Run > Edit Configurations... > + > Application**). Set the **Main class** box to `ro.sync.exml.Oxygen` and add the following code snippet in the **VM options** input box, making sure that the path to the `plugins` directory is the correct one:

```
-Dcom.oxygenxml.app.descriptor=ro.sync.exml.EditorFrameDescriptor
-Dcom.oxygenxml.editor.plugins.dir=D:\projects\MyPluginProject
```

Note:

If you need to configure the *plugin* for Oxygen XML Developer, set the `com.oxygenxml.app.descriptor` to `ro.sync.exml.DeveloperFrameDescriptor`.

8. Add a *breakpoint* (on page 1856) in the source of one of your Java classes.
9. Debug the created configuration. When the code reaches your *breakpoint* (on page 1855), the IntelliJ IDEA debugging view should take over.

Debugging a Plugin Using the Eclipse Workbench

To use the Eclipse workbench to debug problems in the code of a *plugin* (on page 2271) without having to re-bundle the plugin's Java classes in a *JAR* (on page 2270) library, follow these steps:

1. [Download](#) and install Oxygen XML Developer.
2. Set up the *Oxygen SDK* following [this set of instructions](#).
3. Create an Eclipse Java Project (for example, `MyPluginProject`) from one of the sample plugins (for example, the Workspace Access plugin).
4. In the `MyPluginProject` folder, create a folder called `myPlugin`. In this new folder, copy the `plugin.xml` file from the sample *plugin*. Modify the added `plugin.xml` to add a library reference to the directory where Eclipse copies the compiled output. To find out where this directory is located, invoke the contextual menu of the project (in the [Project view \(on page 365\)](#)), and go to **Build Path > Configure Build Path**. Then inspect the value of the **Default output folder** text box.

Example: If the compiled output folder is `classes`, then in the `plugin.xml`, you need to add the following library reference:

```
<library name="../../classes"/>
```

5. Copy the `plugin.dtd` from the `[OXYGEN_INSTALL_DIR]/plugins` folder in the root `MyPluginProject` folder.
6. In the `MyPluginProject` build path, add external *JAR* references to all the *JAR* libraries in the `[OXYGEN_INSTALL_DIR]/lib` folder. Now your `MyPluginProject` should compile successfully.
7. In the Eclipse IDE, create a new *Java Application* configuration for debugging. Set the **Main class** box to `ro.sync.exml.Oxygen`. Click the **Arguments** tab and add the following code snippet in the **VM arguments** input box, making sure that the path to the `plugins` directory is the correct one:

```
-Dcom.oxygenxml.app.descriptor=ro.sync.exml.EditorFrameDescriptor
-Dcom.oxygenxml.editor.plugins.dir=D:\projects\MyPluginProject
```

Note:

If you need to configure the *plugin* for Oxygen XML Developer, set the `com.oxygenxml.app.descriptor` to `ro.sync.exml.DeveloperFrameDescriptor`.

In the **Dependencies** tab, you should only add dependencies to two *JAR* libraries:

`[OXYGEN_INSTALL_DIR]/lib/oxygen.jar` and `[OXYGEN_INSTALL_DIR]/lib/oxygen-basic-utilities.jar`.

8. [Add a breakpoint \(on page 1856\)](#) in the source of one of your Java classes.
9. Debug the created configuration. When the code reaches your [breakpoint \(on page 1855\)](#), the Eclipse IDE debugging perspective should take over.

Debugging an Oxygen SDK Extension Using the Eclipse Workbench

To use the Eclipse workbench to debug problems in the code of an *extension (on page 2271)* without having to bundle its Java classes in a *JAR (on page 2270)* library, perform the following steps:

1. [Download](#) and install Oxygen XML Developer.
2. Create an Eclipse Java Project (for example, `MySDKProject`) with the corresponding Java sources (for example, a custom implementation of the `ro.sync.ecss.extensions.api.StylesFilter` interface).
3. In the Project build path, add external *JAR* references to all the *JAR* libraries in the `[OXYGEN_INSTALL_DIR]/lib` folder. In the build path **Order and Export** panel, make sure that the `oxygen.jar` entry is before all other libraries. Now your Project should compile successfully.
4. Start the standalone version of Oxygen XML Developer from the `[OXYGEN_INSTALL_DIR]` and in the **Document Type Association** preferences page ([on page 128](#)), edit the document type (for example, **DITA**) to open the **Document Type** configuration dialog box ([on page 130](#)). In the **Classpath** tab, add a reference to your Project's `classes` directory and in the **Extensions** tab, select your custom `StylesFilter` extension as a value for the **CSS styles filter** property. Close the application to save your changes.
5. Create a new Java Application configuration for debugging. The Main Class should be `ro.sync.exml.Oxygen`. The given VM Arguments should be:

```
-Dcom.oxygenxml.app.descriptor=ro.sync.exml.EditorFrameDescriptor
```
6. Add a *breakpoint* ([on page 1856](#)) in one of the source Java classes.
7. Debug the created configuration. When the code reaches your *breakpoint* ([on page 1855](#)), the Eclipse IDE debugging perspective should take over.

Disabling a Plugin

To disable a *plugin* ([on page 2271](#)), use one of the following two methods:

- Open the **Preferences** dialog box (**Options > Preferences**) ([on page 114](#)), go to **Plugins**, and deselect the *plugin* that you want to disable.
- Create an empty file called `plugin.disable` next to the *plugin* configuration file (`plugin.xml`). The *plugin* will be disabled and will no longer be loaded by the application on startup.

Note:

This is useful if you want to temporarily stop work on a *plugin* and use the application without it.

Developer Quick Start Guide

Oxygen XML Developer allows you to develop add-ons to customize the editing experience. Such customizations can be achieved through a plugin or a framework configuration. This section is meant to provide guidance to developers who are getting started with these types of customizations and to offer links to various resources to help with customizations.

- A **plugin** can be used to customize the behavior of the entire application no matter what XML document is currently being edited. Once created, a plugin can be [deployed and installed as an add-on \(on page 1897\)](#). For more information, see the [The Oxygen SDK \(Part 1: Plugins\)](#) blog post.
- A **framework** configuration provides validation, content completion, and editing support for a specific XML vocabulary. See: <https://blog.oxygenxml.com/topics/oxygenFrameworks.html>. Once created, a framework can be deployed and installed as an add-on. See: <https://www.oxygenxml.com/doc/ug-editor/topics/packing-and-deploying-addons.html>.

From a legal point of view, you can freely develop and share such extensions as long as they are only used from inside Oxygen XML Developer. For details, see: https://www.oxygenxml.com/sdk_agreement.html .

Plugins

A **plugin** can be used to customize the behavior of the entire application no matter what XML document is currently being edited. Since Oxygen XML Developer is a Java-based application, most of the allowed plugin types are Java-based but some JavaScript-based plugin types are also supported.

There are lots of [plugin types \(on page 1867\)](#) but the [Workspace Access plugin type \(on page 1867\)](#) is the most versatile of them. This type of plugin allows you to contribute actions to the main menu and toolbars, create custom views, interact with the application workspace, make modifications to open documents, and add listeners for various events. A [Workspace Access plugin](#) can also [contribute frameworks \(on page 1875\)](#).

The Maven-based [Oxygen XML SDK](#) comes with sample plugins and it provides the ability to compile Java extensions for your plugins and frameworks. Also, as a quick start for a [Workspace Access plugin](#), you can use this project: <https://github.com/oxygenxml/sample-plugin-workspace-access>.

The [Workspace Access plugin API](#) can also be used with a [JavaScript-based plugin \(on page 1870\)](#). Small plugin samples can be found here: <https://github.com/oxygenxml/wsaccess-javascript-sample-plugins>.

You can create automated tests ([on page](#)) for your plugins and debug them using the Eclipse IDE ([on page 1901](#)).

A plugin can either be installed manually or packed as an add-on and [installed using Help->Install new add-ons \(on page 1866\)](#).

Sample Plugins

A sample Maven-based Workspace Access plugin can be found here: <https://github.com/oxygenxml/sample-plugin-workspace-access>.

There is also a sample project which contains various JavaScript-based plugins: <https://github.com/oxygenxml/wsaccess-javascript-sample-plugins>.

The **Oxygen** GitHub site contains lots of open-source plugins (<https://github.com/topics/oxygen-standalone-plugin>). Most of these plugins are of the [Workspace Access](#) type.

You can also find a variety of other publicly-hosted **Oxygen** plugins in the [Public Hosted Oxygen Plugin and Framework Projects](#) blog post.

Workspace Access Plugin Extension

This type of *plugin* extension allows you to contribute actions to the main menu and toolbars, create custom views, interact with the application workspace, make modifications to open documents, and add listeners for various events. It is the most useful and most commonly used plugin extension.

A *Workspace Access* plugin extension ([on page 1867](#)) can also provide frameworks, allowing you to have a single add-on that provides both workspace-level extensions (independent of any given framework) and document type-specific frameworks. If the frameworks involve Java extensions (for example, custom dialog boxes or link text resolvers), they use the Java code for the *Workspace Access* plugin.

You can include frameworks with a *Workspace Access* plugin by declaring an "additional frameworks" extension in the `plugin.xml` file ([on page 1875](#)).

Java or JavaScript?

Oxygen XML Developer is a Java-based application and all of its APIs are Java-based. The entire user interface (buttons, views, dialog boxes) is built on top of the Java Swing architecture. The entire Javadoc API documentation is available here: <https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/>.

A *Workspace Access* plugin can be implemented either in Java or in JavaScript. Sample Java-based **Workspace Access** plugins can be found on the [Oxygen XML GitHub page](#).

Sample JavaScript-based implementations can be found in this sample project: <https://github.com/oxygenxml/wsaccess-javascript-sample-plugins>. The Rhino library is used to convert the JavaScript method calls to Java API calls: <https://github.com/mozilla/rhino>.

Related Information:

- [Workspace Access Plugin Extension \(on page 1867\)](#)
- [Workspace Access Plugin Extension \(JavaScript-Based\) \(on page 1870\)](#)

API Overview

The *Workspace Access* plugin extension is called when the application starts and when it closes.

The **StandalonePluginWorkspace** API can be used in numerous ways:

- Customize the toolbars, contextual menu, and main menus. See: [Adding Toolbar and Menu Actions \(on page 1906\)](#).
- Import or set global settings in Oxygen XML Developer. See: <https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/exml/workspace/api/options/GlobalOptionsStorage.html>.

- Access the API for the **Project** view. See: [https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/exml/workspace/api/standalone/StandalonePluginWorkspace.html#getProjectManager\(\)](https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/exml/workspace/api/standalone/StandalonePluginWorkspace.html#getProjectManager()).
- Access utility methods to interact with the end-user (for example, show warning and error dialog boxes, update the results view, or change the status bar). See: <https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/exml/workspace/api/WorkspaceUtilities.html>.
- Add a listener to be notified when a new XML document is opened, selected, or closed either in the main editing area or in the **DITA Maps Manager** view. See: [https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/exml/workspace/api/PluginWorkspace.html#addEditorChangeListener\(ro.sync.exml.workspace.api.listeners.WSEditorChangeListener,int\)](https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/exml/workspace/api/PluginWorkspace.html#addEditorChangeListener(ro.sync.exml.workspace.api.listeners.WSEditorChangeListener,int)).
- Provide access to opened XML documents via the **WSEditor** interface. Each opened XML document can be manipulated using the **WSEditor** interface. You can obtain its content, set new content to it, or save its content. You can also validate the editor contents or disable editing inside it. Depending on the current editing mode (**Text** or **Author**), you can gain access to the current [editing page](#) and send it either to the [Author editing page](#) or [Text editing page](#). Both APIs allow you to make changes to the current document content.

Adding Toolbar and Menu Actions

A [Workspace Access plugin extension \(on page 1867\)](#) can contribute custom actions to the contextual menu, main menus, or to the general toolbars.

- **Contributing a new toolbar action:**

This [sample Workspace Access plugin](#) contributes a new toolbar called **SampleWorkspaceAccessToolbarID**. The [java code](#) of the sample plugin will use the [toolbar components customizer API](#).

- **Contributing an action on the main menu:**

As exemplified in the [sample plugin](#), the **addMenuBarCustomizer** API can be used either to add a new menu or to customize the existing main menu.

- **Contributing a contextual menu action:**

The same [sample plugin](#) uses the **addMenusAndToolbarsContributorCustomizer** API to contribute a contextual menu customizer. Such a customizer can be contributed either for the **Text** or **Author** editing modes.

Once an action is added, you can define a new shortcut key for it using the **ActionProvider** API. The action can use the **WSEditor API** to make changes to an open XML document.

The same customizer API can be used to remove actions from the main menu, toolbars, framework-specific menus, and contextual menus.

Adding a New Side-View

A *Workspace Access* plugin (on page 1867) type can contribute a new side view to Oxygen XML Developer. For example, the following **plugin.xml** descriptor file defines a new view ID called **SampleWorkspaceAccessToolBarID**: <https://github.com/oxygenxml/sample-plugin-workspace-access/blob/master/plugin.xml>.

Once the new view ID is declared, the Java code of the plugin can add content to the view using the **pluginWorkspaceAccess.addViewComponentCustomizer** API.

Customizing the Project View

The API method **StandalonePluginWorkspace.getProjectManager()** allows access to various project-related functionalities:

- Add a new contextual menu action in the **Project** view.
- Access the set of resources currently selected in the **Project** view.
- Customize the icons that appear in the **Project** view.

A sample JavaScript-based plugin that uses this API to add a new contextual menu to the **Project** view can be found here: <https://github.com/oxygenxml/wsaccess-javascript-sample-plugins/tree/master/OpenInTerminalProjectContextualAction>.

Customizing the DITA Maps Manager View

You can [add a listener](#) to be notified when a new DITA map is opened, selected, or closed in the **DITA Maps Manager** view. Once the **editorOpened()** callback is received, you can [obtain the opened WSEditor API](#), then send its [current page](#) to the **WSDitaMapEditorPage**.

The API method **WSDitaMapEditorPage** allows you to interact with the DITA map that is open in the **DITA maps Manager** view:

- Add a customizer for the icons and text presented in the tree.
- Enable or disable editing on the tree.
- Set a popup menu customizer.
- Get the selected nodes.
- Get access to the **AuthorDocumentController** API to make changes to the content.

Sample plugins:

- JavaScript-based plugin that customizes the icons and text presented for a DITA map that is open in the **DITA Maps Manager** view: <https://github.com/oxygenxml/wsaccess-javascript-sample-plugins/tree/master/dmmCustomizeTopicTitlesAndIcons>.
- JavaScript-based plugin that adds a new contextual menu action for a DITA map that is open in the **DITA Maps Manager** view: <https://github.com/oxygenxml/wsaccess-javascript-sample-plugins/tree/master/contributePopupActionDMM>.

Persistent Storage

Your plugin may need to save plugin-specific information persistently between two sessions. The `PluginWorkspace.getOptionsStorage()` method allows you to save and retrieve (**key, value**) pairs persistently between sessions (between closing and restarting Oxygen XML Developer). You can also add listeners to be notified when the values for a certain key are changed.

Contributing a Custom Preferences Page

There is a specific plugin extension type that can be used to contribute a [custom preferences page \(on page 1881\)](#) to the **Preferences** dialog box in Oxygen XML Developer. An example of how such a page is implemented can be found in this sample plugin: <https://github.com/oxygenxml/oxygen-dita-prolog-updater-addon/blob/master/src/main/java/com/oxygenxml/prolog/updater/plugin/PrologOptionPageExtension.java>.

Imposing a Fixed Set of Global Preferences

You may want to impose a fixed set of global options to be used by all end-users who install the plugin. The `GlobalOptionsStorage` API provides the ability to set the following:

- **Set a certain global option to a certain value:** ([https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/exml/workspace/api/options/GlobalOptionsStorage.html#setGlobalObjectProperty\(java.lang.String,java.lang.Object\)](https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/exml/workspace/api/options/GlobalOptionsStorage.html#setGlobalObjectProperty(java.lang.String,java.lang.Object))) The `APIAccessibleOptionTags` interface contains a list with all keys that can be set to a custom value.
- **Set global options by importing an options XML file:** ([https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/exml/workspace/api/options/GlobalOptionsStorage.html#importGlobalOptions\(java.io.File,boolean\)](https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/exml/workspace/api/options/GlobalOptionsStorage.html#importGlobalOptions(java.io.File,boolean))) Such an options XML file can be generated by using the **Options->Export Global Options** action in Oxygen XML Developer. A sample JavaScript-based `WorkspaceAccess` plugin implementation that imports such an options XML document into the application can be found here: <https://github.com/oxygenxml/wsaccess-javascript-sample-plugins/tree/master/impose-options>.

Other ways to share a common set of options with others are listed here: <https://blog.oxygenxml.com/topics/sharingSettings.html>.

Interaction with the End-User

If you need your plugin to frequently interact with the end user, some possibilities include:

- Your plugin can create Java Swing-based components (dialog boxes, frames) that are displayed when [custom toolbar or menu actions \(on page 1906\)](#) added by the plugin are called. You can also extend the **Oxygen**-specific API base class [OKCancelDialog](#) to create a dialog box that already includes **OK** and **Cancel** buttons. This specific base also automatically resizes its internal components depending on the currently used fonts or DPI settings and also properly positions the **OK** and **Cancel** buttons depending on the operating system (on macOS, the **OK** button is on the right part of the dialog box, while on Windows and Linux, it is placed on the left part of the dialog box). There is an entire [API package](#) that contains base implementations of Swing components and such implementations are recommended to be used for the plugin-contributed components to look like the ones contributed by Oxygen XML Developer.
- Your plugin can [add a specific side view \(on page 1907\)](#).
- The [WorkspaceUtilities](#) API allows you to:
 - Show file and folder choosers.
 - Show confirmation dialog boxes.
 - Show information, warning, or error dialog boxes.
 - Show a custom status message in the application.
- The [ResultsManager](#) API allows you to add results in the **Results** view. These results can point to a specific document at a specific line/column location.
- The title of the main application frame can be modified using this API: [https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/exml/workspace/api/Workspace.html#setParentFrameTitle\(java.lang.String\)](https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/exml/workspace/api/Workspace.html#setParentFrameTitle(java.lang.String)).

Contributing Translations for New Labels and UI Text

You may want your plugin's interaction with the end-user (dialog boxes, pop-up messages, etc.) to be properly translated in all [user interface languages \(on page 302\)](#) supported by Oxygen XML Developer. The API method [StandalonePluginWorkspace.getResourceBundle\(\)](#) will allow you to pass message keys that will be resolved by the application to specific language-dependent values by looking at a file called **translation.xml**, which needs to be placed in a folder called **i18n** in the plugin installation folder. The structure of the **translation.xml** file needs to look like this: <https://www.oxygenxml.com/doc/ug-editor/topics/contribute-new-languages-extension.html>.

Comparing Documents

Using a Workspace Access plugin extension, you have access to various APIs that allow the comparison of XML documents:

- Display the **Compare Files** tool with a given set of URLs for two-way or three-way comparisons: <https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/exml/workspace/api/standalone/DiffAndMergeTools.html>.
- Compare documents in-memory (for example, to generate reports): <https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/exml/workspace/api/util/CompareUtilAccess.html>.

Customizing the Application Layout

There are two main ways to customize the layout of the application:

- Remove some of the toolbars, actions, menus, or views that Oxygen XML Developer shows by default when the application starts. A sample plugin that filters the user interface based on an XML configuration file is available here: <https://github.com/oxygenxml/oxygen-components-filter-plugin>.
- Export the layout of the current views and toolbars in the application using the **Window->Export Layout** action, then use the *WorkspaceAccess* plugin API to impose a fixed value for a global option key:

```
File layoutFile = new File(baseDir, "application.layout");
if (layoutFile.exists()) {
    PerspectivesLayoutInfo info = new PerspectivesLayoutInfo(true, false, "",
layoutFile.getAbsolutePath());
    pluginWorkspaceAccess.setGlobalObjectProperty("perspectives.layout.info", info);
    ...
}
```

Adding new User Interface Translations

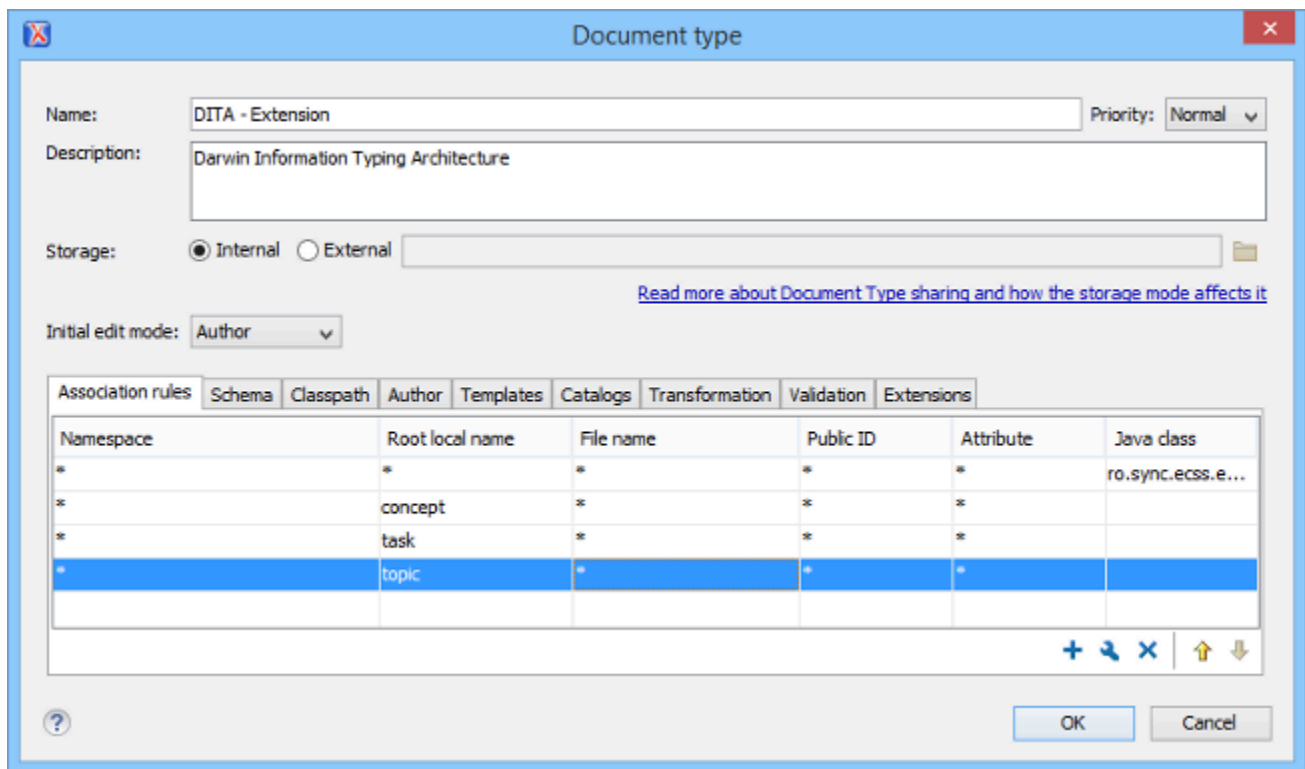

There is a particular plugin extension to contribute a new language to Oxygen XML Developer: <https://www.oxygenxml.com/doc/ug-editor/topics/contribute-new-languages-extension.html>.

Frameworks

A *framework* configuration provides validation, content completion, and visual editing functionality for a certain XML vocabulary. Usually, a framework customization provides a schema used to validate and edit certain type of XML documents, a CSS used to edit the XML documents in the **Author** visual editing mode and various custom actions or behaviors used to enhance the editing experience. For more information about framework customization, see: <https://blog.oxygenxml.com/topics/oxygenFrameworks.html>.

Oxygen XML Developer comes with a lot of framework configuration folders (**[OXYGEN_INSTALL_DIR]/frameworks**) to support editing XML documents of various types (such as DocBook, DITA, XHTML, or TEI). All of these existing framework configurations can be further customized in the **Preferences->Document Type Associations** page. These framework configurations can be used as examples for [building your own customization for a certain XML vocabulary](#) or they can be [extended](#) if you want to share a modified version of a framework with others.

The **Document Type Association** configuration dialog box allows you to configure all the framework-specific settings.

You can also find various open-source frameworks for Oxygen XML Developer online: <https://blog.oxygenxml.com/topics/Oxygen%20plugins%20and%20frameworks.html>.

Once you have set up a framework configuration folder, it can be [packaged as an add-on and shared with others](#) or it can be packaged in *workspace access* plugins using the "additional framework" extension point in the [plugin.xml](#) file ([on page 1875](#)).

Customizing an Existing Framework

An existing framework that has full built-in support (for example the **DITA** framework) can be extended and customized. Afterward, this [customization can be shared with others](#). You can use such a framework customization extension to:

- Provide [custom new file templates](#).
- Provide a custom CSS layer to render the framework in the **Author** visual editing mode.
- Provide [custom Schematron-based validation for the XML documents](#).
- Provide [custom Author mode actions](#) on the toolbar, in the contextual menu, and in the main framework-specific menu.

Customizing the Content Completion Proposals

When editing an XML document either in the **Text** or **Author** editing modes, you can invoke the **Content Completion Assistant** (**Ctrl+Space** in **Text** mode or **ENTER** in **Author** mode) to see the allowed XML elements or attributes that can be inserted at the current location. The **Elements** view also presents the elements that

can be inserted in the document at a certain location, while the **Attributes** view presents a list of allowed attributes and their values.

The content completion proposals can be customized in various ways:

- Each framework can contain a [special content completion configuration file](#). Such a file can:
 - Filter out element proposals for a parent element.
 - Configure a set of required attributes to be inserted along with a certain element.
 - Add new attribute value proposals and for each proposal, add an annotation that will appear in the **Attributes** view for each value.
 - Call an external XSLT script to compute value proposals for a certain attribute.
 - Customize how the element names are presented in the **Outline** view, **Elements** view, and **Content Completion Assistant**.
- You can alter the schema that is associated with the XML document. For example, in the case of the **DITA** vocabulary, you can [create a DTD specialization plugin](#) and integrate it into Oxygen XML Developer.
- You can use the [SchemaManagerFilter](#) API to filter the set of proposed elements and attribute values using Java code.

Adding Custom New File Templates

The [New Document Wizard](#) (*on page 330*) (**File->New** or the  **New** button on the toolbar) presents custom file templates gathered from all frameworks installed in Oxygen XML Developer. A custom framework can have one or more special folders that contain [custom new file templates](#).

Adding Custom Validation Stages

You can distribute a framework with a series of already configured validation scenarios. Also, this provides enhanced validation support that allows you to use multiple grammars to check the document. For example, you can use Schematron rules to impose guidelines that are otherwise impossible to enforce using conventional validation. See: [Configuring Validation Scenarios for a Framework](#).

Adding Custom Transformation Scenarios

When distributing a framework to users, it is a good idea to have the transformation scenarios already configured. This helps the content authors publish their work in various formats. By being contained in the framework configuration, the scenarios can be distributed along with the actions, menus, toolbars, and catalogs. See: [Configuring Transformation Scenarios for a Framework](#).

Customizing the Author Visual Editing Mode

The **Author** visual editing mode is based on CSS. Besides supporting most of the CSS 3 specification, Oxygen XML Developer adds some [custom CSS selectors, properties, and functions](#). Customization possibilities include:

- Use [CSS selectors](#) to match XML comments, processing instructions, entities, and CDATA sections.
- Change the tags display mode and tag color for certain elements, mark certain XML elements as not editable, and other customizations using [additional CSS properties](#).
- Use [custom CSS functions](#). For example, the **oxy_xpath** function allows you to run an XPath search over the document and use that value as static text.
- In [custom pseudo-classes](#), you can match values that can be changed via a custom action.
- There are specific [@media types](#) that can be used to mark certain CSS sections for a certain distribution.
- [Fonts can be dynamically loaded](#) and used for rendering.

Adding Toolbar and Menu Actions

The [framework customization \(on page 1910\)](#) can define actions that appear on a framework-specific toolbar when editing content in the **Author** visual editing mode.

You can use the [Author Action dialog box \(on page 138\)](#) to configure the name, description, icons, menu shortcuts, and various [XPath-enabled activation operations \(on page 141\)](#).

You can use a [variety of pre-defined operations](#) in each activation mode to achieve various things:

- Insert an XML fragment in the document either at the current position or at a specified offset.
- Set an attribute with a certain value on a certain element.
- Invoke an XSLT script using the **XSLTOperation** to produce an XML fragment to be inserted in the document.
- Invoke a JavaScript function that can use the **Author** mode APIs to modify the document. Some samples of such operations can be found here: <https://github.com/oxygenxml/javascript-sample-operations>.
- Set a CSS pseudo-class on a certain element. The pseudo-class can be matched from the CSS to style various elements differently.

You can also create custom **Author** mode operations by extending the [AuthorOperation Java API](#).

Once a custom action has been created, it can be added to the main menu, toolbar, or contextual menu.

Embedding Form Controls

By using custom CSS functions, you can embed form controls (checkboxes, combo boxes, text fields, pop-up boxes, buttons, etc.) in the **Author** visual editing mode to edit attribute values or text content for certain elements.

All the supported form controls can be found in the [Form Controls section](#).

Sample XML and CSS documents that use form controls can be found in the `[OXYGEN_INSTALL_DIR]/samples/form-controls` folder.

Adding Inline Actions

Using the `oxy_button` and `oxy_buttonGroup` form controls, you can add inline actions in the **Author** visual editing mode. To see an example, you can open a Lightweight DITA topic from the folder `[OXYGEN_INSTALL_DIR]/samples/dita/lw-dita/`.

Debugging CSS-related Problems

The **CSS Inspector** view can be used to find out how various CSS styles are applied. For more information, see [Debugging CSS Stylesheets](#).

Customizing Links

If you need to have working links between your XML document instances in the **Author** visual editing mode, consider the following possibilities:

- You can use the `-oxy-link` CSS property to specify a link target on a static icon placed before the element.
- You can use the `oxy_link-text()` CSS function to take control over the text presented inside a link using a specific Java extension.
- You can use a custom **ExtensionsBundle** implementation to be notified on a specific callback if the reference needs further processing.
- You can implement a custom link target element finder if the links are not referenced directly to elements that have an ID attribute. The link target element finder will be used to locate the target when the end-user clicks the link.

Related information

[Sample DITA \(framework\) extension that sets a custom `ExtensionsBundle` implementation for customizing links](#)

Customizing the Smart Paste Mapping

The *Smart Paste* feature in Oxygen XML Developer preserves certain style and structure information when copying content and pasting it into XML documents. It is also possible to [customize the mapping for the Smart Paste mechanism](#).

If you want full control over this behavior, there are also [Java extensions that can be customized](#).

Difference Between a Framework (Document Type) and a Plugin Extension

Question

What is the difference between a *Framework* (on page 2269) and a *Plugin* (on page 2271) Extension?

Answer

There are two possible ways to customize the application:

1. Implement a *plugin*.

A *plugin* serves a general purpose and influences any type of XML file that you open in Oxygen XML Developer.

For the Oxygen XML Developer Plugins API, Javadoc, samples, and documentation, go to https://www.oxygenxml.com/oxygen_sdk.html#Developer_Plugins

2. Create or modify the document type that is associated to your specific XML vocabulary.

This document type can be used, for instance, to provide custom actions for your type of XML files and to mount them on the toolbar, menus, and contextual menus.

For example, if the end-users are editing DITA documents, all the toolbar actions that are specific for DITA are provided by the DITA *framework*. If you look in the [Document Type Association preferences page](#) (on page 128) there is a DITA document type. If you edit that document type you will see that it has an **Author** tab in the [Document Type Configuration dialog box](#) (on page 130). The subtabs in this tab can be used to define custom DITA actions and add them to the toolbars, main menus, or contextual menus.

If you look on disk in the `[OXYGEN_INSTALL_DIR]\frameworks\dita` folder, there is a file called `dita.framework`. That file gets updated when you edit a document type from the [Document Type Association preferences page](#) (on page 128). Then you can share that updated file with all users.

The same folder contains some [JAR](#) (on page 2270) libraries. These libraries contain custom Java operations that are called when the user presses certain toolbar actions.

The *Oxygen SDK* contains the Java sources from all the DITA Java customizations:

https://www.oxygenxml.com/oxygen_sdk.html#XML_Editor_Authoring_SDK

SDK Common Use Cases

This section contains details for specific use cases regarding customizations using the *Oxygen SDK*, or *plugins (on page 1863)*.

For additional questions, [contact the Oxygen support team](#). The preferred approach is via email because these types of questions must be analyzed thoroughly. The *Oxygen support team* also provides code snippets, if applicable.

To stay up-to-date with the latest changes, discuss issues, and ask for solutions from other developers working with the *Oxygen SDK*, register on the [Oxygen-SDK mailing list](#).

Add Custom Actions to the Contextual Menu

Use Case

You want to add your own custom actions to the contextual menu using an API.

Solution

The *WSTextEditorPage.addPopUpMenuCustomizer* API method allows you to customize the contextual menu shown in **Text** mode.

Auto-Generate an ID When a Document is Opened or Created

Use Case

You want to configure how the application generates IDs (you need IDs that have a certain format for each created topic).

Solution

This could be done implementing a *plugin (on page 2271)* for Oxygen XML Developer using the [Plugins SDK](#):

There is a type of *plugin* called "Workspace Access" that can be used to add a listener to be notified when an editor is opened.

The implemented *plugin* would intercept the open editor and editor page change events (which occur when a new editor is created) and generate a new ID attribute value on the root element.

The Java code would look like this:

```
pluginWorkspaceAccess.addEditorChangeListener(new WSEditorChangeListener() {
/**
 * @see WSEditorChangeListener#editorOpened(java.net.URL)
 */
@Override
public void editorOpened(URL editorLocation) {
    WSEditor ed = pluginWorkspaceAccess.getEditorAccess
```

```

(editorLocation, PluginWorkspace.MAIN_EDITING_AREA);

        generateID(ed);
    }
/**
 * @see WSEditorChangeListener#editorPageChanged(java.net.URL)
 */
@Override
public void editorPageChanged(URL editorLocation) {
    WSEditor ed = pluginWorkspaceAccess.getEditorAccess
(editorLocation, PluginWorkspace.MAIN_EDITING_AREA);

        generateID(ed);
    }

private void generateID(WSEditor ed) {
    if(ed.getCurrentPage() instanceof WSAuthorEditorPage) {
        WSAuthorEditorPage authorEditPage = (WSAuthorEditorPage) ed.getCurrentPage();
        AuthorDocumentController ctrl = authorEditPage.getDocumentController();
        AuthorElement root = ctrl.getAuthorDocumentNode().getRootElement();

        if(root.getAttribute("id") == null ||
!root.getAttribute("id").getValue().startsWith("generated_")) {
            ctrl.setAttribute("id", new AttrValue("generated_" + Math.random()), root);
        }
    }
}

    }, PluginWorkspace.MAIN_EDITING_AREA);

```

Customize the Outline View in Text Mode

Use Case

You want to customize the **Outline view** (on page 494) in **Text** mode.

Solution

Suppose that you have the following XML document:

```

<doc startnumber="15">
    <sec counter="no">
        <info/>
        <title>Introduction</title>
    </sec>
    <sec>
        <title>Section title</title>
        <para>Content</para>
    </sec>
</doc>

```

```

    <sec>
        <title>Section title</title>
        <para>Content</para>
    </sec>
</sec>
<sec>
    <title>Section title</title>
    <para>Content</para>
</sec>
</doc>

```

and you want to display the XML content in a simplified Outline view like this:

```

doc "15"
sec Introduction
sec 15 Section title
sec 15.1 Section title
sec 16 Section title

```

Usually, an Outline view should have the following characteristics:

1. Double-clicking a node in the Outline view would select the corresponding XML content in the editor.
2. When the cursor moves in the open XML document, the Outline view would select the proper entry.
3. When modifications occur in the document, the Outline view would refresh.

A simple implementation using a Workspace Access plugin type could be something like this:

```

/**
 * Simple Outline for Text mode based on executing XPath's over the text content.
 */
public class CustomWorkspaceAccessPluginExtension implements
WorkspaceAccessPluginExtension {
    /**
     * The custom outline list.
     */
    private JList customOutlineList;

    /**
     * Maps outline nodes to ranges in document
     */
    private WSXMLTextNodeRange[] currentOutlineRanges;

    /**
     * The current text page
     */
}

```

```

        if(!"".equals(element.getAttribute("startnumber"))) {

            val += " " + "" + element.getAttribute("startnumber") + "";

        }

        NodeList titles = element.getElementsByTagName("title");

        if(titles.getLength() > 0) {

            val += " \\" + titles.item(0).getTextContent() + "\\";

        }

    }

    label.setText(val);

    return label;

}

});

//When we click a node, select it in the text page.
customOutlineList.addMouseListener(new MouseAdapter() {

    @Override

    public void mouseClicked(MouseEvent e) {

        if(SwingUtilities.isLeftMouseButton(e) && e.getClickCount() == 2) {

            int sel = customOutlineList.getSelectedIndex();

            enableCaretListener = false;

            try {

                currentTextPage.select(currentTextPage.getOffsetOfLineStart

(currentOutlineRanges[sel].getStartLine()) +

currentOutlineRanges[sel].getStartColumn() - 1,

                currentTextPage.getOffsetOfLineStart

(currentOutlineRanges[sel].getEndLine()) +

currentOutlineRanges[sel].getEndColumn());

            } catch (BadLocationException e1) {

                e1.printStackTrace();

            }

            enableCaretListener = true;

        }

    }

});

viewInfo.setComponent(new JScrollPane(customOutlineList));

viewInfo.setTitle("Custom Outline");

}

}

});

pluginWorkspaceAccess.addEditorChangeListener(new WSEditorChangeListener() {

    /**

    * @see WSEditorChangeListener#editorOpened(java.net.URL)

```

```

*/

@Override

public void editorOpened(URL editorLocation) {

    //An editor was opened

    WSEditor editorAccess = pluginWorkspaceAccess.getEditorAccess
(editorLocation, StandalonePluginWorkspace.MAIN_EDITING_AREA);

    if(editorAccess != null) {

        WSEditorPage currentPage = editorAccess.getCurrentPage();

        if(currentPage instanceof WSXMLTextEditorPage) {

            //User editing in Text mode an open XML document.

            final WSXMLTextEditorPage xmlTP = (WSXMLTextEditorPage) currentPage;

            //Reconfigure outline on each change.

            xmlTP.getDocument().addDocumentListener(new DocumentListener() {

                @Override

                public void removeUpdate(DocumentEvent e) {

                    reconfigureOutline(xmlTP);

                }

                @Override

                public void insertUpdate(DocumentEvent e) {

                    reconfigureOutline(xmlTP);

                }

                @Override

                public void changedUpdate(DocumentEvent e) {

                    reconfigureOutline(xmlTP);

                }

            });

            JTextArea textComponent = (JTextArea) xmlTP.getTextComponent();

            textComponent.addCaretListener(new CaretListener() {

                @Override

                public void caretUpdate(CaretEvent e) {

                    if(currentOutlineRanges != null && currentTextPage != null &&
enableCaretListener) {

                        enableCaretListener = false;

                        //Find the node to select in the outline.

                        try {

                            int line = xmlTP.getLineOfOffset(e.getDot());

                            for (int i = currentOutlineRanges.length - 1; i >= 0; i--) {

                                if(line > currentOutlineRanges[i].getStartLine() &&
line < currentOutlineRanges[i].getEndLine()) {

                                    customOutlineList.setSelectedIndex(i);

                                    break;

                                }

                            }

                        }

                    }

                }

            });

        }

    }

}

```

```

    }

    } catch (BadLocationException e1) {

        e1.printStackTrace();

    }

    enableCaretListener = true;

    }

    }

    });

    }

    }

    }

    /**
     * @see WSEditorChangeListener#editorActivated(java.net.URL)
     */

    @Override

    public void editorActivated(URL editorLocation) {

        //An editor was selected, reconfigure the common outline

        WSEditor editorAccess = pluginWorkspaceAccess.getEditorAccess

(editorLocation, StandalonePluginWorkspace.MAIN_EDITING_AREA);

        if(editorAccess != null) {

            WSEditorPage currentPage = editorAccess.getCurrentPage();

            if(currentPage instanceof WSXMLTextEditorPage) {

                //User editing in Text mode an open XML document.

                WSXMLTextEditorPage xmlTP = (WSXMLTextEditorPage) currentPage;

                reconfigureOutline(xmlTP);

            }

        }

    }, StandalonePluginWorkspace.MAIN_EDITING_AREA);

}

/**
 * Reconfigure the outline
 *
 * @param xmlTP The XML Text page.
 */

protected void reconfigureOutline(final WSXMLTextEditorPage xmlTP) {

    try {

        //These are DOM nodes.

        Object[] evaluateXPath = xmlTP.evaluateXPath("//doc | //sec");

        //These are the ranges each node takes in the document.

        currentOutlineRanges = xmlTP.findElementsByXPath("//doc | //sec");

```

```

currentTextPage = xmlTP;

DefaultListModel listModel = new DefaultListModel();

if(evaluateXPath != null) {
    for (int i = 0; i < evaluateXPath.length; i++) {
        listModel.addElement(evaluateXPath[i]);
    }
}

customOutlineList.setModel(listModel);
} catch(XPathException ex) {
    ex.printStackTrace();
}
}

/**
 * @see WorkspaceAccessPluginExtension#applicationClosing()
 */
@Override
public boolean applicationClosing() {
    return true;
}
}

```

Open a Document from Another Application

Restriction:

This feature is currently only available for macOS users.

Use Case

You want to open a document from another application in Oxygen XML Developer.

Solution

The Oxygen XML Developer installation kit for macOS comes with a special protocol handler that can be used if you want to open remote resources in the application (for example, opening a file from a CMS). The protocol is **edit-in-oxygen** and you can use it from a command line like this:

```
open edit-in-oxygen:protocol://host/path/file.xml
```

For example, if you start the following from the command line:

```
open edit-in-oxygen:http://www.oxygenxml.com/index.html
```

Oxygen XML Developer will start and open the HTML content from the URL *http://www.oxygenxml.com/index.html*.

**Tip:**

You can also use anchors on the URL to point to specific lines or elements inside the open document:
[Opening a Document at a Specific Location Using a Command-Line Interface \(on page 346\)](#).

Run XSLT or XQuery Transformations

Use Case

You want to run XSL 2.0 / 3.0 transformations with Saxon EE using the *Oxygen SDK*.

Solution

The API class *ro.sync.exml.workspace.api.util.XMLUtilAccess* allows you to create an XSLT Transformer that implements the JAXP interface *javax.xml.transform.Transformer*. Then this type of transformer can be used to transform XML. Here's just an example of transforming when you have an *AuthorAccess* API available:

```

    InputSource is = new org.xml.sax.InputSource
(URLUtil.correct(new File("test/personal.xml")).toString());

    xslSrc = new SAXSource(is);

    javax.xml.transform.Transformer transformer =
authorAccess.getXMLUtilAccess().createXSLTTransformer
(xslSrc, null, AuthorXMLUtilAccess.TRANSFORMER_SAXON_ENTERPRISE_EDITION);

    transformer.transform(new StreamSource(new File("test/personal.xml")),
new StreamResult(new File("test/personal.html")));

```

If you want to create the transformer from the *plugin* side, you can use this method instead:

ro.sync.exml.workspace.api.PluginWorkspace.getXMLUtilAccess().

Save a New Document with a Predefined File Name Pattern

Use Case

You want Oxygen XML Developer to automatically generate a file name comprising a UUID plus file extension using the SDK.

Solution

This could be done implementing a *plugin* (on page 2271) for Oxygen XML Developer using the *Plugins SDK*.

There is a type of *plugin* called *Workspace Access* that can be used to add a listener to be notified before an opened editor is saved. The implemented *plugin* would intercept the save events when a newly created document is untitled and display an alternative chooser dialog box, then save the topic with the proper name.

The Java code would look like this:

```

private static class CustomEdListener extends WSEditorListener{

    private final WSEditor editor;

    private final StandalonePluginWorkspace

```

```

        pluginWorkspaceAccess;

        private boolean saving = false;

        public CustomEdListener
(StandalonePluginWorkspace pluginWorkspaceAccess, WSEditor editor) {

            this.pluginWorkspaceAccess = pluginWorkspaceAccess;

            this.editor = editor;

        }

        @Override

        public boolean editorAboutToBeSavedVeto(int operationType) {

            if(! saving &&

                editor.getEditorLocation().toString().contains("Untitled")) {

                File chosenDir = pluginWorkspaceAccess.chooseDirectory();

                if(chosenDir != null) {

                    final File chosenFile =
new File(chosenDir, UUID.randomUUID().toString() + ".dita");

                    SwingUtilities.invokeLater(new Runnable() {

Add-ons

Oxygen XML Developer offers various default add-ons that can be installed to provide additional functionality to Oxygen XML Developer. Some additional community submissions are also available, although community add-ons are not officially supported or endorsed. For a full list of *add-ons* that are officially supported for Oxygen XML Developer, see [Oxygen XML Add-on Repositories](#).

[Documentation and installation details for the latest versions of each default add-on.](#)

To install one of the default add-ons, follow this procedure:

1. Go to **Help > Install new add-ons** to open an add-on selection dialog box.
2. Enter or paste <https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml> in the **Show add-ons from** field or select it from the drop-down menu.
3. Select the add-on you want to install and click **Next**.
4. Read the end-user license agreement. Then select the **I accept all terms of the end-user license agreement** option and click **Finish**.
5. Restart the application.

19.

Tools

Oxygen XML Developer includes a variety of helpful tools to help you accomplish XML-related tasks. This section presents many of those tools. These tools are available in the **Tools** menu and some of them can be launched through keyboard shortcuts or command-line scripts.

Refactoring XML Documents

In the life cycle of XML documents there are instances when the XML structure needs to be changed to accommodate various needs. For example, when an associated schema is updated, an attribute may have been removed, or a new element added to the structure.

These types of situations cannot be resolved with a traditional *Find/Replace* tool, even if the tool accepts regular expressions. The problem becomes even more complicated if an XML document is computed or referenced from multiple modules, since multiple resources need to be changed.

To assist you with these types of refactoring tasks, Oxygen XML Developer includes a specialized **XML Refactoring** tool that helps you manage the structure of your XML documents.

XML Refactoring Tool

The **XML Refactoring** tool is presented in the form of an easy to use wizard that is designed to reduce the time and effort required to perform various structure management tasks. For example, you can insert, delete, or rename an attribute in all instances of a particular element that is found in all documents within your project.

To access the tool, select the  **XML Refactoring** action from one of the following locations:

- The **Tools** menu.
- The **Refactoring** submenu from the contextual menu in the **Project view** ([on page 365](#)).

Note:

The built-in refactoring operations are also available from the **Refactoring** submenu in the contextual menu of **Text** mode. This is useful because by selecting the operations from the contextual menu, Oxygen XML Developer considers the editing context to skip directly to the wizard page of the appropriate operation and to help you by preconfiguring some of the parameter values. For your convenience, the last 5 operations that were [finished](#) ([on page 1931](#)) or [previewed](#) ([on page 1931](#)) also appear in the **Refactoring** submenu of the contextual menu in the **Project view**.

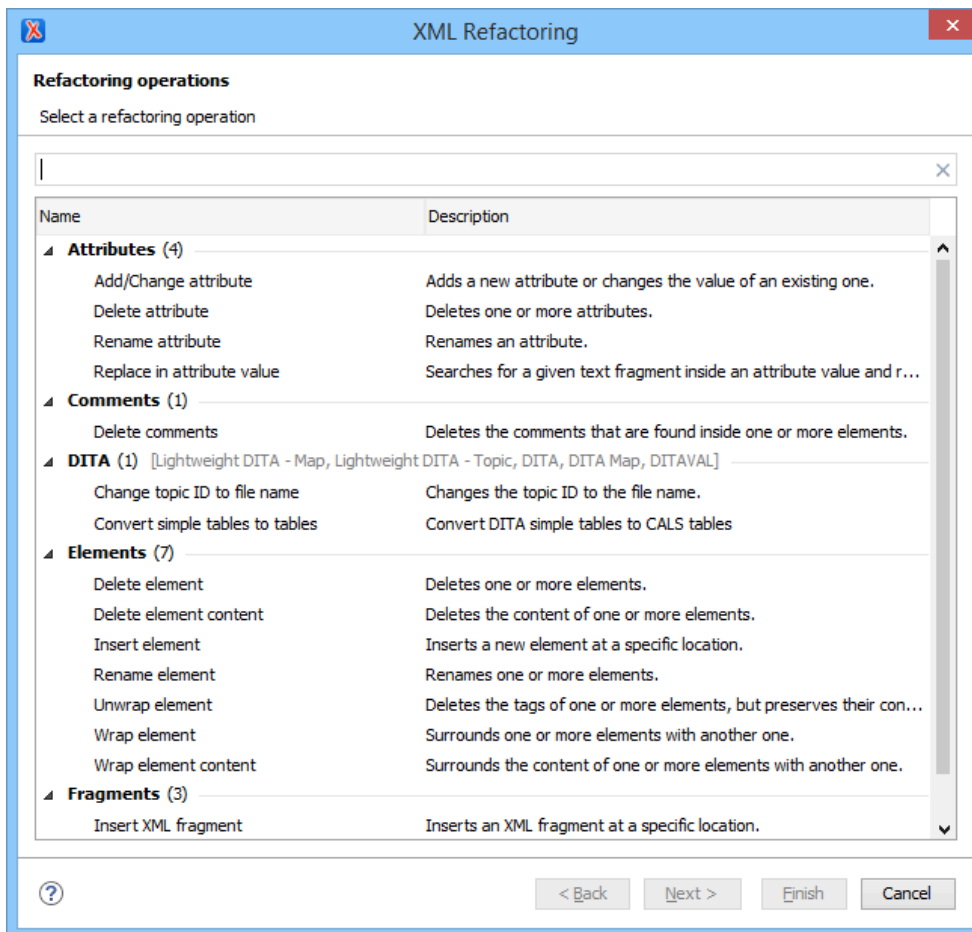

XML Refactoring Wizard

The XML Refactoring tool includes the following wizard pages:

Refactoring operations

The first wizard page presents the available operations, grouped by category. To search for an operation, you can use the filter text box at the top of the page.

Figure 470. XML Refactoring Wizard

Configure Operation Parameters

The next wizard page allows you to specify the parameters for the refactoring operation. The parameters are specific to the type of refactoring operation that is being performed. For example, to delete an attribute you need to specify the parent element and the qualified name of the attribute to be removed.

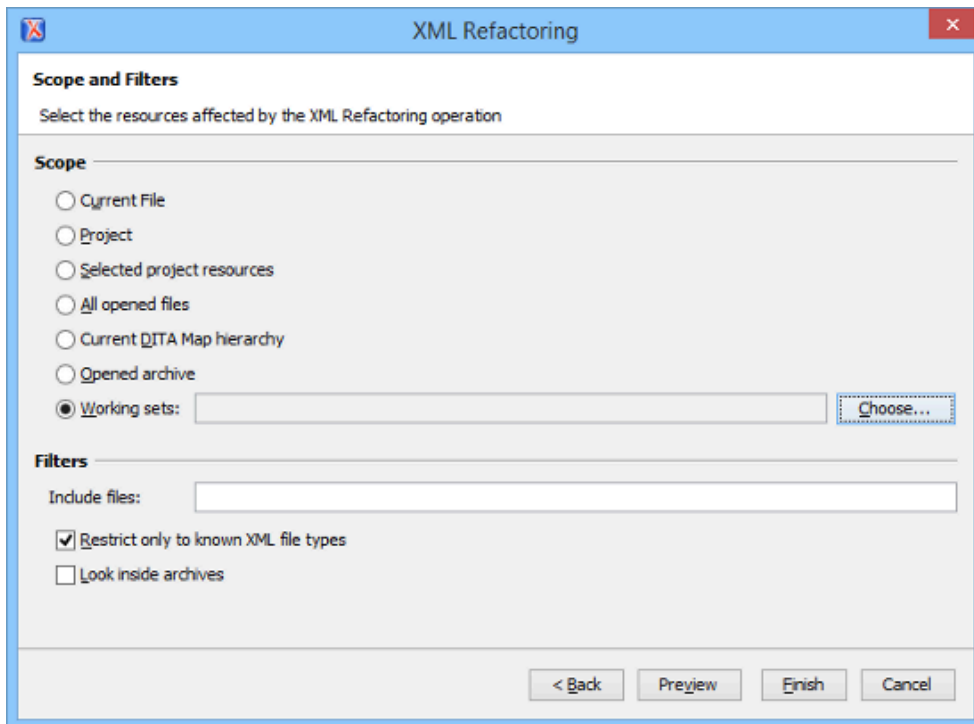

Figure 471. XML Refactoring 2nd Wizard Page (Delete Attribute Operation)

Scope and Filters

The last wizard page allows you to select the set of files that represent the input of the operation.

Figure 472. XML Refactoring - Scope and Filters Wizard Page

Scope section

You can specify the scope for the operation by selecting from predefined resource sets or you can define your own set of resources by creating a *working set* (on page 2273) (select **Working sets** and click the **Choose** button to the right). If you select **Project**, all files attached to the current project will be used for the scope of the operation. If you select **Current DITA Map hierarchy**, the current DITA map

that is open in the DITA Maps Manager along with all of its referenced topics and submaps (and topics referenced in those submaps) are used for the scope.

Filters

The **Filters** section includes the following options:

- **Include files** - Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use `build*.xml` for the file pattern.
- **Restrict only to known XML file types** - When selected, only resources with a known XML file type will be affected by the operation.
- **Look inside archives** - When selected, the resources inside archives will also be affected.

Preview

You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

Finish

After clicking the **Finish** button, the operation will be processed and Oxygen XML Developer provides no automatic means for reverting the operations. Any **Undo** action will only revert changes on the current document.

Troubleshooting:

If an operation fails, a notification will be displayed in the **Results** panel with some information about the error. For example, if the operation was invoked on a read-only resource, the error will indicate that a read-only file cannot be converted.

Tip:

If an operation takes longer than expected you can use the  **Stop** button in the progress bar to cancel the operation.

Restriction:

XML refactoring operations cannot preserve CDATA sections. If your document contains XML CDATA sections, the refactoring operations will convert them to plain text nodes.

Built-in Refactoring Operations

The XML Refactoring tool includes a variety of built-in operations that can be used for common refactoring tasks. They are grouped by category in the **Refactoring operations** wizard page. You can also access the operations from the **Refactoring** submenu in the contextual menu of **Text** mode. The operations are also

grouped by category in this submenu. When selecting the operations from the contextual menu, Oxygen XML Developer considers the editing context to get the names and namespaces of the current element or attribute, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.

**Tip:**

Each operation includes a link in the lower part of the wizard that opens the **XML / XSLT-XQuery / XPath** preferences page where you can configure XPath options and declare namespace prefixes.

The following built-in operations are available:

Refactoring Operations for *Attributes*

Add/Change attribute

Use this operation to change the value of an attribute or insert a new one. This operation allows you to specify the following parameters:

Parent element section

Element

The parent element of the attribute to be changed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute section

Local name

The local name of the affected attribute.

Namespace

The namespace of the affected attribute.

Value

The value for the affected attribute.

Options section

You can choose between one of the following options for the **Operation mode**:

Add the attribute in the parent elements where it is missing

Adds the attribute to all instances of the specified parent element.

Change the value in the parent elements where the attribute already exists

Replaces the value of the already existing attribute in all instance of the specified parent element.

Both

Adds the attributes to the instances where it is missing and replaces the value in instances where the attribute already exists.

Convert attribute to element

Use this operation to convert a specified attribute to an element. This operation allows you to specify the following parameters:

Parent element section

Element

The parent element of the attribute to be converted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute section

Local name

The local name of the affected attribute.

Namespace

The namespace of the affected attribute.

New element section

Local name

The local name of the new element.

Namespace

The namespace of the new element.

Delete attribute

Use this operation to remove one or more attributes. This operation requires you to specify the following parameters:

Element

The parent element of the attribute to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute

The name of the attribute to be deleted.

Rename attribute

Use this operation to rename an attribute. This operation requires you to specify the following parameters:

Element

The parent element of the attribute to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute

The name of the attribute to be renamed.

New local name

The new local name of the attribute.

Replace in attribute value

Use this operation to search for a text fragment inside an attribute value and change the fragment to a new value. This operation allows you to specify the following parameters:

Target attribute section

Element

The parent element of the attribute to be modified, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute

The name of the attribute to be modified.

Find / Replace section

Find

The text fragments to find. You can use Perl-like regular expressions.

Replace with

The text fragment to replace the target with. This parameter can bind regular expression capturing groups (\$1, \$2, etc.) from the find pattern.

Refactoring Operations for *Comments*

Delete comments

Use this operation to delete comments from one or more elements. This operation requires you specify the following parameter:

Element

The target element (or elements) that will have comments deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Note:**

Comments that are outside the root element will not be deleted because the *serializer* preserves the content before and after the root.

Refactoring Operations for *DITA* Topics

Change topic ID to file name

Use this operation to change the ID of a topic to be the same as its file name.

Convert CALS tables to simple tables

Use this operation to convert DITA CALS tables to simple tables.

Convert DITA 1.3 Maps and Topics to DITA 2.0

Use this operation to convert topics and maps that adhere to the DITA 1.3 standard to the DITA 2.0 standard.

- Changes DOCTYPE declarations and XML Schema/Relax NG schema references.
- DITA Map changes:
 - Removes the `@lockmeta` attribute.
 - Removes the `<topicset>` and `<topicsetref>` elements.
 - Removes the `<anchor>` and `<anchorref>` elements and the `@anchorref` attribute.
 - Migrates the `@navtitle` attribute as a `<navtitle>` element.
 - Migrates the `@title` attribute as a `<title>` element.
 - Converts the `@copy-to` attribute to a `<resourceid>` element.
 - Replaces the `@print` attribute with an `@deliveryTarget` attribute.
 - Convert topicmeta `<linktext>` to `<linktitle>`.
 - Removed `<hasInstance>`, `<hasKind>`, `<hasNarrower>`, `<hasPart>`, `<hasRelated>`, and `<relatedSubjects>` from subject scheme relationship tables in subject scheme, including `<subjectRelTable>`, `<subjectRelHeader>`, `<subjectRel>`, and `<subjectRole>`.
- DITA task changes:
 - Converts the `<substep>` element to a `<step>` element.
 - Converts the `<substeps>` element to a `<steps>` element.
- DITA topic changes:
 - Removes the `@type` attribute with the value `fastpath`.
 - Converts the `@alt` attribute to an `<alt>` element.
 - Replaces the `<index-sort-as>` element with a `<sort-as>` element.
 - Removes the `<itemgroup>` element.
 - Moves the contents of the `<titlealts>` element inside the `<prolog>`.
 - Removes the `@domains` attribute.
 - Renames `<sectiondiv>` to `<div>`.
 - Remove `@query` attribute from `<link>` element.

- Remove `@specentry` attribute from `<stentry>` element.

Remove the `@spectitle` attribute.

Convert conrefs to conkeyrefs

Use this operation to convert `@conref` attributes to `@conkeyref` attributes.

Convert Nested Topics to New Topics

Use this operation on topics that contain nested `<topic>` elements to convert each nested topic to a new topic.

Convert Sections to New Topics

Use this operation on topics that contain multiple sections to convert each section to a new topic.

Convert simple tables to CALS tables

Use this operation to convert DITA simple tables to CALS tables.

Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task).

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Rename Key

Use this operation to rename a key. It also updates all references to it.

**Note:**

It does not work on DITA 1.3 key scopes.

Generate IDs

Use this operation to automatically generate unique IDs for elements.

Scope and Filters:

All of the DITA refactoring actions allow you to choose a scope for the operation and some filters:

Scope

Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, **Current DITA map hierarchy**, or just the **Current file**.

Filters section**Include files**

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).

Restrict to known XML file types only

Excludes non-XML file types from the operation.

Look inside archives

If this option is selected, the scope of the operation will include files inside archives.

Refactoring Operations for *DITA* Maps**Convert DITA Bookmap to Map**

Convert a DITA bookmap to a DITA map.

Convert DITA Map to Bookmap

Convert a DITA map to a DITA bookmap.

Change or remove profiling attribute value

Change or remove a value from a DITA profiling attribute. A profiling attribute can have multiple values, separated by spaces (e.g. for `platform="windows redhat"`, you can change the current `redhat` value to `linux`). Select the name of the profiling attribute, the current value to replace, and the new value. If the new value is left empty, the current value is removed from the profiling attribute. The new value is modified and reflected in DITA maps, DITA topics, and DITAVAL files.

Define keys for all topic references

This refactoring action is useful for converting links inside a DITA project from direct to indirect key-based addressing. When applied on DITA resources from your project (DITA maps and topics), this refactoring action defines keys for all of a DITA map's topic references based on the referenced file name and converts each direct reference to a key reference in each DITA topic. If a topic references already has keys defined, the action does not define new ones. Inside the DITA topics, whenever there is a link element (`<xref>` or `<link>`) with a direct reference to another DITA topic or an element with a `@conref`, the action attempts to convert them to indirect key-based addressing. The refactoring action may introduce linking errors or create duplicate keys so it is advised to run the **Validate and check for completeness** action from the **DITA Maps Manager** toolbar to manually fix those problems. You can enable the **Report duplicate keys** checkbox to also report any keys that are defined more than once.

Scope and Filters:

All of the DITA refactoring actions allow you to choose a scope for the operation and some filters:

Scope

Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the **Project, All opened files, Current DITA map hierarchy**, or just the **Current file**.

Filters section

Include files

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as `*` or `?`).

Restrict to known XML file types only

Excludes non-XML file types from the operation.

Look inside archives

If this option is selected, the scope of the operation will include files inside archives.

Refactoring Operations for *Elements*

Delete element

Use this operation to delete elements. This operation requires you to specify the following parameter:

Element

The target element to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Delete element content

Use this operation to delete the content of elements. This operation requires you to specify the following parameter:

Element

The target element whose content is to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Insert element

Use this operation to insert new elements. This operation allows you to specify the following parameters:

Element section**Local name**

The local name of the element to be inserted.

Namespace

The namespace of the element to be inserted.

Location section**XPath**

An XPath expression that identifies an existing element to which the new element is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Position

The position where the new element will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.

Rename element

Use this operation to rename elements. This operation requires you to specify the following parameters:

Target elements (XPath)

The target elements to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

New local name

The new local name of the element.

Unwrap element

Use this operation to remove the surrounding tags of elements, while keeping the content unchanged. This operation requires you to specify the following parameter:

Target elements (XPath)

The target elements whose surrounding tags will be removed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Wrap element

Use this operation to surround elements with element tags. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements to be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Wrapper element section

Local name

The local name of the *Wrapper element*.

Namespace

The namespace of the *Wrapper element*.

Wrap element content

Use this operation to surround the content of elements with element tags. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements whose content will be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Wrapper element section

Local name

The local name of the *Wrapper element* that will surround the content of the target.

Namespace

The namespace of the *Wrapper element* that will surround the content of the target.

Refactoring Operations for *Fragments*

Insert XML fragment

Use this operation to insert an XML fragment. This operation allows you to specify the following:

XML Fragment

The XML fragment to be inserted.

Location section

XPath

An XPath expression that identifies an existing element to which the inserted fragment is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Position

The position where the fragment will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.

Replace element content with XML fragment

Use this operation to replace the content of elements with an XML fragment. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements whose content will be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

XML Fragment

The XML fragment with which to replace the content of the target element.

Replace element with XML fragment

Use this operation to replace elements with an XML fragment. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements to be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

XML Fragment

The XML fragment with which to replace the target element.

Refactoring Operations for *JATSKit*

Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0

Use this operation to add an NLM 'BITS' 2.0 DOCTYPE declaration.

Add Blue DOCTYPE - NISO JATS Publishing 1.1

Use this operation to add a JATS 'Blue' 1.1 DOCTYPE declaration.

Normalize IDs

Use this operation to normalize assigned IDs and assigned IDs to elements that are missing them.

All of these *JATSKit* refactoring actions allow you to choose a scope for the operation and some filters:

Scope

Select from a variety of options to define the scope for the resources that will be affected by the operation. For example, you can choose to affect all resources in the **Project, All opened files**, or just the **Current file**.

Filters section

Include files

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).

Restrict to known XML file types only

Excludes non-XML file types from the operation.

Look inside archives

If this option is selected, the scope of the operation will include files inside archives.

Refactoring Operations for *Processing Instructions*

Accept all tracked changes, remove all Oxygen-specific comments and highlights

Use this operation to accept all application-specific tracked changes (from elements and attributes) or remove all application-specific comments or highlights. There are several options to choose from:

Accept all tracked changes

Accepts all application-specific tracked changes (from elements and attributes).

Remove comments

Removes all application-specific comments.

Remove highlights

Removes all application-specific highlights.

Delete processing instructions

Use this operation to delete all processing instructions that have a certain target name from the processed documents. This operation requires you to specify the following parameter:

Processing instruction target

The target name of the processing instructions to delete.

Note:

Processing instructions that are outside the root element are not deleted because the *serializer* preserves the content before and after the root.

Refactoring Operations for *Publishing Template*

These operations are for those who use *Oxygen Publishing Templates* for WebHelp Responsive output customization.

Migrate HTML Page Layout Files to v21

Use this operation to convert custom [HTML page layout files \(on page 1316\)](#) that are included in a custom Publishing Template that was created in Oxygen XML Developer version 20.0 or 20.1 so that they will be compatible with Oxygen XML Developer version 21.0.

Migrate HTML Page Layout Files to v22

Use this operation to convert custom [HTML page layout files \(on page 1316\)](#) that are included in a custom Publishing Template that was created in Oxygen XML Developer versions 20.0 - 21.1 so that they will be compatible with Oxygen XML Developer version 22.0.

Update HTML Pages

Attention:

This operation is only used by Oxygen XML Developer and should not be used manually.

Additional Notes:

- There are some operations that allow `<ANY>` for the **local name** and **namespace** parameters. This value can be used to select an element or attribute regardless of its local name or namespace. Also, the `<NO_NAMESPACE>` value can be used to select nodes that do not belong to a namespace.
- Some operations have parameters that accept XPath expressions to match elements or attributes. In these XPath expressions you can only use the prefixes declared in the [Options > Preferences > XML > XSLT-XQUERY > XPath \(on page 227\)](#) page. This preferences page can be

easily opened by clicking the link in the note (**Each prefix used in an XPath expression must be declared in the Default prefix-namespace mappings section**) at the bottom of the **Configure Operation Parameters** wizard page.

Custom Refactoring Operations

While Oxygen XML Developer includes a variety of built-in XML refactoring operations to help you accomplish particular tasks, you can also create custom operations according to your specific needs. For example, you could create a custom refactoring operation to convert an attribute to an element and insert the element as the first child of the parent element.

An XML Refactoring operation is defined as a pair of resources:

- An *XQuery Update script* or *XSLT stylesheet* that Oxygen XML Developer will run to refactor the XML files.
- An *XML Operation Descriptor* file that contains information about the operation (such as the name, description, and parameters).

Figure 473. Diagram of an XML Refactoring Operation

All the defined custom operations are loaded by the **XML Refactoring Tool** and presented in the **Refactoring Operations** wizard page (*on page 608*), along with the built-in operations.

After the user chooses an operation and specifies its parameters, Oxygen XML Developer processes an XQuery Update or XSLT transformation over the input file. This transformation is executed in a **safe mode**, which implies the following:

- When loading the document:
 - The **XInclude** mechanism is disabled. This means that the resources included by using XInclude will not be visible in the transformation.
 - The DTD entities will be processed without being expanded.
 - The associated DTD will be not loaded, so the default attributes declared in the DTD will not be visible in the transformation.
- When saving the updated XML document:
 - The `DOCTYPE` will be preserved.

Note:

This can be changed using [Saxon extension functions in XSLT \(on page 640\)](#).

- The DTD entities will be preserved as they are in the original document when the document is saved.
- The attribute values will be kept in their original form without being normalized.
- The spaces between attributes are preserved. Basically, the spaces are lost by a regular XML serialization since they are not considered important.

The result of this transformation overrides the initial input file.

Note:

To achieve some of the previous goals, the XML Refactoring mechanism adds several attributes that are interpreted internally. The attributes belong to the http://www.oxygenxml.com/ns/xmlRefactoring/additional_attributes namespace. These attributes should not be taken into account when processing the input XML document since they are discarded when the transformed document is serialized.

Restriction:

Comments or *processing instructions* that are in any node before or after the root element cannot be modified by an XML Refactoring operation. In other words, XML Refactoring operations can only be applied on the root element and the nodes inside it. However, as a work around to this limitation, you can use [Saxon extension functions and the XSLT stylesheet method \(on page 640\)](#) to implement the new custom XML refactoring operation.

Creating a Custom Refactoring Operation

To create a custom refactoring operation, follow these steps:

1. Create an [XQuery Update script \(on page 630\)](#) or [XSLT stylesheet file \(on page 635\)](#).
2. Create an XML refactoring operation descriptor file, that references the above script, as explained in these sections: [Example descriptor file for an XQuery Update script \(on page 633\)](#) or [Example descriptor file for an XSLT stylesheet \(on page 638\)](#).
3. Store both files in [one of the locations that Oxygen XML Developer \(on page 642\)](#) scans when loading the custom operations.

Result: Once you run the **XML Refactoring** tool again, the custom operation appears in the **Refactoring Operations** wizard page [\(on page 608\)](#).

Related information

[Storing and Sharing Refactoring Operations \(on page 642\)](#)

Custom Refactoring Script

The first step in creating a custom refactoring operation is to create an [XQuery Update script \(on page 630\)](#) or [XSLT stylesheet \(on page 635\)](#) that is needed to process the refactoring operations. The easiest way to create this script file is to use the **New** document wizard to create a new **XQuery** or **XSLT** file and you can use the [XQuery method example \(on page 630\)](#) or [XSLT method example \(on page 635\)](#) to help you with the content.

There are cases when it is necessary to add parameters in the [XQuery script \(on page 630\)](#) or [XSLT stylesheet \(on page 635\)](#). For instance, if you want to rename an element, you may want to declare an external parameter associated with the name of the element to be renamed. To allow you to specify the value for these parameters, they need to be declared in the *refactoring operation descriptor file* that is associated with this operation.

Note:

The XQuery Update processing is disabled by default in Oxygen XML Developer. Thus, if you want to create or edit an XQuery Update script you have to enable this mechanism by creating an [XQuery transformation scenario \(on page 1220\)](#) and choose **Saxon EE** as the transformation engine. Also, you need to make sure the **Enable XQuery update** option is selected in the Saxon processor advanced options [\(on page 1151\)](#).

Note:

If you are using an XSLT file, XPath expressions that are passed as parameters will automatically be rewritten to conform with the mapping of the namespace prefixes declared in the [XML /XSLT-XQuery / XPath preferences page \(on page 227\)](#).

The next step in creating a custom refactoring operation is to create an **XML Refactoring Operation Descriptor** file contains the path to the [XQuery Update script \(on page 633\)](#) or [XSLT stylesheet \(on page 638\)](#).

Related Information:

[XQuery Update Script for Creating a Custom Operation \(on page 630\)](#)

[XSLT Stylesheet for Creating a Custom Operation \(on page 635\)](#)

Custom Refactoring Operation Descriptor File

The second step in creating a custom refactoring operation is to create an operation descriptor file. The easiest way to do this is to use the **New** document wizard and choose the **XML Refactoring Operation Descriptor** template.

Introduction to the Descriptor File

This descriptor file root element specifies required attributes to define the operation `@name`, `@description`, and `@id` which are necessarily when loading an XML Refactoring operation. It also contains the path to the [XQuery Update script \(on page 630\)](#) or [XSLT stylesheet \(on page 635\)](#) that is associated with the particular operation through the `<script>` element.

The optional `@filesFilter` attribute can be specified to filter the resources by using a file pattern or list of file patterns separated by a comma (for example: `filesFilter="*.dita, *.xml"`). When set, its value is automatically populated in the **Include files** field within the **Scope and Filters** wizard page (on page 610) as a default value.

You can specify a *category* for your custom operations to logically group certain operations. The `<category>` element is optional and if it is not included in the descriptor file, the default name of the category for the custom operations is *Other operations*.

The descriptor file is edited and validated against the following schema: `frameworks/xml_refactoring/operation_descriptor.xsd`.

Declaring Parameters in the Descriptor File

If the XQuery Update script or XSLT stylesheet includes parameters, they should be declared in the **parameters** section of the descriptor file. All the parameters specified in this section of the descriptor file will be displayed in the **XML Refactoring** tool within the **Configure Operation Parameters** wizard page (on page 608) for that particular operation.

The value of the first `<description>` element in the `<parameters>` section will be displayed at the top of the **Configure Operation Parameters** wizard page (on page 608).

To declare a parameter, specify the following information:

- **label** - This value is displayed in the user interface for the parameter.
- **name** - The parameter name used in the XQuery Update script or XSLT stylesheet and it should be the same as the one declared in the script.
- **type** - Defines the type of the parameter and how it will be rendered. There are several types available:

- **TEXT** - Generic type used to specify a simple text fragment.
- **XPATH** - Type of parameter whose value is an XPATH expression. For this type of parameter, Oxygen XML Developer will use a text input with corresponding content completion and syntax highlighting.

**Note:**

The value of this parameter is transferred as plain text to the XQuery Update or XSLT transformation without being evaluated. You should evaluate the XPath expression inside the XQuery Update script or XSLT stylesheet. For example, you could use the `saxon:evaluate` Saxon extension function.

**Note:**

A relative XPath expression is converted to an absolute XPath expression by adding `//` before it (`//XPathExp`). This conversion is done before transferring the XPath expression to the XML refactoring engine.

**Note:**

When writing XPath expressions, you can only use prefixes declared in the [Options > Preferences > XML > XSLT-XQuery > XPath](#) (on page 227) options page.

- **NAMESPACE** - Used for editing namespace values.
- **REG_EXP_FIND** - Used when you want to match a certain text by using Perl-like regular expressions.
- **REG_EXP_REPLACE** - Used along with `REG_EXP_FIND` to specify the replacement string.
- **XML_FRAGMENT** - This type is used when you want to specify an XML fragment. For this type, Oxygen XML Developer will display a text area specialized for inserting XML documents.
- **NC_NAME** - The parameter for `NC_NAME` values. It is useful when you want to specify the local part of a *QName* (on page 2272) for an element or attribute.
- **BOOLEAN** - Used to edit boolean parameters.
- **TEXT_CHOICE** - It is useful for parameters whose value should be from a list of possible values. Oxygen XML Developer renders each possible value as a radio button option.
- **optional** - Specifies whether the parameter is optional or required. For optional parameters, the end user is not required to fill in a value in the XML refactoring wizard.
- **description** - The description of the parameter. It is used by the application to display a tooltip when you hover over the parameter.
- **possibleValues** - Contains the list with possible values for the parameter and you can specify the default value, as in the following example:

```
<possibleValues onlyPossibleValuesAllowed="true">
  <value name="before">Before</value>
  <value name="after" default="true">After</value>
  <value name="firstChild">First child</value>
```

```
<value name="lastChild">Last child</value>
</possibleValues>
```

On a `<value>`, you can specify the `@default` attribute with the value `true` to mark it as the default presented value in the XML refactoring wizard. The text specified inside the `<value>` element is displayed as placeholder default text in the text entry box. If the dialog box is accepted with the placeholder text in place, the `@name` attribute value is passed to the refactoring script. Example:

```
<value name="my-actual-default-value" default="true">[default displayed]</value>
```

Specialized Parameters to Match Elements or Attributes

If you want to match elements or attributes, you can use some specialized parameters, in which case Oxygen XML Developer will propose all declared elements or attributes based on the schema associated with the currently edited file. The following specialized parameters are supported:

elementLocation

This parameter is used to match elements. For this type of parameter, the application displays a text field where you can enter the element name or an XPath expression. The text from the `@label` attribute is displayed in the application as the label of the text field. The `@name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If the value of the `@useCurrentContext` attribute is set to `true`, the element name from the cursor position is used as proposed values for this parameter.

Example of an `<elementLocation>`:

```
<elementLocation name="elem_loc" useCurrentContext="false">
  <element label="Element location">
    <description>Element location description.</description>
  </element>
</elementLocation>
```

attributeLocation

This parameter is used to match attributes. For this type of parameter, the application displays two text fields where you can enter the parent element name and the attribute name (both text fields accept XPath expressions for a finer match). The text from the `@label` attributes is displayed in the application as the label of the associated text fields. The `@name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. The value of this parameter is an XPath expression that is computed by using the values of the expression from the *element* and *attribute* text fields. For example, if `section` is entered for the element and a `title` is entered for the attribute, the XPath expression would be computed as `//section/@title`. If the value of the `useCurrentContext` attribute is set to `true`, the element and attribute name from the cursor position is used as proposed values for the operation parameters.

Example of an `<attributeLocation>`:

```

<attributeLocation name="attr_xpath" useCurrentContext="true">
    <element label="Element path">
        <description>Element path description.</description>
    </element>
    <attribute label="Attribute" >
        <description>Attribute path description.</description>
    </attribute>
</attributeLocation>

```

elementParameter

This parameter is used to specify elements by local name and namespace. For this type of parameter, the application displays two combo boxes with elements and namespaces collected from the associated schema of the currently edited file. The text from the `@label` attribute is displayed in the application as label of the associated combo. The `@name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If you specify the `@allowsAny` attribute, the application will propose `<ANY>` as a possible value for the **Name** and **Namespace** combo boxes. You can also use the `@useCurrentContext` attribute and if its value is set to `true`, the element name and namespace from the cursor position is used as proposed values for the operation parameters.

Example of an `<elementParameter>`:

```

<elementParameter id="elemID" useCurrentContext="true">
    <localName label="Name" name="element_localName" allowsAny="true">
        <description>Local name of the parent element.</description>
    </localName>
    <namespace label="Namespace" name="element_namespace" allowsAny="true">
        <description>Local name of the parent element</description>
    </namespace>
</elementParameter>

```

attributeParameter

This parameter is used to specify attributes by local name and namespace. For this type of parameter, the application displays two combo boxes with attributes and their namespaces collected from the associated schema of the currently edited file. The text from the `@label` attribute is displayed in the application as the label of the associated combo box. You can also use the `@useCurrentContext` attribute and if its value is set to `true`, the attribute name and namespace from the cursor position is used as proposed values for the operation parameters.

Note:

An `<attributeParameter>` is dependant upon an `<elementParameter>`. The list of attributes and namespaces are computed based on the selection in the `elementParameter` combo boxes.

Example of an `<attributeParameter>`:

```
<attributeParameter dependsOn="elemID" useCurrentContext="true">
  <localName label="Name" name="attribute_localName">
    <description>The name of the attribute to be converted.</description>
  </localName>
  <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
    <description>Namespace of the attribute to be converted.</description>
  </namespace>
</attributeParameter>
```

Grouping Parameters in the Descriptor File

You can use `<section>` elements to group related parameters in the descriptor file:

```
<section label="Parent element">
  <elementParameter id="elemID">
    <localName label="Name" name="element_localName" allowsAny="true">
      <description>Local name of the parent element.</description>
    </localName>
    <namespace label="Namespace" name="element_namespace" allowsAny="true">
      <description>Local name of the parent element</description>
    </namespace>
  </elementParameter>
</section>
```

Note:

All built-in operations are loaded from the `[OXYGEN_INSTALL_DIR]/refactoring` folder.

[Example of an Operation Descriptor File with an XQuery Update script \(on page 633\)](#)

XSLT Stylesheet for Creating a Custom Operation

To demonstrate creating a custom operation, suppose that you have a task where you need to convert an attribute into an element and insert it inside another element. A specific example would be if you have a project with a variety of `<image>` elements where a deprecated `@alt` attribute was used for the description and you want to convert all instances of that attribute into an element with the same name and insert it as the first child of the `<image>` element.

Thus, the task is to convert this attribute into an element with the same name and insert it as the first child of the image element.

Figure 474. Example: Custom XML Refactoring Operation

An XSLT stylesheet can be used to implement the new custom XML refactoring operation. The second requirement is an [XML Refactoring operation descriptor file \(on page 1954\)](#) that contains the path to the XSLT stylesheet.

Example of an XSLT Script for Creating a Custom Operation to *Convert an Attribute to an Element*

The XSLT stylesheet does the following:

- Iterates over all elements from the document that have the specified local name and namespace.
- Finds the attribute that will be converted to an element.
- Adds the new element as the first child of the parent element.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  xmlns:xr="http://www.oxygenxml.com/ns/xmlRefactoring"
  version="2.0">
  <xsl:import
    href="http://www.oxygenxml.com/ns/xmlRefactoring/resources/commons.xsl"/>
  <xsl:param name="element_localName" as="xs:string" required="yes"/>
  <xsl:param name="element_namespace" as="xs:string" required="yes"/>
  <xsl:param name="attribute_localName" as="xs:string" required="yes"/>
  <xsl:param name="attribute_namespace" as="xs:string" required="yes"/>
  <xsl:param name="new_element_localName" as="xs:string" required="yes"/>
```

```

<xsl:param name="new_element_namespace" as="xs:string" required="yes"/>

<xsl:template match="node() | @">

  <xsl:copy>

    <xsl:apply-templates select="node() | @"/>

  </xsl:copy>

</xsl:template>

<xsl:template match="//*[xr:check-local-name($element_localName, .., true())
and
xr:check-namespace-uri($element_namespace, ..)]">

  <xsl:variable name="attributeToConvert"

    select="*[xr:check-local-name($attribute_localName, .., true())
and
xr:check-namespace-uri($attribute_namespace, ..)]"/>

  <xsl:choose>

    <xsl:when test="empty($attributeToConvert)">

      <xsl:copy>

        <xsl:apply-templates select="node() | @"/>

      </xsl:copy>

    </xsl:when>

    <xsl:otherwise>

      <xsl:copy>

        <xsl:for-each select="*[empty(. intersect $attributeToConvert)]">

          <xsl:copy-of select="."/>

        </xsl:for-each>

        <!-- The new element namespace -->

        <xsl:variable name="nsURI" as="xs:string">

          <xsl:choose>

            <xsl:when test="$new_element_namespace eq $xr:NO-NAMESPACE">

              <xsl:value-of select=""/>

            </xsl:when>

            <xsl:otherwise>

              <xsl:value-of select="$new_element_namespace"/>

            </xsl:otherwise>

          </xsl:choose>

        </xsl:variable>

        <xsl:element name="{ $new_element_localName }" namespace="{ $nsURI }">

          <xsl:value-of select="$attributeToConvert"/>

        </xsl:element>

      </xsl:copy>

    </xsl:otherwise>

  </xsl:choose>

</xsl:template>

```

```

</xsl:copy>

</xsl:otherwise>

</xsl:choose>

</xsl:template>

</xsl:stylesheet>

```

**Note:**

The XSLT stylesheet imports a module library that contains utility functions and variables. The location of this module is resolved via an *XML Catalog (on page 2273)* set in the XML Refactoring framework (on page 2269).

Example of an Operation Descriptor File That References the XSLT Stylesheet for Creating a Custom Operation to *Convert an Attribute to an Element*

After you have developed the XSLT stylesheet (for example, named `convert-attribute-to-element.xsl`), you have to create an XML Refactoring operation descriptor (for example, named `convert-attribute-to-element.xml`) that references the stylesheet and provides descriptions and possible values for its parameters. This descriptor is used by the application to load the operation details such as name, description, or parameters.

```

<?xml version="1.0" encoding="UTF-8"?>

<refactoringOperationDescriptor
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns="http://www.oxygenxml.com/ns/xmlRefactoring"
  id="convert-attribute-to-element"
  name="Convert attribute to element">
  <description>Converts the specified attribute to an element.
    The new element will be inserted as first child of the attribute's
    parent element.</description>
  <script type="XSLT" href="convert-attribute-to-element.xsl"/>
  <parameters>
    <description>Specify the attribute to be converted to element.</description>
    <section label="Parent element">
      <elementParameter id="elemID">
        <localName label="Name" name="element_localName" allowsAny="true">
          <description>Local name of the parent element.</description>
        </localName>
        <namespace label="Namespace" name="element_namespace" allowsAny="true">
          <description>Local name of the parent element</description>
        </namespace>
      </elementParameter>
    </section>
  </parameters>
</refactoringOperationDescriptor>

```

```

<section label="Attribute">
  <attributeParameter dependsOn="elemID">
    <localName label="Name" name="attribute_localName">
      <description>Name of the attribute to be converted.</description>
    </localName>
    <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
      <description>Namespace of the attribute to be converted.</description>
    </namespace>
  </attributeParameter>
</section>

<section label="New element">
  <elementParameter>
    <localName label="Name" name="new_element_localName">
      <description>The name of the new element.</description>
    </localName>
    <namespace label="Namespace" name="new_element_namespace">
      <description>The namespace of the new element.</description>
    </namespace>
  </elementParameter>
</section>
</parameters>
</refactoringOperationDescriptor>

```

**Note:**

If you are using an XSLT file, the line with the `<script>` element would look like this:

```
<script type="XSLT" href="convert-attribute-to-element.xsl"/>
```

The code exemplified above and other refactoring examples can be found on the [DITA Refactoring GitHub sample project](#).

Results

After you have created these files, copy them into a folder scanned by Oxygen XML Developer when it loads the custom operation (on page 642). When the XML Refactoring tool is started again, you will see the created operation.

Since various parameters can be specified, this custom operation can also be used for other similar tasks. The following image shows the parameters that can be specified in the example of the custom operation to convert an attribute to an element:

Figure 475. Example: XML Refactoring Wizard for a Custom Operation

Using Saxon Extension Functions to Allow Custom Refactoring Operations to Read and Modify Content Outside the Root Node

One advantage to using an XSLT stylesheet is that there is limitation when using an [XQuery Update script \(on page 630\)](#) in that refactoring operations can only be performed on *comments* or *processing instructions* that are inside the root element. Thus, using the XQuery method, *comments* or *processing instructions* that are in any node before or after the root element cannot be modified by an XML Refactoring operation.

The XSLT stylesheet method offers a work-around to this limitation through the use of some Saxon extension functions.

To illustrate the use of these functions, consider the following sample XML file:

```
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment before root -->
<?pi before root ?>
<root>
  <child></child>
</root>
<!-- comment after root -->
<?pi after root ?>
```

The following Saxon extension functions can be used to read and modify content outside the root node:

Note:

They belong to the <http://www.oxygenxml.com/ns/xmlRefactoring/functions> namespace.

- **get-content-after-root()** - Returns the content after root as `xs:string`.

For the XML above, the call of this function will return the following string value:

```
<!-- comment after root -->
<?pi after root ?>
```

- **set-content-after-root(xs:string)** - Updates the content that will be serialized in the refactored document after the root node.

The function call `set-content-after-root('<!-- Inserted comment -->')` will result in replacing the nodes after the root element with the comment passed as string argument. The XML document will be modified as follows:

```
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment before root -->
<?pi before root ?>
<root>
  <child></child>
</root><!-- Inserted comment -->
```

- **get-content-before-root()** - Returns the content before root as `xs:string`.

For the XML above, the call of this function will return the following string value:

```
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment before root -->
<?pi before root ?>
```

- **set-content-before-root(xs:string)** - Updates the content that will be serialized in the refactored document after the root node.

The function call `set-content-before-root('<!-- Inserted comment -->')` will result in replacing the nodes before the root element with the comment passed as string argument. The XML document will be modified as follows:

```
<!-- Inserted comment --><root>
  <child></child>
</root>
<!-- comment after root -->
<?pi after root ?>
```

XSLT Example:

To process content after the root node, the XSLT would look like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema" exclude-result-prefixes="xs"
```

```

xmlns:xrf="http://www.oxygenxml.com/ns/xmlRefactoring/functions" version="3.0">

<xsl:template match="/">

  <!-- The comment content that will be inserted after the root element -->

  <xsl:variable name="commentAsText"><!-- COMMENT ADDED FROM XR OPERATION-->

  </xsl:variable>

  <!-- Retrieve the content after the root element as is -->

  <xsl:variable name="after-root-content" as="xs:string"

    select="xrf:get-content-after-root()"/>

  <xsl:variable name="processedContent"

    select="concat($after-root-content, $commentAsText)"/>

  <!-- Update the content after the root element -->

  <xsl:value-of select="xrf:set-content-after-root($processedContent)"/>

  <xsl:apply-templates/>
</xsl:template>

<xsl:template match="node() | @">

  <xsl:copy>

    <xsl:apply-templates select="node() | @"/>

  </xsl:copy>
</xsl:template>
</xsl:stylesheet>

```

**Note:**

The above XSLT retrieves the nodes after the root element as string, appends a new comment, and then sets back the updated content into the XML document.

Storing and Sharing Refactoring Operations

Oxygen XML Developer scans the following locations when looking for XML Refactoring operations to provide flexibility:

- A folder named **refactoring**, created inside the folder of the *framework* you are customizing. In the **Classpath** tab of the **Document type** configuration dialog box (*on page 134*), you need to add a reference to the **refactoring** folder specific for the framework.
- A folder that you specify in the **Load additional refactoring operations from** text box (*on page 237*) in the **XML Refactoring** preferences page (*on page 237*).

**Note:**

If you share a project with your team, you can also share the custom operation by doing the following:

1. Save the custom operation in a folder that is part of your project.
2. Switch the **XML Refactoring** option page to *project level* (on page 2272):
 - a. Open the **Preferences** dialog box (**Options > Preferences**) (on page 114) and go to **XML > XML Refactoring** (on page 237).
 - b. Select **Project Options** (on page 2272) at the bottom of the dialog box.
3. In the **Load additional refactoring operations from text box** (on page 237), use the `${pd}` editor variable (on page 296) so that the folder path is declared relative to the project.

- A folder specified by the **XML Refactoring Operations Plugin Extension** (on page 1885).
- The `refactoring` folder from the Oxygen XML Developer installation directory (`[OXYGEN_INSTALL_DIR]/refactoring/`).

Sharing Custom Refactoring Operations

The purpose of Oxygen XML Developer scanning multiple locations for the XML Refactoring operations is to provide more flexibility for developers who want to share the refactoring operations with the other team members. Depending on your particular use case, you can attach the custom refactoring operations to other resources, such as *framework* (on page 2269) or projects.

After storing custom operations, you can share them with other users by sharing the resources.

Localizing XML Refactoring Operations

Oxygen XML Developer includes localization support for the XML refactoring operations.

The translation keys for the built-in refactoring operations are located in `[OXYGEN_INSTALL_DIR]/refactoring/i18n/translation.xml`.

The localization support is also available for custom refactoring operations. The following information can be translated:

- The operation `name`, `description`, and `category`.
- The `<description>` of the `<parameters>` element.
- The `label`, `description`, and `possibleValues` for each `parameter`.

Translated refactoring information uses the following form:

```
${i18n(translation_key)}
```

Oxygen XML Developer scans the following locations to find the `translation.xml` files that are used to load the translation keys:

- A `refactoring/i18n` folder, created inside a directory that is associated to a customized *framework*.
- A `i18n` folder, created inside a directory that is associated to a customized *framework*.
- An `i18n` folder inside any specified folder. In this case, you need to [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#), go to **XML > XML Refactoring**, and specify the folder in the **Load additional refactoring operations from** text box.
- An `i18n` folder located in directories specified through the [XML Refactoring Operations Plugin Extension \(on page 1885\)](#).
- The `refactoring/i18n` folder from the Oxygen XML Developer installation directory (`[OXYGEN_INSTALL_DIR]/refactoring/i18n`).

Example: Refactoring Operation Descriptor File with *i18n* Support

```
<?xml version="1.0" encoding="UTF-8"?>

<refactoringOperationDescriptor

  xmlns="http://www.oxygenxml.com/ns/xmlRefactoring" id="remove_text_content"

  name="{i18n(Remove_text_content)}">

  <description>{i18n(Remove_text_content_description)}</description>

  <script type="XQUERY_UPDATE" href="remove_text_content.xq"/>

  <parameters>

    <description>{i18n(parameters_description)}</description>

    <parameter label="{i18n(Element_name)}" name="element_localName"

      type="NC_NAME">

      <description>{i18n(Element_name_descriptor)}</description>

      <possibleValues>

        <value default="true" name="value1">{i18n(value_1)}</value>

        <value name="value2">{i18n(value_2)}</value>

      </possibleValues>

    </parameter>

  </parameters>

</refactoringOperationDescriptor>
```

Generating Sample XML Files

Oxygen XML Developer offers support to generate sample XML files both from XML schema 1.0 and XML schema 1.1, depending on the XML schema version set in [XML Schema preferences page \(on page 207\)](#).

To generate sample XML files from an XML Schema, use the  **Generate Sample XML Files** action from the **Tools** menu. This action is also available in the contextual menu of the schema [Design mode \(on page 722\)](#). The action opens the **Generate Sample XML Files** dialog box that allows you to configure a variety of options for generating the files.

The **Generate Sample XML Files** dialog box contains three tabs with various configurable options. Default values for these options can be set in the [Sample XML Files Generator preferences page](#) (on page 210). You can also run the tool from the command line using exported options.

Schema Tab

The first set of options for the  **Generate Sample XML Files** tool are found in the **Schema** tab.

Figure 476. Generate Sample XML Files Dialog Box (Schema Tab)

This tab includes the following options:

URL

Specifies the URL of the Schema location. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the  **Browse** drop-down list.

Namespace

Displays the namespace of the selected schema.

Root Element

After the schema is selected, this drop-down menu is populated with all root candidates gathered from the schema. Choose the root of the output XML documents.

Output folder

Path to the folder where the generated XML instances will be saved.

Filename prefix and Extension

You can specify the prefix and extension for the file name that will be generated. Generated file names have the following format: `prefixN.extension`, where `N` represents an incremental number from 0 up to the specified **Number of instances**.

Number of instances

The number of XML files to be generated.

Open first instance in editor

When selected, the first generated XML file is opened in the editor.

Namespaces section

You can specify the **Default Namespace**, as well as the prefixes for the namespaces.

Export settings

Use this button to save the current settings for future use.

Import settings

Use this button to load previously exported settings.

You can click **OK** at any point to generate the sample XML files.

Options Tab

The **Options** tab allows you to set specific options for namespaces and elements.

Figure 477. Generate Sample XML Files Dialog Box (Options Tab)

Namespace	Element
<ANY>	<ANY>

Namespace: <ANY>
 Element: <ANY>

Generate optional elements
 Generate optional attributes

Values of elements and attributes: Default (ignore restrictions)

Preferred number of repetitions: 2
 Maximum recursivity level: 1
 Type alternative strategy: First

"Choice" and "Substitution Group"
 Choice strategy: Random
 Generate the other options as comments

This tab includes the following options:

Namespace / Element table

Allows you to set a namespace for each element name that appears in an XML document instance. The following prefix-to-namespace associations are available:

- All elements from all namespaces (<ANY> - <ANY>). This is the default setting.
- All elements from a specific namespace.
- A specific element from a specific namespace.

Settings subtab

Namespace

Displays the namespace specified in the table at the top of the dialog box.

Element

Displays the element specified in the table at the top of the dialog box.

Generate optional elements

When selected, all elements are generated, including the optional ones (having the `minOccurs` attribute set to 0 in the schema).

Generate optional attributes

When selected, all attributes are generated, including the optional ones (having the `use` attribute set to `optional` in the schema).

Values of elements and attributes

Controls the content of generated attribute and element values. The following choices are available:

- **None** - No content is inserted.
- **Default** - Inserts a default value depending on the data type descriptor of the particular element or attribute. The default value can be either the data type name or an incremental name of the attribute or element (according to the global option from the **Sample XML Files Generator** preferences page). Note that type restrictions are ignored when this option is selected. For example, if an element is of a type that restricts an `xs:string` with the `xs:maxLength` facet to allow strings with a maximum length of 3, the XML instance generator tool may generate string element values longer than 3 characters.
- **Random** - Inserts a random value depending on the data type descriptor of the particular element or attribute.

**Important:**

If all of the following are true, the **Generate Sample XML Files** tool outputs invalid values:

- At least one of the restrictions is a `regex`.
- The value generated after applying the `regex` does not match the restrictions imposed by one of the facets.

Preferred number of repetitions

Allows you to set the preferred number of repeating elements related to `minOccurs` and `maxOccurs` facets defined in the XML Schema.

- If the value set here is between `minOccurs` and `maxOccurs`, then that value is used.
- If the value set here is less than `minOccurs`, then the `minOccurs` value is used.
- If the value set here is greater than `maxOccurs`, then `maxOccurs` is used.

Maximum recursion level

If a recursion is found, this option controls the maximum allowed depth of the same element.

Type alternative strategy

Used for the `<xsl:alternative>` element from XML Schema 1.1. The possible strategies are:

- **First** - The first valid alternative type is always used.
- **Random** - A random alternative type is used.

Choice strategy

Used for `<xsl:choice>` or `<substitutionGroup>` elements. The possible strategies are:

- **First** - The first branch of `<xsl:choice>` or the head element of `<substitutionGroup>` is always used.
- **Random** - A random branch of `<xsl:choice>` or a substitute element or the head element of a `<substitutionGroup>` is used.

Generate the other options as comments

If selected, generates the other possible choices or substitutions (for `<xsl:choice>` and `<substitutionGroup>`). These alternatives are generated inside comments groups so you can uncomment and use them later. Use this option with care (for example, on a restricted namespace and element) as it may generate large result files.

Element values subtab

Allows you to add values that are used to generate the content of elements. If there are multiple values, then the values are used in a random order.

Attribute values subtab

Allows you to add values that are used to generate the content of attributes. If there are multiple values, then the values are used in a random order.

Export settings

Use this button to save the current settings for future use.

Import settings

Use this button to load previously exported settings.

You can click **OK** at any point to generate the sample XML files.

Advanced Tab

The **Advanced** tab allows you to set some options regarding output values and performance.

Figure 478. Generate Sample XML Files Dialog Box (Advanced Tab)

This tab includes the following options:

Use incremental attribute / element names as default

If selected, the value of an element or attribute starts with the name of that element or attribute. For example, for an `<a>` element the generated values are: `a1`, `a2`, `a3`, and so on. If not selected, the value is the name of the type of that element / attribute (for example: `string`, `decimal`, etc.)

Maximum length

The maximum length of string values generated for elements and attributes.

Discard optional elements after nested level

The optional elements that exceed the specified nested level are discarded. This option is useful for limiting deeply nested element definitions that can quickly result in very large XML documents.

Export settings

Use this button to save the current settings for future use.

Import settings

Use this button to load previously exported settings.

Tip:

This function can be executed from an automated command-line script, for more details, see [Scripting Oxygen \(on page 2233\)](#).

Applying All Default Quick Fix Proposals

The **Apply all default quick fix proposals** tool can be used to apply quick fix proposals for all reported validation errors in one or more documents when one or more quick fix proposals have been detected for reported validation errors. If multiple quick fixes are available for the same validation error, the default quick fix defined in the Schematron validation schema using the `sqf:default-fix` attribute is automatically selected to be applied. If no default quick fix is explicitly specified, the first quick fix proposal in the list is considered. All quick fix proposals are then automatically executed in bulk, one after the other.

**Important Notes to Consider:**

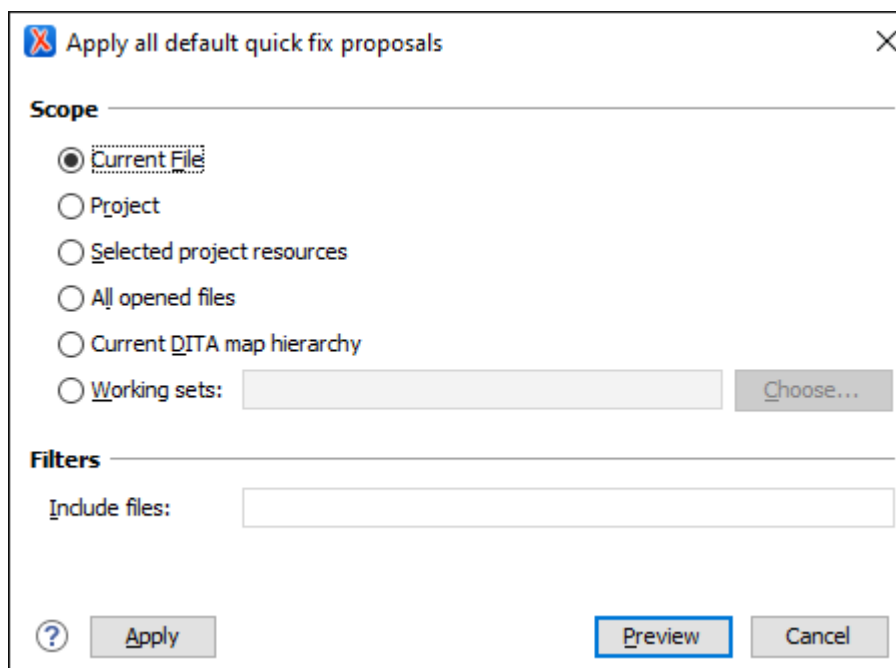

- To maintain the accuracy of the initially calculated error validation ranges, the quick fix proposals are applied in the reverse order of their selection.
- If two or more quick fixes act on the same "area" within the document, only one is applied (no changes can be made to changes already made).
- Quick fixes that involve "user-entered values" that normally present a dialog box to facilitate data entry will not be executed (the automatic process of applying all selected quick fixes cannot be interrupted by the presence of the respective dialog boxes).

The **Apply all default quick fix proposals** tool can be accessed from the following interface locations:

- **[Single Document]** The contextual menu when you right-click anywhere in **Text mode** ([on page 521](#)) when there is a detected quick fix proposal in the current document.
- **[One or More Documents]** The **Tools** menu.
- **[One or More Documents]** The **Refactoring** submenu when you right-click one or more files in the **Project view** ([on page 365](#)).

Invoking the tool opens the **Apply all default quick fix proposals** dialog box where you can choose the scope for the operation and optionally specify a filter to narrow the scope.

Figure 479. Apply All Default Quick Fix Proposals Dialog Box

The **Scope** section allows you to choose from the following scopes:

- **Current File** - The quick fix proposals are applied on the current file only.
- **Project** - The quick fix proposals are applied on the current project.

- **Selected project resources** - The quick fix proposals are applied on the selected files from the current project.
- **All opened files** - The quick fix proposals are applied on all opened files.
- **Current DITA map hierarchy** (for DITA documents) - The quick fix proposals are applied on current DITA map along with all of its referenced topics and submaps (and topics referenced in those submaps).
- **Working sets** - The quick fix proposals are applied on a user-defined set of resources, referred to as a *working set* (on page 2273).

The **Include files** option in the **Filters** section can be used to narrow the scope of the operation by filtering the selected resources using a file pattern. For example, to restrict the operation to only parse and update XML documents from the selected files, you could use `{*}.xml` for the file pattern.

You can click the **Preview** button to see a comparison preview that provides an overview of the content changes that will be made, according to the quick fixes that will be applied. The comparison panel also informs you of any problems encountered. While previewing the changes, you can also choose to exclude certain files from having the quick fixes be applied if you do not agree with the changes for the particular files. If you agree with the changes presented, click **Apply** to trigger the quick fixes and update the content.

Troubleshooting:

If a quick fix did not apply, a notification with some information about the error will be displayed in the **Results** view at the bottom of the application.

Tip:

If the operation takes longer than expected, you can use the **Stop** button in the progress bar to cancel the operation.

Resources

For more information about the **Apply all default quick fix proposals** tool, see our video: [Introducing the Apply All Default Quick Fix Proposals Tool](#).

Converting Schema to Another Schema Language

The  **Generate/Convert Schema** tool allows you to convert a DTD or Relax NG (full or compact syntax) schema or a set of XML files to an equivalent XML Schema, DTD or Relax NG (full or compact syntax) schema. Where perfect equivalence is not possible due to limitations of the target language, Oxygen XML Developer generates an approximation of the source schema. Oxygen XML Developer uses the *Trang multiple format converter* to perform the actual schema conversions.

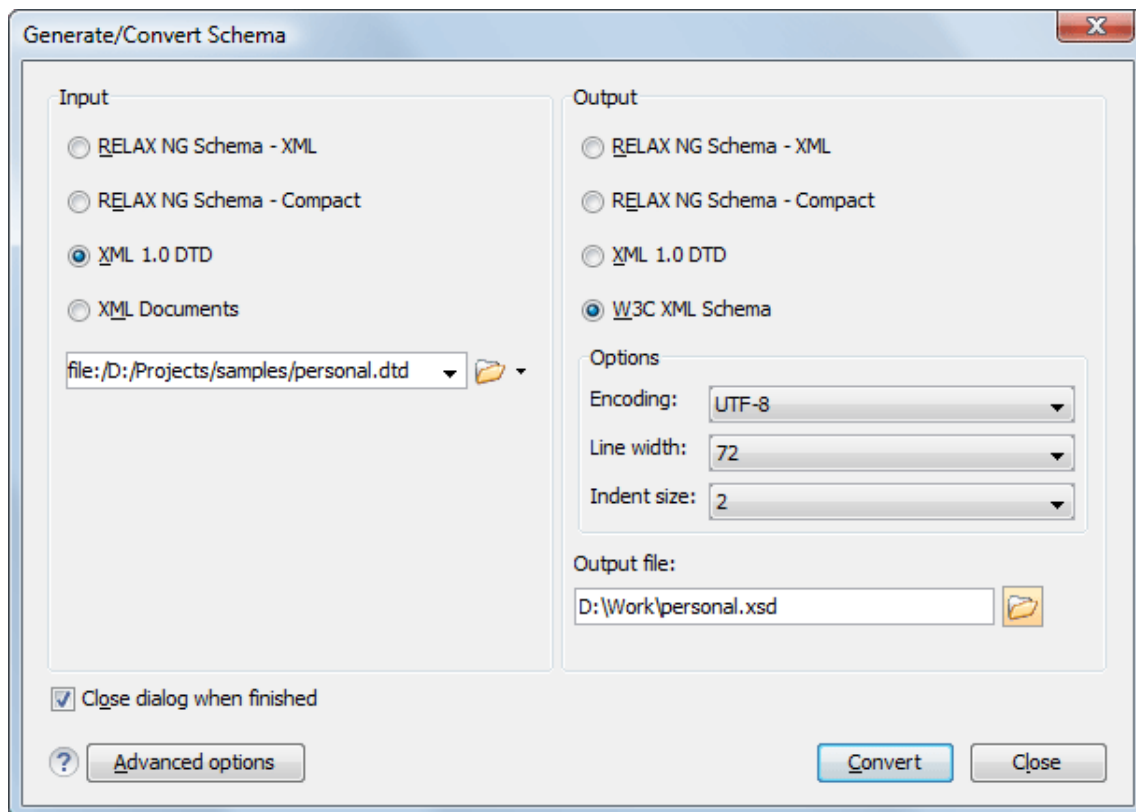

To use this tool, select the  **Generate/Convert Schema (Alt + Shift + C (Command + Option + C on macOS))** action from the **Tools** menu or from the **Open with** submenu when invoking the contextual menu in the **Project view** (on page 365). This action opens the **Generate/Convert Schema** dialog box that allows you to configure various options for conversion.

Figure 480. Generate/Convert Schema Dialog Box

The **Generate/Convert Schema** dialog box includes the following options:

Input section

Allows you to select the language of the source schema. If the conversion is based on a set of XML files, rather than just a single XML file, select the **XML Documents** option and use the file selector to add the XML files involved in the conversion.

Output section

Allows you to select the language of the target schema.

Options

You can choose the **Encoding**, the maximum **Line width**, and the **Indent size** (in number of spaces) for one level of indentation.

Output file

Specifies the path for the output file that will be generated.

Close dialog when finished

If you deselect this option, the dialog box will remain open after the conversion so that you can easily continue to convert more files.

Advanced options

If you select **XML 1.0 DTD** for the input, you can click this button to access more advanced options to further fine-tune the conversion. The following advanced options are available:

XML 1.0 DTD Input section

These options apply to the source DTD:

- **xmlns** - Specifies the default namespace, that is the namespace used for unqualified element names.
- **attlist-define** - Specifies how to construct the name of the definition representing an attribute list declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **colon-replacement** - Replaces colons in element names with the specified chars when constructing the names of definitions used to represent the element declarations and attribute list declarations in the DTD.
- **any-name** - Specifies the name of the definition generated for the content of elements declared in the DTD as having a content model of ANY.
- **element-define** - Specifies how to construct the name of the definition representing an element declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **annotation-prefix** - Default values are represented using a `@prefix:defaultValue` annotation attribute where prefix is the specified value and is bound to `http://relaxng.org/ns/compatibility/annotations/1.0` as defined by the RELAX NG DTD Compatibility Committee Specification. By default, the conversion engine will use a for prefix unless that conflicts with a prefix used in the DTD.
- **inline-attlist** - Instructs the application not to generate definitions for attribute list declarations, but instead move attributes declared in attribute list declarations into the definitions generated for element declarations. This is the default behavior when the output language is XSD.
- **strict-any** - Preserves the exact semantics of *ANY* content models by using an explicit choice of references to all declared elements. By default, the conversion engine uses a wildcard that allows any element
- **generate-start** - Specifies whether or not the conversion engine should generate a start element. DTD's do not indicate what elements are allowed as document elements. The conversion engine assumes that all elements that are defined but never referenced are allowed as document elements.
- **xmlns mappings** table - Each row specifies the prefix used for a namespace in the input schema.

W3C XML Schema Output section

This section is available if you select **W3C XML Schema** for the output.

- **disable-abstract-elements** - Disables the use of abstract elements and substitution groups in the generated XML Schema. This can also be controlled using an annotation attribute.
- **any-process-contents** - One of the values: strict, lax, skip. Specifies the value for the `@processContents` attribute of any elements. The default is skip (corresponding to RELAX NG semantics) unless the input format is DTD, in which case the default is strict (corresponding to DTD semantics).
- **any-attribute-process-contents** - Specifies the value for the `@processContents` attribute of `<anyAttribute>` elements. The default is skip (corresponding to RELAX NG semantics).

Converting Database to XML Schema

Oxygen XML Developer includes a tool that allows you to create an XML Schema from the structure of a database.

To convert a database structure to an XML Schema, use the following procedure:

1. Select the **Convert DB Structure to XML Schema** action from the **Tools** menu.

Result: The **Convert DB Structure to XML Schema** dialog box is opened and your current database connections are displayed in the **Connections** section.

2. If the database source is not listed, click the **Configure Database Sources** button to open the [Data Sources preferences page \(on page 242\)](#) where you can configure data sources and connections.
3. In the **Format for generated schema** section, select one of the following formats:
 - **Flat schema** - A flat structure that resembles a tree-like view of the database without references to elements.
 - **Hierarchical schema** - Display the table dependencies visually, in a type of tree view where dependent tables are shown as indented child elements in the content model. Select this option if you want to configure the database columns of the tables to be converted.

4. Click **Connect**.

Result: The database structure is listed in the **Select database tables** section according to the format you chose.

5. Select the database tables that you want to be included in the XML Schema.
6. If you selected **Hierarchical schema** for the format, you can configure the database columns.
 - a. Select the database column you want to configure.
 - b. In the **Criterion** section you can choose to convert the selected database column as an **Element**, **Attribute**, or to be **Skipped** in the resulting XML Schema.
 - c. You can also change the name of the selected database column by changing it in the **Name** text field.
7. Click **Generate XML Schema**.

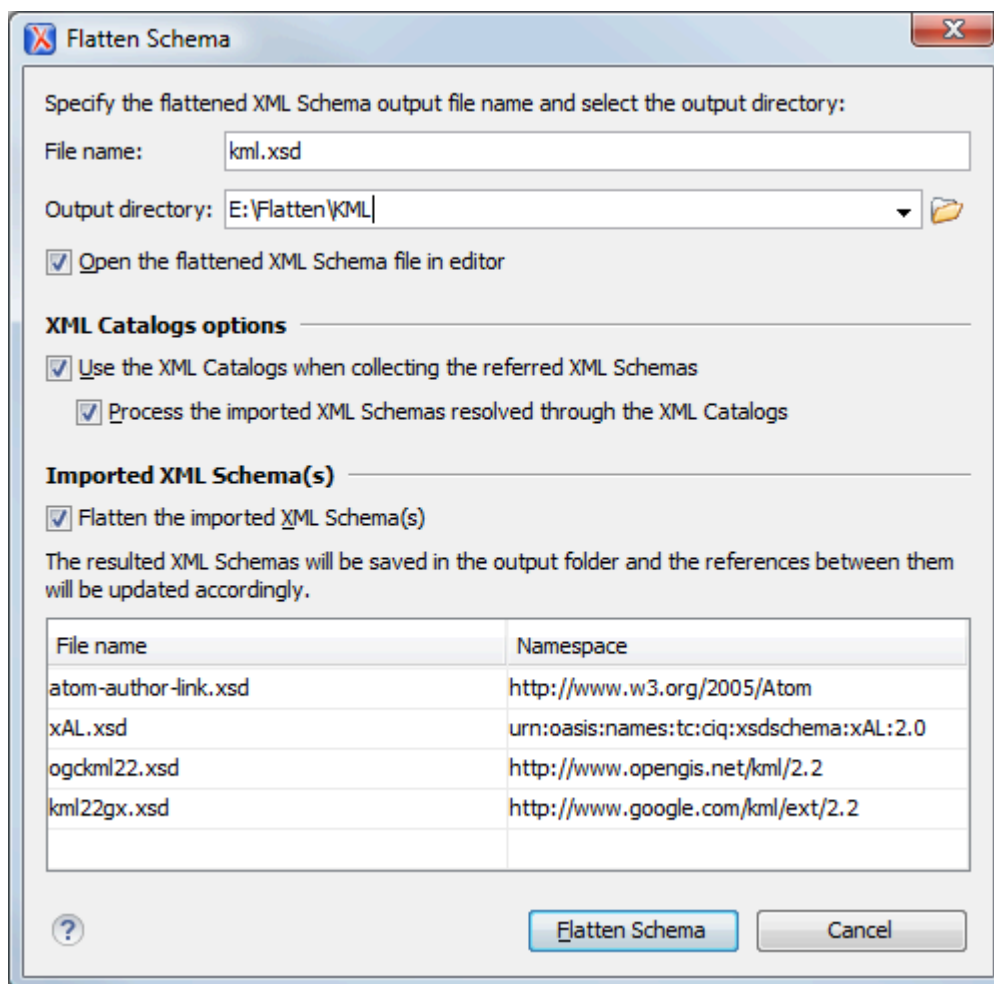

Result: The database structure is converted to an XML Schema and it is opened for viewing and editing.

Flatten an XML Schema

You can organize an XML schema linked by `<xs:include>` and `<xs:import>` statements on several levels. In some cases, working on such a schema as if it were a single file is more convenient than working on multiple files separately. The **Flatten Schema** operation allows you to flatten an entire hierarchy of XML schemas. Starting with the main XML schema, Oxygen XML Developer calculates its hierarchy by processing the `<xs:include>` and `<xs:import>` statements.

The **Flatten Schema** action is available from the **Tools** menu or the contextual menu in **Text** mode. This action opens the **Flatten Schema** dialog box that allows you to configure the operation.

Figure 481. Flatten Schema Dialog Box

For the main schema file and for each imported schema, a new flattened schema is generated in the specified output folder. These schemas have the same name as the original ones.

Note:

If necessary, the operation renames the resulted schemas to avoid duplicated file names.

A flattened XML schema is obtained by recursively adding the components of the included schemas into the main one. This means Oxygen XML Developer replaces the `<xs:include>`, `<xs:redefine>`, and `<xs:override>` elements with the ones coming from the included files.

Options in the Flatten Schema Dialog Box

The following options are available in the **Flatten Schema** dialog box:

File name

The name of the output file.

Output directory

The path of the output directory where the flattened schema file will be saved.

Open the flattened XML Schema file in editor

Opens the main flattened schema in the editing area after the operation completes.

Use the XML Catalogs when collecting the referenced XML Schemas

Enables the imported and included schemas to be resolved through the available [XML Catalogs](#) (on page 2273).

Note:

Changing this option triggers the recalculation of the dependencies graph for the main schema.

Process the imported XML Schemas resolved through the XML Catalogs

Specifies whether or not the imported schemas that were resolved through an [XML Catalog](#) (on page 2273) are also processed.

Flatten the imported XML Schema(s)

Specifies whether or not the imported schemas are flattened.

Note:

For the schemas skipped by the flatten operation, no files are created in the output folder and the corresponding import statements remain unchanged.

Tip:

This function can be executed from an automated command-line script, for more details, see [Scripting Oxygen](#) (on page 2233).

Generating Java Classes from XML Schema

Oxygen XML Developer includes a tool for generating Java classes from an XML Schema (XSD) file. The **Generate Java classes from XML Schema (XSD)** action for invoking the tool can be found in the **Tools** menu.

It requires an additional add-on to be installed, so the first time you invoke the action, Oxygen XML Developer will present a dialog box asking if you want to install it. Once installed, you need to restart Oxygen XML Developer and the action will invoke the Java class generator tool.

[Add-on documentation and installation details.](#)

Compiling an XSL Stylesheet for Saxon

As of Saxon 12.5, it is possible to export a compiled form of a stylesheet as a JSON or XML file (called a *stylesheet export file* or SEF). Oxygen XML Developer includes a simple tool called **Compile XSL Stylesheet for Saxon** (found in the **Tools** menu) that does this for you.

Use-Cases for a Stylesheet Export File (SEF)

- **Use Saxon-JS to run transformations in a browser** - A *stylesheet export file* (SEF) is needed if you want to use the [Saxon-JS product](#) to run transformations in a browser, as in the following example:

```
<script type="text/javascript" src="SaxonJS/SaxonJS.min.js"></script>

<script>

  window.onload = function() {

    SaxonJS.transform({

      stylesheetLocation: "books.sef",

      sourceLocation: "books.xml"

    });

  }

</script>
```

- **Use SEF to run transformations in Oxygen XML Developer** - You can also use a *stylesheet export file* (SEF) in Oxygen XML Developer to apply an XSLT transformation over an XML file. This requires **Saxon-EE** or **Saxon-PE** versions of the Saxon product and you must select one of those two versions for the **Target** when you configure the SEF file ([on page 1975](#)). When configuring the XSLT transformation, you will specify the SEF file in the **XSL URL** field ([on page 1131](#)).

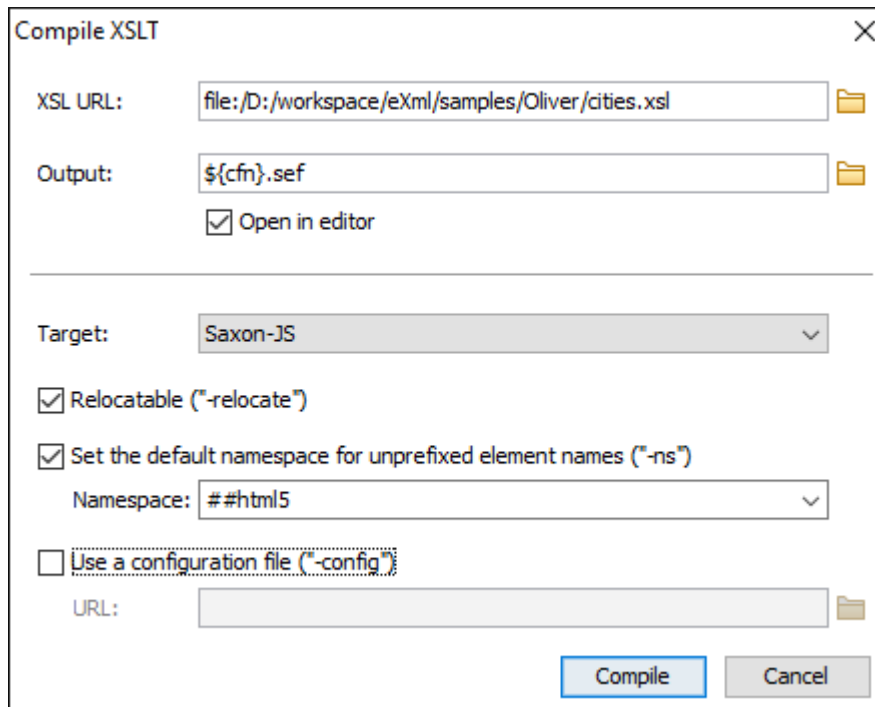

Compiling an SEF File

The **Compile XSL Stylesheet for Saxon** tool can be found in the **Tools** menu and it compiles a specified stylesheet as a JSON or an XML file (*stylesheet export file*).

If you choose **Saxon-JS** as the **Target** (the type of Saxon product that the export file will be used with), then the compiled stylesheet will be a JSON file with a file extension of `.sef` by default.

If you choose **Saxon-EE**, **Saxon-PE**, or **Saxon-HE** for the **Target**, then the compiled stylesheet will be an XML file with a file extension of `.xsef` by default.

Selecting this tool opens the **Compile XSL Stylesheet for Saxon** dialog box that allows you to configure some options for conversion.

Figure 482. Compile XSLT Stylesheet for Saxon Dialog Box

This dialog box includes the following options:

XSL URL

Allows you to select URL of the source XSL stylesheet. You can specify the URL by using the text field, the history drop-down, or the browsing actions in the ▾ **Browse** drop-down list.

Output file

You can specify the path where the output file will be saved by entering it in the text field, using the **Insert Editor Variables** button, or using the browsing actions in the ▾ **Browse** drop-down list.

Open in Editor

Select this option to open the resulting *stylesheet export file* in the main Oxygen XML Developer editing pane.

Target

Allows you to select the type of Saxon product that the export file will be used with. You can choose **Saxon-JS**, **Saxon-EE**, **Saxon-PE**, or **Saxon-HE**.

Relocatable

Can be used to control the Saxon `-relocate` parameter. You can select this option to produce a *relocatable* export package (SEF) that can be deployed to a different location, with a different base URI.

Set the default namespace for unprefix element names ("-ns")

Can be used to control the `-ns:(uri|##any|##html5)` Saxon parameter that defines the handling of unprefix element names that appear as name tests in path expressions and match patterns in the stylesheet:

- The **##any** value declares that unprefix names are treated as a test on the local name of the element only. They will match regardless of namespace.
- The **##html5** value declares that an unprefix element name will match either a name in the XHTML namespace or a name in no namespace. This option is primarily intended for use when generating stylesheets to run under Saxon-JS in the browser since the resulting behavior is close to that defined by the special rules in the HTML5 specification for XSLT and XPath running against an HTML5 DOM.
- You can also specify a valid URI by editing the value in the combo box. Specifying a URI sets the default namespace for elements and types (effectively a default value for `xpath-default-namespace`). Note that an explicit value for this attribute takes precedence.

Use a configuration file ("-config")

Select this option if you want to use a Saxon 12.5 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration file by entering it in the **URL** field, or by using the  **Insert Editor Variables** button, or using the browsing actions in the  **Browse** drop-down list.

Attention:

Oxygen XML Developer does not support the `ALLOWED_PROTOCOLS` Saxon property (<http://saxon.sf.net/feature/allowedProtocols>). This feature is specific to Saxon and controls access by Saxon (but not by underlying software, such as the XML parser). For more information, see <https://www.saxonica.com/documentation12/index.html#!configuration/config-features>.

Compile

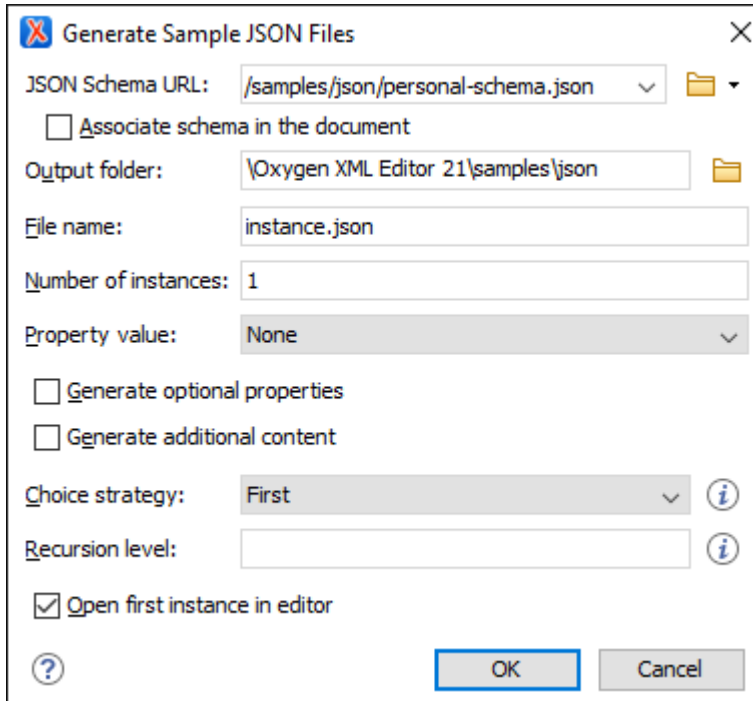

Use this button to generate the *stylesheet export file* according the options selected in this dialog box.

JSON Tools

Oxygen XML Developer includes some useful tools for converting between JSON, XML and YAML, converting XSD to JSON Schema, generating JSON instances or a JSON Schema, and OpenAPI (JSON and YAML) testing.

Generating Sample JSON Files from a JSON Schema

Oxygen XML Developer includes a tool for generating sample JSON files. To generate sample JSON files from a JSON Schema, select **Generate Sample JSON Files** from the **Tools > JSON Tools** menu. The action opens a dialog box where you can configure a variety of options for generating the files.

Figure 483. Generate Sample JSON Files Dialog Box

The **Generate Sample JSON Files** dialog box includes the following fields and options:

Schema URL

The URL of the Schema location. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the **Browse** drop-down list. The tool supports schemas with versions *Draft 04, 06, 07, 2019-09, and 2020-12*.

Associate schema in the document

If enabled, the specified schema will be associated with the generated files.

Output folder

Path to the folder where the generated JSON instances will be saved.

File name

The name of the instance(s) that will be generated. By default, `instance.json` is used.

Number of instances

The desired number of JSON instances to be generated. When more than one instance is generated, the index of the instance will be added to its file name.

Property value

You can specify the way the values of the properties are generated. The following options are available:

- *None* - Assigns empty values for properties (a template file will be generated). This is the default value.
- *Default* - Assigns the name of the property as the value (for strings) or assigns the specified minimum value (for numbers).
- *Random* - Assigns random values according to schema restrictions.

Generate optional properties

If selected, the JSON instance will be generated with optional properties that are defined in the JSON schema. Otherwise, only the required properties will be generated.

Generate additional content

If selected, the JSON instance will be generated with additional properties that are defined in the JSON schema as `additionalProperties` and additional items that are defined as `additionalItems` (in the case of an Array).

Choice strategy

You can specify the way an instance will be generated from a schema that contains a `CombinedSchema` (with either *oneOf* or *anyOf*). The following options are available:

- *First* - The first defined schema in *oneOf* or *anyOf* will be used.
- *Random* - A random schema defined in *oneOf* or *anyOf* will be used.

Recursion level

This option controls the maximum allowed depth (must be a number), in case the selected schema contains recursive calls of `$ref` schemas referencing one another. By default, it is set to 1, meaning that the generation for the recursive calls will stop after the first iteration.

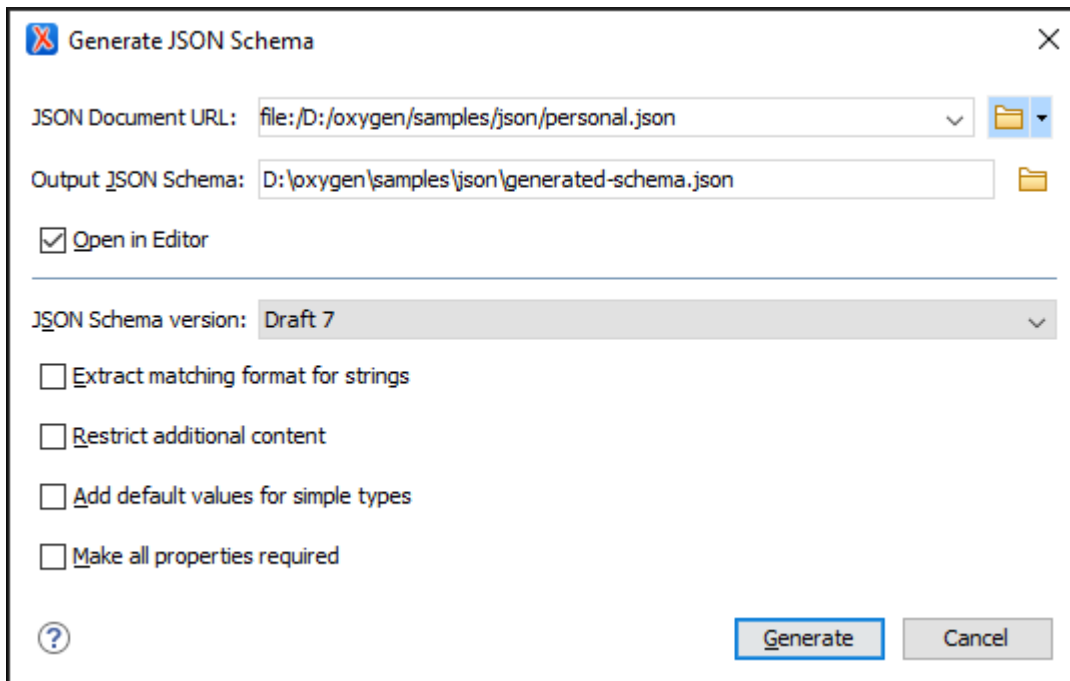

Open first instance in editor

If selected, the first generated instance is opened in the editor.

You can click **OK** at any point to generate the sample JSON files.

Generating JSON Schema from a JSON File

Oxygen XML Developer includes a tool for generating a sample JSON Schema from a JSON file. To generate a sample JSON Schema, select **Generate JSON Schema** from the **Tools > JSON Tools** menu. The action opens a dialog box where you can configure some options for generating the JSON Schema.

Figure 484. Generate JSON Schema Dialog Box

The **Generate JSON Schema** dialog box includes the following fields and options:

JSON Document URL

The URL of the JSON file. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the  **Browse** drop-down list.

Output JSON Schema

The path to the folder where the generated JSON Schema will be saved.

Open in Editor

If selected, the generated JSON Schema is opened in the editor.

JSON Schema version

The version of the resulting JSON schema. The possible choices are: **Draft 4**, **Draft 6**, **Draft 7**, **2019-09**, and **2020-12**.

Extract matching format for strings

If selected, the generator will attempt to find a format that matches the string values from the JSON Document.

Restrict additional content

If selected, *additionalProperties* (for objects) and *additionalItems* (for arrays) will be set to *false* in the resulting schema. By default, these keys are not in the schema, meaning that providing additional content (according to the schema) is allowed.

Add default values for simple types

If selected, the *default* values (*0* for number, *""* for string, *false* for boolean) and *examples* for strings will be added.

Make all properties required

If selected, the generator will mark all the properties as required in the resulting schema.

You can click **Generate** at any point to generate the JSON Schema.

JSON to YAML Converter**Converting JSON to YAML in Oxygen**

Oxygen XML Developer includes a useful and simple tool for converting JSON files to YAML. The **JSON to YAML** action for invoking the tool can be found in the **Tools > JSON Tools** menu.

To convert a JSON document to YAML, follow these steps:

1. Select the **JSON to YAML** action from the **Tools > JSON Tools** menu.

The **JSON to YAML** dialog box is displayed:

Figure 485. JSON to YAML Dialog Box

2. Choose or enter the **JSON URL** for the document you want to convert.
3. Choose the path of the **Output file** that will contain the resulting YAML document.
4. **[Optional]** Select the **Open in Editor** option to open the resulting YAML document in the main editing pane.
5. Click the **Convert** button.

Result: The original JSON document is now converted to a YAML document.

Related Information:

[YAML to JSON Converter \(on page 907\)](#)

YAML to JSON Converter**Converting YAML to JSON in Oxygen**

Oxygen XML Developer includes a useful and simple tool for converting YAML files to JSON. It even works on files that consist of multiple YAML documents, each separated by three dashes (---), in which case the conversion creates multiple JSON files with a number in the name.

The **YAML to JSON** action for invoking the tool can be found in the **Tools > JSON Tools** menu.

To convert a YAML document to JSON, follow these steps:

1. Select the **YAML to JSON** action from the **Tools > JSON Tools** menu.

The **YAML to JSON** dialog box is displayed:

Figure 486. YAML to JSON Dialog Box

2. Choose or enter the **YAML URL** for the document you want to convert.
3. Choose the path of the **Output file** that will contain the resulting JSON document.
4. **[Optional]** Select the **Open in Editor** option to open the resulting JSON document in the main editing pane.
5. Click the **Convert** button.

Result: The original YAML document is now converted to a JSON document.

Related Information:

[JSON to YAML Converter \(on page 907\)](#)

JSON to XML Converter

Discover the Oxygen JSON Editor!
Tailored for Working with JSON and JSON Schema Documents

Online JSON to XML Converter

Attention:

For a simple **ONLINE** tool for converting a single JSON file to XML, or vice versa, go to: https://www.oxygenxml.com/xml_json_converter.html.

Converting JSON to XML in Oxygen

Oxygen XML Developer includes a useful and simple tool for converting JSON files to XML. The **JSON to XML** action for invoking the tool can be found in the **Tools > JSON Tools** menu.

To convert a JSON document to XML, follow these steps:

1. Select the **JSON to XML** action from the **Tools > JSON Tools** menu.

The **JSON to XML** dialog box is displayed:

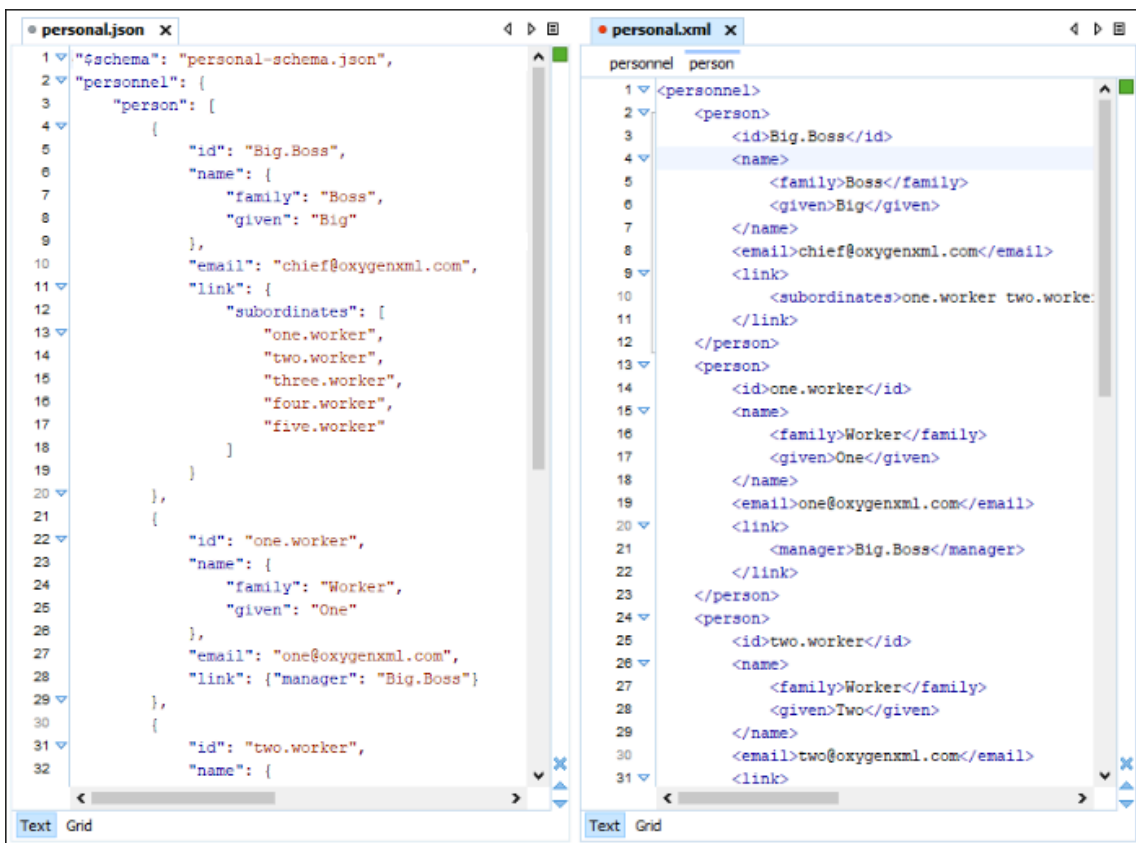

Figure 487. JSON to XML Dialog Box

2. Choose or enter the **Input URL** of the JSON document.
3. Choose the path of the **Output file** that will contain the resulting XML document.
4. Select the **Open in Editor** option to open the resulting XML document in the main editing pane.
5. Click the **Convert** button.

Result: The original JSON document is now converted to an XML document.

Figure 488. Example: XML to JSON Operation Result

Conversion Details

- If the JSON document has more than one property on the first level, the converted XML document will have an additional root element called `<JSON>`.

For example, the following JSON document:

```
{
  "personnel": {
    "person": [
      { "name": "Boss" },
      { "name": "Worker" }
    ]
  },
  "id": "personnel-id"
}
```

it is converted to:

```
<?xml version="1.0" encoding="UTF-8"?>
<JSON>
  <personnel>
    <person>
      <name>Boss</name>
```

```

</person>

<person>
  <name>Worker</name>
</person>

</personnel>

<id>personnel-id</id>

</JSON>

```

- If the JSON document is an array, the converted XML document will have a root element called `<array>` and for each item within the array, another `<array>` is created.

```

[
  { "name": "Boss" },
  { "name": "Worker" }
]

```

it is converted to:

```

<?xml version="1.0" encoding="UTF-8"?>
<array>
  <array>
    <name>Boss</name>
  </array>
  <array>
    <name>Worker</name>
  </array>
</array>

```

- If the name of a JSON property contains characters that are not valid in XML element names (for example, \$), then the invalid characters will be escaped as its hexadecimal equivalent in the converted XML.

```

{"$id": "personnel-id"}

```

is converted to:

```

<_X24_id>personnel-id</_X24_id>

```

XML to JSON Converter

Discover the Oxygen JSON Editor!
Tailored for Working with JSON and JSON Schema Documents

Online XML to JSON Converter

Attention:

For a simple ONLINE tool for converting a single XML file to JSON, or vice versa, go to: https://www.oxygenxml.com/xml_json_converter.html.

Converting XML to JSON in Oxygen

Oxygen XML Developer includes a useful and simple tool for converting XML files to JSON. The **XML to JSON** action for invoking the tool can be found in the **Tools > JSON Tools** menu.

To convert an XML document to JSON, follow these steps:

1. Select the **XML to JSON** action from the **Tools > JSON Tools** menu.

Step Result: The **XML to JSON** dialog box is displayed:

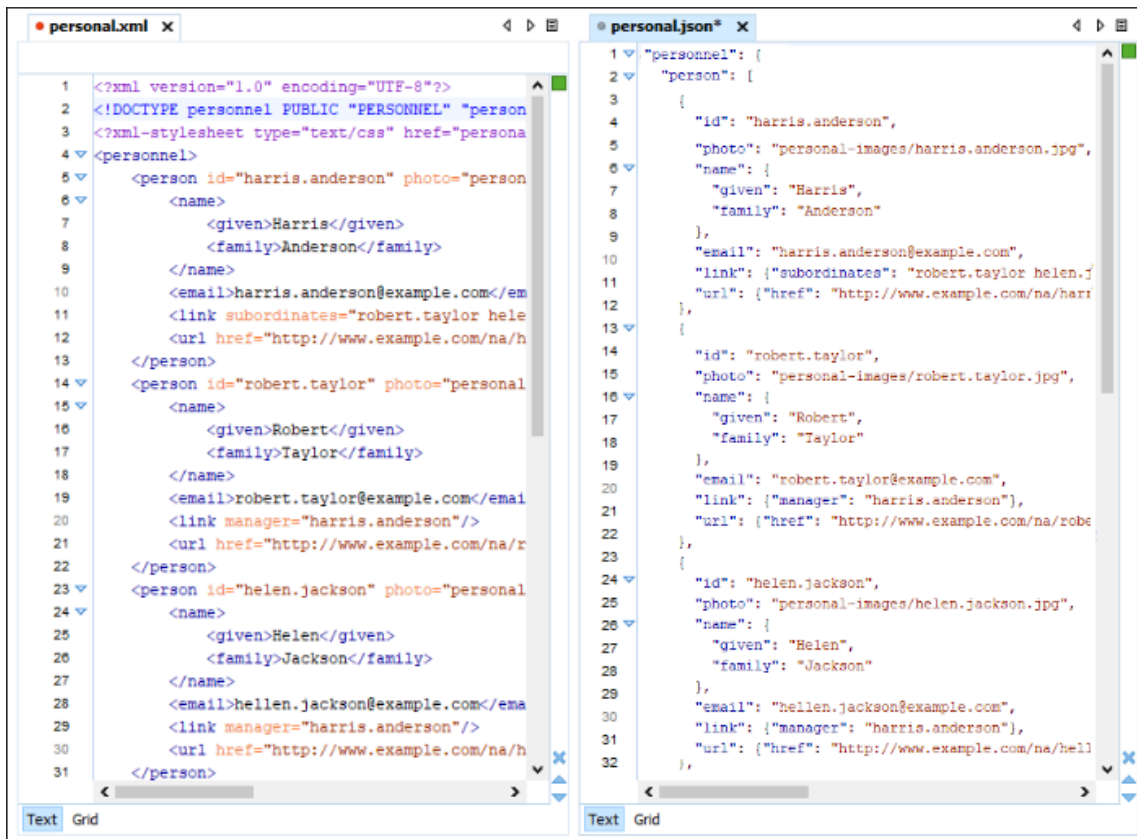

Figure 489. XML to JSON Dialog Box

2. Choose or enter the **Input URL** of the XML document.
3. Choose the path of the **Output file** that will contain the resulting JSON document.
4. Select how you want empty elements to be converted (default is **object**).
5. Select the **Open in Editor** option to open the resulting JSON document in the main editing pane.
6. Click the **Convert** button.

Result: The original XML document is now converted to a JSON document.

Figure 490. Example: XML to JSON Operation Result

Conversion Details

- Some XML components are ignored (e.g. comments and processing instructions).
- If any elements contain attributes in the XML document, the attributes are converted to properties in the converted JSON document. If the XML document contains more than one element with the same name, they will be converted into an array of object in the converted JSON document.

For example, the following XML document:

```

<personnel>
  <person id="person.one">
    <name>Boss</name>
  </person>
  <person id="person.two">
    <name>Worker</name>
  </person>
</personnel>
    
```

it is converted to:

```

{
  "personnel": {
    "person": [
      {
    
```

```

    "id": "person.one",
    "name": "Boss"
  },
  {
    "id": "person.two",
    "name": "Worker"
  }
]
}
}

```

- If the XML document contains elements with mixed content (text plus elements), the converted JSON document will contain a `#text` property with its value set as the text content. If there are multiple text nodes, the subsequent `#text` properties will contain a number (e.g. `#text1`, `#text2`). If there are multiple elements with the same name, the first property will have the element name and the subsequent properties will contain a number (e.g. `b`, `b#1`, `b#2`).

```
<p>This <b>is</b> an <b>example</b>!</p>
```

is converted to:

```

{
  "p": {
    "#text": "This ",
    "b": "is",
    "#text1": " an ",
    "b#1": "example",
    "#text2": "!"
  }
}

```

- If the XML document contains element names that contains hexadecimal codes (for example, if they were escaped during a [JSON to XML conversion \(on page 901\)](#)), it will be converted to the normal character value in the converted JSON document.

```
<_X24_id>personnel-id</_X24_id>
```

is converted to:

```
{"$id": "personnel-id"}
```

Related Information:

[JSON to XML Converter \(on page 901\)](#)

XSD to JSON Schema Converter

Oxygen XML Developer includes a tool for converting an XML Schema file (XSD) to a JSON Schema file. The **XSD to JSON Schema** action for invoking the tool can be found in the **Tools > JSON Tools** menu. It requires an additional add-on to be installed, so the first time you invoke the action, Oxygen XML Developer will present a dialog box asking if you want to install it. Once installed, you need to restart Oxygen XML Developer and the **XSD to JSON Schema** action will invoke the tool.

[Addon documentation and installation details.](#)

JSON Schema Converter

Oxygen XML Developer includes a tool for converting an older version of a JSON schema (Draft 4, 6, or 7) to the latest versions (2019-09 or 2020-12).

To convert a JSON schema, select **Convert JSON Schema** from the **Tools > JSON Tools** menu. The action opens a dialog box where you can configure some options for converting the JSON Schema.

Figure 491. Convert JSON Schema Dialog Box

The **Convert JSON Schema** dialog box includes the following fields and options:

JSON Schema URL

The URL of the JSON schema file. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the **Browse** drop-down list.

Output JSON Schema

The path to the folder where the converted JSON schema will be saved.

Open in Editor

If selected, the converted JSON schema is opened in the editor.

JSON Schema version

The version of the resulting JSON schema. The possible choices are: **Draft 2019-09** or **2020-12**.

You can click **Convert** at any point to generate the JSON Schema.

Conversion Notes

- The `$schema` declaration is changed according to the selected JSON schema version.
- The `definitions` keyword is converted to `$defs` and all the references are updated.
- The `dependencies` keyword is split into `dependentRequired` and `dependentSchemas`.
- The `items` keyword (tuple array) is converted to `prefixItems` (2020-12).
- The `additionalItems` keyword is converted to `items` (2020-12, only if `prefixItems` is present).
- The `exclusiveMinimum` and `exclusiveMaximum` keywords with boolean values (Draft 4) are removed.
- The `id` keyword (Draft 4) is converted to `$id`.
- The `$ref` keyword wrapped into 1-item `allOf` is unwrapped because the latest versions allow processing `$ref` along with other keywords.

OpenAPI Tester

Oxygen XML Developer includes a testing tool for *OpenAPI* files. The tool provides the ability to inspect OpenAPI request responses and to ensure that they work as expected. It can be used for [OpenAPI 3.x](#) in JSON or YAML format.

To use the tool, select **OpenAPI Tester** from the **Tools > JSON Tools** menu. This opens a dialog box where you can specify the location of the OpenAPI file that you want to test.

This tool requires an [additional add-on](#) to be installed, so the first time you invoke the action, Oxygen XML Developer presents a dialog box asking if you want to install it. Once installed, you need to restart Oxygen XML Developer and the **OpenAPI Tester** action will invoke the tool.

Run OpenAPI Test Scenarios

Oxygen XML Developer includes a testing tool for running *OpenAPI* test scenarios. The **Run OpenAPI Test Scenario** tool provides the ability to run a test suite for an OpenAPI document in JSON format. It performs the requests based on the specified OpenAPI document and the data entered in the test file, and then checks if the server responses are as expected.

Attention:

This tool requires the [OpenAPI Tester add-on \(on page 1989\)](#) (version 1.2.0 or newer) to be installed before it becomes available in the **JSON Tools** menu.

To use the tool, select **Run OpenAPI Test Scenario** from the **Tools > JSON Tools** menu. This opens a dialog box where you can specify the location of the test scenario file that you want to run.

Figure 492. Run OpenAPI Test Scenario Dialog Box

The scenario file must be valid according to the schema from here: [frameworks/json/schemas/openapi/scenario/openAPIScenario.jschema](#). There is a default scenario file template available when creating [new documents from templates \(on page 330\)](#) and it can be found in the **Framework Templates > OpenAPI Test Scenario**. The template will automatically be validated against the schema.

For the scenario file, you have to specify the path of the OpenAPI document and the server where the requests are made. Then, for each test, you need to enter valid data for the required fields "**path**", "**operation**", "**expectedResponse**", and the optional fields "**description**", "**parameters**", "**authorization**", or "**body**".

After successfully running the test scenario, the results are displayed in a new JSON file.

**Tip:**

Oxygen XML Developer includes a [specialized framework for editing and working with OpenAPI test scenario files \(on page 1093\)](#).

Format and Indent (Pretty-Print) Multiple Files

Oxygen XML Developer provides support for formatting and indenting ([pretty-print \(on page 2271\)](#)) multiple files at once. This action is available for any document in XML format, as well as for XQuery, CSS, JavaScript, and JSON documents.

To format and indent multiple files, use the  **Format and Indent Files** action that is available in the contextual menu of the [Project view \(on page 365\)](#) or from the **Tools** menu. This opens the **Format and Indent Files** dialog box that allows you to configure options for the action.

Figure 493. Format and Indent Files Dialog Box

The **Scope** section allows you to choose from the following scopes:

- **All opened files** - The *pretty-print (on page 2271)* is performed in all opened files.
- **Directory of the current file** - All the files in the folder of the currently edited file.
- **Project files** - All files from the current project.
- **Selected project files** - The selected files from the current project.
- **Specified path** - the *pretty-print (on page 2271)* is performed in the files located at a specified path.

The **Options** section includes the following options:

- **File filter** - Allow you to filter the files from the selected scope.
- **Recurse subdirectories** - When selected, the *pretty-print (on page 2271)* is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to **All opened files**.
- **Include hidden files** - When selected, the *pretty-print (on page 2271)* is also performed in the hidden files.
- **Make backup files with extension** - When selected, Oxygen XML Developer makes backup files of the modified files. The default extension is `.bak`, but you can change the extension as you prefer.

Generate Documentation

Oxygen XML Developer includes a tool for generating documentation for XSLT, XML Schema, XQuery, WSDL, JSON schema, and OpenAPI documents.

Generating Documentation for an XML Schema

Oxygen XML Developer can generate detailed documentation for the components of an XML Schema in HTML, PDF, DocBook, or other custom formats. You can select the components and the level of detail. The components are hyperlinked in both HTML and DocBook documents.

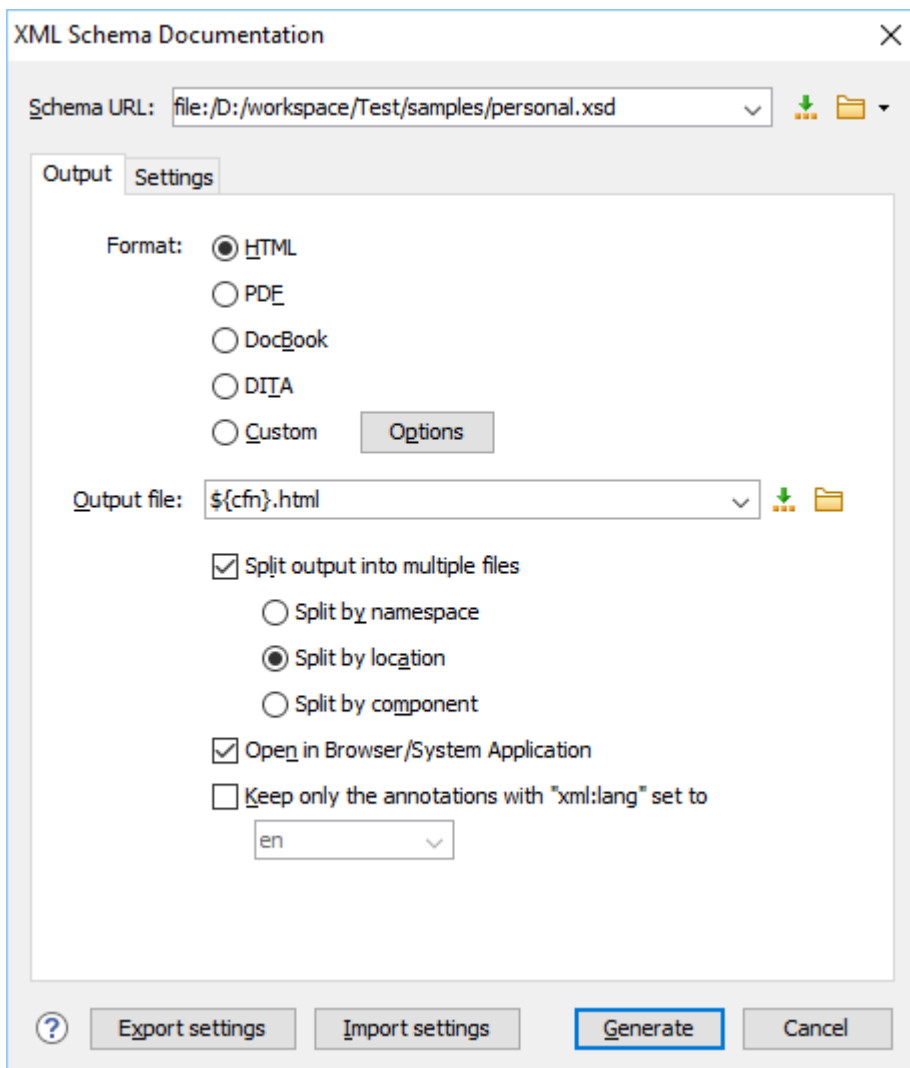

Note:

You can generate documentation for both XML Schema version 1.0 and 1.1.

To generate documentation for an XML Schema document, select **XML Schema Documentation** from the **Tools > Generate Documentation** menu or from the **Generate Documentation** submenu in the contextual menu of the **Project view** (on page 365). You can also open the tool by using the **Generate Documentation** toolbar button.

Figure 494. XML Schema Documentation Dialog Box

The **Schema URL** field of the dialog box must contain the full path to the XML Schema (XSD) file that will have documentation generated. The schema may be a local or a remote file. You can specify the path to the

schema by entering it in the text field, or by using the  **Insert Editor Variables** button or the options in the  ▾ **Browse** drop-down menu.

Output Tab

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
 - **HTML** - The documentation is generated in [HTML output format \(on page 786\)](#).
 - **PDF** - The documentation is generated in [PDF output format \(on page 789\)](#).
 - **DocBook** - The documentation is generated in [DocBook output format \(on page 789\)](#).
 - **DITA** - The documentation is generated in [DITA output format \(on page 789\)](#).
 - **Custom** - The documentation is generated in a [custom output format \(on page 789\)](#), allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.
- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the  **Insert Editor Variables** button or the options in the  ▾ **Browse** drop-down menu.
- **Split output into multiple files** - Instructs the application to split the output into multiple files. You can choose to split them by namespace, location, or component name.
- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type. For DITA and DocBook documents, this option appears as **Open in Editor** and the result will be opened in Oxygen XML Developer (in the current editor).

Note:

To set the browser or system application that will be used, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#), go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

- **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the `@xml:lang` attribute set to the selected language. If you choose a primary language code (for example, **en** for English), this includes all its possible variations (**en-us**, **en-uk**, etc.).

Settings Tab

When you generate documentation for an XML schema you can choose what components to include in the output and the details to be included in the documentation.

Figure 495. Settings Tab of the XML Schema Documentation Dialog Box

The **Settings** tab allows you to choose whether or not to include the following components: **Global elements**, **Global attributes**, **Local elements**, **Local attributes**, **Simple Types**, **Complex Types**, **Groups**, **Attribute Groups**, **Redefines**, **Referenced schemas**, **Include notations**.

You can choose whether or not to include the following other details:

- **Diagram** - Displays the diagram for each component. You can choose the image format (JPEG, PNG, GIF, SVG) to use for the diagram section. The generated diagrams are dependent on the options from the [Schema Design Properties \(on page 167\)](#) page.
- **Diagram annotations** - This option controls whether or not the annotations of the components presented in the diagram sections are included.
- **Namespace** - Displays the namespace for each component.
- **Location** - Displays the schema location for each component.
- **Type** - Displays the component type if it is not an anonymous one.
- **Type hierarchy** - Displays the types hierarchy.
- **Model** - Displays the model (sequence, choice, all) presented in BNF form. The separator characters that are used depend upon the information item used:

- **xs:all** - Its children will be separated by space characters.
- **xs:sequence** - Its children will be separated by comma characters.
- **xs:choice** - Its children will be separated by / characters.
- **Children** - Displays the list of component's children.
- **Instance** - Displays an XML instance generated based on each schema element.
- **Used by** - Displays the list of all the components that reference the current one. The list is sorted by component type and name.
- **Properties** - Displays some of the component's properties.
- **Facets** - Displays the facets for each simple type.
- **Identity constraints** - Displays the identity constraints for each element. For each constraint there are presented the name, type (unique, key, keyref), reference attribute, selector and field(s).
- **Attributes** - Displays the attributes for the component. For each attribute there are presented the name, type, fixed or default value, usage and annotation.
- **Asserts** - Displays the **assert** elements defined in a complex type. The test, XPath default namespace, and annotation are presented for each assert.
- **Annotations** - Displays the annotations for the component. If you choose **Escape XML Content**, the XML tags are present in the annotations.
- **Source** - Displays the text schema source for each component.
- **Generate index** - Displays an index with the components included in the documentation.
 - **Include local elements and attributes** - If selected, local elements and attributes are included in the documentation index.
 - **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is deselected by default.

Export settings - Save the current settings in a settings file for further use (for example, if you need the exported settings file for [generating the documentation from the command-line interface](#)).

Import settings - Reloads the settings from the exported file.

Generate - Use this button to generate the XML Schema documentation.

Tip:

This function can be executed from an automated command-line script, for more details, see [Scripting Oxygen \(on page 2233\)](#).

Related Information:

[Customizing PDF or DocBook Output of Generated XML Schema Documentation \(on page 790\)](#)

Generating Documentation for an XSLT Stylesheet

You can use Oxygen XML Developer to generate detailed documentation in HTML format for the elements (top-level elements whose names are in the XSLT namespace) of an XSLT stylesheet. You can select what XSLT elements to include in the generated documentation and also the level of details to present for each of

them. The elements are hyperlinked. To generate documentation in a [custom output format \(on page 700\)](#), you can edit the XSLT stylesheet used to generate the documentation, or create your own stylesheet.

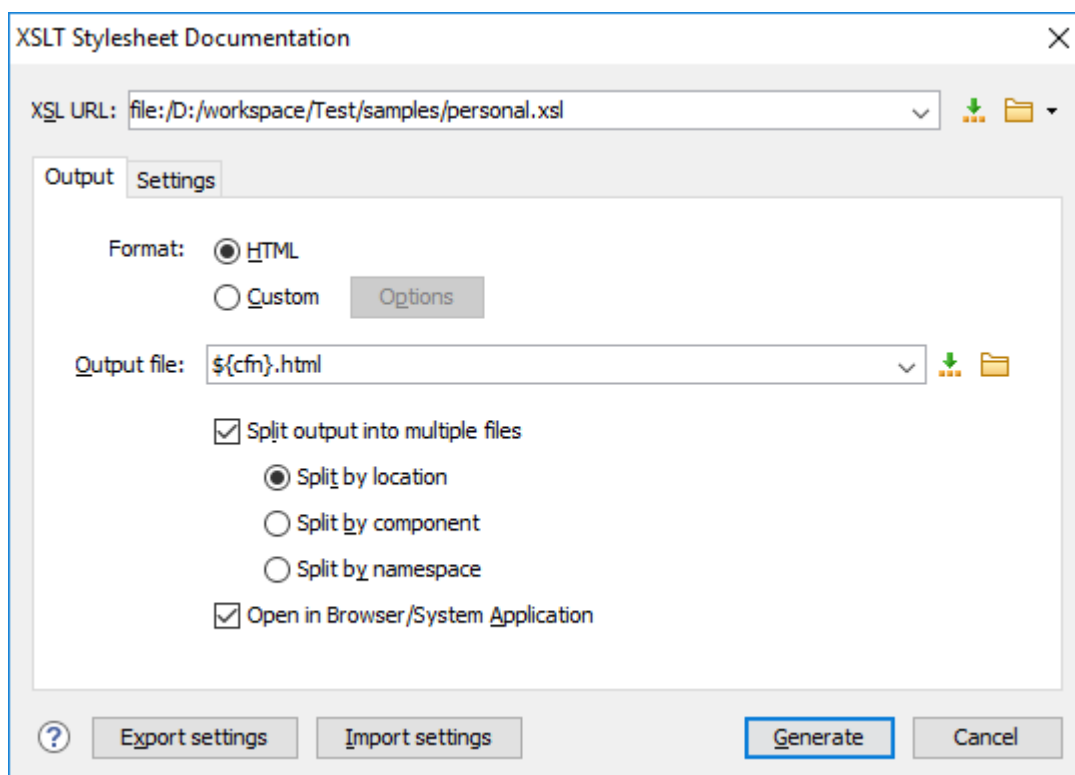

To open the **XSLT Stylesheet Documentation** dialog box, select **XSLT Stylesheet Documentation** from the **Tools > Generate Documentation** menu or from the **Generate Documentation** submenu in the contextual menu of the **Project view (on page 365)**. You can also open the tool by using the  **Generate Documentation** toolbar button.

Figure 496. XSLT Stylesheet Documentation Dialog Box

The **XSL URL** field of the dialog box must contain the full path to the XSL Stylesheet file you want to generate documentation for. The stylesheet may be a local or a remote file. You can specify the path to the stylesheet by entering it in the text field, or by using the  **Insert Editor Variables** button or the options in the  **Browse** drop-down menu.

Output Tab

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
 - **HTML** - The documentation is generated in [HTML output format \(on page 697\)](#).
 - **Custom** - The documentation is generated in a [custom output format \(on page 700\)](#), allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box [\(on page 701\)](#) where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the

additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.

- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the  **Insert Editor Variables** button or the options in the  **Browse** drop-down menu.
- **Split output into multiple files** - Instructs the application to split the output into multiple files. For large XSLT stylesheets, choosing another split criterion may generate smaller output files, providing faster documentation browsing. You can choose to split them by namespace, location, or component name.
- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

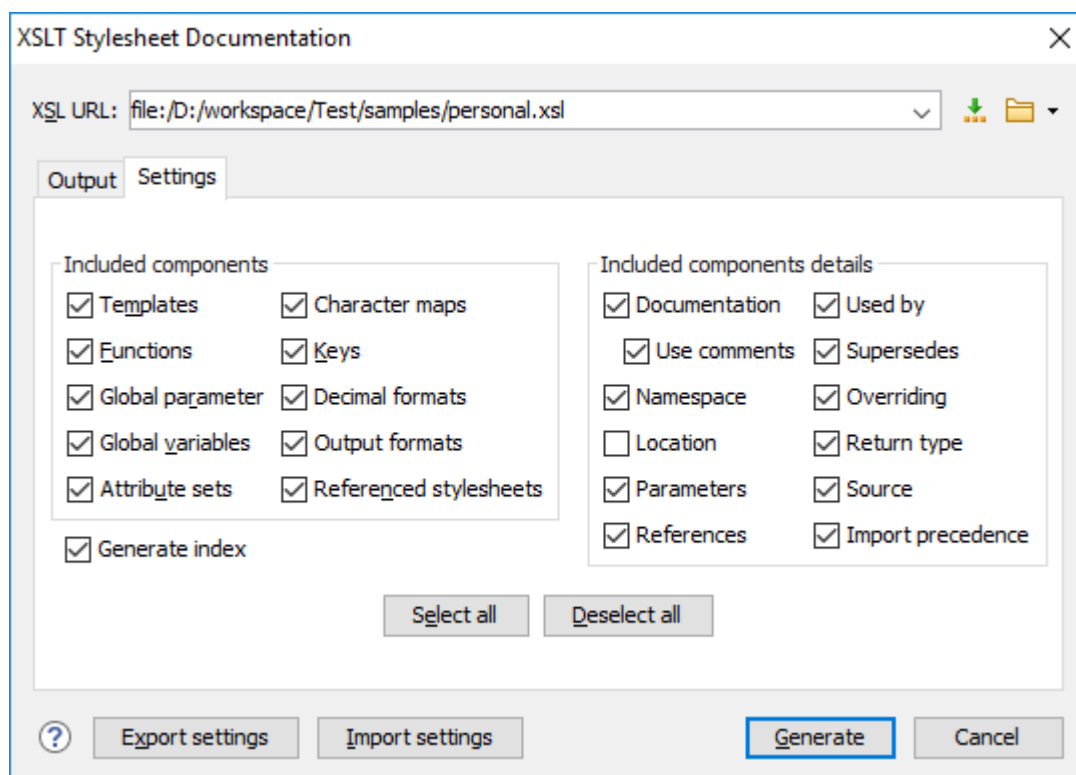

Note:

To set the browser or system application that will be used, open the **Preferences** dialog box (**Options > Preferences**) (on page 114), go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

Settings Tab

When you generate documentation for an XSLT stylesheet you can choose what XSLT elements to include in the output (templates, functions, global parameters, global variables, attribute sets, character maps, keys, decimal formats, output formats, XSLT elements from referenced stylesheets) and the details to include in the documentation.

Figure 497. Settings Tab of the XSLT Stylesheet Documentation Dialog Box

The **Settings** tab allows you to choose whether or not to include the following components: **Templates, Functions, Global parameters, Global variables, Attribute sets, Character maps, Keys, Decimal formats, Output formats, Referenced stylesheets.**

You can choose whether or not to include the following other details:

- **Documentation** - Shows the documentation for each XSLT element. For HTML format, the user-defined data elements that are recognized and transformed in documentation blocks of the XSLT elements they precede, are the ones from the following schemas:
 - Oxygen XML Developer built-in XSLT documentation schema.
 - A subset of DocBook 5 elements. The recognized elements are: *section, sect1 to sect5, emphasis, title, ulink, programlisting, para, orderedlist, itemizedlist.*
 - A subset of DITA elements. The recognized elements are: *concept, topic, task, codeblock, p, b, i, ul, ol, pre, sl, sli, step, steps, li, title, xref.*
 - Full XHTML 1.0 support.
 - XSLStyle documentation environment. XSLStyle uses DocBook or DITA languages inside its own user-defined data elements. The supported DocBook and DITA elements are the ones mentioned above.
 - DOXSL documentation [framework \(on page 2269\)](#). Supported elements are: *codefrag, description, para, docContent, documentation, parameter, function, docSchema, link, list, listitem, module, parameter, template, attribute-set.*

Other XSLT documentation blocks that are not recognized will just be serialized inside an HTML *pre* element. You can change this behavior by using a [custom format \(on page 700\)](#) instead of the built-in [HTML format \(on page 697\)](#) and providing your own XSLT stylesheets.

- **Use comments** - Controls whether or not the comments that precede an XSLT element is treated as documentation for the element they precede. Comments that precede or succeed the *xsl:stylesheet* element, are treated as documentation for the whole stylesheet. Note that comments that precede an import or include directive are not collected as documentation for the imported/included module. Also, comments from within the body of the XSLT elements are not collected at all.
- **Namespace** - Shows the namespace for named XSLT elements.
- **Location** - Shows the stylesheet location for each XSLT element.
- **Parameters** - Shows parameters of templates and functions.
- **References** - Shows the named XSLT elements that are referenced from within an element.
- **Used by** - Shows the list of all the XSLT elements that reference the current named element.
- **Supersedes** - Shows the list of all the XSLT elements that are superseded the current element.
- **Overriding** - Shows the list of all the XSLT elements that override the current element.
- **Return type** - Shows the return type of the function.
- **Source** - Shows the text stylesheet source for each XSLT element.
- **Import precedence** - Shows the computed import precedence as declared in the XSL transformation specifications.
- **Generate index** - Creates an index with all the XSLT elements included in the documentation.

Export settings - Save the current settings in a settings file for further use (for example, if you need the exported settings file for [generating the documentation from the command-line interface](#)).

Import settings - Reloads the settings from the exported file.

Generate - Use this button to generate the XSLT documentation.

**Tip:**

This function can be executed from an automated command-line script, for more details, see [Scripting Oxygen \(on page 2233\)](#).

Related Information:

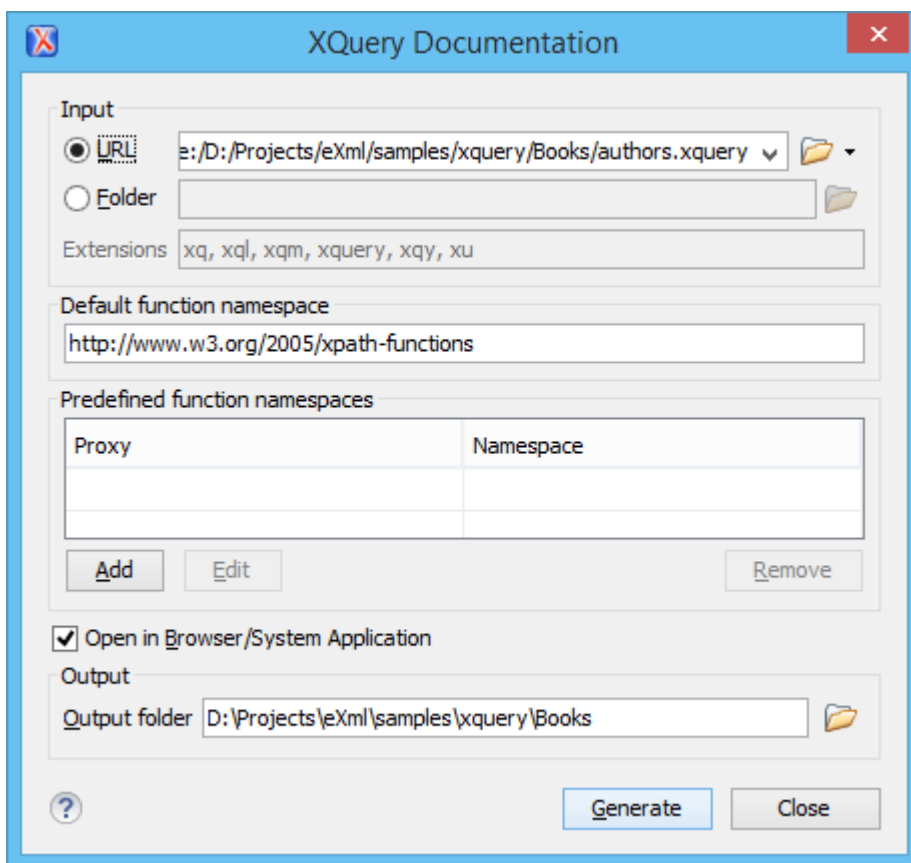

[XSLT Stylesheet Component Documentation Support \(on page 681\)](#)

Generating HTML Documentation for an XQuery Document

To generate HTML documentation for an XQuery document, use the **XQuery Documentation** dialog box. It is opened with the **XQuery Documentation** action that is available from the **Tools > Generate Documentation** menu or from the **Generate Documentation** submenu in the contextual menu of the **Project view (on page 365)**. You can also open the tool by using the  **Generate Documentation** toolbar button.

The dialog box allows you to configure a set of parameters for the process of generating the HTML documentation.

Figure 498. XQuery Documentation Dialog Box

The following options are available:

- **Input** - The full path to the XQuery file must be specified in one of the two fields in this section:
 - **URLFile** - The URL of the file to be used for generating the documentation.
 - **Folder** - The directory that contains the files to be used for generating the documentation. You can also specify the XQuery file extensions to be searched for in the specified directory.
- **Default function namespace** - Optional URI for the default namespace for the submitted XQuery.
- **Predefined function namespaces** - Optional, engine-dependent, predefined namespaces that the submitted XQuery refers to. They allow the conversion to generate annotation information to support the presentation component hypertext linking (only if the predefined modules have been loaded into the local xqDoc XML repository).
- **Open in Browser/System Application** - Select this option if you want the result to be opened in the system application associated with that file type.

Note:

To set the browser or system application that will be used, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#), go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

- **Output** - Allows you to specify where the generated documentation is saved on disk.

Generating Documentation for WSDL Documents (Deprecated)

You can use Oxygen XML Developer to generate detailed documentation for the components of a WSDL document in HTML format. You can select the WSDL components to include in your output and the level of details to present for each of them. Also, the components are hyperlinked. You can also generate the documentation in a [custom output format \(on page 841\)](#) by using a custom stylesheet.

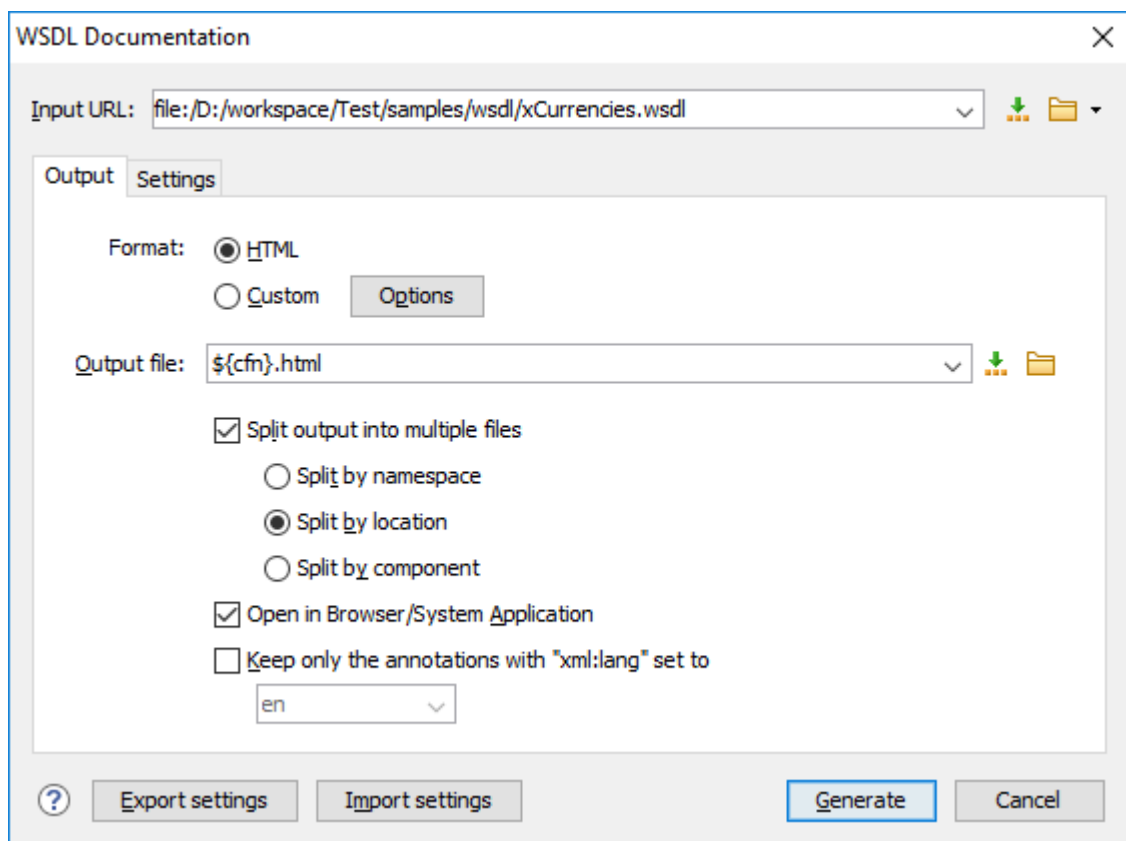

Note:

The WSDL documentation includes the XML Schema components that belong to the internal or imported XML schemas.

To generate documentation for a WSDL document, select **WSDL Documentation** from the **Tools > Generate Documentation** menu or from the **Generate Documentation** submenu in the contextual menu of the **Project view (on page 365)**. You can also open the tool by using the **Generate Documentation** toolbar button.

Figure 499. WSDL Documentation Dialog Box

The **Input URL** field of the dialog box must contain the full path to the WSDL document that you want to generate documentation for. The WSDL document may be a local or a remote file. You can specify the path to the WSDL file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

Output Tab

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
 - **HTML** - The documentation is generated in [HTML output format \(on page 840\)](#).
 - **Custom** - The documentation is generated in a [custom output format \(on page 841\)](#), allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.
- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the  **Insert Editor Variables** button or the options in the  **Browse** drop-down menu.
- **Split output into multiple files** - Instructs the application to split the output into multiple files. For large WSDL documents, choosing a different split criterion may generate smaller output files providing a faster documentation browsing. You can choose to split them by namespace, location, or component name.
- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

Note:

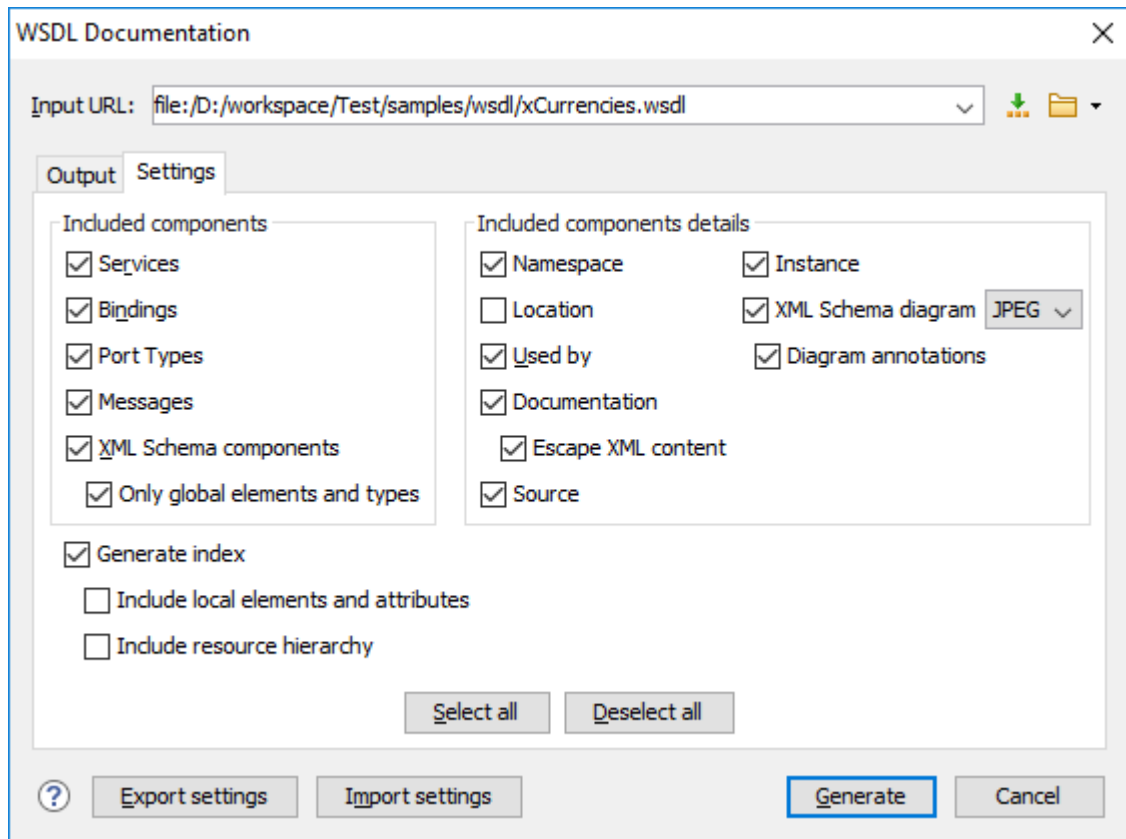

To set the browser or system application that will be used, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#), go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

- **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the `@xml:lang` attribute set to the selected language. If you choose a primary language code (for example, **en** for English), this includes all its possible variations (**en-us**, **en-uk**, etc.).

Setting Tab

When you generate documentation for a WSDL document, you can choose what components to include in the output and the details to be included in the documentation.

Figure 500. Settings Tab of the WSDL Documentation Dialog Box

The **Settings** tab allows you to choose whether or not to include the following:

- **Components**

- **Services** - Specifies whether or not the generated documentation includes the WSDL services.
- **Bindings** - Specifies whether or not the generated documentation includes the WSDL bindings.
- **Port Types** - Specifies whether or not the generated documentation includes the WSDL port types.
- **Messages** - Specifies whether or not the generated documentation includes the WSDL messages.
- **XML Schema Components** - Specifies whether or not the generated documentation includes the XML Schema components.
- **Only global elements and types** - Specifies whether or not the generated documentation includes only global elements and types.

- **Component Details**

- **Namespace** - Presents the namespace information for WSDL or XML Schema components.
- **Location** - Presents the location information for each WSDL or XML Schema component.
- **Used by** - Presents the list of components that reference the current one.
- **Documentation** - Presents the component documentation. If you choose **Escape XML Content**, the XML tags are presented in the documentation.
- **Source** - Presents the XML fragment that defines the current component.
- **Instance** - Generates a sample XML instance for the current component.

**Note:**

This option applies to the XML Schema components only.

- **XML Schema Diagram** - Displays the diagram for each XML Schema component. You can choose the image format (JPEG, PNG, GIF, SVG) to use for the diagram section.
- **Diagram annotations** - Specifies whether or not the annotations of the components presented in the diagram sections are included.
- **Generate index** - Displays an index with the components included in the documentation.
 - **Include local elements and attributes** - If selected, local elements and attributes are included in the documentation index.
 - **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is deselected by default.

Export settings - Save the current settings in a settings file for further use (for example, if you need the exported settings file for [generating the documentation from the command-line interface](#)).

Import settings - Reloads the settings from the exported file.

Generate - Use this button to generate the WSDL documentation.

**Tip:**

This function can be executed from an automated command-line script, for more details, see [Scripting Oxygen \(on page 2233\)](#).

Generating JSON Schema Documentation

Oxygen XML Developer includes a tool for generating documentation for a JSON Schema file in HTML format. To generate JSON Schema documentation, select **JSON Schema Documentation** from the **Tools > Generate Documentation** menu. You can also open the tool by using the **Generate Documentation** toolbar button. This opens a dialog box where you can specify the location of the JSON Schema file and HTML output file.

This tool requires an additional add-on to be installed, so the first time you invoke the action, Oxygen XML Developer presents a dialog box asking if you want to install it. Once installed, you need to restart Oxygen XML Developer and the **JSON Schema Documentation** action will invoke the tool.

[Add-on documentation and installation details.](#)

Generating OpenAPI Documentation

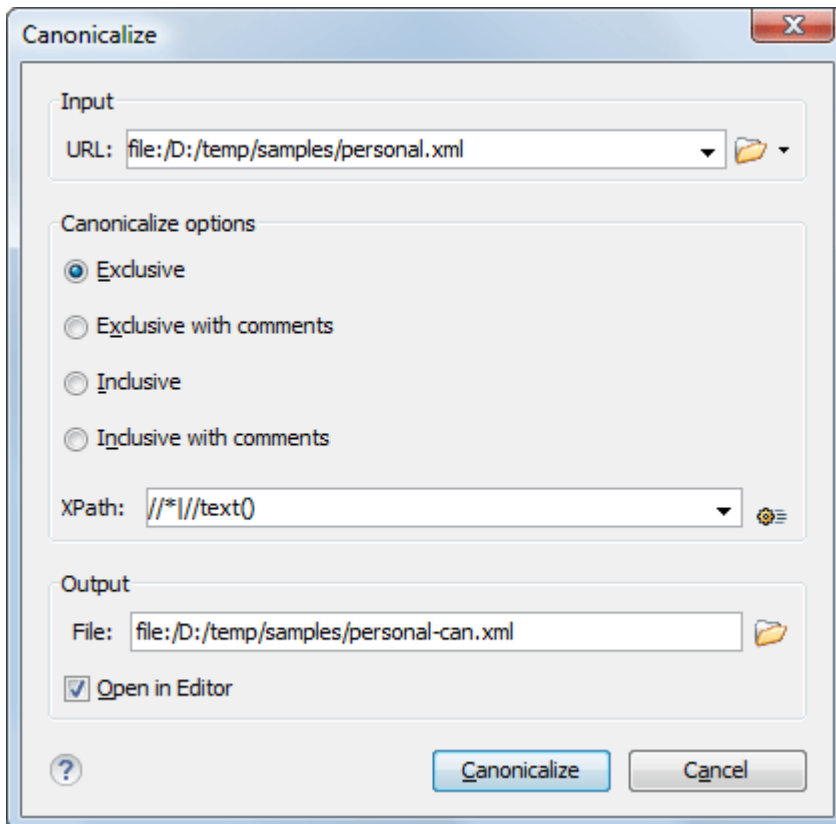

Oxygen XML Developer includes a tool for generating documentation for *OpenAPI* 3.0, or 3.1 documents in either JSON or YAML format, including annotations and cross references. The documentation displays information about the servers, paths, components and tags defined in the OpenAPI documents and you can choose whether the output is presented in HTML (with various sections, hyperlinks, and filtering options), DITA, or PDF.

[Addon documentation and installation details.](#)

Canonicalizing Files

You can select the *canonicalization* (on page 2267) algorithm to be used for a document from the dialog box that is displayed by using the **Canonicalize** action that is available from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu.

Figure 501. Canonicalization Settings Dialog Box

The **Canonicalize** dialog box allows you to set the following options:

- **Input URL** - Available if the **Canonicalize** action was selected from the **Tools** menu. It allows you to specify the location of the input file.
- **Exclusive** - If selected, the exclusive (uncommented) *canonicalization* (on page 2267) method is used.

Note:

Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments *canonicalization (on page 2267)* method is used.
- **Inclusive** - If selected, the inclusive (uncommented) *canonicalization (on page 2267)* method is used.

Note:

Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. *Inclusive Canonicalization* is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the *Inclusive Canonicalization* will copy them and the signature will be invalid.

- **Inclusive with comments** - If selected, the inclusive with comments *canonicalization (on page 2267)* method is used.
- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **Output** - Available if the **Canonicalize** action was selected from the **Tools** menu. It allows you to specify the output file path where the signed XML document will be saved.
- **Open in editor** - If selected, the output file will be opened in the editor.

Related Information:

[Digital Signatures Overview \(on page 646\)](#)

Signing Files

You can select the type of signature to be used for documents from a signature settings dialog box. To open this dialog box, select the **Sign** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu.

Figure 502. Signature Settings Dialog Box

The following options are available:

Note:

If Oxygen XML Developer could not find a valid certificate, a link is provided at the top of the dialog box that opens the [XML Signing Certificates preferences page \(on page 236\)](#) where you can configure a valid certificate.

Could not obtain a valid certificate. [You must configure a valid certificate.](#)

- **Input** - Available if the **Sign** action was selected from the **Tools** menu. Specifies the location of the input URL.
- **Transformation Options** - See the [Digital Signature Overview \(on page 646\)](#) section for more information about these options.

- **None** - If selected, no *canonicalization (on page 2267)* algorithm is used.
- **Exclusive** - If selected, the exclusive (uncommented) *canonicalization (on page 2267)* method is used.

**Note:**

Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments *canonicalization (on page 2267)* method is used.
- **Inclusive** - If selected, the inclusive (uncommented) *canonicalization (on page 2267)* method is used.

**Note:**

Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. *Inclusive Canonicalization* is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the *Inclusive Canonicalization* will copy them and the signature will be invalid.

- **Inclusive with comments** - If selected, the inclusive with comments *canonicalization (on page 2267)* method is used.
- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **ID** - Provides ID of the XML element to be signed.
- **Envelope** - If selected, the *enveloped* signature is used. See the [Digital Signature Overview \(on page 646\)](#) for more information.
- **Detached** - If selected, the *detached* signature is used. See the [Digital Signature Overview \(on page 646\)](#) for more information.
- **Append KeyInfo** - If this option is selected, the `<ds:KeyInfo>` element will be added in the signed document.
- **Signature algorithm** - The algorithm used for signing the document. The following options are available: **RSA with SHA1**, **RSA with SHA256**, **RSA with SHA384**, **RSA with SHA512**, **ECDSA with SHA1**, **ECDSA with SHA256**, **ECDSA with SHA384**, and **ECDSA with SHA512**.

- **Output** - Available if the **Sign** action was selected from the **Tools** menu. Specifies the path of the output file where the signed XML document will be saved.
- **Open in editor** - If selected, the output file will be opened in Oxygen XML Developer.

Related Information:[Digital Signatures Overview \(on page 646\)](#)[Verifying Signature \(on page 654\)](#)[Example of How to Digitally Sign XML Files or Content \(on page 654\)](#)

Verifying Signature

You can verify the signature of a file by selecting the **Verify Signature** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu. The **Verify Signature** dialog box then allows you to specify the location of the file whose signature is verified.

If the signature is valid, a dialog box displays the name of the signer. Otherwise, an error shows details about the problem.

Related Information:[Digital Signatures Overview \(on page 646\)](#)[Signing Files \(on page 651\)](#)[Example of How to Digitally Sign XML Files or Content \(on page 654\)](#)

WSDL SOAP Analyzer Tool (Deprecated)

WSDL SOAP Analyzer is a tool that helps you test if the messages defined in a Web Service Descriptor (WSDL) are accepted by a Web Services server.

After you edit and validate your Web service descriptor against a mix of the XML Schemas for WSDL and SOAP, it is easy to check if the defined SOAP messages are accepted by the remote Web Services server by using the integrated **WSDL SOAP Analyzer** tool (available from the toolbar or **Tools** menu).

Oxygen XML Developer provides two ways of testing, one for the currently edited WSDL document and another for the remote WSDL documents that are published on a web server. To open the **WSDL SOAP Analyzer** tool for the currently edited WSDL document do one of the following:

- Click the  **WSDL SOAP Analyzer** toolbar button.
- Use the  **WSDL SOAP Analyzer** action from the **Tools** menu.
- Go to **Open with >**  **WSDL SOAP Analyzer** in the contextual menu of the **Project** (on page 365) view.

Figure 503. WSDL SOAP Analyzer Dialog Box

This tool contains a SOAP analyzer and sender for Web Services Description Language file types. The analyzer fields are as follows:

- **Services** - The list of services defined by the WSDL file.
- **Ports** - The ports for the selected service.
- **Operations** - The list of available operations for the selected service.
- **Action URL** - The script that serves the operation.
- **SOAP Action** - Identifies the action performed by the script.
- **Version** - Choose between 1.1 and 1.2. The SOAP version is selected automatically depending on the selected port.

- **Request Editor** - It allows you to compose the web service request. When an action is selected, Oxygen XML Developer tries to generate as much content as possible for the SOAP request. The envelope of the SOAP request has the correct namespace for the selected SOAP version, that is *http://schemas.xmlsoap.org/soap/envelope/* for SOAP 1.1 or *http://www.w3.org/2003/05/soap-envelope* for SOAP 1.2. Usually you just have to change a few values for the request to be valid. The [Content Completion Assistant \(on page 2267\)](#) is available for this editor and is driven by the schema that defines the type of the current message. While selecting various operations, Oxygen XML Developer remembers the modified request for each one. You can click the **Regenerate** button to overwrite your modifications for the current request with the initial generated content.
- **Attachments List** - You can define a list of file URLs to be attached to the request.
- **Response Area** - Initially it displays an auto generated server sample response so you can have an idea about how the response looks like. After pressing the **Send** button, it presents the message received from the server in response to the Web Service request. It may show also error messages. If the response message contains attachments, Oxygen XML Developer prompts you to save them, then tries to open them with the associated system application.
- **Errors List** - There may be situations where the WSDL file is respecting the WSDL XML Schema, but it fails to be valid (for example, in the case of a message that is defined by means of an element that is not found in the types section of the WSDL). In such a case, the errors are listed here. This list is presented only when there are errors.
- **Send Button** - Executes the request. A status dialog box is displayed when Oxygen XML Developer is connecting to the server.

The testing of a WSDL file is straight-forward. Click the WSDL analysis button, then select the service, the port, and the operation. The editor generates the skeleton for the SOAP request. You can edit the request, eventually attach files to it and send it to the server. Watch the server response in the response area. You can find more details in the [Testing Remote WSDL Files \(on page 844\)](#) section.

Note:

SOAP requests and responses are automatically validated in the **WSDL SOAP Analyzer** using the XML Schemas specified in the WSDL file.

Once defined, a request derived from a Web Service descriptor can be saved with the **Save** button to a Web Service SOAP Call (WSSC) file for later reuse. In this way, you save time in configuring the URLs and parameters.

You can open the result of a Web Service call in an editor panel using the **Open** button.

Testing Remote WSDL Files

To open and test a remote WSDL file the steps are the following:

1. Go to **Tools >**  **WSDL SOAP Analyzer** .
2. On the **WSDL File** tab enter the URL of the remote WSDL file.

3. Click the **OK** button.

This will open the **WSDL SOAP Analyzer tool** (on page 841). In the **Saved SOAP Request** tab you can open directly a previously saved Web Service SOAP Call (WSSC) file, thus skipping the analysis phase.

XML Schema Regular Expressions Builder Tool

The XML Schema regular expressions builder allows you to test regular expressions on a fragment of text as they are applied to an XML instance document. Start the tool by selecting **XML Schema Regular Expressions Builder** from the **Tools** menu.

Figure 504. XML Schema Regular Expressions Builder Dialog Box

The dialog box contains the following:

Regular expressions editor

Allows you to edit the regular expression to be tested and used. Content completion is available and presents a list with all the predefined expressions. It is triggered by pressing **Ctrl + Space**.

Error display area

If the edited regular expression is incorrect, an error message will be displayed here. The message contains the description and the exact location of the error. Also, clicking the quick navigation button (↔) highlights the error inside the regular expression.

Category

You can choose from several categories of predefined expressions. The selected category influences the displayed expressions in the **Available expressions** table.

Available expressions

This table includes the available regular expressions and a short description for each of them. The set of expressions depends on the category selected in the previous **Category** combo box. You can add an expression in the **Regular expressions editor** by double-clicking the expression row in the table. You will notice that in the case of **Character categories** and **Block names**, the expressions are also listed in complementary format.

Evaluate expression on

You can choose between two options:

- **Evaluate expression on each line** - The edited expression will be applied on each line in the **Test** area.
- **Evaluate expression on all text** - The edited expression will be applied on the whole text.

Test

A text editor that allows you to enter a text sample that will have the regular expression applied. All matches of the edited regular expression will be highlighted.

After editing and testing your regular expression you can insert it in the current editor. The **Insert** button will become active when an editor is opened in the background and there is an expression in the **Regular expressions editor**.

The regular expression builder cannot be used to insert regular expressions in the **Grid mode** ([on page 316](#)) or **schema Design mode** ([on page 317](#)). Accordingly, the **Insert** button will be not available if the current document is edited in these modes.

Note:

Some regular expressions may indefinitely block the Java Regular Expressions engine. If the execution of the regular expression does not end in about five seconds, the application displays a dialog box that allows you to interrupt the operation.

Large File Viewer

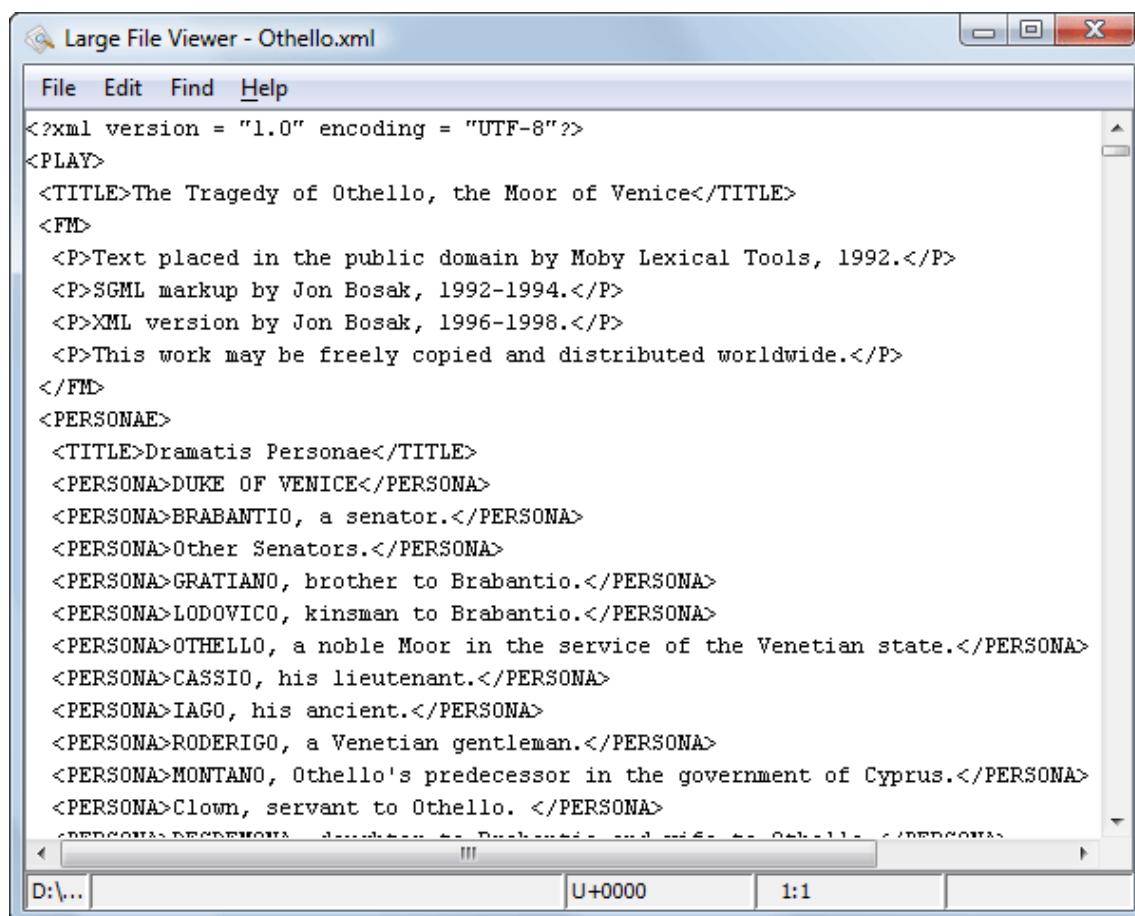

XML files tend to become larger and larger mostly because they are frequently used as a format for database export or for porting between multiple database formats. Traditional XML text editors simply cannot handle opening these huge export files, some having sizes exceeding one gigabyte, because all of the file content must be loaded in memory before the user can actually view it.

The best performance of the viewer is obtained for encodings that use a fixed number of bytes per character (such as UTF-16 or ASCII). The performance for UTF-8 is very good for documents that use mostly characters

of the European languages. For the same encoding, the rendering performance is higher for files consisting of long lines (up to few thousands characters) and may degrade for short lines. In fact, the maximum size of a file that can be rendered in the Large File Viewer decreases when the total number of the text lines of the file increases. Trying to open a very large file (for example, a file of 4 GB) with a very high number of short lines (100 or 200 characters per line) may produce an *out of memory* error (**OutOfMemoryError**) that would require either increasing the Java heap memory with the **-Xmx** startup parameter or decreasing the total number of lines in the file.

The powerful **Large File Viewer** is available from the **Tools** menu or as a standalone application. You can also right-click a file in your project and choose to open it with the viewer. It uses an efficient structure for indexing the open document. No information from the file is stored in the main memory, just a list of indexes in the file. In this way the viewer can open very large files, up to 10 gigabytes. If the open file is XML, the encoding used to display the text is detected from the XML prolog of the file. For other file types, the encoding is taken from the Oxygen XML Developer options. See [Encoding for non-XML files \(on page 158\)](#).

Figure 505. Large File Viewer

Large File Viewer components:

- The menu bar provides menu driven access to all the features and functions that are available in **Large File Viewer**:

File > Open

Opens files in the viewer (also available in the contextual menu).

File > Exit

Closes the viewer.

Edit > Copy

Copies the selected text to clipboard (also available in the contextual menu).

Find > Find

Opens a reduced **Find** dialog box that provides some basic search options, such as:

- **Case sensitive** - When selected, operations are case-sensitive.
- **Regular Expression** - When selected, allows you to use any regular expression in [Perl-like syntax \(on page 409\)](#).
- **Wrap around** - Continues the find operation from the start/end of the document after reaching the end/, depending on whether the search is in forward or backward direction.

Help > Help

Provides access to the User Manual.

- The status bar provides information about the current file path, the Unicode representation of the character at the cursor position and the line and column in the open document where the cursor is located.

Attention:

For faster computation the **Large File Viewer** uses a fixed font (plain, monospace font of size 12) to display characters. The font is *not* configurable from the [Preferences page \(on page 114\)](#).

Tip:

The best performance of the viewer is accomplished for encodings that use a fixed number of bytes per character (such as UTF-16 or ASCII). The performance for UTF-8 is very good for documents that use mostly characters of the European languages. For the same encoding the rendering performance is high for files consisting of short lines (up to a few thousand characters) and may degrade for long lines.

Hex Viewer

When the Unicode characters that are visible in a text viewer or editor are not enough and you need to see the byte values of each character of a document, you can start the **Hex Viewer** that is available on the **Tools** menu. It has two panels: the characters are rendered in the right panel and the bytes of each character are displayed in the left panel. There is a 1:1 correspondence between the characters and their byte representation: the byte representation of a character is displayed in the same matrix position of the left panel as the character in the matrix of the right panel.

Figure 506. Hex Viewer

To open a file in **Hex Viewer** use the **File > Open** action. Alternatively, you can drag a file and drop it in the **Hex Viewer** panel.

Standalone SVG Viewer

Oxygen XML Developer includes a simple **SVG Viewer** that allows you to work with SVG images.

To open the viewer, select **SVG Viewer** from the **Tools** menu.

Figure 507. SVG Viewer

You can browse for and open any SVG file that has the **.svg** or **.svgz** extension.

If the file is included in the current project, you can open it in the viewer by right-clicking the image file in the **Project view** (on page 365) and selecting **Open with > SVG Viewer**.

Actions Available in the SVG Viewer

The following actions are available in the **SVG Viewer**:

Zoom in

To zoom in on an image, use any of the following methods:

- Scroll **forward** with the mouse wheel.
- Select **Zoom in** from the contextual menu.
- Use the **Ctrl + I (Command + I on macOS)** keyboard shortcut.

Zoom out

To zoom in on an image, use any of the following methods:

- Scroll **backward** with the mouse wheel.
- Use the **Ctrl + O (Command + O on macOS)** keyboard shortcut.
- Select **Zoom out** from the contextual menu.

Rotate

To rotate an image, use either of the following methods:

- Use the **Ctrl + Right-Click + Drag (Command + Right-Click + Drag on macOS)** shortcut.
- Select **Rotate** from the contextual menu. This rotates the image exactly 90 degrees clockwise.

Refresh

To refresh (or reset) an image, use either of the following methods:

- Use the **Ctrl + T (Command + T on macOS)** keyboard shortcut.
- Select **Refresh** from the contextual menu.

Move

To move an image, use either of the following methods:

- Use the **Arrow Keys** on your keyboard.
- Use the **Shift + Left-Click + Drag** shortcut.

Pan

To pan an image, **click and drag** the image with your mouse.

Related Information:

[Editing SVG Files \(on page 1034\)](#)

Tree Editor (Deprecated)

The **Tree Editor (Tools > Tree Editor)** is used for editing the content of a document displayed as an XML tree. The workspace offers the following functional areas:

- **Main menu** - Provides access to all the features and functions available in Oxygen XML Developer **Tree Editor**.
- **Toolbar** - Provides easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function.
- **Editor panel** - Easy editing of structured mark-up documents. Each token has an associated icon for easier visual identification.
- **Message panel** - Displays messages returned from user operations.
- **Model view** - Shows the detailed information about the attribute or element that you are working on.
- **All Elements panel** - Presents a list of all defined elements that can be inserted within your document.

The tree editor does not offer entity support. Entities are not presented with a special type of node in the tree and new entity nodes cannot be inserted in the document.

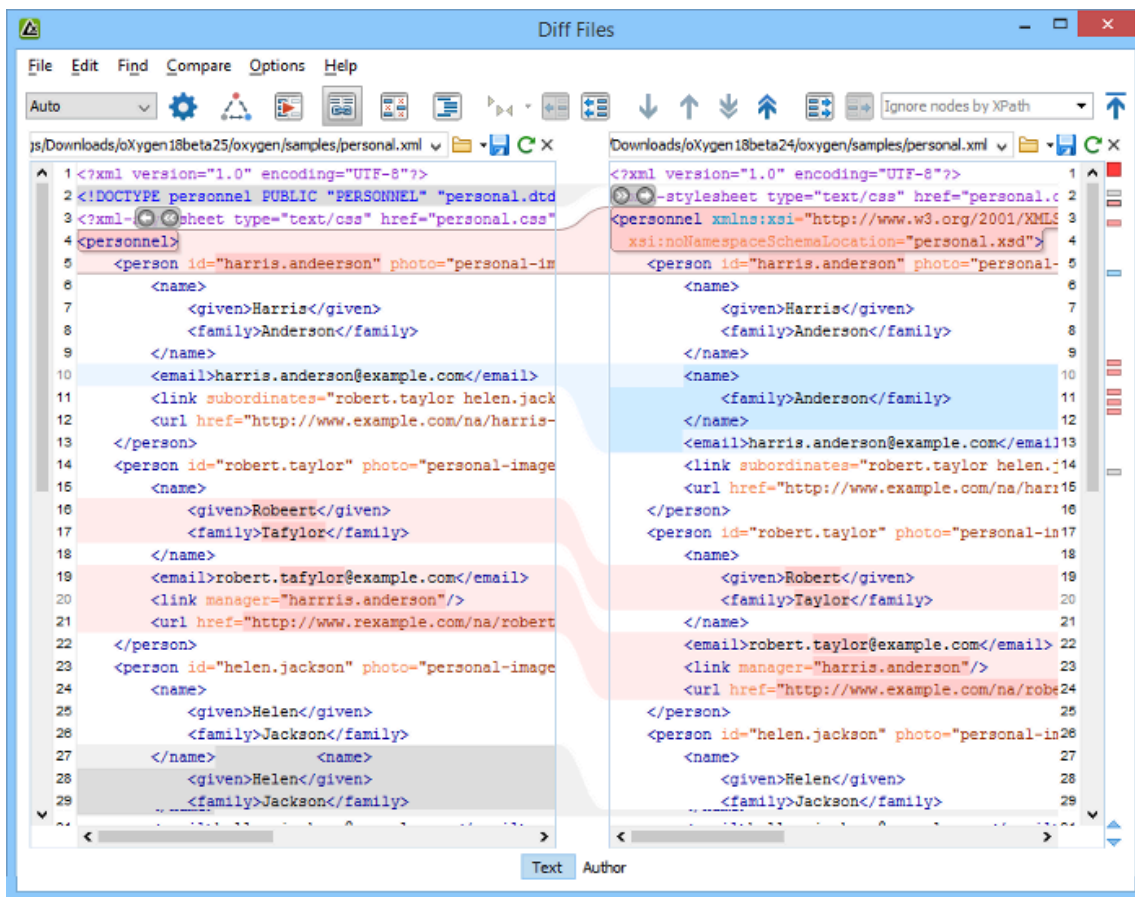

Comparison Tools

Oxygen XML Developer includes some useful tools for comparing files and directories. These tools are found in the **Comparison Tools** submenu within the **Tools** menu.

Compare Files Tool

The built-in **Compare Files** tool can be used to compare files or XML file fragments. The tool provides a mechanism for comparing two files or fragments, as well as the mechanism for a three-way comparison. The utility is available from the **Tools > Comparison Tools** menu or can be opened as a stand-alone application from the Oxygen XML Developer installation folder (`diffFiles.exe`).

Figure 508. Compare Files Tool

Two-Way Comparisons

The **Compare Files** tool can be used to compare the differences between two files or XML fragments.

Compare Files

To perform a two-way comparison, follow these steps:

1. Open a file in the left panel and the file you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the browsing actions in the  **Browse** drop-down menu.

Step Result: The selected files are opened in the two side-by-side editors. A text editing mode is used to offer a better view of the differences.

2. To highlight the differences between the two files, click the  **Perform File Differencing** button from the toolbar.
3. You can use the drop-down menu on the left side of the toolbar to change the *algorithm* ([on page 2021](#)) for the operation.

4. You can also use the  **Diff Options** button to access the **Files Comparison** preferences page where you can choose to ignore certain types of markup and configure various options.
5. If you are comparing XML documents using the **XML Fast** or **XML Accurate** algorithms, you can enter an XPath 2.0 expression in the **Ignore nodes by XPath** text field to ignore certain nodes from the comparison.

The resulting comparison will show you differences between the two files. The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes. This layout allows you to easily identify and focus on a group of related changes.

Figure 509. Two-Way Differences

Highlighting Colors

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the [Files Comparison / Appearance preferences page \(on page 254\)](#), but the default colors and their shades mean the following:

- **Pink** - Identifies modifications on either side.
- **Gray** - Identifies an addition of a node in the left side (your outgoing changes).
- **Blue** - Identifies an addition of a node in the right side (incoming changes).
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

Comparing Fragments (Copy/Paste)

To compare XML file fragments, you need to copy and paste the fragments you want to compare into each side, without selecting a file. If a file is already selected, you need to close it using the  **Close (Ctrl + W (Command + W on macOS))** button, before pasting the fragments. Other notes for pasting fragments:

- As long as the fragment is more than 10 characters, the application will attempt to automatically detect the content type. It can detect the following types: XML, DTD, CSS, JSON, and Markdown (if it starts with #). If one of those content types is detected, the fragments will be displayed with syntax highlights.
- If you save modified fragments, a dialog box opens that allows you to save the changes as a new document.

Navigate Differences

To navigate through differences, do one of the following:

- Use the navigation buttons on the toolbar (or in the **Compare** menu).
- Select a block of differences by clicking its small colored marker in the overview ruler located in the right-most part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.
- Click a colored area in between the two text editors.

Editing Actions

You can edit the files directly in either editing pane. The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the  **Perform File Differencing** button.

A variety of actions are available on the [toolbar \(on page 444\)](#) and in the [various menus \(on page 447\)](#) (these same actions are also available in the contextual menu in both editing panes). The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

Append left change to right and Append right change to left

Copies the content of the selected change from one side and appends it on the other, according to the content of the corresponding change. As a result, the side where the arrow points to will contain the changes from both sides.

Copy change from left to right and Copy change from right to left

Replaces the content of a change from one side with the content of the corresponding change from the other side.

Remove change

Rejects the change on the particular side and preserves the particular content on the other side.

Two-Way Diff Algorithms

Oxygen XML Developer offers the following two-way diff algorithms to compare files or fragments:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters.
- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **Syntax Aware** - Computes differences for known file types or fragments. This algorithm splits the files or fragments into sequences of *tokens* and computes the differences between them. The meaning of a *token* depends on the type of compared files or fragments.

Known file types include those listed in the **New** dialog box, such as XML file types (XSLT files, XSL-FO files, XSD files, RNG files, NVDL files, etc.), XQuery file types (.xquery, .xq, .xqy, .xqm extensions), DTD file types (.dtd, .ent, .mod extensions), TEXT file type (.txt extension), or PHP file type (.php extension).

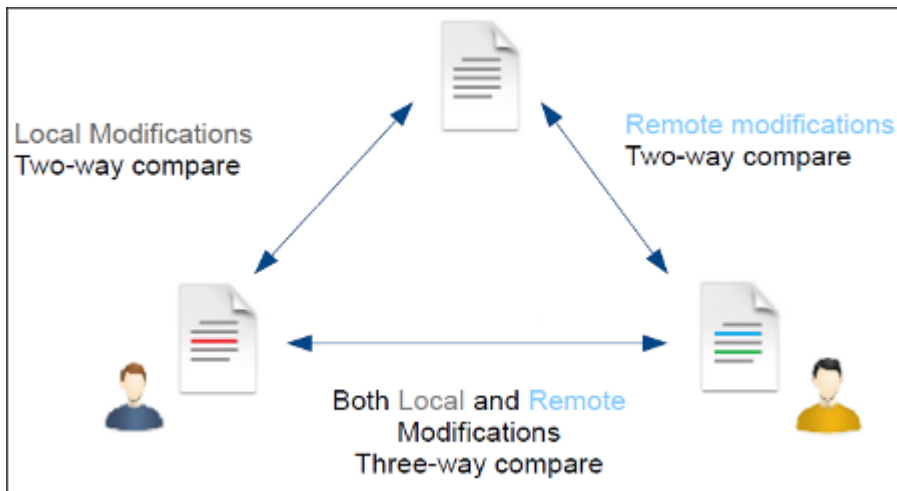

For example:

- When comparing XML files or fragments, a token can be one of the following:
 - The name of an XML tag
 - The < character
 - The /> sequence of characters
 - The name of an attribute inside an XML tag
 - The = sign
 - The " character
 - An attribute value
 - The text string between the start tag and the end tag (a text node that is a child of the XML element corresponding to the XML tag that encloses the text string)
- When comparing plain text, a token can be any continuous sequence of characters or any continuous sequence of whitespaces, including a new line character.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Three-Way Comparisons

Oxygen XML Developer also includes a three-way comparison feature to help you solve conflicts and merge changes between multiple modifications. It is especially helpful for teams who have multiple authors editing and committing the same documents. It provides a comparison between a local change, another change, and the original base revision. Some additional advantages include:

- Visualize and merge content that was modified by you and another member of your team.
- Marks differences correctly even when the document structure is rearranged.
- Allows you to merge XML-relevant modifications.

Figure 510. Three-Way Comparison

Compare Files

To perform a three-way comparison, follow these steps:

1. Open a file in the left panel and the file you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the browsing actions in the **Browse** drop-down menu.

Step Result: The selected files are opened in the two side-by-side editors. A text editing mode is used to offer a better view of the differences.

2. Click the **Three-Way Comparison** button on the toolbar and select the base (original) file in the **Base** field. You can specify the path by using the text field, the history drop-down, or the browsing actions in the **Browse** drop-down menu.
3. To highlight the differences, click the **Perform File Differencing** button on the toolbar.
4. You can use the drop-down menu on the left side of the toolbar to change the [algorithm \(on page 2021\)](#) for the operation.
5. You can also use the **Diff Options** button to access the **Files Comparison** preferences page where you can choose to ignore certain types of markup and configure various options.

The resulting comparison will show you differences between the two files, as well as differences between either of them and the base (original) file. The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes.

Figure 511. Three-Way Differences

7	<code><given>Robert</given></code>	<code><given>Helen</given></code>	8
8	<code><family>Taylor</family></code>	<code><family>Jackson</family></code>	9
9	<code></name></code>	<code></name></code>	10
10	<code><email>robert.taylor@example</code>	<code><email>helen.jackson@example</code>	11

Highlighting Colors

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the [Files Comparison / Appearance preferences page \(on page 254\)](#), but the default colors and their shades mean the following:

- **Pink** - Identifies blocks of changes that include conflicts.
- **Gray** - Identifies your outgoing changes that do not include conflicts.
- **Blue** - Identifies incoming changes that do not include conflicts.
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

Navigate Differences

To navigate through differences, do one of the following:

- Use the navigation buttons on the toolbar (or in the **Compare** menu).
- Select a block of differences by clicking its small colored marker in the overview ruler located in the right-most part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.
- Click a colored area in between the two text editors.

Editing Actions

You can edit the files directly in either editing pane. The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the  **Perform File Differencing** button.

A variety of actions are available on the [toolbar \(on page 444\)](#) and in the [various menus \(on page 447\)](#) (these same actions are also available in the contextual menu in both editing panes). The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

Append left change to right and Append right change to left

Copies the content of the selected change from one side and appends it on the other, according to the content of the corresponding change. As a result, the side where the arrow points to will contain the changes from both sides.

Copy change from left to right and Copy change from right to left

Replaces the content of a change from one side with the content of the corresponding change from the other side.

Remove change

Rejects the change on the particular side and preserves the particular content on the other side.

Three-Way Diff Algorithms

Oxygen XML Developer offers the following three-way diff algorithms to compare files:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Second-Level Comparisons

For both two-way and three-way comparisons, Oxygen XML Developer automatically performs a second-level comparison for the **Lines**, **XML Fast**, and **XML Accurate** algorithms. After the first comparison is finished, the second-level comparison for the **Lines** algorithm is processed on text nodes using a word level comparison, meaning that it looks for identical words. For the **XML Fast** and **XML Accurate** algorithms, the second-level comparison is processed using a *syntax-aware comparison (on page 2021)*, meaning that it looks for identical *tokens*. This second-level comparison makes it easier to spot precise differences and you can merge or reject the precise modifications.

Figure 512. Second-Level Diff Comparison

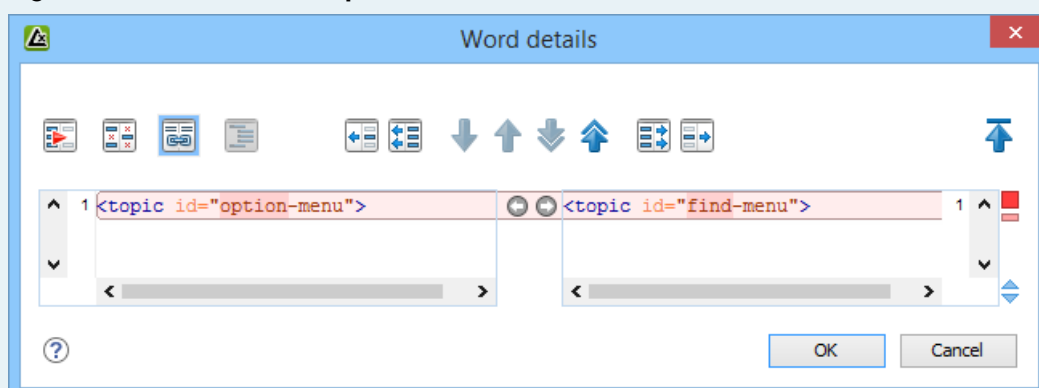

Note:

If a modified text fragment contains XML markup (such as processing instructions, XML comments, CDATA, or elements), the second-level comparison will not automatically be performed. In this case you can manually select a second-level comparison by doing a word level or character level comparison.

To do a word level comparison, select **Show word level details** from the contextual menu or **Compare** menu.

Figure 513. Word Level Comparison

To do a character level comparison, select **Show Character Level details** from the contextual menu or **Compare** menu.

Figure 514. Character Level Comparison

Related information

[Files Comparison Preferences Page \(on page 252\)](#)

[Compare Directories Tool \(on page 451\)](#)

[Toolbar and Contextual Menu Actions of the Compare Files Tool \(on page 444\)](#)

Starting File Comparison Tool from a Command Line

The file comparison tool can be started by using command-line arguments. In the installation folder there is an executable shell (`diffFiles.bat` on Windows, `diffFiles.sh` on macOS and Linux). To specify the files to compare, you can pass command-line arguments using the following construct: `diffFiles.bat/diffFiles.sh [path to left file] [path to right file] [path to 3-way base file]`.

If three files are specified, the tool will start in the [3-way comparison mode \(on page 436\)](#). If only two files are specified, the tool will start in the [2-way comparison mode \(on page 433\)](#). The first specified file will be added to the left panel in the comparison tool, the second file to the right panel, and the optional third file will be the base (ancestor) file used for a 3-way comparison. If you pass only one argument, you are prompted to manually choose another file.

If you want to launch the file comparison tool from an external application with specified files and you want the file browsing buttons at the top of both panels to be hidden, you should use the `-ext` argument as the first command. There are some additional arguments that are allowed and to see all the details for the command-line construct, type `diffFiles.bat --help` in the command line.

Example:

To do a 3-way comparison, the command line might look like this:

Windows

```
diffFiles.bat "c:\docs\file 1" "c:\docs\file 2" c:\docs\basefile
```

**Tip:**

If there are spaces in the path names, surround the paths with quotes.

Linux

```
diffFiles.sh home/file1 home/file2 home/basefile
```

macOS

```
diffFiles.sh documents/file1 documents/file2 documents/basefile
```

How to Integrate the File Comparison Tool with Git

The file comparison tool can be integrated with Git clients. It requires that you configure your `.gitconfig` file and then you can simply start the tool from the command line.

To integrate the **Compare Files** tool with your Git client, follow this procedure:

1. Use one of the following methods to instruct your Git client to use the *Oxygen Compare Files* tool:
 - **Manual Configuration** - Locate your Git user-specific configuration file (`.gitconfig`) and edit it with a text editor (for example, in Windows, the `.gitconfig` file is most likely located in your user home directory). Add (or replace) the following lines:

```
[diff]
    tool = oxygendiff

[merge]
    tool = oxygendiff

[difftool "oxygendiff"]
    cmd = '[pathToOxygenInstallDir]/diffFiles.exe' -ext $REMOTE $LOCAL $LOCAL

[mergetool "oxygendiff"]
    cmd = '[pathToOxygenInstallDir]/diffFiles.exe' -ext $LOCAL $REMOTE $BASE $MERGED
    trustExitCode = true

[difftool]
    prompt = false
```

**Note:**

For macOS, the `cmd` lines would start with something like: `sh "/Applications/Oxygen XML Editor/diffFiles.sh"`. For Linux, the `cmd` lines would start with something like: `sh "/Oxygen XML Editor/diffFiles.sh"`.

**Tip:**

On Redhat 7, the following command would work, where the whole command is quoted and then inside that, the path to `diffFiles.sh` is quoted:

**[difftool "oxygendiff"]**`cmd = '/home/user/Oxygen XML Editor 21/diffFiles.sh' -ext $REMOTE $LOCAL $LOCAL`**[mergetool "oxygendiff"]**`cmd = '/home/user/Oxygen XML Editor 21/diffFiles.sh' -ext $LOCAL $REMOTE $BASE``$MERGED trustExitCode = true`

- **Command Line Configuration** - To automatically configure the `.gitconfig` file, you can run the following commands from a command line:

```
git config --global diff.tool oxygendiff
git config --global difftool.oxygendiff.cmd '[Oxygen install dir]/diffFiles.exe -ext
$REMOTE $LOCAL $LOCAL'
git config --global merge.tool oxygendiff
git config --global mergetool.oxygendiff.cmd '[Oxygen install dir]/diffFiles.exe
-ext $LOCAL $REMOTE $BASE $MERGED'
git config --global mergetool.oxygendiff.trustExitCode true
```

**Note:**

For macOS, the *Oxygen* file comparison tool would be specified in the second and fourth commands with something like: `sh "/Applications/Oxygen XML Editor/diffFiles.sh"`. For Linux, it would be something like: `sh "/Oxygen XML Editor/diffFiles.sh"`.

2. To start the **Compare Files** tool and see a comparison of changes for a particular file, run the following command from a command line:

```
git difftool [PathToFile]
```

**Tip:**

If the file you want to compare has conflicts, you can start the **Compare Files** tool as a *merge conflict resolution* tool by running the following command:

```
git mergetool [PathToFile]
```

For more information about the Git *difftool* syntax, see <https://git-scm.com/docs/git-difftool>.

For more information about the Git *mergetool* syntax, see <https://git-scm.com/docs/git-mergetool>.

How to Integrate the File Comparison Tool with Sourcetree

The file comparison tool can be integrated with Sourcetree so that you can use it to compare changes. The *Oxygen Compare Files* tool provides the following advantages when using it with Sourcetree:

- The files are presented side-by-side to make it much easier to determine real changes.
- XML comparison algorithms are available.

- Various options can be used to configure the comparison.
- You can navigate through changes, one by one.

To integrate the **Compare Files** tool with Sourcetree, use the following procedure, depending on your operating system:

Windows

1. In Sourcetree, go to **Tools > Options**.
2. Go to the **Diff** tab.
3. In the **External Diff/Merge** section, configure the settings as follows:
 - **External Diff Tool** - Select **Custom**.
 - **Diff Command** - Enter the path of the *Oxygen diffFiles.exe* file (for example: `c:\Programs\Oxygen XML Editor\diffFiles.exe`).
 - **Arguments** - Enter `-ext $REMOTE $LOCAL $LOCAL`.
 - **Merge Tool** - Select **Custom**.
 - **Diff Command** - Enter the path of the *Oxygen diffFiles.exe* file (for example: `c:\Programs\Oxygen XML Editor\diffFiles.exe`).
 - **Arguments** - Enter `-ext $LOCAL $REMOTE $BASE $MERGED`.
4. Click **OK**.

Result: In Sourcetree, you can now compare file changes with the *Oxygen Compare Files* tool by simply selecting **External Diff** from the contextual menu, **Actions** menu, or **Ctrl+D**.

macOS

1. In Sourcetree, go to **Sourcetree > Preferences**.
2. Go to the **Diff** tab.
3. In the **External Diff/Merge** section, configure the settings as follows:
 - **External Diff Tool** - Select **Custom**.
 - **Diff Command** - Enter a command-line argument to launch the *Oxygen diffFiles.sh* file (for example: `sh "/Applications/Oxygen XML Editor/diffFiles.sh"`).
 - **Arguments** - Enter `-ext $REMOTE $LOCAL $LOCAL`.
 - **Merge Tool** - Select **Custom**.
 - **Diff Command** - Enter a command-line argument to launch the *Oxygen diffFiles.sh* file (for example: `sh "/Applications/Oxygen XML Editor/diffFiles.sh"`).
 - **Arguments** - Enter `-ext $LOCAL $REMOTE $BASE $MERGED`.
4. Close the preferences dialog box.

Result: In Sourcetree, you can now compare file changes with the *Oxygen Compare Files* tool by simply selecting **External Diff** from the contextual menu or **Actions** menu.

Toolbar and Contextual Menu Actions of the Compare Files Tool

The toolbar of the **Compare Files** tool contains operations that can be performed on the source and target files or XML fragments. Many of the actions are also available in the contextual menu.

Figure 515. Compare Toolbar

The following actions are available:

Algorithm

This drop-down menu allows you to select one of the following diff algorithms (depending on whether it is a two-way or three-way comparison):

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters.
- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **Syntax Aware** - Computes differences for the file types or fragments known by Oxygen XML Developer, taking the syntax (the specific types of tokens) into consideration.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Diff Options

Opens the [Files Comparison preferences page \(on page 252\)](#) where you can configure various options.

Three-Way Comparison

Toggle action that allows you to perform a three-way comparison between the two files displayed in the two editing panes and a base (ancestor) file.

Perform Files Differencing

Looks for differences between the two files displayed in the left and right side panels.

Synchronized scrolling

Toggles synchronized scrolling on or off so that a selected difference can be seen on both sides of the application window. This option is on by default.

Ignore Whitespaces

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

Format and Indent Both Files (**Ctrl + Shift + P** (**Command + Shift + P** on macOS))

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

Note:

When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.

Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

Copy All Changes from Right to Left

Copies all changes from the file in the right panel to the file in the left panel.

Next Block of Changes (**Ctrl + Period** (**Command + Period** on macOS))

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

Note:

A change block groups one or more consecutive lines that contain at least one change.

Previous Block of Changes (**Ctrl + Comma** (**Command + Comma** on macOS))

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

Next Change (**Ctrl + Shift + Period** (**Command + Shift + Period** on macOS))

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

Previous Change (**Ctrl + Shift + Comma** (**Command + Shift + M** on macOS))

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

**Copy All Changes from Left to Right**

Copies all changes from the file in the left panel to the file in the right panel.

**Copy Change from Left to Right**

Copies the selected difference from the file in the left panel to the file in the right panel.

Ignore Nodes by XPath

You can use this text field to enter an *XPath expression* ([on page 1732](#)) to ignore certain nodes from the comparison. It will be processed as XPath version 2.0. You can also enter the name of the node to ignore all nodes with the specified name (for example, if you want to ignore all ID attributes from the document, you could simply enter `@id`). This field is only available when comparing XML documents using the **XML Fast** or **XML Accurate** algorithms.

**Note:**

If an XPath expression is specified in the **ignore nodes by XPath option** ([on page 254](#)) in the **Diff / File Comparison** preferences page, that one is used as a default when the application is started. If you then enter an expression in this field on the toolbar, this one will be used instead of the default. If you delete the expression from this field, neither will be used.

**First Change (Ctrl + B (Command + B on macOS))**

Jumps to the first change.

Base

Available for *three-way comparisons* ([on page 436](#)). It is the base file that will be compared with the files opened in the left and right editors. You can specify the path to the file by using the text field, its history drop-down, or the browsing actions in the **Browse** drop-down menu.

Left-Side (Source) File

You can specify the path to the file to be compared on the left side (source) by using the text field, its history drop-down, or the browsing actions in the **Browse** drop-down menu.

**Save**

Saves the changes made in the source (left-side) file.

**Reload**

Reloads the source (left-side) file.

**Close**

Closes the source (left-side) file.

Right-Side (Target) File

You can specify the path to the file to be compared on the right side (target) by using the text field, its history drop-down, or the browsing actions in the  **Browse** drop-down menu.

 **Save**

Saves the target (right-side) file.

 **Reload**

Reloads the target (right-side) file.

 **Close**

Closes the target (right-side) file.

Compare Files Tool Menus

The menus in the **Compare Files** tool contain some of the same actions that are on the toolbar, as well as some common actions that are identical to the same actions in the Oxygen XML Developer menus. The menu actions include:

File Menu

Source >  **Open**

Browses for a file that will be displayed in the left panel.

Source >  **Open URL**

Browses for a remote file that will be displayed in the left panel.

Source >  **Open File from Archive**

Browses an archive for a file that will be displayed in the left panel.

Source >  **Reload**

Reloads the file in the left panel.

Source >  **Save**

Saves the changes made to the file in the left panel.

Source > **Save As**

Allows you to choose a destination to save the file in the left panel.

Source >  **Close**

Closes the file in the left panel.

Target >  **Open**

Browses for a file that will be displayed in the right panel.

Target >  **Open URL**

Browses for a remote file that will be displayed in the right panel.

Target >  Open File from Archive

Browses an archive for a file that will be displayed in the right panel.

Target >  Reload

Reloads the file in the right panel.

Target >  Save

Saves the changes made to the file in the right panel.

Target > Save As

Allows you to choose a destination to save the file in the right panel.

Target >  Close

Closes the file in the right panel.

Base >  Open

Browses for a file that will be compared with both files in a [three-way comparison \(on page 436\)](#).

Base >  Open URL

Browses for a remote file that will be compared with both files in a [three-way comparison \(on page 436\)](#).

Base >  Open File from Archive

Browses an archive for a file that will be compared with both files in a [three-way comparison \(on page 436\)](#).

 Save Results as HTML (Available in Text mode only)

Generates an HTML file that contains detailed information about the comparison result. See an [example of what the generated report look like in the Generate HTML Report for Directory Comparison topic \(on page 466\)](#).

Save Comparison as Document with Tracked Changes (Available for two-way comparison in Author mode only)

Allows you to merge two compared documents based on the differences detected and save the results as a specified file that includes the special change tracking marks. You can load the resulting file in **Oxygen's Author** mode to review the changes that resulted from the merge process and you can accept or reject them. Note that if the documents to be compared already contain tracked changes, they will be automatically accepted before generating the output file.

Close (Ctrl + W (Command + W on macOS))

Closes the application.

Edit Menu

 Cut

Cut the selection from the currently focused editor panel to the clipboard.

Copy

Copy the selection from the currently focused editor panel to the clipboard.

Paste

Paste content from the clipboard into the currently focused editor panel.

Select all

Selects all content in the currently focused editor panel.

Undo

Undo changes in the currently focused editor panel.

Redo

Redo changes in the currently focused editor panel.

Find Menu

Find/Replace

Perform *find/replace* operations in the currently focused editor panel.

Find Next

Go to the next match using the same options as the last *find* operation. This action runs in both editor panels.

Find Previous

Go to the previous match using the same options as the last *find* operation. This action runs in both editor panels.

Compare Menu

Three-Way Comparison

Toggle action that allows you to perform a three-way comparison between the two files displayed in the two editing panes and a base (ancestor) file.

Perform Files Differencing

Looks for differences between the two files displayed in the left and right side panels.

Next Block of Changes (**Ctrl + Period** (**Command + Period** on macOS))

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

Note:

A change block groups one or more consecutive lines that contain at least one change.

 **Previous Block of Changes (Ctrl + Comma (Command + Comma on macOS))**

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

 **Next Change (Ctrl + Shift + Period (Command + Shift + Period on macOS))**

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

 **Previous Change (Ctrl + Shift + Comma (Command + Shift + M on macOS))**

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

 **Last Change (Ctrl + E (Command + E on macOS))**

Jumps to the last change.

 **First Change (Ctrl + B (Command + B on macOS))**

Jumps to the first change.

 **Copy All Changes from Right to Left**

Copies all changes from the file in the right panel to the file in the left panel.

 **Copy All Changes from Left to Right**

Copies all changes from the file in the left panel to the file in the right panel.

 **Copy Change from Right to Left**

Copies the selected difference from the file in the right panel to the file in the left panel.

 **Copy Change from Left to Right**

Copies the selected difference from the file in the left panel to the file in the right panel.

 **Show Word Level Details**

Provides a word-level comparison of the selected change.

 **Show Character Level Details**

Provides a character-level comparison of the selected change.

 **Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on macOS))**

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

Note:

When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.

Options Menu

Preferences

Opens the preferences dialog box that includes numerous pages of options that can be configured.

Menu Shortcut Keys

Opens the **Menu Shortcut Keys** option page where you can configure keyboard shortcuts available for menu items.

Reset Global Options

Resets options to their default values. Note that this option appears only when the tool is executed as a stand-alone application.

Import Global Options

Allows you to import an options set that you have previously exported.

Export Global Options

Allows you to export the current options set to a file.

Help Menu

Help (F1)

Opens a **Help** dialog box that displays the User Manual at a section that is appropriate for the context of the current cursor position.

Use Online Help

If this option is selected, when you select Help or press F1 while hovering over any part of the interface, Oxygen XML Developer attempts to open the help documentation in online mode. If this option is not selected or an internet connection fails, the help documentation is opened in offline mode.

Report problem

Opens a dialog box that allows the user to write the description of a problem that was encountered while using the application. You can change the URL where the reported problem is sent by using the `com.oxygenxml.report.problems.url` system property. The report is sent in XML format through the `report` parameter of the POST HTTP method.

Support Center

Opens the Oxygen XML Developer Support Center web page in a browser.

How to Compare and Merge Documents with Change Tracking Highlights

Oxygen XML Developer includes two actions (**Merge Documents with Change Tracking Highlights** and a **Merge Directories with Change Tracking Highlights**) within the **Tools > Comparison Tools** menu that can be

used to compare and merge content and the comparison results are saved as documents with highlighted tracked changes that can be later reviewed and accepted or rejected.

This topic provides instructions and several different use cases for how to get the most out of comparing and merging documents with change tracking highlights present.

Use Case 1: Review Changes Made to an XML Document

The **Merge Documents with Change Tracking Highlights** tool (*on page 2045*) can be used to merge two XML documents, based on a 2-way mode comparison. The files involved in the process are merged by saving the comparison results as documents with highlighted tracked changes.

Here is the basic procedure:

1. Select the **Merge Documents with Change Tracking Highlights** action that is found in the **Tools > Comparison Tools** menu to invoke the tool. It opens a dialog box where you can specify the documents to merge.
2. In the resulting dialog box, you need to provide the URLs of the base version of the document (**Base document**) and the modified version (**Document to merge with**), and then click the **Merge** button.

Step Result: The resulting document is automatically loaded into a new editor tab. It incorporates special markings for the tracked changes/differences between the 2 compared and analyzed XML files.

3. Switch to the **Author** mode and then open the **Review** view (click the  **Manage reviews** button on the toolbar or select it from the **Window > Show View** menu).

Step Result: All detected changes are listed in the **Review** view and they are marked accordingly in the resulting document as well.

4. You can analyze each detected change one by one and accept or reject them individually or in bulk.
5. Save the changes you made during the reviewing process.

Figure 516. Revised Merged Document

Use Case 2: Compare Differences Between Two Versions

Another interesting way of using the resulting merged document that incorporates the change tracking marks between 2 versions is to apply a transformation of the resulting document into a PDF file that highlights the changes between the compared versions.

Here is the basic procedure (for this particular example, suppose the resulting merged document is a DITA file):

1. Select the **Merge Documents with Change Tracking Highlights** action that is found in the **Tools > Comparison Tools** menu to invoke the tool. It opens a dialog box where you can specify the documents to merge.
2. In the resulting dialog box, you need to provide the URLs of the base version of the document (**Base document**) and the modified version (**Document to merge with**), and then click the **Merge** button.
3. With the resulting merged document open in the editor, click the **Configure Transformation Scenario(s)** button from the toolbar.
4. Select the default read-only scenario **DITA PDF - based on HTML5 & CSS** and click the **Duplicate** button to create a copy so that you can make a few changes to the default settings.
5. In the resulting **Edit DITA Scenario** dialog box, go to the **Parameters** tab and type "changes" in text filter field above the table of parameters. This will display the three parameters that are responsible for displaying the tracked changes in the resulting PDF and they must all be set to the value of yes:
 - `show.changes.and.comments`
 - `show.changes.and.comments.as.changebars`
 - `show.changes.and.comments.as.pdf.sticky.notes`

6. Click **OK**, and with the newly created copy of the scenario selected, click the **Apply associated** button to run the transformation.

Result: Once the transformation is finished, the resulting PDF is automatically opened in the system's default PDF reader (e.g. Adobe). If you hover the mouse over the presented colored markers, you will notice that the tooltip shows that some are of the type "inserted", while others are of the type "deleted". Text areas and fragments with changes are also marked with gray "change" bars on the left. The

changed content is placed between curly brackets and is colored blue or red depending on the type of change (insertion or deletion).

Use Case 3: Compare and Merge Entire Directories

Another use case is to use the **Merge Directories with Change Tracking Highlights** action to merge entire directories instead of specified pairs of XML files.

Here is the basic procedure (for this particular example, suppose you want to review the changes between two versions of an entire DITA project):

1. Select the **Merge Directories with Change Tracking Highlights** action that is found in the **Tools > Comparison Tools** menu to invoke the tool. It opens a dialog box where you can specify the documents to merge.
2. In the resulting dialog box, you need to provide the URLs of the **Base directory**, the **Directory to merge with**, and the **Output directory**.
3. You can optionally select the **Backup the base directory** option. Not that this option is automatically activated and selected in the following cases:
 - The output directory is not specified (the field is left blank).
 - The specified output directory is the base directory itself.

In these situations, a backup of the base directory will be performed automatically and the backup operation must succeed to proceed with the merge. Otherwise, the merge process is aborted.

4. You can adjust the settings in the **Merge options** section. You can find details for each option in [Merge Directories with Change Tracking Highlights: Merge Options \(on page 2064\)](#). Note that all of these options are enabled by default except for **Create change tracking markers for the XML files to be added**.

To better understand the merge options presented in this section, note that the merge process has a preliminary phase where the entire structure and the content of the base directory is copied to the output directory.

Since this example is for reviewing the changes between two versions of an entire DITA project, you would select all options in the **Merge options** section, including the **Create change tracking markers for XML files to be added** option.

- Click the **Merge** button to start the process of generating the results of the merge operation. Depending on the number of files in the compared directories and the total number of changes detected, the process may take some time.

Step Result: The operation report should automatically open in **Author** mode. The listed URLs are actually links that will open the corresponding merged DITA file in the editor. You can inspect the changes and accept or reject them, individually or in bulk.

Merge operation report

Files failed to merge: -

The first group of URLs listed represents the group of XML files detected as modified and merged with change tracking highlights.

The modified non-XML file group follows. Since the **Update the modified non-XML files** option was selected, these type of non-XML files from the **Base directory** were replaced by their corresponding files in the **Directory to merge with**.

Next are the XML files that were initially present only in the **Directory to merge with**. They were also added to the **Output directory**, since the **Add the files found only in the directory to merge with** option was selected.

Since the **Create change tracking markers for the XML files to be added** was also selected, change tracking markers of type "entire content added/inserted" were created. Note that it does not make sense to reject that type of change. The **Create change tracking markers for the XML files to be added** option is not intended for the merge process itself, but it is useful if you want to apply various *Oxygen* transformation scenarios to the resulting output directory, as explained later.

Next comes the group of non-XML files initially present only in the **Directory to merge with** and they were also copied to the output directory. Basically, these are resources (usually image or video files) used by the file group listed above. Clicking these types of file links results in opening them in the appropriate application installed on your computer.

The last group listed in the report represents the group of files from the "base directory" that have no longer counterparts in the "directory to merge with". Since the **Delete the files found only in the base directory** option was selected, these files are eventually deleted, even if they were initially copied to the output directory. The links also work for them, opening the associated files from the **Base directory**.

- Now that you have the directory resulting from the merge operation at your disposal, you can apply a transformation scenario to obtain a PDF document that highlights the changes between the 2 versions. Open the DITA map that resulted from the merge operation in the **DITA Maps Manager**, click the **Configure Transformation Scenario(s)** button in the toolbar of the view, and apply the **DITA Map PDF - based on HTML5 & CSS - Copy** transformation scenario using the same configuration as explained in [Use Case 2: Compare Differences Between Two Versions \(on page 2039\)](#).

Step Result: Once the transformation is finished, the resulting PDF is automatically opened in the system's default PDF reader (e.g. Adobe).

- In Adobe, there is a side view identified as **Bookmarks** (on the right or left side, depending of the Adobe version). By selecting **Contents** in this view and then scrolling down, you can hover the mouse over the presented colored markers for the new topics and you will notice that tooltip shows that they are "inserted". You can click on any of these new topics to scroll to the respective topic and you will notice that it is marked with blue in the document (the color used for newly added content). If you continue to scroll down the PDF, you will notice various "insert" and "delete" changes.
- Click the **Review comments** button on the side stripe of the **Bookmarks** view:

Step Result: A list appears that contains all highlighted changes in the PDF.

9. You can scroll through the list and click on the changes listed to conveniently analyze and review all tracked and highlighted changes between the 2 versions of the DITA project.

WebHelp Responsive Alternative

As an alternative to the **DITA Map PDF - based on HTML5 & CSS** transformation, there are other types of transformations that can be applied to the resulting DITA map, leading to a different kind of output. For example, you can use the **DITA Map WebHelp Responsive** transformation scenario:

1. Select the default read-only scenario **DITA Map WebHelp Responsive** and click the **Duplicate** button to create a copy so that you can make a few changes to the default settings.
2. In the resulting **Edit DITA Scenario** dialog box, go to the **Parameters** tab and type "changes" in text filter field above the table of parameters. Make sure the `webhelp.show.changes.and.comments` parameter is set to `yes`.

3. Click **OK**, and with the newly created copy of the scenario selected, click the **Apply associated** button to run the transformation.

Step Result: Once the transformation finishes, the resulting WebHelp output is opened in your default Internet browser. By clicking on any of the chapters listed, you can browse the respective content and observe how the changes are rendered. The color code is the same (blue for the changes of the type "added" or "inserted", and red for those of the type "deleted"). The yellow markings on the right side also help to navigate through and analyze/review the highlighted changes.

Resources

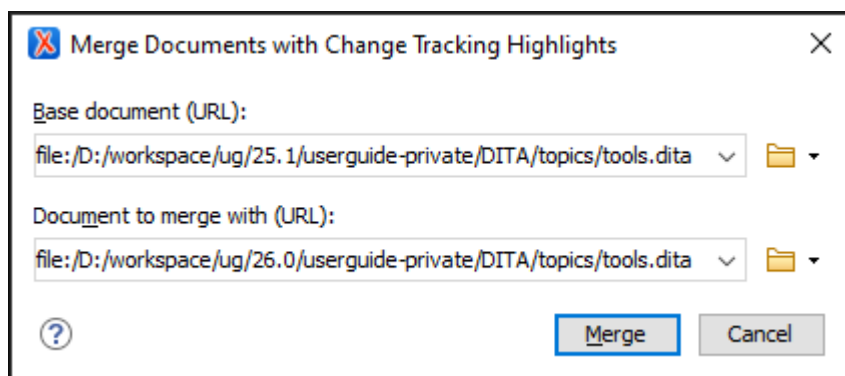

For more information about how to merge documents/directories with change tracking highlights, watch our video demonstration:

Merge Documents with Change Tracking Highlights

The **Merge Documents with Change Tracking Highlights** tool can be used to merge two XML documents (based on a 2-way mode comparison) and the files involved in the process are merged by saving the comparison results as documents with highlighted tracked changes that can later be reviewed and accepted or rejected.

To invoke the tool, select the **Merge Documents with Change Tracking Highlights** action that is found in the **Tools > Comparison Tools** menu. It opens a dialog box where you can specify the documents to merge.

Figure 517. Merge Documents with Change Tracking Highlights Dialog Box

The **Merge Documents with Change Tracking Highlights** dialog box contains the following options:

Base document (URL)

Specifies the URL of the base document.

Directory to merge with (URL)

Specifies the URL of the document to merge with.

After specifying the documents to be merged, click the **Merge** button to trigger the operation.

Once the merge operation is complete, the merged document is opened in a new editor tab. With the merged document open in **Author** mode, the highlighted tracked changes can easily be reviewed and accepted or rejected, thus finishing the entire merge process. Initially, the merged document is untitled and not saved. You

can choose the name when saving it in a location of your choosing (for example, a common use case is to overwrite the base document with the final resulting merged file).

Additional Notes and Limitations:

- When comparing documents in **Author** mode, changes made in the prolog of XML documents (where the XML version and encoding are declared) are not reported and therefore not considered in the merge process.
- Any "doctype" changes are not reported and therefore not considered in the merge process.
- If one or both of the compared XML documents contain tracked changes (represented internally by custom XML processing instructions), all these modifications are automatically accepted prior to the compare and merge procedures.

For more information about the merge with change tracking support, see the following resources:

- Video: [Mastering Document Comparisons: A Guide to Generating Tracked Changes Between Two Versions](#)
- Webinar: [Discover the Power of Diff with Change Tracking](#)

Compare Directories Tool

The **Compare Directories** tool can be used to compare and manage changes to files and folders within the structure of your directories. The utility is available from the **Tools > Comparison Tools** menu or can be opened as a stand-alone application from the Oxygen XML Developer installation folder ([diffDirs.exe](#)).

Figure 518. Diff Directories Dialog Box

Starting the Tool from a Command Line

The directory comparison tool can also be started by using command-line arguments. In the installation folder there is an executable shell (`diffDirs.bat` on Windows, `diffDirs.sh` on macOS and Linux). To specify the directories to compare, you can pass command-line arguments using the following construct:

```
diffDirs.bat/diffDirs.sh [directory path 1] [directory path 2].
```

If you pass only one argument, you are prompted to manually choose the second directory or archive.

Example:

To do a comparison between two directories, the command line would look like this:

Windows

```
diffDirs.bat "c:\documents new" "c:\documents old"
```

Tip:

If there are spaces in the path names, surround the paths with quotes.

Linux

```
diffDirs.sh home/documents1 home/documents2
```

macOS

```
diffDirs.sh documents1 documents2
```

Directory Comparisons

To perform a directory comparison, follow these steps:

1. Select a folder in the left panel and the folder you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the **Browse for local directory** action in the  **Browse** drop-down menu.

Step Result: The selected directory structures are opened in the two side-by-side panels.

2. To highlight the differences between the two folders, click the  **Perform Directories Differencing** button from the toolbar.
3. You can also use the  **Diff Options** button to access the [Directories Comparison preferences page \(on page 255\)](#) where you can configure various options.

To compare the content of two archives, follow these steps:

1. Use the **Browse for archive file** action in the  **Browse** drop-down menu to select the archives in the left and right panels.
2. By default, the supported archives are not treated as directories and the comparison is not performed on the files inside them. To make Oxygen XML Developer treat supported archives as directories, select the **Look in archives** option [\(on page 256\)](#) in the **Directories Comparison** preferences page.
3. To highlight the differences, click the  **Perform Directories Differencing** button from the toolbar.

The directory comparison results are presented using two tree-like structures showing the files and folders, including their name, size, and modification date. A column that contains graphic symbols separates the two tree-like structures. The graphic symbols can be one of the following:

- An **X** symbol, when a file or a folder exists in only one of the compared directories.
- A **≠** symbol, when a file exists in both directories but the content differs. The same sign appears when a collapsed folder contains differing files.

The color used for the symbol and the directory or file name can be customized in the [Directories Comparison / Appearance preferences page \(on page 256\)](#). You can double-click lines marked with the **≠** symbol to open a **Compare Files** window, which shows the differences between the two files.

The directories that contain files that differ are expanded automatically so that you can focus directly on the differences. You can merge the contents of the directories by using the copy actions. If you double-click (or press **Enter**) on a line with a pair of files, Oxygen XML Developer starts a [file comparison \(on page 433\)](#) between the two files, using the **Compare Files** tool.

[Compare Directories Script \(on page 2251\)](#)

Toolbar and Contextual Menu Actions of the Compare Directories Tool

The toolbar of the **Compare Directories** tool contains operations that can be performed on the compared directory structure. Some of the toolbar actions are also available in the contextual menu.

Figure 519. Compare toolbar

Toolbar Actions

Perform Directories Differencing

Looks for differences between the two directories displayed in the left and right side of the application window.

Perform Files Differencing

Opens the **Compare Files** tool ([on page 433](#)) that allows you to compare the currently selected files.

Copy Change from Right to Left

Copies the selected change from the right side to the left side (if there is no file/folder in the right side, the left file/folder is deleted).

Copy Change from Left to Right

Copies the selected change from the left side to the right side (if there is no file/folder in the left side, the right file/folder is deleted).

Binary Compare

Performs a byte-level comparison on the selected files.

Diff Options

Opens the **Directory Comparison preferences page** ([on page 255](#)) where you can configure various options.

Show Only Modifications

Displays a more uncluttered file structure by hiding all identical files.

Save Results as HTML

Generates an HTML file that contains detailed information about the comparison result.

File and folder filters

Differences can be filtered using three combo boxes: **Include files**, **Exclude files**, and **Exclude folders**. They come with predefined values and are editable to allow custom values. All of them accept multiple comma-separated values and the * and ? wildcards. For example, to filter out

all JPEG and GIF image files, edit the **Exclude files** filter box to read ***.jpeg, *.png**. Each filter includes a drop-down menu with the latest 15 filters applied.

Contextual Menu Actions

Perform Files Differencing

Opens the **Compare Files** tool ([on page 433](#)) that allows you to compare the currently selected files.

Binary Compare

Performs a byte-level comparison on the selected files.

Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

Copy Change from Left to Right

Copies the selected difference from the file in the left panel to the file in the right panel.

Open

If the action is invoked on a file, the selected file is opened in Oxygen XML Developer. If the action is invoked on a directory, the selected directory is opened in the default file browser for your particular operating system.

Open in System Application

Opens the selected file in the system application that is associated with that type of file. The action is available when launching the **Compare Directories** tool from the **Tools** menu in Oxygen XML Developer.

Show in Explorer

Opens the default file browser for your particular operating system with the selected file highlighted.

Compare Directories Tool Menus

The menus in the **Compare Directories** tool contain some of the same actions that are on the toolbar, as well as some common actions that are identical to the same actions in the Oxygen XML Developer menus. The menu actions include:

File Menu

Save Results as HTML

Generates an HTML file that contains detailed information about the comparison result. See an [example of what the generated report look like in the Generate HTML Report for Directory Comparison topic \(on page 466\)](#).

Close (Ctrl + W (Command + W on macOS))

Closes the application.

Compare Menu

Perform Directories Differencing

Looks for differences between the two directories displayed in the left and right side of the application window.

Perform Files Differencing

Opens the **Compare Files** tool (*on page 433*) that allows you to compare the currently selected files.

Copy Change from Right to Left

Copies the selected change from the right side to the left side (if there is no file/folder in the right side, the left file/folder is deleted).

Copy Change from Left to Right

Copies the selected change from the left side to the right side (if there is no file/folder in the left side, the right file/folder is deleted).

Options Menu

Preferences

Opens the preferences dialog box that includes numerous pages of options that can be configured.

Menu Shortcut Keys

Opens the **Menu Shortcut Keys** option page where you can configure keyboard shortcuts available for menu items.

Reset Global Options

Resets options to their default values. Note that this option appears only when the tool is executed as a stand-alone application.

Import Global Options

Allows you to import an options set that you have previously exported.

Export Global Options

Allows you to export the current options set to a file.

Help Menu

Help (F1)

Opens a **Help** dialog box that displays the User Manual at a section that is appropriate for the context of the current cursor position.

Use Online Help

If this option is selected, when you select Help or press F1 while hovering over any part of the interface, Oxygen XML Developer attempts to open the help documentation in online mode. If this option is not selected or an internet connection fails, the help documentation is opened in offline mode.

Report problem

Opens a dialog box that allows the user to write the description of a problem that was encountered while using the application. You can change the URL where the reported problem is sent by using the `com.oxygenxml.report.problems.url` system property. The report is sent in XML format through the `report` parameter of the POST HTTP method.

Support Center

Opens the Oxygen XML Developer Support Center web page in a browser.

Compare Images

You can use the **Compare Directories** tool to compare images. If you double-click a line that contains two different images, the **Compare images** window is displayed. This dialog box presents the images in the left and right sides, scaled to fit the available view area. You can use the contextual menu actions to scale the images to their original size or scale them down to fit in the view area.

The supported image types are: *GIF, JPG, JPEG, PNG, and BMP*.

Compare Directories Against a Base (3-Way) Tool

The **Compare Directories Against a Base (3-way)** tool allows you to perform three-way comparisons on directories to help you identify and merge changes between multiple modifications of the same directory structure. It is especially helpful for teams that have multiple authors contributing documents to the same directory system. It offers information about conflicts and changes, and includes actions to easily merge, accept, overwrite, or ignore changes to the directory system.

How to Perform 3-Way Directory Comparisons

To perform a 3-way directories comparison, follow these steps:

1. Select  **Compare Directories Against a Base (3-way)** from the **Tools > Comparison Tools** menu.

Step Result: This opens a dialog box that allows you to select the 3 file sets that will be used for the comparison.

Figure 520. Compare Directories Against a Base File Set Chooser

2. Select the file sets to be compared:

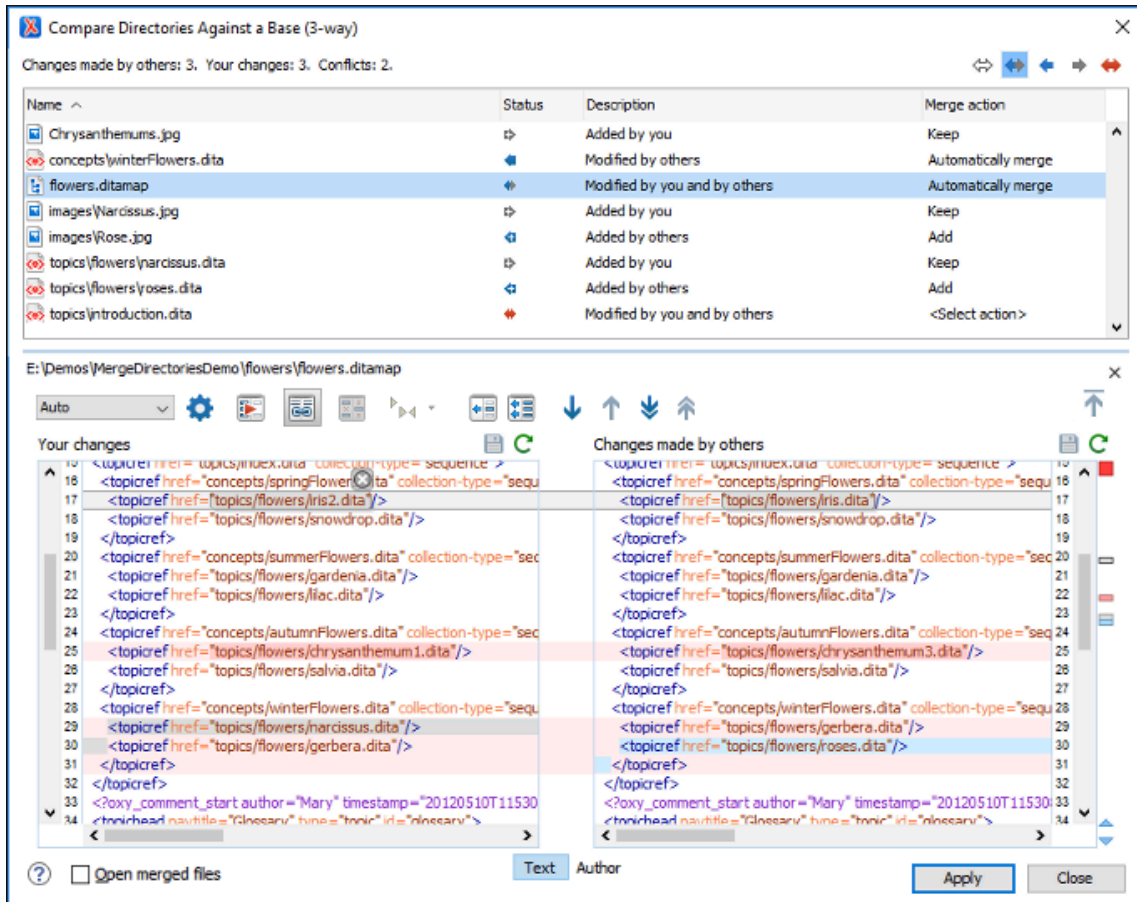

- **Base directory** - This is the original (base) file set before any modifications were made by you or others.
- **Directory with your changes** - This is the file set with changes that you have made. This file set will be displayed in the left panel in the comparison tool.
- **Directory with changes made by others** - This is the file set with changes made by others that you want to merge with your changes. This file set will be displayed in the right panel in the comparison tool.

3. Click the **Compare** button to compare the file sets and open the comparison and merge tool.

4. Use the features and actions described in the next section to identify and merge the changes.

3-Way Directory Comparison and Merge Tool

Figure 521. Comparison and Merge Tool

The 3-way directory comparison and merge tool includes the following information, features, and actions:

Number of Changes and Conflicts

The first thing you see in the top-left corner of the tool is the grand total of all the changes made by others, changes made by you, and the number of conflicts.

Filter Buttons

In the top-right corner you can use the toggle buttons to filter the list of modifications:

⇆ Show all files

Use this button to show all modified and unmodified files, as well as conflicts.

⇆ Show only files modified by you and others

Filters the list to show all files that have been modified, including conflicts.

⇆ Show only files modified by others

Filters the list to only show the files that were modified by others.

⇆ Show only files modified by you

Filters the list to only show the files that were modified by you.

Show only conflicting files

Filters the list to only show files that contain conflicts.

List of Files Panel

This panel shows the list of files in the compared file sets based upon the filter button that is selected. This panel includes the following sortable columns:

- **Name** - The file names.
- **Status** - An icon that represents the file status. Red icons indicate some sort of conflict. Gray icons indicate modifications made by you. Blue icons indicate modifications made by others.
- **Description** - A description of the file status.
- **Merge Action** - This column provides a drop-down menu for each file that allows you to choose some merge actions depending upon its status. A default action is always set to **Automatically merge** the changes made by others with your changes. If there is a conflict, the default is **<Select action>** and you are required to make a selection. Click this column to access the drop-down menu where you can make a selection. The same actions are available in the contextual menu.

Tip:

If the solution proposed in the **Merge Action** column for any particular file is not satisfactory, you can change it directly in that column (even if that file is not selected) without automatically re-triggering the comparison (except for in certain cases where re-triggering the comparison is necessary).

You can click a file to open it in the file comparison panel (the file from your file set is shown in the left panel while the file from the file set with changes made by others is shown in the right panel). For image files, the comparison panel shows a preview of the image. For other binary files, a preview is not available and you will just see its status.

File Comparison Panels

If you click a file in the top panel, the file is opened in this file comparison section. The file from your file set is shown in the left panel and the file from the other file set is shown in the right panel.

Note:

If Oxygen XML Developer does not recognize the file type, a dialog box will be displayed that allows you to select the type of editor you want it to be associated with for this comparison (if you want Oxygen XML Developer to remember this association, you can select the **Associate file type with editor** option at the bottom of the dialog box).

This panel includes the following information and toolbar actions:

File Path

The first thing you see in this panel is the file path where merge actions will be applied if you make changes.

✕ Close

Closes the file comparison panel.

Algorithm Drop-down Menu

This drop-down menu allows you to select one of the following diff algorithms to be used for file comparisons:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

 Diff Options

Opens the [Files Comparison preferences page \(on page 252\)](#) where you can configure various options.

**Perform Files Differencing**

Looks for differences between the two files displayed in the left and right side panels.

**Synchronized scrolling**

Toggles synchronized scrolling. When toggled on, a selected difference can be seen in both panels.

**Ignore Whitespaces**

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

**Copy Change from Right to Left**

Copies the selected difference from the file in the right panel to the file in the left panel.

**Copy All Changes from Right to Left**

Copies all changes from the file in the right panel to the file in the left panel.

↓ **Next Block of Changes (Ctrl + Period (Command + Period on macOS))**

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

Note:

A change block groups one or more consecutive lines that contain at least one change.

↑ **Previous Block of Changes (Ctrl + Comma (Command + Comma on macOS))**

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

↘ **Next Change (Ctrl + Shift + Period (Command + Shift + Period on macOS))**

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

↖ **Previous Change (Ctrl + Shift + Comma (Command + Shift + M on macOS))**

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

↖ **First Change (Ctrl + B (Command + B on macOS))**

Jumps to the first change.

Left-Side File (Your changes)

Above the panel you can see the file path and the following two buttons:

Save

Saves changes made to the file.

Reload

Reloads the file.

Right-Side File (Changes made by others)

Above the panel you can see the file path and the following two buttons:

Reload

Reloads the file.

Displaying Changes in the File Comparison Panels

The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes.

Figure 522. File Comparison Panels

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the [Files Comparison / Appearance preferences page \(on page 254\)](#), but the default colors and their shades mean the following:

- **Pink** - Identifies modifications on either side.
- **Gray** - Identifies an addition of a node in the left side (your outgoing changes).
- **Blue** - Identifies an addition of a node in the right side (incoming changes).
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

Direct Editing Actions in the File Comparison Panels

In addition to selecting merge actions from the drop-down menus in the **Merge Action** column in the top panel, you can also edit the files directly in the left pane (your local changes). The two editors are constantly synchronized and the differences are refreshed when you save the modified document ( **Save** button or **Ctrl+S**) or when you click the  **Perform File Differencing** button.

A variety of actions are available in the contextual menu in both editing panes. The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

Append right change to left

Copies the content of the selected change from the right side and appends it on the left side.

Copy change from right to left

Replaces the content of a change in the left side with the content of the change in the right side.

Remove change

Removes the change from the left side.

Anytime you save manual changes ( **Save** button or **Ctrl+S**), the selection in the **Merge Action** column in the top panel automatically changes to **Use merged** and a copy of the original file is kept so that you can revert to the original file if necessary. To discard your manual changes and revert to your original changes, select a different action in the **Merge Action** drop-down menu.

Open Merged Files

If you select this option, all the files that will be modified by the merge operation will be opened in the editor after the operation is finished.

Applying Changes

When you click the **Apply** button, all the merge actions you have selected and the changes you have made will be processed.

If there are unresolved conflicts (conflicts where no merge action is selected in the **Merge Action** drop-down menu), a dialog box will be displayed that allows you to choose how to solve the conflicts. You can choose between the following:

- **Keep your changes** - If you select this option and then click **Apply**, your local changes will be preserved for the unresolved conflicts.
- **Overwrite your changes** - If you select this option and then click **Apply**, your local changes will be overwritten with the changes made by others, for the unresolved conflicts.
- **Cancel** - You can click the **Cancel** button to go back to the merge tool to resolve the conflicts individually.

Canceling Changes

If you click the **Cancel** button at the bottom of the merge tool, all the changes you made in the tool will be lost.

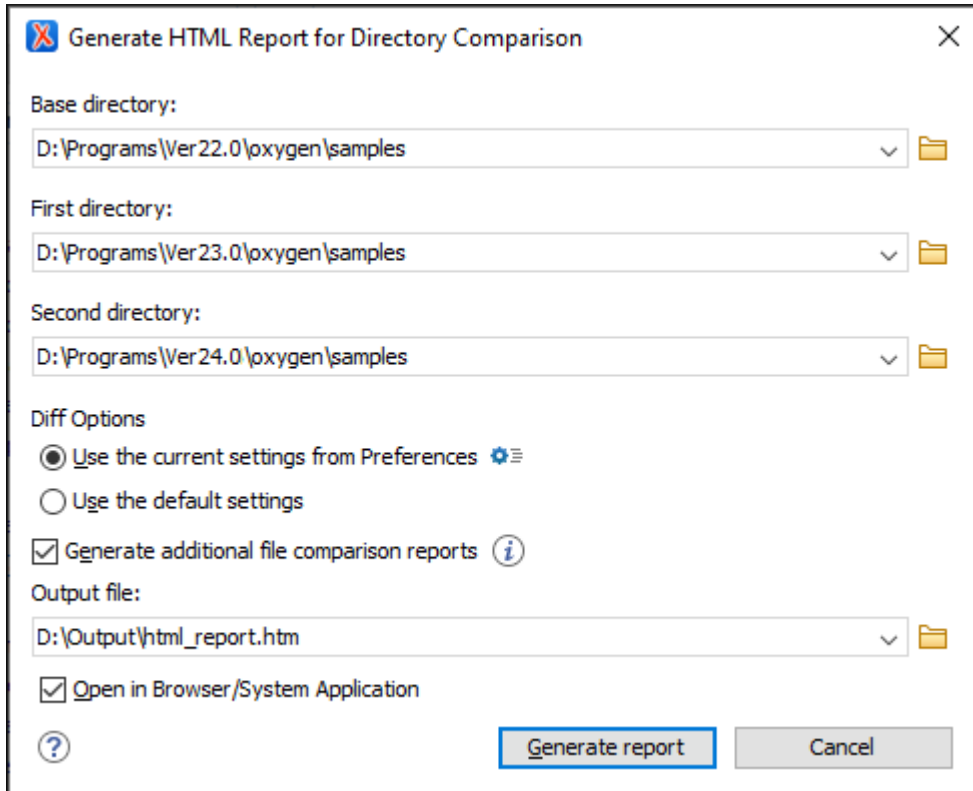

Related information

[Compare Directories Tool \(on page 451\)](#)

[Compare Files Tool \(on page 433\)](#)

Generate HTML Report for Directory Comparison

The **Generate HTML report for directory comparison** tool can be used to generate a report in the form of an HTML file that contains the results of a directory comparison (for either 2-way or 3-way comparisons). The **Generate HTML report for directory comparison** action for invoking the tool can be found in the **Tools > Comparison Tools** menu. It opens a dialog box where you can specify the directories to compare as well as some other options.

Figure 523. Generate HTML Report for Directory Comparison Dialog Box

The **Generate HTML report for directory comparison** dialog box contains the following options:

Base directory

Specifies the path of the base directory that the other two directories will be compared against in a 3-way comparison. This field should be left empty for 2-way comparisons.

First directory

Specifies the path of the first directory to be included in the comparison.

Second directory

Specifies the path of the second directory to be included in the comparison.

Diff options

Specifies which option set to use for generating the comparison report. If you choose **Use the current settings from Preferences**, the options set in the **Directories Comparison preferences page (on page 255)** and the **include/exclude filter options in the Compare Directories tool (on page 454)** are taken into account when generating the comparison result. You can also click the  **Diff options** button to open the **Directories Comparison preferences page** where you can see or modify the current settings. If you choose **Use the default settings**, the default values for all settings are used.

Generate additional file comparison reports

Generates further comparison reports for all non-binary modified file pairs and provides links to them in the main report (in the middle cells of the results table). [See the example below \(on page 2062\)](#). These additional file comparison reports are saved to a directory that will have the

same parent directory and the same name as the output file provided, suffixed by **"-OXY-FC-REPORTS"**. The links created in the main report are relative to this directory. If the main HTML report is later copied or moved to another location, to retain full functionality in the browser, the directory with the additional file comparison reports must also be copied/moved to the same location.

 **Note:**
Generating additional file comparison reports could significantly increase the execution time. A progress tracker for the whole operation is available.

 **Tip:**
An XPath expression specified in the **Ignore nodes by XPath** text field within the **Files Comparison preferences page (on page 252)** is now taken into account if you enable the **Generate additional file comparison reports** option.

Output file

Specifies the path for an output file to save the comparison results file.

Open in Browser/System Application

Opens the comparison results file in the browser or system application that is associated with HTML files.

After clicking the **Generate report** button, a report in the form of an HTML file is generated with details about the comparison results.

Related information

[Compare Directories Tool \(on page 451\)](#)

[Compare Directories Against a Base \(3-Way\) Tool \(on page 457\)](#)

[Compare Files Tool \(on page 433\)](#)

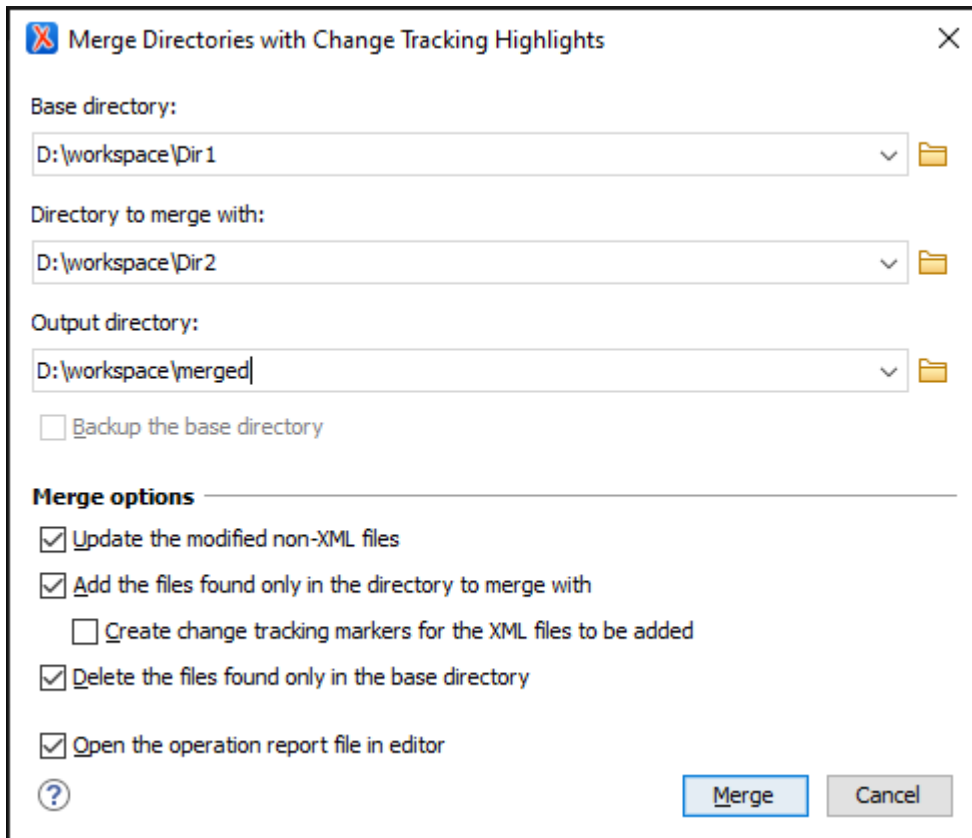

Merge Directories with Change Tracking Highlights

The **Merge Directories with Change Tracking Highlights** tool can be used to merge two directories (based on a 2-way mode comparison) and all pairs of modified XML files involved in the process are merged by saving the comparison results as documents with highlighted tracked changes that can be later reviewed and accepted or rejected.

All other detected situations are treated based on several options that are applicable to both XML and non-XML files, or another option that is applicable only to non-XML files.

To invoke the tool, select the **Merge Directories with Change Tracking Highlights** action that is found in the **Tools > Comparison Tools** menu. It opens a dialog box where you can specify the directories to merge and the output directory to save the results, as well as some other options.

Figure 526. Merge Directories with Change Tracking Highlights Dialog Box

The **Merge Directories with Change Tracking Highlights** dialog box contains the following options:

Base directory

Specifies the path of the base directory.

Directory to merge with

Specifies the path of the directory to merge with.

Output directory

Specifies the path of the directory where the merge operation results are saved to. You can leave this field blank and the merge results will be saved in the base directory by overwriting it, or you can choose a separate output directory.

Note:

You cannot choose the same directory specified as the directory to merge with as the output directory.

Backup the base directory

If this option is selected, a backup copy is saved on your hard disk when the operation completes. This option is automatically activated and selected in the following cases:

- The output directory is not specified (the field is left blank).
- The specified output directory is the base directory itself.
- In both of the above situations, a backup of the base directory will be performed automatically and the backup operation must succeed to proceed with the merge. Otherwise, the merge process being aborted.

**Note:**

The backup copy will have the same parent directory as the base directory and its name will be the name of the base directory suffixed by ".OXY.BAK".

Merge options

The merge process has a preliminary phase where the entire structure and the content of the base directory is copied to the output directory. The following merge options are available:

Update the modified non-XML files

If this option is selected, all files in the output directory that are copies of non-XML files in the base directory are replaced by their corresponding files in the directory to merge with. Otherwise, they remain unchanged.

Add the files found only in the directory to merge with

If this option is selected, all files that are only present in the directory to merge with are also added to the output directory.

Create change tracking markers for the XML files to be added

This option can only be used in conjunction with the **Add the files found only in the directory to merge with** option. Select this option if you want to create change tracking markers for the XML files that are only present in the directory to merge with and will be added to the output directory. Although these files have no counterparts in the base directory, change tracking markers of type "entire content added/inserted" will be created.

The option is not necessarily intended for the merge process itself, but it is useful if you want to apply various *Oxygen* transformation scenarios to the resulting output directory. For example, if you merge 2 versions of a DITA project and then want a PDF to highlight the changes between those versions, you can apply a transformation on the resulting `ditamap` file. This option results in presenting the new DITA files as "added content" in the resulting PDF.

Delete the files found only in the base directory

If this option is selected, all files that are only present in the base directory and initially copied to the output directory are deleted. Otherwise, they are preserved.

Open the operation report file in editor

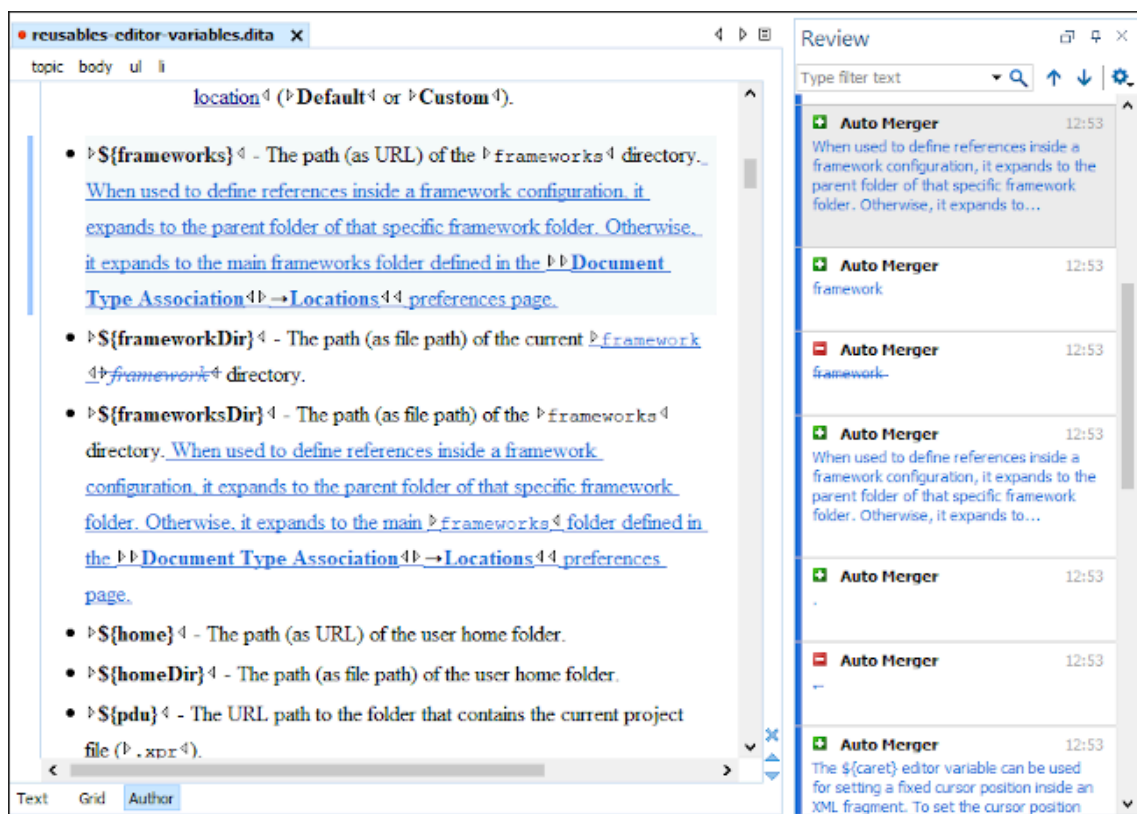

Opens the merge operation report (XML file) in the editor.

Once the merge operation is complete, loading the report file in Oxygen XML Developer provides additional functionality. Aside from the fact that the report provides an overview of the merge process, it also provides links to all the files in the resulting output directory. This is helpful for generating XML documents with tracked changes. For example, you can use the respective links to load these XML files in **Author** mode to review the tracked changes and accept or reject them. This phase of reviewing and manually merging the XML files is typically the final phase of the entire merge procedure.

Syncro SVN Client (Deprecated)

The Syncro SVN Client is a client application for the Apache Subversion™ version control system, compatible with Subversion 1.6, 1.7, and 1.8 servers. It manages files and directories that change over time and are stored in a central repository. The version control repository is much like an ordinary file server, except that it remembers every change ever made to your files and directories. This allows you to access older versions of your files and examine the history of how and when your data changed.

To start Syncro SVN Client, go to **Tools > SVN Client**.

Attention:

The Syncro SVN Client that comes bundled with Oxygen XML Developer is considered deprecated as of version 21.0.

Main Window

This section explains the main window of Syncro SVN Client.

Views

The main window consists of the following views:

- **Repositories view** ([on page 2157](#)) - Allows you to define and manage Apache Subversion™ repository locations.
- **Working Copy view** ([on page 2162](#)) - Allows you to manage with ease the content of the working copy.
- **History view** ([on page 2177](#)) - Displays information (author name, revision number, commit message) about the changes made to a resource during a specified period of time.
- **Editor view** ([on page 2183](#)) - Allows you to edit various types of text files, with full syntax-highlight.
- **Annotations view** ([on page 2184](#)) - Displays a list with information regarding the structure of a document (author and revision for each line of text).
- **Compare view** ([on page 2186](#)) - Displays the differences between two revisions of a text file from the working copy.
- **Image Preview panel** ([on page 2190](#)) - Allows you to preview standard image files supported by Syncro SVN Client: JPG, GIF and PNG.
- **Compare Images view** ([on page 2190](#)) - Displays two images side by side.
- **Properties view** ([on page 2190](#)) - Displays the SVN properties of a resource under version control.
- **Console view** ([on page 2192](#)) - Displays information about the currently running operation, similar with the output of the Subversion command-line client.
- **Dynamic Help view** ([on page 2192](#)) - Shows information about the currently selected view.

The main window's status bar presents in the left side the operation in progress or the final result of the last performed action. In the right side there is a progress bar for the running operation and a stop button to cancel the operation.

SVN Main Menu

The main menu of the Syncro SVN Client is composed of the following menus:

File Menu

New submenu:

New File

This operation creates a new file as a child of the selected folder from the **Repositories view** ([on page 2157](#)) tree or the **Working Copy view** ([on page 2162](#)) tree, depending on the view that was last used. Note that for the **Working Copy view** ([on page 2162](#)), the file is added to *version control* only if the selected folder is under *version control*.

New Folder (Ctrl + Shift + F (Command + Shift + F on macOS))

This operation creates a new folder as a child of the selected folder from the **Repositories view** (on page 2157) tree or the **Working Copy view** (on page 2162) tree, depending on the view that was last used. Note that for the **Working Copy view** (on page 2162), the file is added to *version control* only if the selected folder is under *version control*.

New External Folder (Ctrl + Shift + W (Command + Shift + W on macOS))

This operation allows you to add a new external definition on the selected folder. An external definition is a mapping of a local directory to a **URL of a versioned directory** (on page 2197), and ideally a particular revision, stored in the `svn:externals` property of the selected folder.

**Tip:**

You can specify a particular revision of the external item by using a **peg revision** (on page 2199) at the end of the URL (for example, `URL@rev1234`). You can also use peg revisions to access external items that were deleted, moved, or replaced.

The URL used in the external definition format can be relative. You can specify the repository URL that the external folder points to by using one of the following relative formats:

- `../` - Relative to the URL of the directory that the `svn:externals` property is set.
- `^/` - Relative to the root of the repository where the `svn:externals` property is versioned.
- `//` - Relative to the scheme of the URL of the directory that the `svn:externals` property is set.
- `/` - Relative to the root URL of the server that has the `svn:externals` property versioned.

**Important:**

To change the target URL of an external definition, or to delete an external item, do the following:

1. Modify or delete the item definition found in the `svn:externals` property that is set on the parent folder.
2. For the change to take effect, use the **Update** operation on the parent folder of the external item.

**Note:**

Syncro SVN Client does not support definitions of local relative external items.

Open (Ctrl + O (Command + O on macOS))

This action opens the selected file in an editor where you can modify it. The action is active only when a single item is selected. The action opens a file with the internal editor or the external application associated with that file type. This action works on any file selection from the **Repositories view** (*on page 2157*), **Working Copy view** (*on page 2162*), **History view** (*on page 2177*), or **Directory Change Set view** (*on page 2182*), depending on the view that was last used to invoke it. In the case of a folder, the action opens the selected folder with the system application for folders (for example, Windows Explorer on Windows or Finder on macOS). Note that opening folders is available only for folders selected in the **Working Copy view** (*on page 2162*).

Open with (Ctrl + Shift + O (Command + Shift + O on macOS))

Displays the **Open with** dialog box for specifying the editor where the selected file is opened. If multiple files are selected only external applications can be used to open the files. This action works on any file selection from **Repositories view** (*on page 2157*), **Working Copy view** (*on page 2162*), **History view** (*on page 2177*), or **Directory Change Set view** (*on page 2182*), depending on the view that was last used to invoke it.

Show in Explorer/Show in Finder

Opens the parent directory of the selected working copy file and selects the file.

**Save (Ctrl + S (Command + S on macOS))**

Saves the local file currently opened in the editor or the **Compare** view.

Save as

Saves any file selected in the **Repositories**, **History**, or **Directory Change Set** view.

Copy URL Location (Ctrl + Alt + U (Command + Option + U on macOS))

Copies the URL location of the resource currently selected in the **Repositories** view to clipboard.

**Copy to**

Copies the currently selected resource, either in **Repositories** or **Working copy** view, to a specified location.

**Note:**

This action can also be used from **History** and **Directory Change Set** views to recover older versions of a repository item.

Move to (Ctrl + M (Command + M on macOS))

Moves the currently selected resource, either in **Repositories** or **Working copy** view, to a specified location.

Rename (F2)

Renames the resource currently selected, either in **Repositories** or **Working copy** view.

✗ Delete (Delete)

Deletes the resource currently selected either, in **Repositories** or **Working copy** view.

Locking:

- **Scan for locks (Ctrl + L (Command + L on macOS))** - Contacts the repository and recursively obtains the list of locks for the selected resources. A dialog box containing the locked files and the lock description will be displayed. This is only active for resources under *version control*. For more details see [Scanning for locks \(on page 2098\)](#).
- **🔒 Lock (Ctrl + K (Command + K on macOS))** - Allows you to lock certain files that need exclusive access. You can write a comment describing the reason for the lock and you can also force (*steal*) the lock. This action is active only on files under *version control*. For more details on the use of this action see [Locking a file \(on page 2099\)](#).
- **🔓 Unlock (Ctrl + Alt + K (Command + Option + K on macOS))** - Releases the exclusive access to a file from the repository. You can also choose to unlock it by force (*break the lock*).

**Show SVN Properties (Ctrl + P (Command + P on macOS))**

Opens the **Properties** view ([on page 2190](#)) and displays the SVN properties for a selected resource from **Repositories** view ([on page 2157](#)) or **Working Copy** view ([on page 2162](#)), depending on the view that was last used to invoke it.

**Show SVN Information (Ctrl + I (Command + I on macOS))**

Provides additional information for a selected resource. For more details, go to [Obtain information for a resource \(on page 2115\)](#).

Exit (Ctrl + Q (Command + Q on macOS))

Closes the application.

Edit Menu **Undo (Ctrl + Z (Command + Z on macOS))**

Undo edit changes in the local file that is currently opened in the editor or the **Compare** view.

 **Redo (Ctrl + Y (Command + Y on macOS))**

Redo edit changes in the local file that is currently opened in the editor or the **Compare** view.

 **Cut (Ctrl + X (Command + X on macOS))**

Cut selection from the local file that is currently opened in the editor view or the **Compare** view to clipboard.

 **Copy (Ctrl + C (Command + C on macOS))**

Copy selection from the local file that is currently opened in the editor or the **Compare** view to clipboard.

 **Paste (Ctrl + V (Command + V on macOS))**

Paste selection from clipboard into the local file that is currently opened in editor or the **Compare** view.

 **Find/Replace (Ctrl + F (Command + F on macOS))**

Perform find and replace operations in the local file that is currently opened in the editor or the **Compare** view.

 **Find Next (F3)**

Go to the next match using the same find options of the last find operation. This action runs in the editor panel and in any non-editable text area (for example, the **Console** view).

 **Find Previous (Shift + F3)**

Go to the previous match using the same find options of the last find operation. This action runs in the editor panel and in any non-editable text area (for example, the **Console** view).

Repository Menu **New Repository Location (Ctrl + Alt + N (Command + Option + N on macOS))**

Displays the **Add SVN Repository** dialog box. This dialog box allows you to define a new repository location.

Figure 529. Add SVN Repository Dialog Box

If the **Validate repository connection** option is selected, the URL connection is validated before being added to the **Repositories** view.

Edit Repository Location (Ctrl + Alt + E (Command + Option + E on macOS))

Context-dependent action that allows you to edit the selected repository location using the **Edit SVN Repository** dialog box. It is active only when a repository location root is selected.

Change the Revision to Browse (Ctrl + Alt + B (Command + Option + B on macOS))

Context-dependent action that allows you to change the selected repository revision using the **Change the Revision to Browse** dialog box. It is active only when a repository location root is selected.

Remove Repository Location (Ctrl + Alt + R (Command + Option + R on macOS))

Allows you to remove the selected repository location from the view. It shows you a confirmation dialog box before removal. It is active only when a repository location root is selected.

Refresh (F5)

Refreshes the resource selected in the **Repositories** view.

Check out (Ctrl + Alt + O (Command + Option + O on macOS))

Allows you to create a working copy from a repository directory, on your local file system. To read more about this operation, see [Check out a working copy \(on page 2088\)](#).

Export

Opens the **Export** dialog box ([on page 2152](#)) that allows you to configure options for exporting a folder from the repository to the local file system.

Import:

Import folder (Ctrl + Shift + L (Command + Shift + L on macOS))

Allows you to import the contents of a specified folder from the file system into the selected folder in a repository. To read more about this operation, see the section [Importing resources into a repository \(on page 2151\)](#).

**Note:**

The difference between the **Import folder** and **Share project** actions is that the latter also converts the selected directory into a working copy.

Import Files (Ctrl + Shift + I (Command + Shift + I on macOS))

Imports the files selected from the files system into the selected folder in the repository.

Working Copy Menu**Working Copies Manager (📁 on macOS)**

Opens a dialog box with a list of working copies that the Apache Subversion™ client is aware of. In this dialog box you can add existing working copies or remove those that are no longer needed.

Switch to

Selects one of the following view modes: **All Files**, **Modified**, **Incoming**, **Outgoing**, or **Conflicts**.

**Refresh (F5)**

Refreshes the state of the selected resources or of the entire working copy (if there is no selection).

**Synchronize (Ctrl + Shift + S (Command + Shift + S on macOS))**

Connects to the repository and determines the working copy and repository changes made to the selected resources. The application switches to **Modified** view mode if the **Always switch to 'Modified' mode** option ([on page 249](#)) is selected.

Update (Ctrl + U (Command + U on macOS))

Updates all the selected resources that have incoming changes to the HEAD revision. If one of the selected resources is a directory then the update for that resource will be recursive.

Update to revision/depth

Allows you to update the selected resources from the working copy to an earlier revision from the repository. You can also select the update *depth* for the current folder. You can find out more about the *depth* term in the [sparse checkouts \(on page 2156\)](#) section.

Commit

Collects the outgoing changes from the selected resources in the working copy and allows you to choose exactly what resources to commit. A directory will

always be committed recursively. Unversioned resources will be deselected by default. In the **Commit** dialog box you can also enter a comment before sending your changes to the repository.

Update all (Ctrl + Shift + U (Command + Shift + U on macOS))

Updates all resources from the working copy that have incoming changes. It performs a recursive update on the synchronized resources.

Commit all

Commits all the resources with outgoing changes. It is disabled when **Incoming** mode is selected or the synchronization result does not contain resources with outgoing changes. It performs a recursive commit on the synchronized resources.

Revert (Ctrl + Shift + V (Command + Shift + V on macOS))

Undoes all local changes for the selected resources. It does not contact the repository and the files are obtained from Apache Subversion™ pristine copy. It is available only for modified resources. See [Revert your changes \(on page 2106\)](#) for more information.

Edit conflict (Ctrl + E (Command + E on macOS))

Opens the **Compare** editor, allowing you to modify the content of the currently conflicting resources. For more information about editing conflicts, see [Edit conflicts \(on page 2104\)](#).

Mark Resolved (Ctrl + Shift + R (Command + Shift + R on macOS))

Instructs the Subversion system that you resolved a conflicting resource. For more information, see [Merge conflicts \(on page 2107\)](#).

Mark as Merged (Ctrl + Shift + M (Command + Shift + M on macOS))

Instructs the Subversion system that you resolved the pseudo-conflict by merging the changes and you want to commit the resource. Read the [Merge conflicts \(on page 2107\)](#) section for more information about how you can solve the pseudo-conflicts.

Override and Update

Drops any outgoing change and replaces the local resource with the HEAD revision. This action is available on resources with outgoing changes, including conflicting ones. See the [Revert your changes \(on page 2106\)](#) section.

Override and Commit

Drops any incoming changes and sends your local version of the resource to the repository. This action is available on conflicting resources. For more information see [Drop incoming modifications \(on page 2108\)](#).

Mark as copied

You can use this action to mark an item from the working copy as a copy of another item under *version control*, when the copy operation was performed outside of an SVN client. The **Mark as copied** action is available when you select two items (both the new item and source item), and it depends on the state of the source item.

Mark as moved

You can use this action to mark an item from the working copy as being moved from another location of the working copy, when the move operation was performed outside of an SVN client. The **Mark as moved** action is available when you select two items from different locations (both the new item and the source item that is usually reported as *missing*), and it depends on the state of the source item.

Mark as renamed

You can use this action to mark an item from the working copy as being renamed outside of an SVN client. The **Mark as renamed** action is available when you select two items from the same directory (both the new item and the source item that is usually reported as *missing*), and it depends on the state of the source item.

Add to "svn:ignore" (**Ctrl + Alt + I (Command + Option + I on macOS)**)

Allows you to add files that should not participate in the *version control* operations inside your working copy. This action can only be performed on resources not under *version control*. It actually modifies the value of the `svn:ignore` property in the parent directory of the resource. Read more about this in the [Ignore Resources Not Under Version Control \(on page 2094\)](#) section.

Add to version control (**Ctrl + Alt + V (Command + Option + V on macOS)**)

Allows you to add resources that are not under *version control*. For further details, see [Add Resources to Version Control \(on page 2092\)](#) section.

Remove from version control

Schedules the selected items for deletion from repository upon the next commit. The items are not removed from the file system after committing.

Clean up (**Ctrl + Shift + C (Command + Shift + C on macOS)**)

Performs a maintenance cleanup operation on the selected resources from the working copy. This operation removes the Subversion maintenance locks that were left behind. This is useful when you already know where the problem originated and want to fix it as quickly as possible. It is only active for resources under *version control*.

Expand All (**Ctrl + Alt + X (Command + Option + X on macOS)**)

Displays all descendants of the selected folder. The same behavior is obtained by double-clicking a collapsed folder.

 **Collapse all (Ctrl + Alt + Z (Command + Option + Z on macOS))**

Collapses all descendants of the selected folder. The same behavior is obtained by double-clicking an expanded folder.

Compare Menu

 **Perform Files Differencing**

Looks for differences between the two files displayed in the left and right side panels.

 **Next Block of Changes (Ctrl + Period (Command + Period on macOS))**

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

Note:

A change block groups one or more consecutive lines that contain at least one change.

 **Previous Block of Changes (Ctrl + Comma (Command + Comma on macOS))**

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

 **Next Change (Ctrl + Shift + Period (Command + Shift + Period on macOS))**

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

 **Previous Change (Ctrl + Shift + Comma (Command + Shift + M on macOS))**

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

 **Last Change (Ctrl + E (Command + E on macOS))**

Jumps to the last change.

 **First Change (Ctrl + B (Command + B on macOS))**

Jumps to the first change.

 **Copy All Changes from Right to Left**

Copies all changes from the file in the right panel to the file in the left panel.

 **Copy Change from Right to Left**

Copies the selected difference from the file in the right panel to the file in the left panel.

Show Word Level Details

Provides a word-level comparison of the selected change.

Show Character Level Details

Provides a character-level comparison of the selected change.

Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on macOS))

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

Note:

When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.

Ignore Whitespaces

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

History Menu

Show History (Ctrl + H (Command + H on macOS))

Displays the history for an SVN resource at a given revision. The resource can be one selected from the **Repositories** view, **Working Copy** view, or from the **Affected Paths** table from the **History** view, depending on which view was last focused when this action was invoked.

Show Annotation (Ctrl + Shift + A (Command + Shift + A on macOS))

Opens the **Show Annotation** dialog box that computes [the annotations for a file](#) and displays them in the **Annotations** view ([on page 2184](#)), along with the history of the file in the **History** view.

Repositories

This operation is available for any resource selected from view, **Working Copy** view, **History** view or **Directory Change Sets** view, depending on which view was last focused when this action was invoked.

Revision Graph (Ctrl + G (Command + G on macOS))

This action allows you to see the graphical representation of a resource's history. For more details about a resource's revision graph see the section [Revision Graph](#)

([on page 2192](#)). This operation is available for any resource selected in the **Repositories** view or **Working Copy** view.

Tools Menu

Share project

Allows you to [share a new project \(on page 2085\)](#) using an SVN repository. The local project is automatically converted into an SVN working copy.

Branch / Tag

Allows you to copy the selected resource from the **Repositories** view or **Working Copy** view to a branch or tag into the repository. To read more about this operation, see the section [Creating a Branch / Tag \(on page 2117\)](#).

➔ Merge (Ctrl + J (Command + J on macOS))

Allows you to merge the changes made on one branch back into the trunk, or vice versa, using the selected resource from the working copy. To read more about this operation, see the section [Merging \(on page 2119\)](#).

Switch (Ctrl + Alt + W (Command + Option + W on macOS))

Allows you to change the repository location of a working copy, or only of a versioned item of the working copy, within the same repository. It is available when the selected item of the working copy is a versioned resource, except for *external* items. To read more about this action, see the [Switching the Repository Location \(on page 2136\)](#) section.

Relocate

Allows you to change the base URL of the root folder of the working copy to a new URL when the base URL of the repository changed. For example, if the repository itself was moved to a different server. This operation is only available for the root item of the working copy. To read more about this operation, see the [Relocate a Working Copy \(on page 2138\)](#) section.

✂ Create patch (Ctrl + Alt + P (Command + Option + P on macOS))

Allows you to create a file containing all the differences between two resources, based on the `svn diff` command. To read more about creating patches, see [the section about patches \(on page 2141\)](#).

Working copy format

This submenu contains the following two operations:

Upgrade

Upgrades the format of the currently loaded working copy to the newest one known by Syncro SVN Client. This allows you to benefit of all the new features of the client.

Downgrade

Downgrades the format of the currently loaded working copy to SVN 1.7 format. This is useful if you want to use older SVN clients with the current working copy, or, by mistake, you have upgraded the format of an older working copy to SVN 1.8.

Note:

SVN 1.7 working copies cannot be downgraded to older formats.

See the section [Working Copy Format \(on page 2169\)](#) to read more about this subject.

Options Menu

Preferences

Opens the **Preferences** dialog box.

Menu Shortcut Keys

Opens the **Menu Shortcut Keys preferences page (on page 260)**, where users can configure in one place the keyboard shortcuts available for menu items available in Syncro SVN Client.

Global Run-Time Configuration

Allows you to configure SVN general options, that should be used by all the SVN clients you may use:

- **Edit 'config' file** - In this file you can configure various SVN client-side behaviors.
- **Edit 'servers' file** - In this file you can configure various server-specific protocol parameters, including HTTP proxy information and HTTP timeout settings.

Export Options

Allows you to export the current options to an XML file.

Import Options

Allows you to import options you have previously exported.

Reset Options

Resets all your options to the default ones.

Reset Authentication

Resets the Subversion authentication information.

Window Menu

Show View

Allows you to select the view you want to bring to front.

Show Toolbar

Allows you to select the toolbar you want to be visible.

Enable flexible layout

Toggles between a fixed and a flexible layout. When the flexible layout is enabled, you can move and dock the internal views to adapt the application to various viewing conditions and personal requirements.

Reset Layout

Resets all the views to their default position.

Help Menu

Help (F1)

Opens the **Help** dialog box.

Use online help (selected by default)

If this option is selected, when you select **Help** or press **F1** while hovering over any part of the interface, Oxygen XML Developer attempts to open the help documentation in online mode. If this option is not selected or an internet connection fails, the help documentation is opened in offline mode.

Show Dynamic Help view

Displays the **Dynamic Help** view.

Report Problem

Opens a dialog box that allows you to write the description of a problem that was encountered while using the application.

Support Center

Opens the Support Center web page in a browser.

About

Opens the **About** dialog box.

SVN Main Toolbar

The toolbar of the Syncro SVN Client SVN Repositories window contains the following actions:

Check out

Checks out a working copy from a repository. The repository URL and the working copy format must be specified.

Synchronize

Synchronizes the current working copy with the repository.

Update All

Updates all resources of the working copy that have an older revision than repository.

Commit All

Commits all resources of working copy that have a newer version compared to that of the repository.

Refresh

Refreshes the whole content of the current working copy from disk starting from the root folder. At the end of the operation, the modified files and folders that were not committed to repository yet, are displayed in the **Working Copy** view.

Compare

The selected resource is compared with:

- The *BASE* revision, when the selected resource is:
 - Locally modified and the **All Files** view mode is currently selected (no matter if there are incoming changes).
 - Locally modified and there are no incoming changes when any other view mode is selected.
- The remote version of the same resource, when remote information is available after a **Synchronize** operation (only when one of **Modified**, **Incoming**, **Outgoing** and **Conflicts** view modes is selected).
- The working copy revision, when the selected resource is from the **History** view.

Show History

Displays the history of the selected resource (from the **Working Copy** or **Repository** views) in the **History** view.

Show Annotation

Displays the annotations of the selected resource. The selected resource can be in the **Working Copy** or the **History** views.

Revision Graph

Displays the revision graph of the selected resource. The selected resource can be in the **Working Copy** or the **Repositories** views.

Enable/Disable flexible layout

Toggles between a fixed and a flexible layout. When the flexible layout is enabled, you can move and dock the internal views to adapt the application to various viewing conditions and personal requirements.

Status Bar

The status bar of the Syncro SVN Client window displays important details of the current status of the application. This information is available only in the **Working Copy** view.

Figure 530. Status bar

The status bar is composed of the following areas:

- The path of the currently processed file from the current working copy (during an operation such as **Check out** or **Synchronize**) or the result of the last operation.
- The current status of the following working copy options:
 - Show ignored files ().
 - Show deleted files ().
 - Process `svn:externals` definitions ().

The options for ignored and deleted files are switched on and off from the **Settings** menu (on page 2168) of the **Working Copy** panel:

- The format of the currently loaded working copy.
- The current numbers of incoming changes (), outgoing changes () and conflicting changes ().
- A progress bar for the currently running SVN operation and a button () that allows you to stop it.

Getting Started

This section explains the basic operations that can be done in Syncro SVN Client.

SVN Repository Location

This section explains how to add and edit the repository locations in Syncro SVN Client.

Add / Edit / Remove Repository Locations

Usually, team members do all of their work separately, in their own working copy, and then must share their work by committing their changes. This is done using an Apache Subversion™ repository. Oxygen XML Developer supports versions 1.4, 1.5, 1.6, 1.7, and 1.8 of the SVN repository format.

Before you can begin working with a Subversion repository, you must define a repository location in the **Repositories** view (on page 2157).

To create a repository location, use the  **New Repository Location** action that is available in the **Repository** menu, the **Repositories** view toolbar, and in the contextual menu. This action opens the **New Repository Location** dialog box, which prompts you for the [URL of the repository \(on page 2197\)](#) you want to connect to. You can also [use peg revisions at the end of the URLs \(on page 2199\)](#) (for example, `URL@rev1234`) to browse only that specific revision. No authentication information is requested at the time the location is defined. It is left to the Subversion client to request the user and password information when it is needed. The main benefit of allowing Subversion to manage your password is that it prompts you for a new password only when your password changes.

Once you enter the repository URL, Oxygen XML Developer tries to contact the server to get the content of the repository for displaying it in the **Repositories** view (on page 2157). If the server does not respond in the timeout interval set in the preferences, an error is displayed. If you do not want to wait until the timeout expires, you can use the  **Stop** button from the toolbar of the view.

To edit a repository location, use the  **Edit Repository Location** action that is available in the **Repository** menu and in the contextual menu. This action opens the **Edit Repository Location** dialog box, which prompts you for the [URL of the repository \(on page 2197\)](#) you want to connect to. You can also [use peg revisions at the end of the URLs \(on page 2199\)](#) (for example, `URL@rev1234`) to browse only that specific revision.

To remove a repository location, use the  **Remove Repository Location** action that is available in the **Repository** menu and in the contextual menu. A confirmation dialog box is displayed to make sure that you do not accidentally remove the wrong locations.

The order of the repositories can be changed in the **Repositories** view at any time with the  **Up** arrow and  **Down** arrow buttons on the toolbar of the view. For example, pressing the up arrow once moves the selected repository in the list up one position.

To set the reference revision number of an SVN repository use the **Change the Revision to Browse** action that is available in the **Repository** menu and in the contextual menu. The revision number of the repository is used for displaying the contents of the repository when it is viewed in the **Repositories** view (on page 2157). Only the files and folders that were present in the repository at the moment when this revision number was generated in the repository are displayed as contents of the repository tree. Also, this revision number is used for all the operations executed directly from the **Repositories** view (on page 2157).

Authentication

Five protocols are supported: *HTTP*, *HTTPS*, *SVN*, *SVN + SSH* and *FILE*. If the repository that you are trying to access is password protected, the **Enter authentication data** dialog box requests a user name and a password. If the **Store authentication data** checkbox is selected, the credentials are stored in the Apache Subversion™ default directory:

- Windows - %HOME%\Application Data\Subversion\auth. Example: C:\Documents and Settings\John\Application Data\Subversion\auth
- Linux and macOS - \$HOME/.subversion/auth. Example: /home/John/.subversion/auth

There is one file for each server that you access. If you want to make Subversion forget your credentials, you can use the **Reset authentication** command from the **Options** menu. This causes Subversion to forget all your credentials. When you reset the authentication data, restart Oxygen XML Developer for the change to take effect.

**Tip:**

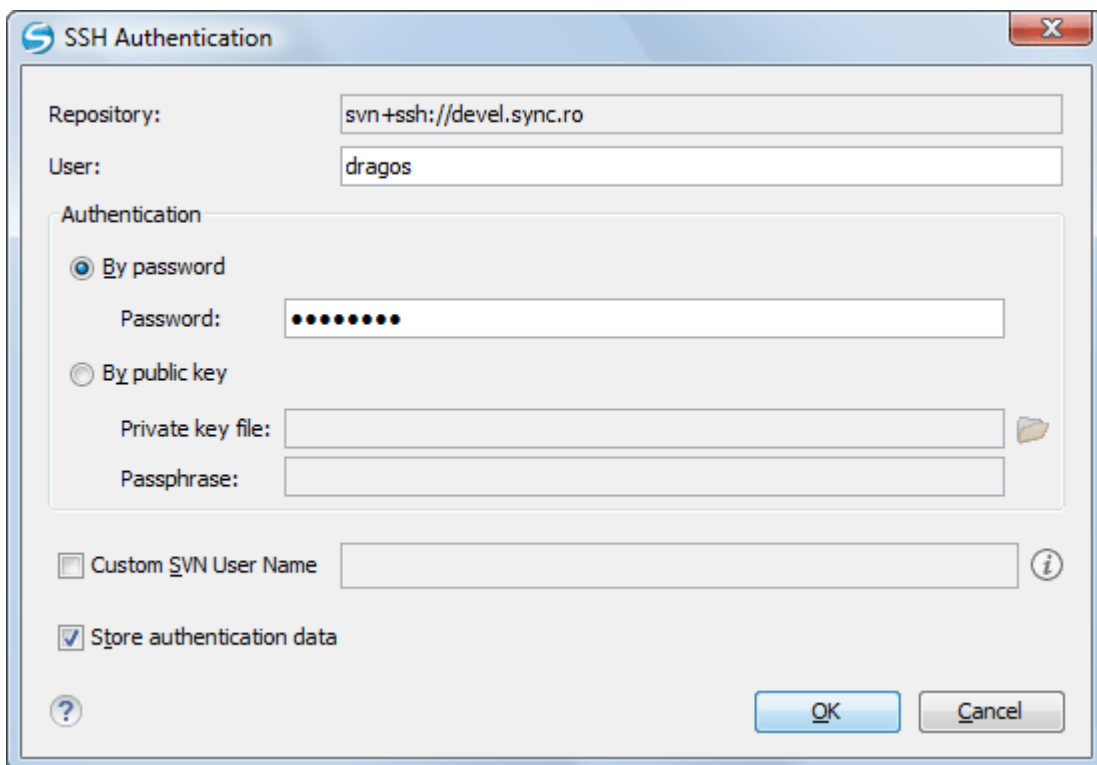

The *FILE* protocol is recommended if the SVN repository and Oxygen XML Developer are located on the same computer as it ensures faster access to the SVN repository compared with other protocols.

For HTTPS connections where client authentication is required by your SSL server, you must choose the certificate file and enter the corresponding certificate password that is used to protect your certificate.

When using a secure HTTP (HTTPS) protocol for accessing a repository, a **Certificate Information** dialog box is displayed and asks you whether you want to accept the certificate permanently, temporarily, or simply deny it.

If the repository has SVN+SSH protocol, the SSH authentication can also be made with a private key and a pass phrase.

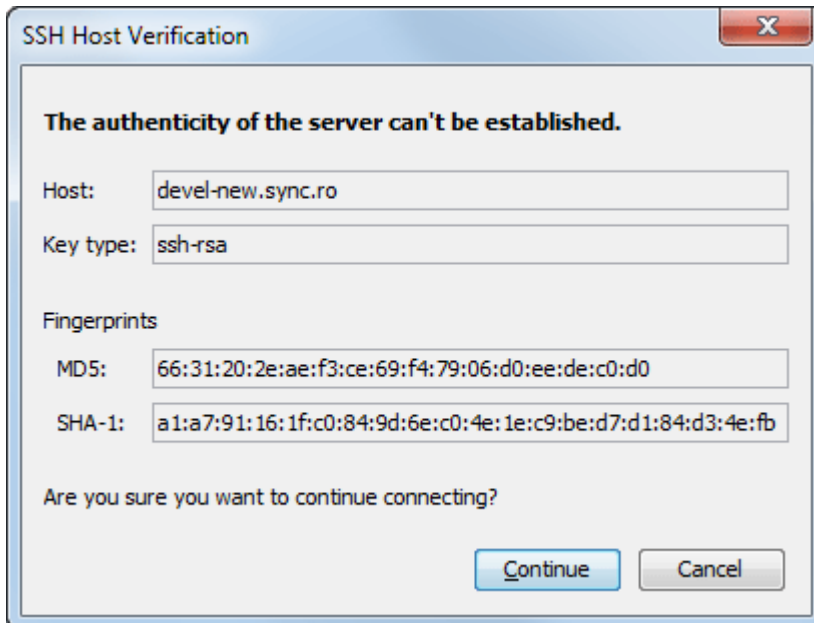

Figure 531. SSH Authentication Dialog Box

After the SSH authentication dialog box, another dialog box appears for entering the SVN user name that accesses the SVN repository. The SVN user name is recorded as the *committer* in SVN operations.

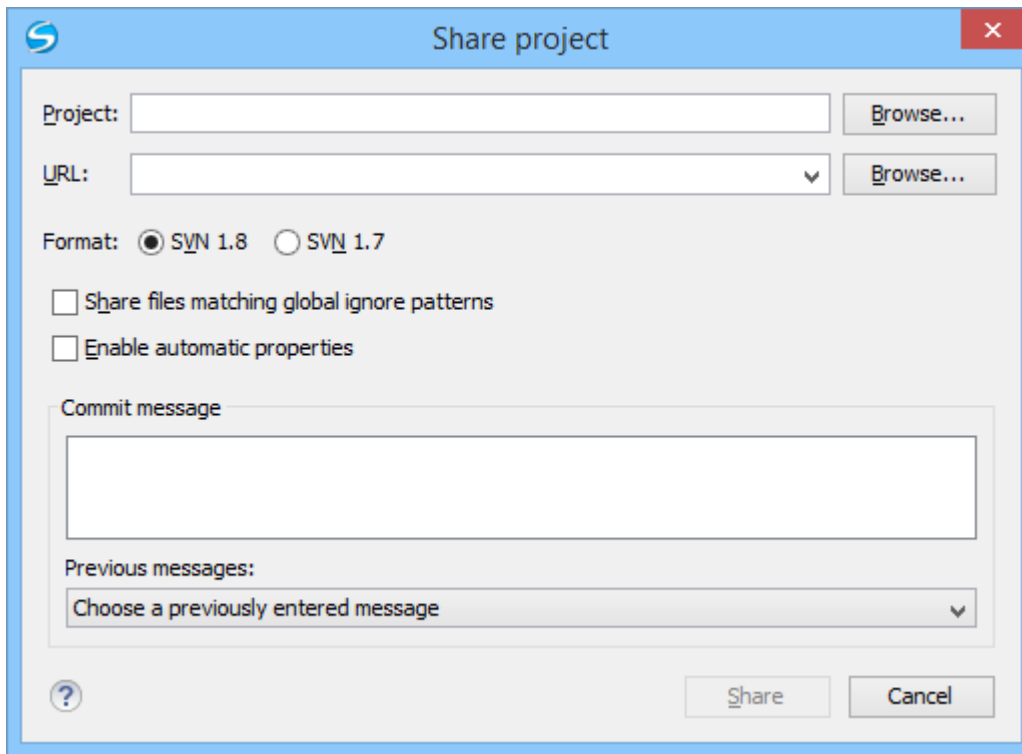

When connecting for the first time to a Subversion repository through SVN+SSH protocol, you will be asked to confirm if you trust the SSH host. The same dialog box is also displayed when the server changed the SSH key or when the key was deleted from the local Subversion cache folder.

Figure 532. SSH server name and key fingerprint

Share a Project

Even if you start developing a new project, or you want to migrate an existing one to Subversion, the Syncro SVN Client allows you to easily share it with the rest of your team. The shared project directory is automatically converted to a working copy and added under Syncro SVN Client management. The **Share project** action is available in the **Tools** menu and the contextual menu of the **Repositories** view.

Figure 533. Share Project Dialog Box

The following options can be configured in the **Share project** dialog box:

Project

The location of the project folder ([on page 2197](#)) on the local disk by using the text box or the **Browse** button. This folder should not be empty or already under version control.

Important:

By default, the SVN system only imports the content of the specified folder, and not the root folder itself. Therefore, it is recommended to use the **Browse** button to select the project folder so that the client will automatically append the name of it to the specified URL.

URL

The new location of the project ([on page 2197](#)) (inside the repository) that will be used to access it.

Note:

Peg revisions have no effect for this operation since it is used to send information to the repository.

Attention:

If the new location already exists, make sure that it is an empty directory to avoid mixing your project content with other files (if items exist with the same name, an error will

occur and the operation will not proceed). Otherwise, if the address does not exist, it is created automatically.

Format

The SVN format of the working copy. You can choose between **SVN 1.8** or **SVN 1.7**.

Share files matching global ignore patterns

When selected, the file names that match the patterns defined in either of the following locations are also imported into the repository:

- The `global-ignores` property in the SVN configuration file (*on page 2197*).
- The **File name ignore patterns** option (*on page 250*) in the **SVN > Working Copy** preferences page (*on page 249*).

Enable automatic properties/Disable automatic properties

Enables or disables automatic property assignment (per runtime configuration rules), overriding the `enable-auto-props` runtime configuration directive, defined in the SVN configuration file (*on page 2197*).

Note:

This option is available only when there are defined properties to be applied automatically for newly added items under version control. You can define these properties in the SVN `config` file (in the `auto-props` section). Based on the value of the `enable-auto-props` runtime configuration directive, the presented option is either **Enable automatic properties**, or **Disable automatic properties**.

Defining a Working Copy

An Apache Subversion™ working copy is an ordinary directory tree on your local system, containing a collection of files. You can edit these files however you want, your working copy being your private work area. To make your own changes available to others or incorporate changes made by others, you must explicitly tell Subversion to do so. You can even have multiple working copies of the same project.

Figure 534. Working Copy View

A Subversion working copy also contains some extra files, created and maintained by Subversion, to help it keep track of your files. In particular, each directory in your working copy contains a subdirectory named `.svn`, also known as the working copy *administrative directory*. This administrative directory contains an unaltered copy of the last updated files from the repository. This copy is usually referred to as the *pristine copy* or the *BASE revision* of the working copy. These files help Subversion recognize which files contain unpublished changes, and which files are out-of-date with respect to others' work.

A typical Subversion repository often holds the files (or source code) for several projects. Usually each project is a subdirectory in the repository's file system tree. In this arrangement, a user's working copy usually corresponds to a particular sub-tree of the repository.

Check Out a Working Copy

Check out means to make a copy of a project from a repository to your local file system. This copy is called a *working copy*. An Apache Subversion™ working copy is a specially formatted directory structure that contains additional `.svn` directories that store Subversion information, as well as a pristine copy of each item that is checked out.

To check out a working copy, locate and select the desired directory in the **Repositories** view and select the **Check out** action from the contextual menu, the toolbar, or the **Repository** menu.

Figure 535. Check Out Dialog Box

The following options can be configured in the **Check out** dialog box:

URL

The location of the repository directory ([on page 2197](#)) to be *checked out*.

Note:

To check out an item that was deleted, moved, or replaced, you need to specify the original URL (before the item was removed) and use a *peg revision* ([on page 2199](#)) at the end (for example, `URL@rev1234`).

Revision

You can choose between the **HEAD** or **Other** revision. If you need to *check out* a specific revision, specify it in the **Other** text box or use the **History** button and choose a revision from [the History dialog box \(on page 2090\)](#).

Check out to

Specify [the location where you want to check out \(on page 2197\)](#) the new working copy by typing the local path in the text box or by using the **Browse** button. If the specified local path does not point to an existing directory, it will automatically be created.

Important:

By default, the SVN system only checks out the content of the directory specified by the URL, and not the directory itself. Therefore, it is recommended to use the **Browse** button to select the *check out* location so that the client will automatically append the name of the remote directory to the path of the selected directory.

**Warning:**

The destination directory should be empty. If files exist, they are skipped (left unchanged) by the *check out* operation and **displayed as modified** ([on page 2164](#)) after the operation has finished. Also, the destination directory must not already be under version control.

Format

The SVN format of the working copy. You can choose between **SVN 1.8** or **SVN 1.7**.

Depth

The depth is useful if you want to *check out* only a part of the selected repository directory and bring the rest of the files and subdirectories in a future update. You can find out more about the checkout depth in the [sparse checkouts](#) ([on page 2156](#)) section. You can choose between the following depths:

- **Recursive (infinity)** - Checks out all the files and folders contained in the selected folder.
- **Immediate children (immediates)** - Checks out only the child files and folders without recursing subfolders.
- **File children only (files)** - Checks out only the child files.
- **This folder only (empty)** - Checks out only the selected folder (no child file or folder is included).

Ignore "svn:externals" definitions

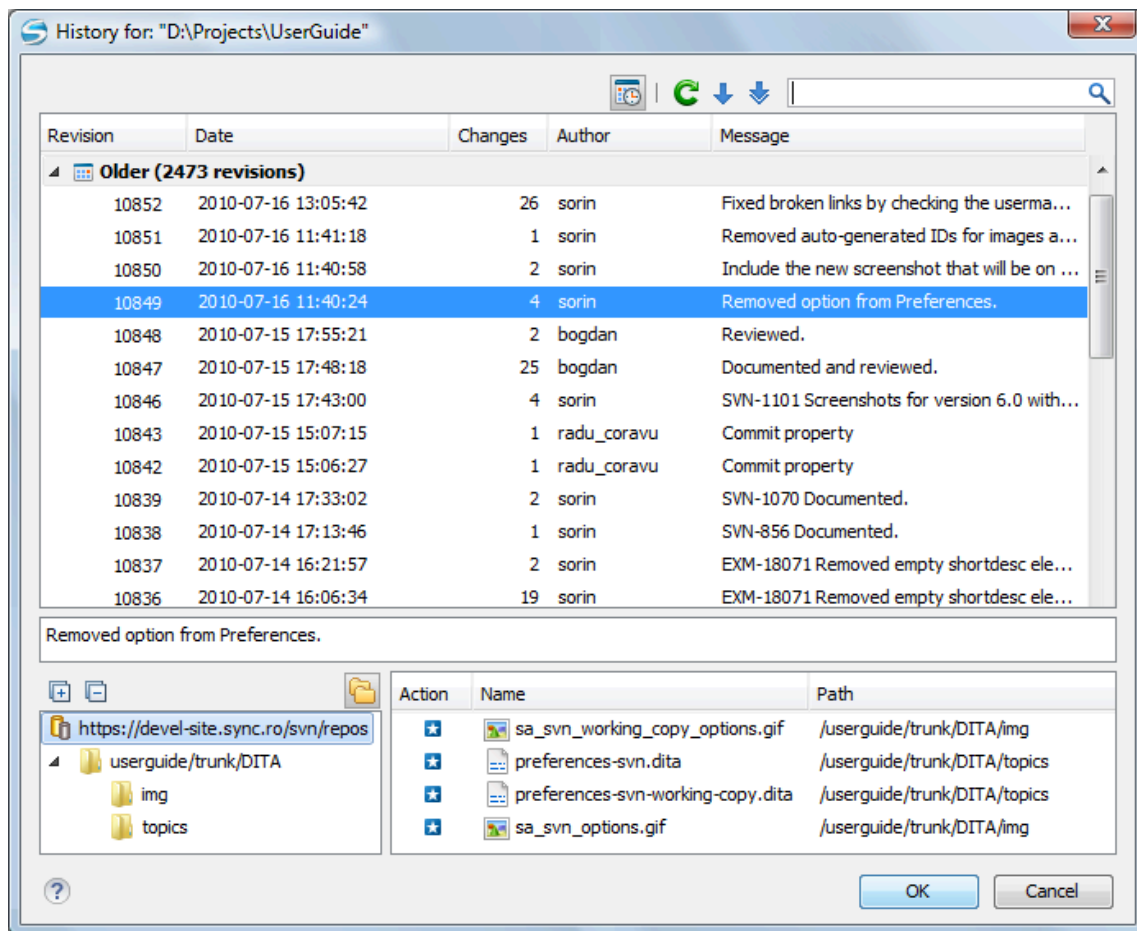

When selected, external items are ignored in the *check out* operation. This option is only available if you choose the **Recursive (infinity)** depth.

After a *check out*, the new working copy is added to the list in the **Working Copy view** ([on page 2162](#)) and loaded automatically.

History Dialog Box

The **History** dialog box presents a list of revisions for a resource. It is opened from the dialog boxes that require setting an SVN revision number, such as the **Check Out dialog box** ([on page 2088](#)) or the **Branch / Tag dialog box** ([on page 2117](#)). It presents information about revision, commit date, author, and commit comment.

Figure 536. History Dialog Box

The initial number of entries in the list is 50. Additional revisions can be added to the list using the **Get next 50** and **Get all** buttons. The list of revisions can be refreshed at any time with the **Refresh** button. You can group revisions in predefined time frames (today, yesterday, this week, this month), by pressing the **Group by date** button from the toolbar.

The **Affected Paths** area displays all paths affected by the commit of the revision selected in history. You can see the changes between the selected revision and the file's previous state using the **Compare with previous version** action, available in the contextual menu.

Use an Existing Working Copy

Using an existing working copy is the process of taking a working copy that exists on your file system and connecting it to the Apache Subversion™ repository. If you have a brand new project that you want to import into your repository, then see the section [Import resources into the repository \(on page 2151\)](#). The following procedure assumes that you have an existing valid working copy on your file system.

1. Click the **Working Copies Manager** toolbar button  (on macOS) in the **Working Copy** view (on page 2162).

Step Result: This action opens the **Working copies list** dialog box.

2. Click the **Add** button.

3. Select the working folder copy from the file system. The name is useful to differentiate between working copies located in folders with the same name. The default name is the name of the root folder of the working copy.

Note:

For SVN 1.7 and newer working copies, all the internal information is kept only in the root directory. Thus, Syncro SVN Client needs to load the whole working copy.

4. Click the **OK** button.

The selected working copy is loaded and presented in the **Working Copy view** (on page 2162).

Notice:

You can add working copies older than SVN 1.7. However, to load any of them, Syncro SVN Client will require to upgrade the working copy to SVN 1.8 format.

Manage Working Copy Resources

This section explains how to work with the resources that are displayed in the **Working Copy view**.

Edit Files

You can edit files from the **Working Copy view** (on page 2162) by double clicking them or by right clicking them and choosing **Open** from the contextual menu.

Note that only one file can be edited at a time. If you try to open another file, it is opened in the same editor window. The editor has syntax highlighting for known file types, meaning that a different color is used for each type of recognized token in the file. If the selected file is an image, then it is previewed in the editor, with no access to modifying it.

After modifying and saving a file from a working copy, a modified marker - an asterisk (*) - will be added to the file's icon in the **Working Copy view** (on page 2162). The asterisk marks the files that have local modifications that were not committed to the repository.

Add Resources to Version Control

To share new files and folders (created in your working copy), add them to version control using the **Add to version control** option from the **Working Copy view** (on page 2162).

You can easily spot resources not under version control by the *unversioned* (🔒) icon displayed in the **Local file status** column. Resources scheduled for addition are displayed with this *added* (🔑) icon in the **Working Copy view** and are added in the repository after you commit them.

**Note:**

Do not make a confusion between  and  icons. The former icon stands for resources that are actually copies of resources already committed in the repository, meaning they are *scheduled for addition with history*.

When you use the **Add to version control** option on a directory, its entire structure is scanned and all the resources that can be added under version control are presented.

Although it is not mandatory to add resources under version control explicitly, it is recommended. If you forgot to add a resource, when you [commit your changes \(on page 2110\)](#), the resource is presented in the commit dialog box, but not selected. When you commit and *unversioned* resource, it is automatically added under version control before starting the commit operation.

Figure 537. Add to Version Control Dialog Box

**Note:**

Ignored () items can also be added under version control.

The **Depth** column is displayed only when directories are also presented in the dialog box. For any directory, you can use one of the available values to instruct Subversion to limit the scope of the operation to a particular tree depth.

**Note:**

The initial value of the **Depth** field can have the following values, depending on the [listing mode of the items in the working copy view \(on page 2168\)](#):

- *infinity* - When the working copy items are presented as a tree.
- *files* - When the working copy items are presented compressed.
- *empty* - When the working copy items are presented flat.

When you add unversioned or ignored directories, the initial value of the **Depth** field also depends on the state of the **Show unversioned directories content** and **Show ignored directories content** options. If these options are selected, the value is based on the listing mode of the items in the working copy view. When they are not selected, the value is *empty*.

The following options are available in this dialog box:

- **Enable automatic properties** or **Disable automatic properties** - enables or disables automatic property assignment (per runtime configuration rules), overriding the `enable-auto-props` runtime configuration directive, defined in the `config` file of the Subversion configuration directory.

Note:

This option is available only when there are defined properties to be applied automatically for resources newly added under version control. You can define these properties in the `config` file of the Subversion configuration directory, in the `auto-props` section. Based on the value of the `enable-auto-props` runtime configuration directive, the presented option is either **Enable automatic properties**, or **Disable automatic properties**.

- **No ignore** - when you select this option, file-name patterns defined to ignore *unversioned* resources do not apply. Resources that are located inside an *unversioned* directory selected for addition, and match these patterns, are also scheduled for addition in the repository.

Note:

This option is available only when directories are also presented in the dialog box.

You can define file-name patterns to ignore *unversioned* resources in one of the following locations:

- In the `config` file of the Subversion configuration directory (the `global-ignores` option from the `miscellany` section).
- In the Oxygen XML Developer options ([open the Preferences dialog box \(Options > Preferences\)](#) (on page 114) and go to **SVN > Working copy > Application global ignores**).

Each of the above two options is activated only when you select an item that can have the option applied.

Ignore Resources Not Under Version Control

Some resources inside your working copy do not need to be subject to version control. These resources can be files created by the compiler, `*.obj`, `*.class`, `*.lst`, or output folders used to store temporary

files. Whenever you [commit changes \(on page 2110\)](#), Apache Subversion™ shows your modified files in the commit dialog box, but the unversioned files are also listed. Since the unversioned files are committed unless otherwise specified, it is difficult to see exactly what you are committing.

The best way to avoid these problems is to add the derived files to the Subversion ignore list. That way they are never displayed in the commit dialog box and only genuine unversioned files that must be committed are displayed.

You can choose to ignore a resource by using the **Add to svn:ignore** action in the contextual menu of the [Working Copy view \(on page 2162\)](#).

In the **Add to svn:ignore** dialog box, you can specify the resource to be ignored by name or by a custom pattern. The custom pattern can contain the following wildcard characters:

- * - Matches any string of characters of any size, including the empty string.
- ? - Matches any single character.

For example, you can choose to ignore all text documents by using the pattern: `*.txt`.

The action **Add to svn:ignore** adds a predefined Subversion property called `svn:ignore` to the parent directory of the specified resource. In this property, there are specified all the child resources of that directory that must be ignored. The result is visible in the **Working Copy** view. The ignored resources are represented with gray icons.

Delete Resources

The  **Delete** action is available in the contextual menu of the [Working Copy view \(on page 2162\)](#). When you delete an item from the working copy, it is marked as *deleted* (scheduled for deletion from repository upon the next commit) and removed from the file system. Depending on the state of each item, you are prompted to confirm the operation.

If a resource is deleted from the file system without Subversion's knowledge, the resource is marked as *missing* () in your working copy. You can decide what you want to do with a *missing* item:

- In the case of a commit, any *missing* item is first automatically deleted and then committed.

Note:

Not any *missing* item can be committed as *deleted*, and removed from the repository. For example, you cannot commit an item that no longer exists on the disk and that was scheduled for addition () previously, since this item does not exist in the repository, but you can use the **Delete** action instead.

- If you want to recover *missing* items, either [update \(on page 2109\)](#) the items themselves or one of their parent directories. This fetches their latest version from the repository.

You can also delete conflicting items (file content conflicts, property conflicts, tree-conflicts) and Syncro SVN Client automatically marks them as resolved.

**Note:**

It is recommended that you resolve conflicts manually to avoid losing any important remote modifications.

Finally, you can change your mind and [revert \(on page 2106\)](#) the deleted items to their initial, pristine, state.

Copy Resources

You can copy resources from various locations of the working copy. You select them in the **Working Copy view (on page 2162)** and then use **Copy to** from the contextual menu. This is not a simple file system copy, but an Apache Subversion™ command. It will copy the resource and the copy will also have the original history. This is one of the important features of Subversion, as you can keep track of where the copied resources originated.

Based on the selected items, the **Copy to** action is available only if it can be performed. Even if the operation would not normally be possible in SVN (due to some invalid local file states against copy), Oxygen XML Developer performs the copy operation as a simple file system operation. This means no SVN versioning meta-data is affected.

**Note:**

- If you copy an item to a directory that is [not under version control \(on page 2164\)](#) (*unversioned* or *ignored*), the history of the item is not preserved. For example, when copying directories, all items inside them will also be copied without history.
- If you copy a directory that contains [external \(on page 2164\)](#) items, these are not copied. This is specific for SVN 1.7 working copies only. To fetch the *external* items, use the **Update** operation on the copied directory.

In the **Copy to** dialog box, you can navigate through the working copy directories to choose a target directory, to copy inside it. If you try to copy a single resource you are also able to change that resource's name. For *versioned* items, you can select **Ignore resource history** to copy them without their history (similar to a simple file system copy).

**Note:**

The **Copy to** dialog box only presents all the local directories that are a valid destination against the copy operation, based on their local file status. Also, the [working copy settings \(on page 2168\)](#) are taken into account.

In the **Commit** dialog box, only the directory in question will appear without its children.

Move Resources

As in the case of the copy command, you can move several resources at once. Select the resources in the **Working Copy view** ([on page 2162](#)) and choose the **Move to** action from the contextual menu. The move command actually behaves as if a copy followed by a delete command were issued. You will find the moved resources at the desired destination and also at their original location, but marked as *deleted*.

**Note:**

External items cannot be moved using the **Move to** action, because they cannot be deleted. Instead, you should edit the `svn:externals` property defining the *external* item and use the **Update** operation on the item's parent folder for the change to take effect.

**Attention:**

For SVN 1.8 working copies: when committing items that were moved and/or renamed, make sure you select both the source and the destination. Otherwise, the commit operation will fail.

Rename Resources

The **Rename** action is available in the contextual menu of the **Working Copy view** ([on page 2162](#)) and can be performed on a single resource. This action acts as a move command with the destination directory being the same as the original location of the resource. A copy of the original item is created with the new name, also keeping its history. The original item is marked as *deleted*.

**Note:**

External items cannot be renamed using the **Rename** action because they cannot be deleted. Instead, you should edit the `svn:externals` property defining the *external* item, then use the **Update** operation on the item's parent folder for the change to take effect.

**Attention:**

For SVN 1.8 working copies: when committing items that were moved and/or renamed, make sure you select both the source and the destination. Otherwise, the commit operation will fail.

Lock / Unlock Resources

The idea of version control is based on the *copy-modify-merge* model of file sharing. This model states that each user contacts the repository and creates a local working copy (check out). Users can then work independently and modify their working copies according to their needs. When their goal has been accomplished, it is time for the users to share their work with the others, to send them to the repository (commit). When a user has modified a file that has been also modified on the repository, the two files will have to be merged. The version control system assists the user with the merging as much as it can, but in the end the user is the one that must make sure it is done correctly.

The copy-modify-merge model only works when files are contextually mergeable: this is usually the case of line-based text files (such as source code). However this is not always possible with binary formats, such as images or sounds. In these situations, the users must each have exclusive access to the file, ending up with a *lock-modify-unlock* model. Without this, one or more users could end up wasting time on changes that cannot be merged.

An SVN lock is a piece of metadata that grants exclusive access to a user. This user is called the lock owner. A lock is uniquely identified by a lock token (a string of characters). If someone else attempts to commit the file (or delete a parent of the file), the repository demands two pieces of information:

- User authentication - the user performing the commit must be the lock owner
- Software authorization - the user's working copy must have the same lock token as the one from the repository, proving that it is the same working copy where the lock originated from.

Scanning for Locks

When starting to work on a file that is not contextually mergeable (usually a binary file), it is better to verify if someone else is not already working on that file. You can do this in the **Working Copy view** ([on page 2162](#)) by selecting one or more resources, then right-clicking them and choosing the **Scan for Locks** action from the contextual menu.

Figure 538. Locked Items Dialog Box

The **Locked items** dialog box contains a table with all the resources that were found locked on the repository. For each resource there are specified: resource path, state of the lock, owner of the lock, lock comment, creation and expiration date for the lock (if any).

The state of the lock can be one of the following:

- 🔒 - Appears when one of the following conditions apply:
 - Another user has locked the file in the repository.
 - The file was locked by the same user from another working copy.
 - The file was locked from the **Repositories** view.
- 🟢 - Displayed after you have locked a file from the current working copy.

-  - A file already locked from your working copy is no longer locked in the repository (it was unlocked by another user).
-  - A file already locked from your working copy is being locked by another user. Now the owner of the file lock is the user who stole the lock from you.

You can unlock a resource by selecting it and pressing the **Unlock** button.

Related Information:

[Working Copy Locks \(on page 2166\)](#)

[Repository Locks \(on page 2157\)](#)

Locking a File

By locking a file, you have exclusive write access to it in the repository.

You can lock a file from your working copy or directly from the **Repositories** view.

Note:

You can only lock files (not directories). This is a restriction imposed by Apache Subversion™.

The **Lock** dialog box allows you to write a comment when you set a lock or when you *steal* an existing one. Note that you should *steal* a lock only after you made sure that the previous owner no longer needs it. Otherwise, you may cause an unsolvable conflict, which could be the reason the lock was put there in the first place. The Subversion server can have a policy concerning lock stealing, as it may not allow you to do this if certain conditions are not met.

The lock stays in place until you unlock the file or until someone breaks it. There is also the possibility that the lock expires after a period of time specified in the Subversion server policy.

Unlocking a File

A file can be unlocked from the contextual menu of the **Working Copy view (on page 2162)**. A dialog box will prompt you to confirm the unlocking and it will also allow you to break the lock (unlock it by force).

Synchronize with Repository

In the work cycle you will need to incorporate other people's changes (update) and to make your own work available to others (commit). This is what the **Incoming** and **Outgoing** modes of **the Working Copy view (on page 2162)** was designed for, to help you send and receive modifications from the repository.

The **Incoming** and **Outgoing** modes of this view focus on incoming and outgoing changes. The incoming changes are the changes that other users have committed in the repository since you last updated your working copy. The outgoing changes are the modifications you made to your working copy as a result of editing, removing or adding resources.

The view presents the status of the working copy resources against the BASE revision after a **Refresh** operation. You can view the state of the resources versus a repository HEAD revision by using the **Synchronize** action from [the Working Copy view \(on page 2162\)](#).

View Differences

One of the most common requirements in project development is to see what changes have been made to the files from your Working Copy or to the files from the repository. You can examine these changes after a synchronize operation with the repository, by using the **Open in compare editor** action from the contextual menu.

The text files are compared using a built-in **Compare view (on page 2186)** that uses a line differencing algorithm or a specified external diff application (if such an application is set in the **SVN Diff preferences page (on page 250)**). When a file with outgoing status is involved, the compare is performed between the file from the working copy and the BASE revision of the file. When a file with incoming or conflict status is involved, the differences are computed using a three-way algorithm that means that the local file and the repository file are each compared with the BASE revision of the file. The results are displayed in the same view. The differences obtained from the local file comparison are considered outgoing changes and the ones obtained from the repository file comparison are considered incoming changes. If any of the incoming changes overlap outgoing changes then they are in conflict.

A special case of difference is a *diff pseudo-conflict*. This is the case when the left and the right sections are identical but the BASE revision does not contain the changes in that section. By default, this type of changes are ignored. If you want to change this, you can go to the **SVN** preferences page and select the **Allow unversioned obstructions** option [\(on page 248\)](#).

The right editor of the internal compare view presents either the BASE revision or a revision from the repository of the file so its content cannot be modified. By default, when opening a synchronized file in the **Compare** view, a compare is automatically performed. After modifying and saving the content of the local file presented in the left editor, another compare is performed. You will also see the new refreshed status in the **Working Copy view (on page 2162)**.

Figure 539. Compare View

At the top of each of the two editors, there are presented the name of the open file, the corresponding SVN revision number (for remote resources) and the author who committed the associated revision.

There are three types of differences:

- Incoming changes - Changes committed by other users and not present yet in your working copy file. They are marked with a blue highlight and on the middle divider the arrows point from right to left.
- Outgoing changes - Changes you have done in the content of the working copy file. They are marked with a gray highlight and the arrows on the divider are pointing from left to right.
- Conflicting changes - This is the case when the same section of text that you already modified in the local file has been modified and committed by some other person. They are marked with a red highlight and red diamonds on the divider.

There are numerous actions and options available in the **Compare View** toolbar (on page 2187) or in the **Compare** menu from the main menu. You can decide that some changes need adjusting or that new ones must be made. After you perform the adjustments, you may want to perform a new compare between the files. For this case there is an action called **Perform files differencing**. After each files differencing operation the first found change will be selected. You can navigate from one change to another by using the actions **Go to first**, **Go to previous**, **Go to next** and **Go to last modification**. If you decide that some incoming change needs to be present in your working file you can use the action **Copy change from right to left**. This is useful also when you want to override the outgoing modifications contained in a conflicting section. The **Copy all**

non-conflicting changes from right to left action copies all incoming changes that are not contained inside a conflicting section in your local file.

Suppose that only a few words or letters are changed. Considering that the differences are performed taking whole lines of text into account, the change will contain all the lines involved. To find exactly what words or letters have changed, the **Word Details** and **Character Details** dialog boxes are available. They present a more detailed comparison result when you double-click the middle divider of a difference.

When you want to examine only the changes in the real text content of the files, while disregarding the changes in the number of white spaces between words or lines, there is an option available in the [SVN Preferences \(on page 247\)](#) that allows you to enable or disable the white space ignoring feature of the compare algorithm.

Conflicts

A file conflict occurs when two or more developers have changed the same few lines of a file or the properties of the same file. As Subversion knows nothing of your project, it leaves resolving the conflicts to the developers. Whenever a conflict is reported, you should open the file in question, and try to analyze and resolve the conflicting situation.

Real Conflicts vs Mergeable Conflicts

There are two types of conflicts:

- *real conflict* ( icon in *Name* column) - Syncro SVN Client considers the following resource states to be real conflicts:
 - *conflicted* state - A file reported by SVN as being in this state is obtained after it was updated/merged while having incoming and outgoing content or property changes at the same time, changes that could not be merged. A content conflict ( icon in *Local file status* column) is reported when the modified file has binary content or it is a text file and both local and remote changes were found on the same line. A properties conflict ( icon in *Local properties status* column) is reported when a property's value was modified both locally and remotely.
 - *tree conflicted* state ( icon in *Local file status* column) - Obtained after an update or merge operation, while having changes at the directory structure level (for example, file is locally modified and remotely deleted or locally scheduled for deletion and remotely modified).
 - *obstructed* state ( icon in *Local file status* column) - Obtained after a resource was versioned as one kind of object (file, directory, symbolic link), but has been replaced outside Syncro SVN Client by a different kind of object.
- *pseudo-conflict* ( icon in *Name* column) - A file is considered to be in *pseudo-conflict* when it contains both incoming and outgoing changes. When incoming and outgoing changes do not intersect, an update operation may automatically merge the incoming file content into the existing locally one. In this case, the *pseudo-conflict* marker is removed. This marker is used only as a warning that should prevent you to run into a real conflict.

**Note:**

- A conflicting resource cannot be committed to repository. You have to resolve it first, by using **Mark Resolved** action (after manually editing/merging file contents) or by using **Mark as Merged** action (for pseudo-conflicts).
-  and  icons are presented only when one of the following view modes is selected: **Modified, Incoming, Outgoing, Conflicts**.
- The  icon is used also for folders to signal that they contain a file in real conflict or pseudo-conflict state.

Content Conflicts vs Property Conflicts

A *Content conflict* appears in the content of a file. A merge occurs for every inbound change to a file that is also modified in the working copy. In some cases, if the local change and the incoming change intersect each other, Apache Subversion™ cannot merge these changes without intervention. So if the conflict is real when updating the file in question the conflicting area is marked like this:

```
<<<<<< filename
your changes
====
code merged from repository
>>>>>> revision
```

Also, for every conflicted file Subversion places three additional temporary files in your directory:

- `filename.ext.mine` - This is your file as it existed in your working copy before you updated your working copy, that is without conflict markers. This file has your latest changes in it and nothing else.
- `filename.ext.rOLDREV` - This is the file that was the BASE revision before you updated your working copy, that is the file revision that you updated before you made your latest edits.
- `filename.ext.rNEWREV` - This is the file that Subversion client just received from the server when you updated your working copy. This file corresponds to the HEAD revision of the repository.

OLDREV and NEWREV are revision numbers. If you have conflicts with binary files, Subversion does not attempt to merge the files by itself. The local file remains unchanged (exactly as you last changed it) and you will get `filename.ext.r*` files also.

A *Property conflict* is obtained when two people modify the same property of the same file or folder. When updating such a resource a file named `filename.ext.prej` is created in your working copy containing the nature of the conflict. Your local file property that is in conflict will not be changed. After resolving the conflict, you should use the **Mark resolved** action to commit the file. Note that the **Mark resolved** action does not really resolve the conflict. It just removes the conflicted flag of the file and deletes the temporary files.

Edit Real Content Conflicts

The conflicts of a file in the conflicted state (a file with the red double arrow icon) can be edited visually with the **Compare** view (the built-in file comparison tool) or with an [external diff application \(on page 247\)](#). Resolving the conflict means deciding for each conflict if the local version of the change will remain or the remote one instead of the special conflict markers inserted in the file by the SVN server.

The **Compare** view (or the external diff application [set in Preferences \(on page 247\)](#)) is opened with the **Edit Conflict** action, which is available on the contextual menus of [the Working Copy view \(on page 2162\)](#) for files in the conflicted state (an update operation was executed but the differences could not be merged without conflicts). The external diff application is called with 3 parameters because it is a 3-way diff operation between the local version of the file from the working copy and the HEAD version from the SVN repository with the BASE version from the working copy as common ancestor.

If the [Show warning dialog when edit conflicts option \(on page 251\)](#) is selected, you will be warned at the beginning of the operation that the operation will overwrite the conflict version of the file received from the SVN server (the version that contains the conflict markers <<<<<<, =====, >>>>>>) with the original local version of the file that preceded the update operation. If you click the OK button the visual conflict editing will proceed and a backup file of the conflict version received from the SVN server is created in the same working copy folder as the file with the edited conflicts. The name of the backup file is obtained by appending the extension `.sync.bak` to the file as stored on the SVN server. If you click the **Cancel** button the visual editing will be aborted.

The usual actions on the differences between two versions of a file are available on the toolbar of this view:

Save

Saves the modifications of the local version of the file displayed in the left side of the view.

Perform Files Differencing

Looks for differences between the two files displayed in the left and right side panels.

Ignore Whitespaces

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

Synchronized scrolling

Toggles synchronized scrolling. When toggled on, a selected difference can be seen in both panels.

Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on macOS))

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

**Note:**

When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.

**Copy Change from Right to Left**

Copies the selected difference from the file in the right panel to the file in the left panel.

**Copy All Changes from Right to Left**

Copies all changes from the file in the right panel to the file in the left panel.

**Next Block of Changes (Ctrl + Period (Command + Period on macOS))**

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

**Note:**

A change block groups one or more consecutive lines that contain at least one change.

**Previous Block of Changes (Ctrl + Comma (Command + Comma on macOS))**

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

**Next Change (Ctrl + Shift + Period (Command + Shift + Period on macOS))**

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

**Previous Change (Ctrl + Shift + Comma (Command + Shift + M on macOS))**

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

**First Change (Ctrl + B (Command + B on macOS))**

Jumps to the first change.

The operation begins by overwriting the conflict version of the file received from the SVN server (the version that contains the conflict markers <<<<<<, =====, >>>>>>) with the original local version of the file before running the update action that created the conflict. After that the differences between this original local version and the repository version are displayed in the **Compare** view.

If you want to edit the conflict version of the file directly in a text editor instead of the visual editing offered by the **Compare** view you should work on the local working copy file after the update operation without running the action **Edit Conflict**. If you decide that you want to edit the conflict version directly after running the action **Edit Conflict** you have to work on the `.sync.bak` file.

If you did not finish editing the conflicts in a file at the first run of the action **Edit Conflict** you can run the action again and you will be prompted to choose between resuming the editing where the previous run left it and starting again from the conflict file received from the SVN server.

After the conflicts are edited and saved in the local version of the file you should run one of the following:

- The **Mark Resolved** action on the file so that the result of the conflict editing process can be committed to the SVN repository.
- The **Revert** action so that the repository version overwrites all the local modifications.

Both actions remove the backup file and other temporary files created with the conflict version of the local file.

Revert Your Changes

If you want to undo changes made in your working copy, since the last update, select the items you are interested in, right-click to display the contextual menu and select **Revert**. A dialog box will open that shows you the files and folders that you have changed and can be reverted. Select those you want to revert and click the **OK** button. Revert will undo only your local changes. It does not undo any changes that have already been committed. If you choose to revert a conflicting item to its pristine copy, then the eventual conflict is solved by losing your outgoing modifications. If you try to revert a resource not under version control, the resource will be deleted from the file system.

Note:

By default, a directory will be recursively reverted (including any other modified item it contains). However, if the directory has only property changes, you need to explicitly choose if the operation will include any modified items found inside it.

If you want some of your outgoing changes to be overridden you must first open the file in **Compare view** ([on page 2186](#)) and choose the sections to be replaced with ones from the repository file. This can be achieved either by editing directly the file or by using the action **Copy change from right to left** from the **Compare view toolbar** ([on page 2187](#)). After editing the conflicting file you have to run the action **Mark as merged** before committing it.

If you want to drop all local changes and bring all incoming changes into your working copy resource, you can use the **Override and update** action. It discards the changes in the local file and updates it from the repository. A dialog box will display the files that will be affected.

Figure 540. Override and Update Dialog Box

In the first table of the dialog box you will be able to see the resources that will be overridden. In the second table you will find the list of resources that will be updated. Only resources that have an incoming status are updated.

**Tip:**

If you want to roll-back out of your working copy changes that have already been committed to the repository, see [Merge Revisions \(on page 2124\)](#).

Merge Conflicted Resources

Before you can safely commit your changes to the repository you must first resolve all conflicts. In the case of pseudo-conflicts they can be resolved in most cases with an update operation that will merge the incoming modifications into your working copy resource. In the case of real conflicts, conflicts that persist after an update operation, it is necessary to resolve the conflict using the built-in compare view and editor or, in the case of properties conflict, the [Properties view \(on page 2190\)](#). Before you can commit you must *mark as resolved* the affected files.

Both pseudo and real conflicts can be resolved without an update. You should open the file in the compare editor and decide which incoming changes need to be copied locally and which outgoing changes must

be overridden or modified. After saving your local file you have to use the *Mark as merged* action from the contextual menu before committing.

Drop Incoming Modifications

In the situation when your file is in conflict but you decide that your working copy file and its content is the correct one, you can decide to drop some or all of the incoming changes and commit afterwards. The action **Mark as merged** proves to be useful in this case too. After opening the conflicting files with **Compare view** ([on page 2186](#)), **Editor** ([on page 2183](#)) or editing their properties in the **Properties** view and deciding that your file can be committed in the repository replacing the existing one, you should use the **Mark as merged** action. When you want to override completely the remote file with the local file you should run the **Override and commit** action, which drops any remote changes and commits your file.

In general it is much safer to analyze all incoming and outgoing changes using the **Compare** view and only after to update and commit.

Tree Conflicts

A *tree conflict* is a conflict at the directory tree structure level and occurs when the user runs an update action on a resource that has the following conditions:

- It is locally modified and the same resource was deleted from the repository (or deleted as a result of being renamed or moved).
- It was locally deleted (or deleted as a result of being renamed or moved) and the same resource is incoming as modified from the repository.

The same conflict situation can occur after a merge or a switch action. The action ends with an error and the folder containing the file that is now in the tree conflict state is also marked with a conflict icon.

Such a conflict can be resolved in one of the following ways that are available when the user double clicks on the conflicting resource or when running the **Edit conflict** action:

Figure 541. Resolve a tree conflict

- **Keep local change (delete resource)** - Keeps the incoming change that comes from the repository.
- **Keep incoming modified resource** - If there is a renamed version of the file committed by other user that will be added to the working copy too.

Update the Working Copy

While you are working on a project, other members of your team may be committing changes to the project repository. To get these changes, you have to *update* your working copy. Updating may be done on single files, a set of selected files, or recursively on entire directory hierarchies. The update operation can be performed from **Working Copy view** (on page 2162). It updates the selected resources to the last synchronized revision (if remote information is available) or to the *HEAD* revision of the repository.

There are three different kinds of incoming changes:

- *Non-conflicting* - A non-conflicting change occurs when a file has been changed remotely but has not been modified locally.
- *Conflicting, but auto-mergeable* - An auto-mergeable conflicting change occurs when a text file has been changed both remotely and locally (for example, has non-committed local changes) but the changes are on different lines of text. Not applicable to binary resources (for example, multimedia files, PDFs, executable program files)
- *Conflicting* - A conflicting change occurs when one or more of the same lines of a text file have been changed both remotely and locally.

If the resource contains only incoming changes or the outgoing changes do not intersect with incoming ones then the update will end normally and the Subversion system will merge incoming changes into the local file. In the case of a conflicting situation the update will have as result a file with conflict status.

The Oxygen XML Developer allows you to update your working copy files to a specific revision, not only the most recent one. This can be done by using the **Update to revision/depth** action from the **Working Copy** view (**All Files** view mode) or the **Update to revision** action from the **History view** ([on page 2177](#)) contextual menu.

If you select multiple files and folders and then you perform an **Update** operation, all of those files and folders are updated one by one. The Subversion client makes sure that all files and folders belonging to the same repository are updated to the exact same revision, even if between those updates another commit occurred.

When the update fails with a message saying that there is already a local file with the same name Subversion tried to check out a newly versioned file, and found that an unversioned file with the same name already exists in your working folder. Subversion will never overwrite an unversioned file unless you specifically do this with an **Override and update** action. If you get this error message, the solution is simply to rename the local unversioned file. After completing the update, you can check to see if the renamed file is still needed.

Send Your Changes to the Repository

Sending the changes you made to your working copy is known as *committing* the changes. If your working copy is up-to-date and there are no conflicts, you are ready to commit your changes.

The **Commit** action sends the changes from your local working copy to the repository. The **Commit** dialog box presents all the items that you can commit.

Figure 542. Commit dialog box

Enter a message to associate with the commit, or choose a previous message from the **Previous messages** list (the last 10 commit messages will be remembered even after restarting the SVN client application).

An item that can be committed has one of the following states: *added*, *modified* (content or properties), *replaced*, and *deleted*. All items that have one of these states are selected in the dialog box by default. If you do not want to commit one of the items, deselect it.

Attention:

For SVN 1.8 working copies: when committing items that were moved and/or renamed, make sure you select both the source and the destination. Otherwise, the commit operation will fail.

Besides the items that have one of the mentioned states, Syncro SVN Client also includes the files being *unversioned* or *missing* and these items are handled automatically:

- *Unversioned* items are added under version control.
- *Missing* items are deleted.

**Note:**

If the **Show unversioned directories content** option is not selected, the **Commit** dialog box does not display the items inside an *unversioned* directory.

Unversioned or *missing* items are not selected by default in the **Commit** dialog box, unless you have selected them explicitly when issuing the commit command.

**Note:**

In some cases, items that have one of the above states are not presented in the **Commit** dialog box.

For example:

- Items that have been *added* or *replaced* previously, but now are presented as *missing* after being removed from the file system, outside of an SVN client. Such items do not exist in the repository and you should use the **Delete** action to remove them from your working copy.
- Items that have incoming changes from the repository, after a synchronization. You need to have your working copy up-to-date before committing your changes.
- Files that, after a synchronization, appear as locked by other users or from other locations than the current working copy.

**Note:**

Due to dependencies between items, when you select or clear an *unversioned* (?) or *added* (+) item in the **Commit** dialog box, other items with one of these states can be selected or cleared automatically.

The modifications that will be committed for each file can be reviewed in the compare editor window by double-clicking a file in the **Commit** dialog box, or by right-clicking and selecting the **Show Modifications** action from the contextual menu. This option is available to review only file content changes, not property changes.

The **Local file status** column indicates the actual state of the items and the **Local properties status** column indicates whether or not the properties of an item are modified.

The **Lock information** column is displayed if at least one of the files in the **Commit** dialog box has lock information associated with it, valid against the commit operation.

The following options are available in this dialog box:

- **Enable automatic properties** or **Disable automatic properties** - enables or disables automatic property assignment (per runtime configuration rules), overriding the `enable-auto-props` runtime configuration directive, defined in the `config` file of the Subversion configuration directory.

**Note:**

This option is available only when there are defined properties to be applied automatically for resources newly added under version control. You can define these properties in the `config` file of the Subversion configuration directory, in the `auto-props` section. Based on the value of the `enable-auto-props` runtime configuration directive, the presented option is either **Enable automatic properties**, or **Disable automatic properties**.

- **Keep locks** - selecting the **Keep locks** option preserves any locks you set on various files.

**Note:**

This option is available only when files that you locked are presented in the dialog box.

Each of the above options is activated only when you select an item that can have the option applied.

Your working copy must be up-to-date with respect to the resources you commit. This is ensured by using the **Update** action prior to committing, resolving conflicts and re-testing as needed. If your working copy resources you are trying to commit are out of date you will get an appropriate error message.

Committing to Multiple Locations

Although Subversion does not support committing to multiple locations at once, Syncro SVN Client offers this functionality regarding *external* items.

If items to be committed belong to different *external* definitions than those found in the working copy, they are grouped under the corresponding item that indicates their repository origin. Each parent item is rendered bold and its corresponding repository location is presented when hovering it. Parent items are decorated with a small arrow () if they are *external* definitions. The working copy root directory is never decorated and is not presented if there are no *external* items listed (all items belong to the main working copy). Each child item is presented relative to the parent item.

**Note:**

When an *external* directory has modifications of its own, it is presented both as a parent item and as an item that you can select and commit. This is always the case for *external* files.

The sets of items belonging to *external* definitions from the same repository are committed together, resulting a single revision. So, the number of revisions can be smaller than the number of *externals*. External definitions are considered from the same repository if they have the same protocol, server address, port, and repository address within the server.

**Note:**

External files are always from the same repository as the parent directory that defines them, so they are always committed together with the changes from their parent directory.

Integration with Bug Tracking Tools

Users of bug tracking systems can associate the changes they make in the repository resources with a specific ID in their bug tracking system. The only requirement is that the user includes the bug ID in the commit message that they enter in the **Commit** dialog box. The format and the location of the ID in the commit message are configured with SVN properties.

To make the integration possible Syncro SVN Client needs some data about the bug tracking tool used in the project. You can configure this using the following [SVN properties \(on page 2116\)](#) that must be set on the folder that contains resources associated with the bug tracking system (usually they are set recursively on the root folder of the working copy):

- **bugtraq:message** - A string property. If it is set the **Commit dialog box (on page 2110)** will display a text field for entering the bug ID. It must contain the string `%BUGID%`, which is replaced with the bug number on commit.
- **bugtraq:label** - A string property that sets the label for the text field configured with the **bugtraq:message** property.
- **bugtraq:url** - A string property that is the URL pointing to the bug tracking tool. The URL string should contain the substring `%BUGID%` which Syncro SVN Client replaces with the issue number. That way the resulting URL will point directly to the correct issue.
- **bugtraq:warnifnoissue** - A boolean property with the values *true/yes* or *false/no*. If set to *true*, the Syncro SVN Client will warn you if the bug ID text field is left empty. The warning will not block the commit, only give you a chance to enter an issue number.
- **bugtraq:number** - A boolean property with the value *true* or *false*. If this property is set to *false*, then any character can be entered in the bug ID text field. If the property is set to *true* or is missing then only numbers are allowed as the bug ID.
- **bugtraq:append** - A boolean property. If set to *false*, then the bug ID is inserted at the beginning of the commit message. If *yes* or not set, then it is appended to the commit message.
- **bugtraq:logregex** - This property contains one or two regular expressions, separated by a newline. If only one expression is set, then the bug ID's must be matched in the groups of the regular expression string (for example, `[Ii]ssue #?(\\d+)`). If two expressions are set, then the first expression is used to find a string which relates to a bug ID but may contain more than just the bug ID (for example, `Issue #123` or `resolves issue 123`). The second expression is then used to extract the bug ID from the string extracted with the first expression. An example: if you want to catch every pattern `issue #XXX` and `issue #890, #789` inside a log message you could use the following strings:

- `[Ii]ssue #?(\\d+)(, ? ?#?(\\d+))+`
- `(\\d+)`

The data configured with these SVN properties is stored on the repository when a revision is committed. A bug tracking system or a statistics tool can retrieve the revisions that affected a bug from the SVN server and present the commits related to that bug to the user of the bug tracking system.

If the **bugtraq:url** property was filled in with the URL of the bug tracking system and this URL includes the *%BUGID%* substring as specified above in the description of the **bugtraq:url** property then the **History view** (*on page 2177*) presents the bug ID as a hyperlink in the commit message. Clicking such a hyperlink in the commit message of a revision opens a Web browser at the page corresponding to the bug affected by that commit.

Obtain Information for a Resource

This section explains how to obtain information for a SVN resource:

Request Status Information for a Resource

While you are working with the SVN Client you often need to know which files you have changed, added, removed, or renamed, or even which files got changed and committed by others. This is where the **Synchronize** action from the **Working Copy view** (*on page 2162*) comes in handy. The **Working Copy** view shows you every file that has changed your working copy, as well as any unversioned files you may have.

If you want more detailed information about a given resource, you can use the  **Show SVN Information** action. This action is available from the **File** menu or the contextual menu of the **Working Copy**, **Repositories**, **History**, or **Directory Change Set** views, or from the **Revision Graph** dialog box. The **SVN Information** dialog box will be displayed, showing information about the selected resource. The information displayed depends on the location of the item (local or remote) and may include the following:

- Local path and repository location
- Revision number
- Last change author, revision and date
- Information about locks
- Local file status
- Local properties status
- Local directory depth
- Repository location and revision number for copied files or directories
- Path information about locally moved items
- Path information about conflict generated files
- Remote file status
- Remote properties status
- File size and other information

The value of a property of the resource displayed in the dialog box can be copied by right-clicking the property and selecting the **Copy** action.

Request History for a Resource

In Apache Subversion™, both files and directories are versioned and have a history. If you want to examine the history for a selected resource and find out what happened at a certain revision you can use the **History view** that can be accessed from [Repositories view \(on page 2157\)](#), [Working Copy view \(on page 2162\)](#), [Revision Graph \(on page 2192\)](#), or [Directory Change Set view \(on page 2182\)](#). From the **Working copy view** you can display the history of local versioned resources. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Related Information:

[History View \(on page 2177\)](#)

Management of SVN Properties

In the **Properties view (on page 2190)** you can read and set the Apache Subversion™ properties of a file or folder. There is a set of predefined properties with special meaning to Subversion. For more information about properties in Subversion see the SVN Subversion specification. Subversion properties are revision-dependent. After you change, add or delete a property for a resource, you have to commit your changes to the repository.

If you want to change the properties of a given resource you need to select that resource from the **Working Copy view (on page 2162)** and run the **Show properties** action from the contextual menu. The **Properties view (on page 2190)** will show the local properties for the resource in the working copy. Once the **Properties view** is visible, it will always present the properties of the currently selected resource. There are actions available in the **Properties view toolbar (on page 2191)** that allows you to add, change, and delete the properties.

If you choose the **Add a new property** action, a new dialog box will appear that contains the following:

- **Name** - Combo box that allows you to enter the name of the property. The drop-down menu of the combo box presents the predefined Subversion properties (such as **svn:ignore**, **svn:externals**, **svn:needs-lock**, etc.)
- **Current value** - Text area that allows you to enter the value of the new property.

If the selected item is a directory, you can also set the property recursively on its children by selecting the **Set property recursively** checkbox.

If you want to change the value for a previously set property, you can use the **Edit property** action, which will display a dialog box with the following information:

- **Name** - Property name (cannot be changed).
- **Current value** - The current value (can be changed).
- **Base value** - The value of the property, if any, from the resource in the pristine copy (cannot be changed).

If you want to completely remove a property previously set you can choose the **Remove property** action. It will display a confirmation dialog box where you can also choose if the property will be removed recursively.

There is a **Refresh** action in the **Properties view** ([on page 2190](#)) that can be used when the properties have been changed from outside the view. This can happen, for example, when the view was already presenting the properties of a resource and they have been changed after an **Update** operation.

Branches and Tags

One of the fundamental features of version control systems is the ability to create a new line of development from the main one. This new line of development will always share a common history with the main line if you look far enough back in time. This line is known as a *branch*. Branches are mostly used to try out features or fixes. When the feature or fix is finished, the branch can be merged back into the main branch (*trunk*).

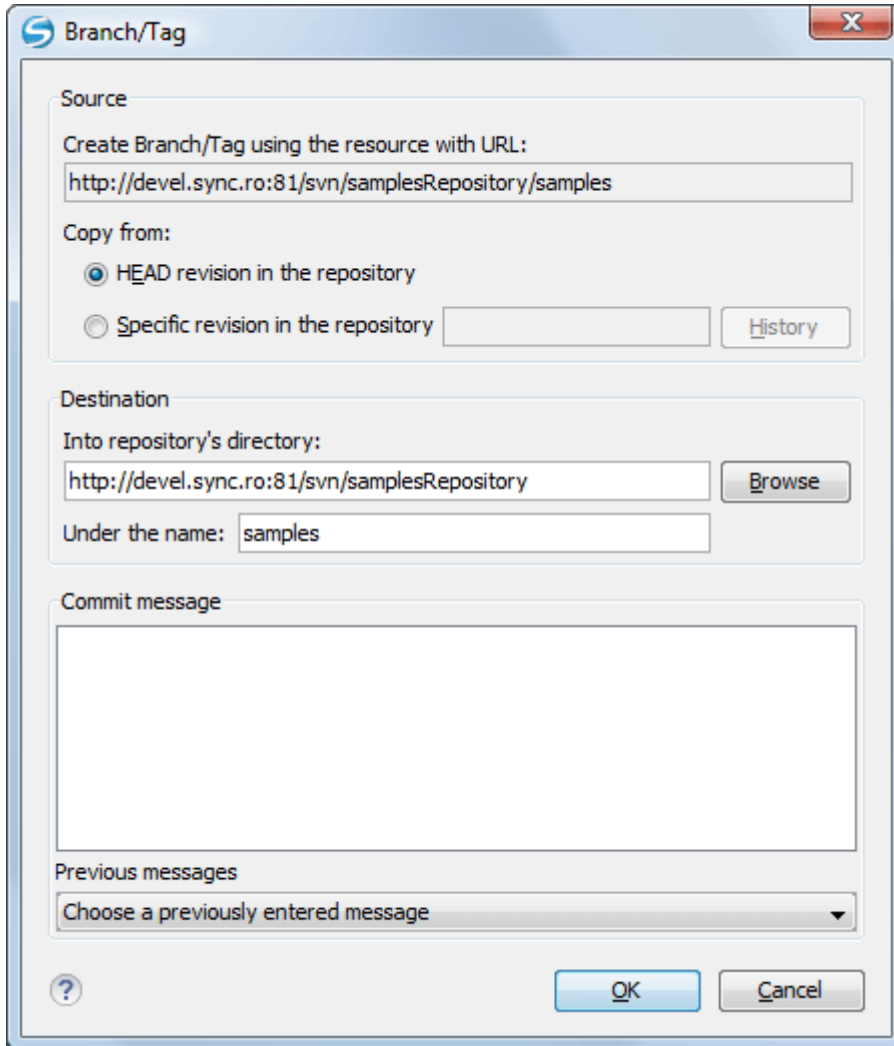

Another feature of version control systems is the ability to take a snapshot of a particular revision, so you can at any time recreate a certain build or environment. This is known as *tagging*. Tagging is especially useful when making release versions.

In Apache Subversion™, there is no difference between a *tag* and a *branch*. On the repository, both are ordinary directories that are created by copying. The trick is that they are cheap copies instead of physical copies. Cheap copies are similar to hard links in Unix, which means that they merely link to a specific tree and revision without making a physical copy. As a result, branches and tags occupy little space on the repository and are created very quickly.

Provided that nobody ever commits to the directory in question, it remains a tag. If people start committing to it, it becomes a branch.

Create a Branch / Tag

To create a branch or tag by copying a directory, use the **Branch/Tag** action that is available in the **Tools** menu when an item is selected in the **Working Copy view** ([on page 2162](#)) or **Repositories view** ([on page 2157](#)), or from the contextual menu of the **Repositories** view.

Figure 543. Branch/Tag Dialog Box

You can configure the following options in this dialog box:

You can specify the source revision of the copy in the **Copy from** section. You can choose between the following options:

- **HEAD revision in the repository** - The new branch or tag will be copied in the repository from the **HEAD** revision. The branch will be created very quickly, as the repository will make a *cheap* copy.
- **Specific revision in the repository** - The new branch will be copied into the repository, but you can specify the exact desired revision. For example, this is useful if you forgot to make a branch or tag when you released your application. If you click the **History** button you can select the revision number from [the History dialog box \(on page 2090\)](#). This type of branch will also be created very quickly.
- **Working copy** - (Available only if the item is selected from the **Working copy** view). The new branch will be a copy of your local working copy. If you have updated some files to an older revision in your working copy, or if you have made local changes, that is exactly what goes into the copy. This involves transferring some data from your working copy back to the repository, or more specifically, the locally modified files.

You can specify the location of the new branch or tag in the **Destination** section:

- **Into repository's directory** - The URL of the parent directory (*on page 2197*) of the new branch or tag.

**Note:**

Peg revisions have no effect for this operation since it is used to send information to the repository.

- **Under the name** - You can specify another branch or tag name other than the name of the resource selected in the **Repositories** or **Working copy** view.

The new branch or tag will be created as a child of the specified URL of the repository directory and will have the new name.

Merging

At some stage during the development process, you will want to merge the changes made on a *branch* back into the *trunk*, or vice-versa. The *merge* is accomplished by comparing two points (branches or revisions) in the repository and applying the obtained differences to your working copy. This process is closely related to the *diff* concept.

**Note:**

A *branch* is a line of development that exists independently of another line, yet still shares a common history if you look far enough back in time. A *branch* always begins life as a *copy of something* (such as a trunk, another branch, or tag), and moves on from there, generating its own history.

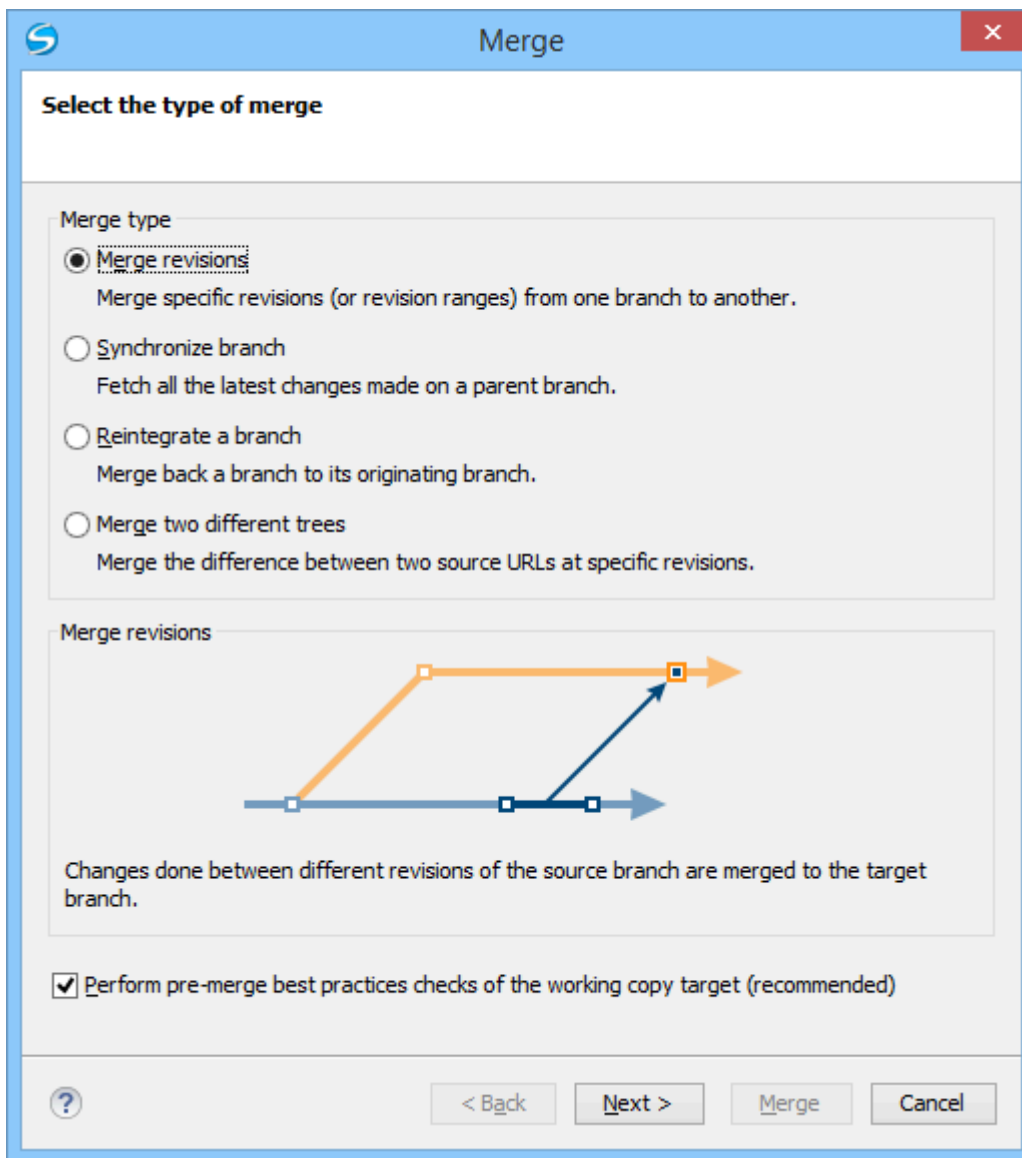

The  **Merge** action is available in the **Tools** menu. The working copy item selected when you issued the command will be the one receiving the generated changes. If there is no item selected, the *merge* operation will be performed on the entire working copy.

Figure 544. Merge Wizard

The four types of merging are as follows:

- **Merge revisions** (on page 2123) - Port changes from one branch to another. Note that the *trunk* can also be considered a branch, in this context.
- **Synchronize branch** (on page 2125) - Fetch all the changes made on a parent branch (or the *trunk*) to a child branch.
- **Reintegrate a branch** (on page 2127) - Merge a branch back to its parent branch (can also be the *trunk*).
- **Merge two different trees** (on page 2129) - Integrate the changes done on a branch to a different branch.

It is recommended that you enable the following pre-merge check:

Perform pre-merge best practices checks of the working copy target (on page 2121) - When selected, the SVN Client checks if the working copy target item is ready for the merge operation and displays the **pre-merge checks** wizard page.

**Remember:**

It is a good idea to perform a merge into an unmodified working copy. If you have made changes to your working copy, commit them first. If the *merge* does not go as you expect, you may want to revert the changes and revert cannot recover your uncommitted modifications.

**Important:**

The above recommendation becomes mandatory when *reintegrating a branch (on page 2119)*.

Pre-Merge Checks

Before performing a merge, it is recommended to make sure that the working copy target item is ready for the merge operation. The SVN Client includes a best practices step that checks various conditions of the working copy target item to ensure that the merge operation will succeed. By selecting the **Perform pre-merge best practices checks of the working copy target** option in the first page of the **Merge** wizard, the **Pre-merge checks** wizard page is displayed to give you a summary of the verified conditions.

Figure 545. Pre-Merge Checks Wizard Page

The following conditions are checked in this operation:

No local modifications

The working copy item (or any of its children) receiving the merge should not contain uncommitted changes, to make it easier to revert merge-generated changes if you encounter unexpected results.

Tip:

If this condition fails, you should *commit* or *revert* the local modifications before merging.

No switched children

None of the children of the working copy item receiving the merge should be switched, to avoid incomplete merges and *subtree mergeinfo*.

Tip:

If this condition fails, you should switch back all the children before merging.

Complete working copy tree

The working copy item receiving the merge should be a complete directory tree structure with an infinite depth, to avoid incomplete merges and *subtree mergeinfo*.

Tip:

If this condition fails, you should change the *sticky* depth of the working copy item receiving the merge to *infinity* value.

No mixed revisions

To avoid unexpected merge conflicts, the working copy item that is receiving the merge should not contain items that were updated to other revisions.

Tip:

If this condition fails, you should *update* the working copy before merging.

Each condition is marked with an icon that represents the state of the condition. The possible states are as follows:

-  **(Successful)** - The condition is fulfilled successfully.
-  **(Warning)** - The condition is not fulfilled, but it is not mandatory.
-  **(Error)** - The condition is not fulfilled and is mandatory (therefore, the operation cannot proceed until you solve the error).

**Tip:**

For each condition state, a message is displayed that gives you additional information about the results and, for warning or errors, a hint that explains how you can solve them.

**Important:**

After solving any of the warnings or errors, it is recommended that you perform the *pre-merge checks* again to make sure your new changes are valid.

Merge Revisions

This case is when you have made one or more changes to a branch and you want to duplicate them in another branch. For example, suppose you know that a problem has been fixed by committing revisions [17](#), [20](#), and [25](#) on branch [B1](#). These changes are also needed in branch [B2](#). Thus, to merge them, you need a working copy of the [B2](#) branch.

To merge revisions from a different branch, follow these steps:

1. Go to menu **Tools > Merge**.

The **Merge** wizard is opened.

2. Select the **Merge revisions** option.

3. It is recommended that you select the **Perform pre-merge best practices checks of the working copy target** option to make sure that the working copy target item is ready for the merge operation.

- a. Click the **Next** button.

If the **Perform pre-merge best practices checks of the working copy target** option is selected, the **Pre-Merge Checks** wizard page ([on page 2121](#)) is displayed.

**Note:**

If errors are found you need to solve them before proceeding.

4. Click the **Next** button.

The **Merge revisions** wizard page is displayed.

5. In the **Merge from (URL)** text box, enter [the URL of the branch or tag \(on page 2197\)](#) that contain the changes that you want to duplicate in your working copy.

You may also click the **Browse** button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop-down menu, which displays a history of previously used URLs.

**Note:**

If the URL belongs to a different repository than the working copy, the **Ignore ancestry / Disable merge tracking** option (in the **Merge Options** wizard page ([on page 2132](#))) will be selected

automatically (and you cannot change this). This is because the [Subversion client cannot track changes between different repositories \(on page 2135\)](#).

**Tip:**

You can also specify a [peg revision \(on page 2199\)](#) at the end of the URL (for example, `URL@rev1234`). The peg revision does not affect the merge range you select. By default, the `HEAD` revision is assumed.

6. In the **Revisions to merge** section, choose between the **all revisions** and **specific revision(s)** options.

- **all revisions** - The operation will include *all eligible revisions* that were not yet merged.
- **specific revision(s)** - You can specify one or more individual revisions and/or revision ranges. Also, you can mix *forward* ranges (for example, `1-5`), *backward* ranges (for example, `20-15`), and subtract specific revisions from a range (for example, `1-5, -3`).

**Note:**

If using the Subversion command-line client, a revision range of the form `1-5` means all changes starting from revision 2 up to revision 5 (the changes necessary to reach revision 5, committed after revision 1). Unlike the Subversion command-line client, in Syncro SVN Client the revision ranges are inclusive, meaning that it will process all revisions, starting with revision 1, up to and including revision 5.

**Attention:**

The `HEAD` revision is the only non-numerical revision allowed, and it can only be used when specifying revision ranges as one of the ends of the range (for example, `10-HEAD`). Be careful when using it, as it might not refer to the desired revision, if it has recently been committed by another user.

**Tip:**

If you want to perform a *reverse merge* and roll-back your working copy changes that have already been committed to the repository, use the *negative revisions* notation (for example, `-7`) or *backward revision ranges* (for example, `20-10`).

- a. If you click the **History** button, the **History** dialog box (on page 2090) is displayed, which allows you to select one or more revisions to be merged.

7. Optionally, if you want to [configure the options \(on page 2132\)](#) for your merge, click the **Next** button.

The **Merge Options** wizard page (on page 2132) is displayed that allows you to configure options for the operation.

**Warning:**

If the **Ignore ancestry / Disable merge tracking** option is selected and you chose **all revisions** in the **Revisions to merge** section, revisions that were previously merged will also be included, which may result in conflicts.

8. Click the **Merge** button.

The merge operation is performed.

If the merge is completed successfully, all the changes corresponding to the selected revisions should be merged in your working copy.

It is recommended to look at the results of the merge, in the working copy, to review the changes and see if it meets your expectations. Since merging can sometimes be complicated, [you may need to resolve conflicts \(on page 2134\)](#) after making major changes.

**Note:**

The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

Synchronize a Branch

While working on your own branch, other people on your team might continue to make important changes in the parent branch (which can be the *trunk* itself or any other branch). It is recommended to periodically duplicate those changes in your branch to make sure your changes are compatible with them. This is done by performing a *synchronize merge*, which will bring your branch up-to-date with any changes made to its ancestral parent branch since your branch was last created or synchronized. Subversion is aware of the history of your branch and can detect when it split away from the parent branch.

Frequently keeping your branch in sync with the parent branch helps you to prevent unexpected conflicts when the time comes for you to duplicate your changes back into the parent branch. The synchronization uses *merge tracking* to skip all those revisions that have already been merged, thus a sync merge can be repeated periodically to fetch all the latest changes of the parent branch to keep up-to-date with it.

**Important:**

It is recommended to synchronize the whole working copy that was created from the child branch (the root of the working copy), rather than just a part of it.

After running the *synchronize merge*, your working copy from the child branch now contains new local modifications, and these edits are duplications of all of the changes that have happened on the *trunk* since you first created your branch. At this point, your private branch is now synchronized with the trunk.

To synchronize your branch with its parent branch, follow these steps:

1. Go to **Tools > Merge**.

The **Merge** wizard is opened.

2. Select the **Synchronize branch** option.

3. It is recommended that you select the **Perform pre-merge best practices checks of the working copy target** option to make sure that the working copy target item is ready for the merge operation.

- a. Click the **Next** button.

If the **Perform pre-merge best practices checks of the working copy target** option is selected, the **Pre-Merge Checks** wizard page ([on page 2121](#)) is displayed.

**Note:**

If errors are found you need to solve them before proceeding.

4. Click the **Next** button.

The **Synchronize branch** wizard page is displayed.

5. In the **Parent branch (URL)** text box, enter [the URL of the branch where you created your branch \(on page 2197\)](#). This means that the URL must belong to the same repository as your working copy that was created from the child branch.

You may also click the **Browse** button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop-down menu, which displays a history of previously used URLs.

**Tip:**

You can also specify a [peg revision \(on page 2199\)](#) at the end of the URL (for example, `URL@rev1234`). The peg revision specifies both the peg revision of the URL and the latest revision that will be considered for merging. By default, the `HEAD` revision is assumed.

6. Optionally, if you want to [configure the options \(on page 2132\)](#) for your merge, click the **Next** button.

The **Merge Options** wizard page ([on page 2132](#)) is displayed that allows you to configure options for the operation.

**Note:**

The **Ignore ancestry / Disable merge tracking** option is not available for this merge type, since a synchronization merge should always be recorded in the destination branch.

7. Click the **Merge** button.

The merge operation is performed.

If the merge is completed successfully, all the changes corresponding to the selected revisions should be merged in your working copy.

It is recommended to look at the results of the merge, in the working copy, to review the changes and see if it meets your expectations. Since merging can sometimes be complicated, [you may need to resolve conflicts \(on page 2134\)](#) after making major changes.

**Note:**

The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

Reintegrate a Branch

**Prerequisites:**

There are some conditions that apply to reintegrate a branch:

- The server must support merge tracking.
- The source branch (to be reintegrated) must be coherently synchronized with its parent branch. This means that all revisions between the branching point and the last revision merged from the parent branch to the child branch must be merged to the latter one (there must be no missing revisions in-between).
- The working copy **must not** contain the following:
 - Local modifications.
 - A mixture of revisions (all items must point to the same revision).
 - Sparse directories (all directories must be of **infinity** depth).
 - Switched items.
- The revision of the working copy must be greater than or equal to the last revision of the parent branch with which the child branch was synchronized.

**Tip:**

You can use [the *pre-merge checks* option \(on page 2121\)](#) to make sure these conditions are fulfilled.

This method is useful when you have a feature branch on which the development has concluded and it should be merged back into its parent branch. Since you have kept the feature branch synchronized with its parent, the latest versions of them will be absolutely identical except for your feature branch changes. These changes can be reintegrated into the parent branch by using a working copy of it and the **Reintegrate a branch** option.

This method uses the *merge-tracking* features of Apache Subversion™ to automatically calculate the correct revision ranges and to perform additional checks that will ensure that the branch to be reintegrated has been fully updated with its parent changes. This ensures that you do not accidentally undo work that others have committed to the parent branch since the last time you synchronized the child branch with it. After the merge, all branch development will be completely merged back into the parent branch, and the child branch will be redundant and can be deleted from the repository.

**Tip:**

Before reintegrating the child branch it is recommended to synchronize it with its parent branch one more time, to help avoid any possible conflicts.

To reintegrate a child branch into its parent branch, follow these steps:

1. Go to menu **Tools > Merge**.
The **Merge** wizard is opened.
2. Select the **Reintegrate a branch** option.

**Note:**

This option is not available if the selected working copy item (or if it is a directory, any of the items inside of it) has any type of modification. This is because it is mandatory for the target item to have no modifications.

3. It is recommended that you select the **Perform pre-merge best practices checks of the working copy target** option to make sure that the working copy target item is ready for the merge operation.
 - a. Click the **Next** button.
If the **Perform pre-merge best practices checks of the working copy target** option is selected, the **Pre-Merge Checks** wizard page (*on page 2121*) is displayed.

**Note:**

If errors are found you need to solve them before proceeding.

4. Click the **Next** button.
The **Reintegrate a branch** wizard page is displayed.
5. In the **Child branch (URL)** text box, enter *the URL of the child branch to be reintegrated (on page 2197)*. This means that the URL must belong to the same repository as your working copy that was created from the parent branch.
You may also click the **Browse** button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop-down menu, which displays a history of previously used URLs.

**Tip:**

You can also specify a *peg revision (on page 2199)* at the end of the URL (for example, `URL@rev1234`). The peg revision specifies both the peg revision of the URL and the latest revision that will be considered for merging. By default, the `HEAD` revision is assumed.

The **Merge Options** wizard page (*on page 2132*) is displayed that allows you to configure options for the operation.

**Note:**

Since a *reintegrate merge* is so specialized, most of the merge options are not available, except for those in the **File Comparison** category.

6. Click the **Merge** button.

The merge operation is performed.

If the merge is completed successfully, all the changes corresponding to the selected revisions should be merged in your working copy.

It is recommended to look at the results of the merge, in the working copy, to review the changes and see if it meets your expectations. Since merging can sometimes be complicated, [you may need to resolve conflicts \(on page 2134\)](#) after making major changes.

**Note:**

The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

Merge Two Different Trees

This merge type is useful when you need to duplicate changes from one child branch (for example, `CB1`) to another child branch (`CB2`) from the same parent branch. The SVN client will calculate the changes necessary to get from the `HEAD` revision of the parent branch (or the *trunk*) to the `HEAD` revision of one of its child branches (`CB1`), and apply those changes to your working copy of the other branch (`CB2`). The result is that the latter child branch (`CB2`) will also include the changes made on the original child branch (`CB1`), although that branch was not reintegrated into the parent branch.

This merge type could also be used to reintegrate a child branch back into its parent when the repository does not support *merge tracking*.

**Note:**

If the server does not support *merge-tracking*, then this is the only way to merge a branch back to its parent.

1. Go to menu **Tools > Merge**.
The **Merge** wizard is opened.
2. Select the option **Merge two different trees**.
3. It is recommended that you select the **Perform pre-merge best practices checks of the working copy target** option to make sure that the working copy target item is ready for the merge operation.

- a. Click the **Next** button.

If the **Perform pre-merge best practices checks of the working copy target** option is selected, the **Pre-Merge Checks** wizard page (*on page 2121*) is displayed.

**Note:**

If errors are found you need to solve them before proceeding.

4. Click the **Next** button.

The **Merge two different trees** wizard is displayed.

5. In the **From (starting URL and revision)** section, enter *the URL of the first branch (on page 2197)*.

You may also click the **Browse** button to browse the repository and find the desired branch. If you have previously merged from this URL, then you can simply use the drop-down menu, which displays a history of previously used URLs.

**Tip:**

If you are using this method to merge a feature branch back to its parent branch, you need to start the merge wizard from within a working copy of the parent. In this field enter the full URL of the parent branch. This may sound wrong, but remember that the parent is the starting point to which you want to add the branch changes.

**Note:**

If the URL belongs to a different repository than the working copy, the **Ignore ancestry / Disable merge tracking** option (in the **Merge Options** wizard page (*on page 2132*)) will be selected automatically (and you cannot change this). This is because the **Subversion client cannot track changes between different repositories (on page 2135)**.

**Tip:**

You can also specify a *peg revision (on page 2199)* at the end of the URL (for example, `URL@rev1234`). By default, the `HEAD` revision is assumed.

6. Enter the last revision number at which the two trees were synchronized by choosing between **HEAD revision** and **other revision**.

- **HEAD revision** - Use this option if you are sure that no one else has committed changes since the last synchronization.
- **other revision** - Use this option to input a specific revision number and avoid losing recent commits. You can use the **History** button to see a list of all revisions.

7. In the **To (ending URL and revision)** section, enter *the URL of the second branch (on page 2197)*.

You may also click the **Browse** button to browse the repository and find the desired branch. If you have previously merged from this URL, then you can simply use the drop-down menu, which displays a history of previously used URLs.

**Tip:**

If you are using this method to merge a feature branch back to its parent branch, enter the URL of the feature branch. This way, only the changes unique to this branch will be merged, since the branch should have been periodically synchronized with its parent.

**Attention:**

The URL must point to the same repository as the one in the **From (starting URL and revision)** field. Otherwise, the operation will not be allowed, since Subversion cannot compute changes between items from different repositories.

**Tip:**

You can also specify a *peg revision (on page 2199)* at the end of the URL (for example, `URL@rev1234`). By default, the `HEAD` revision is assumed.

8. Select a revision to compute all changes committed up to that point by choosing between **HEAD revision** and **other revision**.
 - **HEAD revision** - This is the default selected revision.
 - **other revision** - Use this option if you want to enter a previous revision. You can use the **History** button to see a list of all revisions.
9. Optionally, if you want to *configure the options (on page 2132)* for your merge, click the **Next** button. The **Merge Options wizard page (on page 2132)** is displayed that allows you to configure options for the operation.

**Warning:**

If the **Ignore ancestry / Disable merge tracking** option is selected and you chose **all revisions** in the **Revisions to merge** section, revisions that were previously merged will also be included, which may result in conflicts.

10. Click the **Merge** button.

The merge operation is performed.

If the merge is completed successfully, all the changes corresponding to the selected revisions should be merged in your working copy.

It is recommended to look at the results of the merge, in the working copy, to review the changes and see if it meets your expectations. Since merging can sometimes be complicated, *you may need to resolve conflicts (on page 2134)* after making major changes.

**Note:**

The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

Merge Options

Here is the list of options that can be used when merging:

Figure 546. Merge Wizard - Advanced Options

- **Depth** (This option is applicable only for directories) - sets the depth of the merge operation. You can specify how far down into your working copy the merge should go by selecting one of the following values:
 - **Current depth** - Obeys the depths registered for the directories in the working copy that are to be switched.
 - **Recursive (infinity)** - Merges all the files and folders contained in the selected folder. This is the recommended depth for most users, to avoid incomplete merges and *subtree mergeinfo*.
 - **Immediate children (immediates)** - Merges only the child files and folders without recursing subfolders.
 - **File children only (files)** - Merges only the child files.
 - **This folder only (empty)** - Merges only the selected folder (no child files or folders are included).

**Note:**

The *depth* term is described in the [Sparse checkouts \(on page 2156\)](#) section. The default depth is the current depth of the working copy item receiving the merge.

- **Ignore ancestry / Disable merge tracking** - Changes the way two items are merged if they do not share a common ancestry. Most merges involve comparing items that are ancestrally related to one another. However, occasionally you may want to merge unrelated items. If this option is not selected, the first item will be replaced with the second item. In these situations, you would want the merge to do a path-based comparison only, ignoring any relations between the items. For example, if two different files have the same name and are in the same relative location, deselecting the option replaces one of the files with the other one, and selecting it merges their contents.

**Note:**

If the URL of the merge source belongs to a different repository than the URL of the target working copy item (the one receiving the changes), this option is selected automatically (and you cannot change this). This is because the [Subversion client cannot track changes between different repositories \(on page 2135\)](#).

- **Force deletion of modified or non-versioned items, if necessary** - If not selected, when the merge operation involves deleting locally modified or non-versioned items, it will fail. This is done to prevent data loss. This option is only available if there are uncommitted changes in the working copy.
- **Only record the merge (block revisions from getting merged)** - Available when the [Ignore ancestry / Disable merge tracking option \(on page 2133\)](#) is not selected. It enables a special mode of the merge operation that just records it in the local merge tracking information, without actually performing it (does not modify any file contents or the structure of your working copy). You might want to select this option for two possible reasons:
 - You made (or will make) the merge manually, and therefore need to mark the revisions as being merged to make the merge tracking system aware of them. This will exclude them from future merges.
 - You want to prevent one or more particular changes from being fetched in subsequent merges.
- **Ignore line endings** - Allows you to specify how the line ending changes should be handled. By default, all such changes are treated as real content changes, but you can ignore them if you select this option.
- **Ignore whitespaces** - Allows you to specify how the whitespace changes should be handled. By default, all such changes are treated as real content changes, but you can ignore them if you select this option.

- **Ignore whitespace changes** - Ignores changes in the amount of whitespaces or to their type (for example, when changing the indentation or changing tabs to spaces).

**Note:**

Whitespaces that were added where there were none before, or that were removed, are still considered to be changes.

- **Ignore all whitespaces** - Ignores all types of whitespace changes.
- **Test merge** - Performs a dry run of the merge operation, allowing you to *preview* it without actually performing the merge. In the **Console** view you will see a list of the working copy items that will be affected and how they will be affected. This is helpful in detecting whether or not a merge will be successful, and where conflicts may occur.

Resolving Merge Conflicts

After the merge operation is finished, it is possible to have some items in conflict. This means that some incoming modifications for an item could not be merged with the current working copy version. If there are such conflicts, the **Merge conflicts** dialog box will appear, presenting the items that are in conflict. This dialog box offers you choices for resolving the conflicts.

Figure 547. Merge Conflicts Dialog Box

The options to resolve a conflict are as follows:

- **Resolve later** - Used for leaving the conflict as it is, to manually resolve it later.
- **Keep incoming** - This option keeps all the incoming modifications and discards all current ones from your working copy.
- **Keep outgoing** - This option keeps all current modifications from your working copy and discards all incoming ones.
- **Mark resolved** - You should choose this option after you have manually solved the conflict, to instruct the Subversion that it was resolved. To do this, use the **Edit conflict** button, which displays a dialog box that presents the contents of the conflicting items (the content of the working copy version versus the incoming version).

Additional Notes About the Merge Operation

Sub-tree Merges

It is recommended to perform a merge on the whole working copy (select its root directory when triggering the operation) to avoid *sub-tree mergeinfo*. *Sub-tree mergeinfo* is the *mergeinfo* recorded to describe a *sub-tree merge*. That is, a merge done directly to a child of a branch root that might be needed in certain situations. There is nothing special about *sub-tree merges* or *sub-tree mergeinfo* except that the complete record of merges to a branch may not be contained solely in the *mergeinfo* on the branch root and you may have to look to any *sub-tree mergeinfo* to get a full accounting. Fortunately, Subversion does this for you and rarely will you need to look for it.

Merging from Foreign Repositories

Subversion supports merging from foreign repositories. While all merge source URLs must point to the same repository, the merge target (from the working copy) may come from a different repository than the source. However, copies made in the merge source will be transformed into plain additions in the merge target. Also, *merge-tracking* is not supported for merges from foreign repositories.

**Note:**

When performing merges from repositories other than the one corresponding to the target item (from the working copy), the **Ignore ancestry / Disable merge tracking option** ([on page 2133](#)) in the **Merge Options wizard page** ([on page 2132](#)) will be selected automatically (and you cannot change this).

General Merge Recommendations

As a recommendation, you should only merge into clean working copies that **do not** contain any of the following:

- Modifications.
- Sparse directories (all directories must be of depth *infinity*).
- Switched items.

**Important:**

This recommendation becomes mandatory when performing a *reintegrate merge* (on page 2127) operation. Also, trying to merge to mixed-revision working copies will fail in all types of merge operations.

**Remember:**

The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

Switch the Repository Location

The **Switch** action is useful when the repository location of a working copy, or an already committed item in the working copy, must be changed within the same repository. The action is available on the **Tools** menu when a versioned resource is selected in the current working copy that is displayed in the **Working Copy** view (on page 2162).

**Note:**

External items cannot be switched using this action. Instead, change the value of the `svn:externals` property set on the parent directory of the external item and update the parent directory.

Figure 548. Switch Dialog Box

The following options can be configured in the **Switch** dialog box:

Switch to URL

The new location in the same repository (*on page 2197*) you are switching to.

Tip:

You can switch to items that were deleted, moved, or replaced, by specifying the original URL (before the item was removed) and use a *peg revision* (*on page 2199*) at the end (for example, `URL@rev1234`).

Note:

For items that are already *switched* (*on page 2164*) that you want to switch back, the proposed URL is the original location of the item.

Revision

The specific version of the location that you are switching to.

Depth - (This option is applicable only for directories)

Current depth

Obeys the depths registered for the directories in the working copy that are to be switched.

Recursive (infinity)

Switches the location of the selected folder and all of its files and folders.

Immediate children (immediates)

Switches the location of the selected folder and its child files and folders without recursing subfolders.

File children only (files)

Switches the location of the selected folder and its child files.

This folder only (empty)

Switches the location of the selected folder (no child files or folders are included).

Ignore "svn:externals" definitions

When selected, external items are ignored in the switch operation. This option is only available if you choose the **Current depth** or **Recursive (infinity)** depth.

Change the working copy item to the specified depth

Changes the *sticky* depth on the directory in the working copy.

Ignore ancestry

When not selected, the SVN system does not allow you to switch to a location that does not share a common ancestry with the current location. If selected, the SVN does not check for a common ancestry.

Relocate a Working Copy

Sometimes the base URL of the repository is changed after a working copy is checked out from that URL. For example, if the repository itself is moved to a different server. In such cases, you do not have to check out a working copy from the new repository location. It is easier to change the base URL of the root folder of the working copy to [the new URL of the repository \(on page 2197\)](#).

Note:

Peg revisions have no effect for this operation.

This **Relocate** action is available in the **Tools** menu when selecting the root item of the working copy.

Note:

External items that are defined using absolute URLs and that point to the same repository as the working copy are not affected by the **Relocate** action (the URL is not updated). To relocate these items, change the value of the `svn:externals` property for each external item (set on their parent directories). For example, if an external item is defined as `externalDir http://host/path/to/repo/to/dir` and the repository was moved to another server (`host2`) and its protocol changed to `https`, then the value of the property needs to be updated to `externalDir https://host2/path/to/repo/to/dir`.

Tip:

If you edit external items using the method described in the previous note, on the next update the system will try to fetch the external items again. To avoid this, you can invoke the **Relocate** action on each of these external items.

Patches

This section explains how to work with patches in Syncro SVN Client.

What is a Patch

Suppose you are working with a set of XML files that you want to tag the project and distribute releases to other team members. While working on the project and correcting problems, you may need to distribute the corrections to other team members. In this case, you can distribute a patch (a collection of differences) that would correct the problems when applied over the last distribution. By default, the Syncro SVN Client generates patches in [the Unified Diff format](#), but it can also use [the Git format \(on page 2150\)](#).

Creating a patch in Apache Subversion™ implies the access to either two revisions of a versioned item, or two different versioned items from the repository:

- *Two revisions of a version item* - the item can be local or remote and you can select two versions of it. This also applies when you need to generate a patch that only contains the changes in the working copy that were not yet committed.
- *Two different versioned items from the repository* - the items are remote and you need to specify a revision for both.

Warning:

The resulting patch file may contain content that was written using a mix of encodings, based upon the encodings of the files that were compared. If you open the generated patch file in a text editor, it may result in unrecognizable content.

Generating a Patch - Local Items

Based on a versioned item (already committed or scheduled for addition) in the working copy, you can generate patches that contain the local changes, the differences between a specific revision of that item and the item itself, or differences between the pristine item and another item from the repository. There are four options for generating a patch based upon local items.

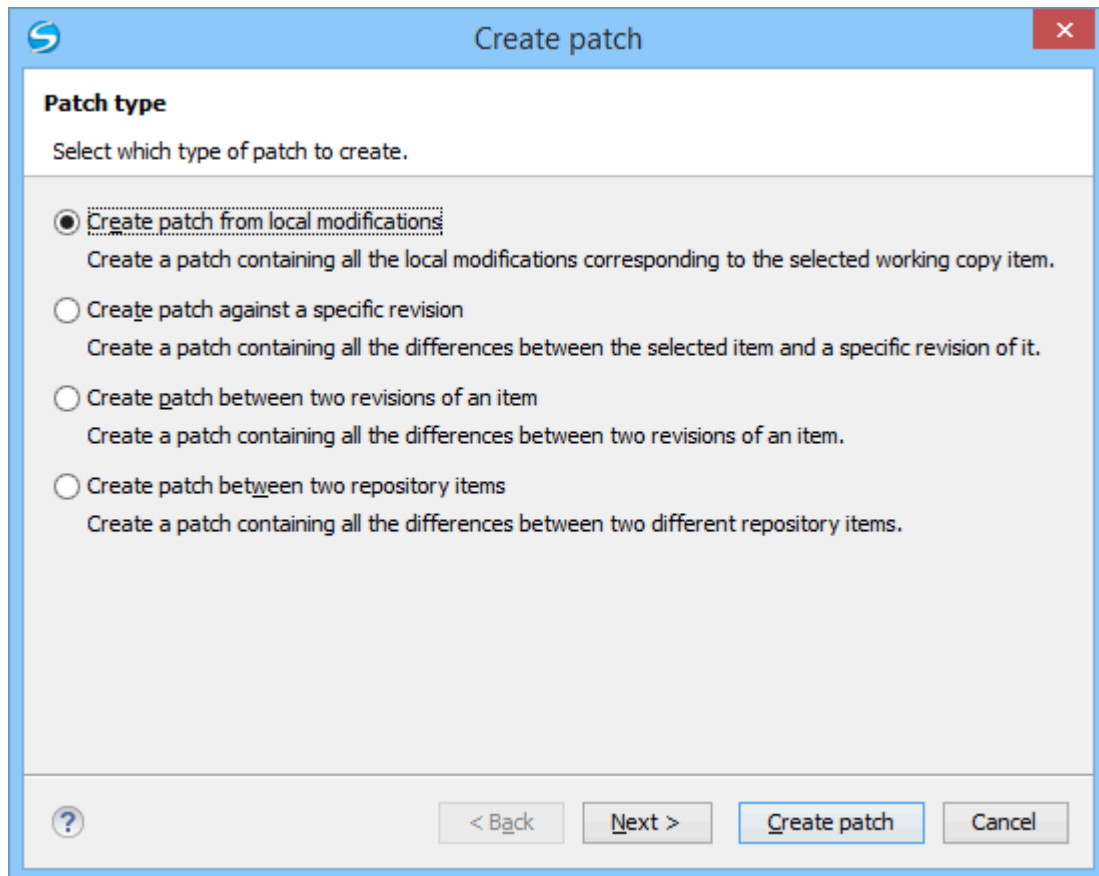

To open the **Create patch** wizard, use the  **Create patch** action from the **Tools** menu or from the contextual menu in the **Modified**, **Incoming**, **Outgoing**, or **Conflicts** modes.

Figure 549. Create Patch Wizard - Local Items

Create Patch from Local Modifications

This is the most commonly used type of patch and contains only the local changes for the selected item.

This option is useful if you want to share changes with other team members and you are not yet ready to commit them. This option is only available for local items that contain modifications. It is not available for items that have a local file status of *unversioned* or *ignored*, and in some cases *missing* or *obstructed* (on page 2164).

The steps are as follows:

1. Go to menu **Tools > Create patch**.

This opens the **Create patch** wizard.

2. Select the **Create patch from local modifications** option in the dialog box.

3. Optionally, if you want to [configure the options \(on page 2148\)](#) for your patch, click the **Next** button.

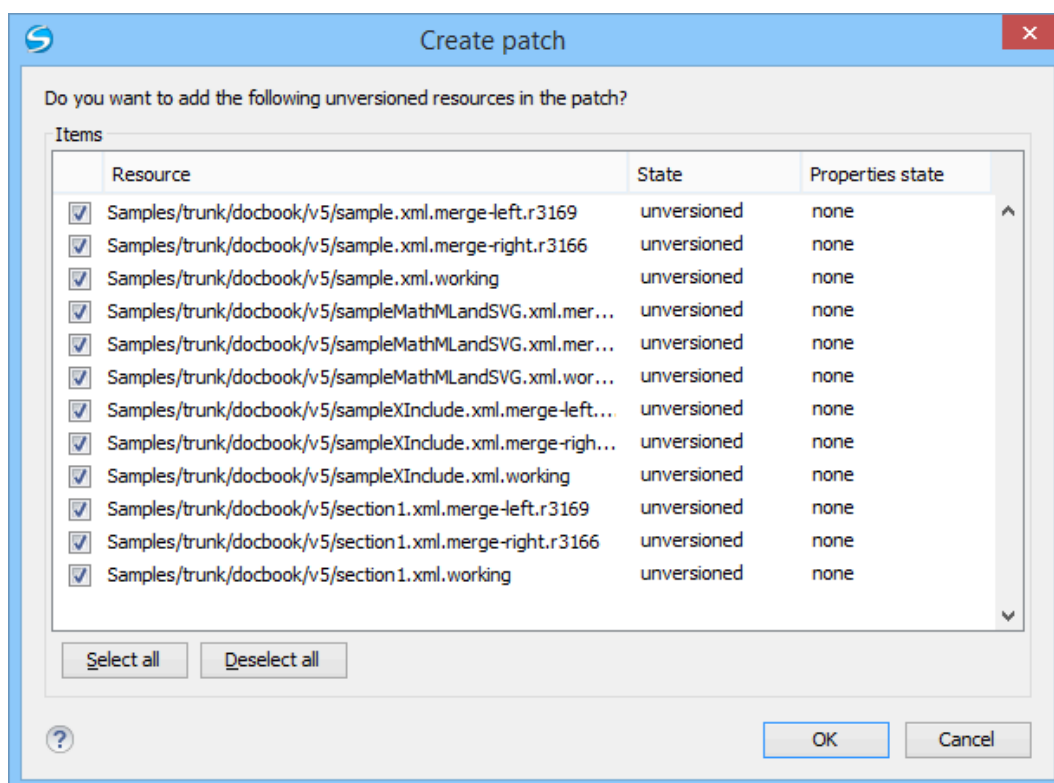

This options page does not remember your selections when creating future patches. It will revert to the default values.

The **Options** wizard page is displayed.

4. Click the **Create patch** button.

If the patch is applied on a folder of the working copy and that folder contains *unversioned* files (on page 2164), this step of the wizard offers the option of selecting the ones that will be included in the patch.

Figure 550. Create Patch Dialog Box - Add Unversioned Resources

The patch is created and stored in the path specified in the **Output** section of the **Options** page (on page 2148) or in the default location.

Create Patch Against a Specific Revision

This type of patch contains changes between an old revision and the current content from the selected item within the working copy.

This option is useful if you want to obtain differences between an older revision and the current state of the working copy (for instance, to test how current changes apply to an older version).

The steps are as follows:

1. Go to menu **Tools > Create patch**.

This opens the **Create patch** wizard.

2. Select the **Create patch against a specific revision** option in the dialog box.
3. Click the **Next** button.

The second step of the wizard is opened:

Figure 551. Create Patch Wizard - Step 2

4. Select the **revision to create patch against**.

You can select between the **HEAD revision** and a specific revision number. For the **other revision** option, you can click the **History** button (*on page 2090*) to display a list of the item revisions.

**Note:**

If the **revision to create patch against** is older than the revision that the working copy item was updated for, the patch will include changes that were made **after** the selected revision.

- Optionally, if you want to [configure the options \(on page 2148\)](#) for your patch, click the **Next** button. This options page does not remember your selections when creating future patches. It will revert to the default values.
The **Options** wizard page is displayed.
- Click the **Create patch** button.
The patch is created and stored in the path specified in the **Output** section of the **Options** page ([on page 2148](#)) or in the default location.

Create Patch Between Two Revisions of an Item

This type of patch contains historical changes between two revisions of a selected item.

This option is useful if you want to share changes between two revisions with other team members.

**Tip:**

If you need to generate a patch between two revisions of a previously *deleted, moved, or replaced* item, you should use the **Create patch between two repository items** option ([on page 2143](#)) instead.

The steps are as follows:

- Go to menu **Tools > Create patch**.
This opens the **Create patch** wizard.
- Select the **Create patch between two revisions of an item** option in the dialog box.
- Click the **Next** button.

The second step of the wizard is opened:

Figure 552. Create Patch Wizard - Step 2

The screenshot shows a dialog box for the 'Create Patch Wizard - Step 2'. It is divided into two main sections: 'From' and 'To'.
 In the 'From' section, there are two radio buttons: 'HEAD revision' (unselected) and 'other revision:' (selected). The 'other revision:' option has a text input field containing the number '27436' and a 'History' button to its right.
 In the 'To' section, there are also two radio buttons: 'HEAD revision' (selected) and 'other revision:' (unselected). The 'other revision:' option has an empty text input field and a 'History' button to its right.

- Select the starting and ending revisions in the **From** and **To** sections.
You can select between the **HEAD revision** and a specific revision number. For the **other revision** option, you can click the **History** button ([on page 2090](#)) to display a list of the item revisions.

**Note:**

The patch will only include changes between the two specified revisions, starting with the changes that were made **after** the older revision.

**Tip:**

If you want to reverse changes done between two revisions by using a patch file, you can specify the newer revision in the **From** section and the older version in the **To** section.

5. Optionally, if you want to [configure the options \(on page 2148\)](#) for your patch, click the **Next** button. This options page does not remember your selections when creating future patches. It will revert to the default values.
The **Options** wizard page is displayed.
6. Click the **Create patch** button.
The patch is created and stored in the path specified in the **Output** section of the **Options** page ([on page 2148](#)) or in the default location.

Create Patch Between Two Repository Items

This type of patch contains changes between one version of an item and a specific version of another item.

This option is useful for generating a patch that contains changes between existing, or even previously deleted, moved, or replaced items from different branches. This is the default option when you do not have a working copy loaded, when no repository items are selected, or when exactly two repository items of the same kind are selected.

**Tip:**

To access an item that was deleted, moved, or replaced, you need to specify the original URL (before the item was removed) and use a [peg revision \(on page 2199\)](#) at the end (for example, `URL@rev1234`).

The steps are as follows:

1. Go to menu **Tools > Create patch**.
This opens the **Create patch** wizard.
2. Select the **Create patch between two repository items** option in the dialog box.
3. Click the **Next** button.
The second step of the wizard is opened:

Figure 553. Create Patch Wizard - Step 2

Create patch

Create patch between two repository items

Select the items to create patch between.

From (starting URL and revision)

HEAD revision

other revision:

To (ending URL and revision)

HEAD revision

other revision:

4. Select the starting and ending URLs (on page 2197) and revisions in the **From** and **To** sections. You can select between the **HEAD revision** and a specific revision number. For the **other revision** option, you can click the **History** button (on page 2090) to display a list of the item revisions.

**Important:**

Both URLs must point to items from the same repository.

**Note:**

If you use a *peg* revision in the URL field, anything specified in the **other revision** field is ignored.

5. Optionally, if you want to configure the options (on page 2148) for your patch, click the **Next** button. This options page does not remember your selections when creating future patches. It will revert to the default values.
The **Options** wizard page is displayed.
6. Click the **Create patch** button.
The patch is created and stored in the path specified in the **Output** section of the **Options** page (on page 2148) or in the default location.

Generating a Patch - Remote Items

Based on a repository item, you can generate patches that contain the differences between two specific revisions of that item, or between a revision of that same item and another revision of another item from the repository. There are two options for generating a patch based upon remote items.

To open the **Create patch** wizard, use the  **Create patch** action from the **Tools** menu.

Figure 554. Create Patch Wizard - Remote Items

Create Patch Between Two Revisions of an Item

This type of patch contains historical changes between two revisions of a selected item.

This option is useful if you want to share changes between two revisions with other team members.

Tip:

If you need to generate a patch between two revisions of a previously *deleted, moved, or replaced* item, you should use the **Create patch between two repository items** option ([on page 2143](#)) instead.

The steps are as follows:

1. Go to menu **Tools > Create patch**.
This opens the **Create patch** wizard.
2. Select the **Create patch between two revisions of an item** option in the dialog box.
3. Click the **Next** button.

The second step of the wizard is opened:

Figure 555. Create Patch Wizard - Step 2

The screenshot shows a dialog box titled "Create Patch Wizard - Step 2". It is divided into two main sections: "From" and "To".

From section:

- Radio button: HEAD revision
- Radio button: other revision:

To section:

- Radio button: HEAD revision
- Radio button: other revision:

- Select the starting and ending revisions in the **From** and **To** sections.

You can select between the **HEAD revision** and a specific revision number. For the **other revision** option, you can click the **History** button (*on page 2090*) to display a list of the item revisions.

**Note:**

The patch will only include changes between the two specified revisions, starting with the changes that were made **after** the older revision.

**Tip:**

If you want to reverse changes done between two revisions by using a patch file, you can specify the newer revision in the **From** section and the older version in the **To** section.

- Optionally, if you want to *configure the options* (*on page 2148*) for your patch, click the **Next** button. This options page does not remember your selections when creating future patches. It will revert to the default values.
The **Options** wizard page is displayed.
- Click the **Create patch** button.
The patch is created and stored in the path specified in the **Output** section of the **Options** page (*on page 2148*) or in the default location.

Create Patch Between Two Repository Items

This type of patch contains changes between one version of an item and a specific version of another item.

This option is useful for generating a patch that contains changes between existing, or even previously deleted, moved, or replaced items from different branches. This is the default option when you do not have a working copy loaded, when no repository items are selected, or when exactly two repository items of the same kind are selected.

**Tip:**

To access an item that was deleted, moved, or replaced, you need to specify the original URL (before the item was removed) and use a *peg revision* (on page 2199) at the end (for example, URL@rev1234).

The steps are as follows:

1. Go to menu **Tools > Create patch**.
This opens the **Create patch** wizard.
2. Select the **Create patch between two repository items** option in the dialog box.
3. Click the **Next** button.

The second step of the wizard is opened:

Figure 556. Create Patch Wizard - Step 2

4. Select the starting and ending URLs (on page 2197) and revisions in the **From** and **To** sections. You can select between the **HEAD revision** and a specific revision number. For the **other revision** option, you can click the **History** button (on page 2090) to display a list of the item revisions.

**Important:**

Both URLs must point to items from the same repository.

**Note:**

If you use a *peg* revision in the URL field, anything specified in the **other revision** field is ignored.

- Optionally, if you want to [configure the options \(on page 2148\)](#) for your patch, click the **Next** button. This options page does not remember your selections when creating future patches. It will revert to the default values.
The **Options** wizard page is displayed.
- Click the **Create patch** button.
The patch is created and stored in the path specified in the **Output** section of the **Options** page ([on page 2148](#)) or in the default location.

Patch Options

Figure 557. Create Patch Wizard - Options

Save as:

 Use Git extended diff format

Patch Section

Depth - (This option is applicable only for directories)

Current depth

The depth of recursing the folder for creating the patch is the same as the depth of that same folder in the working copy (available only when generating patches that contain changes from the working copy).

Recursive (infinity)

The patch is created on all the files and folders contained in the selected folder.

Immediate children (immediates)

The patch is created only on the child files and folders without recursing subfolders.

File children only (files)

The patch is created only on the child files.

This folder only (empty)

The patch is created only on the selected folder (no child file or folder is included in the patch).

Ignore content of added files

When selected, the patch file does not include the content of the *added* items. This option corresponds to the `--no-diff-added` option of the `svn diff` command.

Ignore content of delete files

When selected, the patch file does not include the content of the *deleted* items. This option corresponds to the `--no-diff-deleted` option of the `svn diff` command.

Treat copied files as newly added

When selected, copied items are treated as new, rather than comparing the items with their sources. This option corresponds to the `--show-copies-as-adds` option of the `svn diff` command.

Include files having a binary MIME type

When selected, the application is forced to compare items that are considered binary file types. This option corresponds to the `--force` option of the `svn diff` command.

Ignore properties

When selected, differences in the properties of items are ignored. This option corresponds to the `--ignore-properties` option of the `svn diff` command.

Properties only

When selected, only differences in the properties of the items are included in the patch file (file content is ignored). This option corresponds to the `--properties-only` option of the `svn diff` command.

**Note:**

The **Ignore properties** and **Properties only** options are mutually exclusive.

Notice ancestry

If selected, the SVN common ancestry is taken into consideration when calculating the differences. This option corresponds to the `--notice-ancestry` option of the `svn diff` command.

Files Comparison Section**Ignore line endings**

If selected, the differences in line endings are ignored when the patch is generated. This option corresponds to the `--ignore-eol-style` option of the `svn diff` command.

Ignore whitespaces

If selected, it allows you to specify how the whitespace changes should be handled. When selected, you can then choose between two options:

- **Ignore whitespace changes** (`--ignore-space-change`) - Ignores changes in the amount of whitespaces or changes to their type (for example, when changing the indentation or changing tabs to spaces).

**Note:**

Whitespaces that are added or removed are still considered to be changes.

- **Ignore all whitespaces** (`--ignore-all-space`) - Ignores all types of whitespace changes.

Output Section**Save as**

The patch will be created and saved in the specified file.

Use Git extended diff format

When selected, the patch is generated using the *Git* format. This option corresponds to the `--git` option of the `svn diff` command.

Working with Repositories

This section explains how to locate and browse SVN repositories in Syncro SVN Client.

Importing Resources Into a Repository

Importing resources into a repository is the process of copying local files and directories into a repository so that they can be managed by an Apache Subversion™ server. If you have already been using Subversion and you have an existing working copy you want to use, then you will likely want to follow the procedure for [using an existing working copy \(on page 2091\)](#).

The **Import folder** and **Import Files** actions are available from the **Import** submenu of the **Repository** menu or of the contextual menu in the **Repositories** view. These actions open a dialog box that allow you to select the directories or files that will be imported into the selected repository location.

The **Import folder** action opens the **Import folder** dialog box.

Figure 558. Import Folder Dialog Box

You can configure the following options:

Folder

Specify [the local folder \(on page 2197\)](#) by using the text box or the **Browse** button. This folder should not be empty or already under version control.

Important:

By default, the SVN system only imports the content of the specified folder, and not the folder itself. Therefore, it is recommended to use the **Browse** button to select the local folder so that the client will automatically append the name of it to the specified URL.

URL

Specify [the repository location \(on page 2197\)](#) that will be used to access the folder to be imported.

Note:

Peg revisions have no effect for this operation since it is used to send information to the repository.

**Attention:**

If the new location already exists, make sure that it is an empty directory to avoid mixing your project content with other files (if items exist with the same name, an error will occur and the operation will not proceed). Otherwise, if the address does not exist, it is created automatically.

Depth**Recursive (infinity)**

Imports all the files and folders contained in the selected folder.

Immediate children (immediates)

Imports only the child files and folders without recursing subfolders.

File children only (files)

Imports only the child files.

This folder only (empty)

Imports only the selected folder (no child file or folder is included).

Share files matching global ignore patterns

When selected, the file names that match the patterns defined in either of the following locations are also imported into the repository:

- The `global-ignores` property in the [SVN configuration file \(on page 2197\)](#).
- The **File name ignore patterns** option (on page 250) in the **SVN > Working Copy** preferences page (on page 249).

Enable automatic properties/Disable automatic properties

Enables or disables automatic property assignment (per runtime configuration rules), overriding the `enable-auto-props` runtime configuration directive, defined in [the SVN configuration file \(on page 2197\)](#).

**Note:**

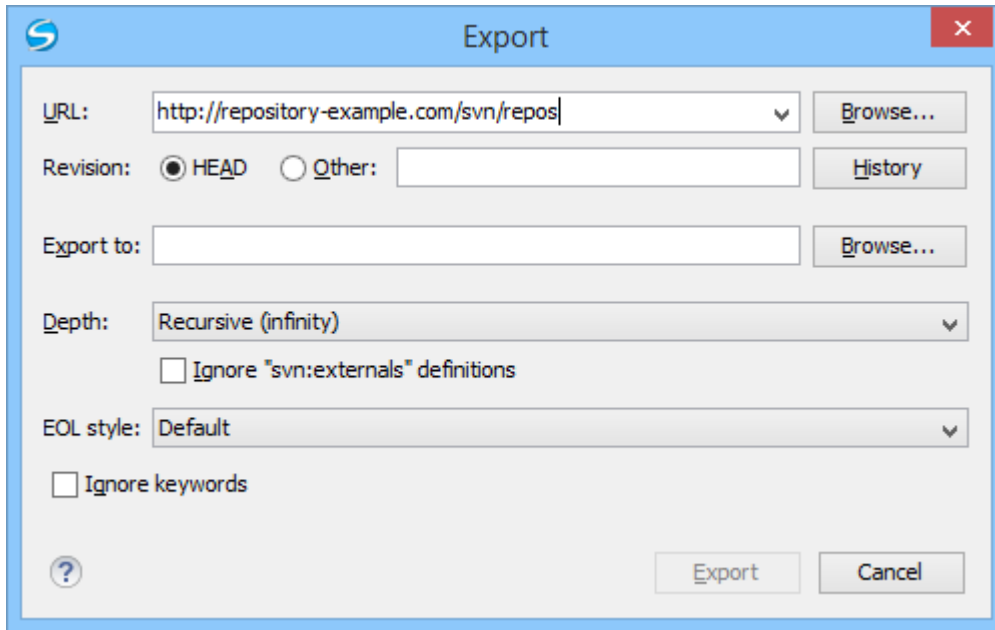

This option is available only when there are defined properties to be applied automatically for newly added items under version control. You can define these properties in the `SVN config` file (in the `auto-props` section). Based on the value of the `enable-auto-props` runtime configuration directive, the presented option is either **Enable automatic properties**, or **Disable automatic properties**.

Exporting Resources From a Repository

This is the process of taking a resource from the repository and saving it locally in a clean form, with no version control information. This is very useful when you need a clean build for an installation kit.

The **Export** dialog box is similar to the **Check out** dialog box:

Figure 559. Export from Repository Dialog Box

You can configure the following options:

URL

Specify the source directory from the repository (*on page 2197*) by using the text box or the **Browse** button.

Tip:

To export an item that was deleted, moved, or replaced, you need to specify the original URL (before the item was removed) and use a *peg revision* (*on page 2199*) at the end (for example, `URL@rev1234`).

Note:

The content of the selected directory from the repository and not the directory itself will be exported to the file system.

Revision

You can choose between the **HEAD** or **Other** revision. If you need to export a specific revision, specify it in the **Other** text box or use the **History** button and choose a revision from the **History** dialog box.

Export to

Specify the location where you want to export (*on page 2197*) the repository directory by typing the local path in the text box or by using the **Browse** button. If the specified local path does not point to an existing directory, it will automatically be created.

Important:

By default, the SVN system only exports the content of the directory specified by the URL, and not the directory itself. Therefore, it is recommended to use the **Browse** button to select the *export* location so that the client will automatically append the name of the remote directory to the path of the selected directory.

Warning:

The destination directory should be empty. If files exist, they will be overwritten by exported files with matching names.

Depth

Recursive (infinity)

Exports all the files and folders contained in the selected folder.

Immediate children (immediates)

Exports only the child files and folders without recursing subfolders.

File children only (files)

Exports only the child files.

This folder only (empty)

Exports only the selected folder (no child file or folder is included).

Ignore "svn:externals" definitions

When selected, external items are ignored in the export operation. This option is only available if you choose the **Recursive (infinity)** depth.

EOL style

Defines the *end-of-line (EOL)* marker that should be used when exporting files that have the value or the `svn:eol-style` property set to `native`. You can choose between the following styles:

- **Default** - It uses the system-specific *end-of-line* marker.
- **CRLF** - The Windows-specific *end-of-line* marker (*carriage return - line feed*).
- **LF** - The Unix / macOS-specific *end-of-line* marker (*line feed*).
- **CR** - The macOS 9 (or older)-specific *end-of-line* marker (*carriage return*).

Ignore keywords

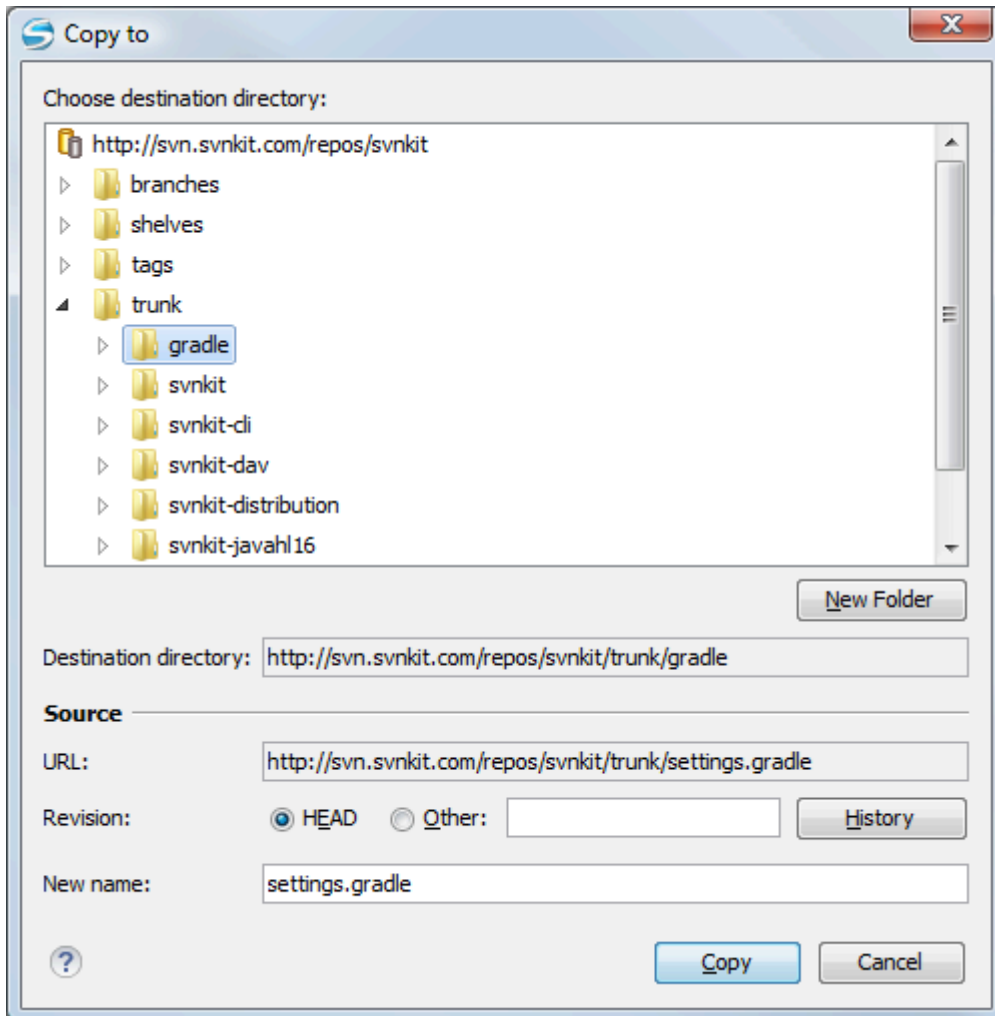

When selected, the export operation does not expand the *SVN keywords* found inside the files.

Copy / Move / Delete Resources From a Repository

Once you have a location defined in the **Repositories** view (on page 2157), you can run commands (such as copy, move, and delete) directly on the repository. The commands correspond to the following actions in the contextual menu:

The **Copy to** and **Move to** action allows you to copy and move individual or multiple resources to a specific directory from the *HEAD* revision of the repository.

Figure 560. Copy/Move Items in Repository

The dialog box used to copy or move items allows you to browse the *HEAD* revision of the repository and select the destination of the items, presenting its repository URL below the tree view.

The **Source** section presents relevant options regarding the item(s) that you move or copy:

- **URL** - This field is displayed only if you copy/move a single item.
- **Revision** - Presents the revision that will have one or more items copied, allowing you to also choose another revision.

**Note:**

Since only items from the HEAD revision can be moved, the **Revision** options are not presented for the **Move to** action.

**Note:**

When you copy a single item while browsing a revision other than *HEAD*, the **Revision** options present this revision but does not allow you to change it. The same applies if copying multiple items.

- **New name** - This option is presented when you copy or move a single item, allowing you to also rename it.

Another useful action is **Delete**, allowing you to erase resources directly from the repository.

All three actions are commit operations and you will be prompted with the **Commit message** dialog box.

Sparse Checkout

Sometimes you only need to check out certain parts of a directory tree. In this case, you can check out the top directory (using the **Check out** action from the **Repositories** view (on page 2158)) and then recursively update only the needed directories (using the **Update** action from the **Working Copy** view (on page 2170)). Each directory then has a depth set to it, with four possible values:

- **Recursive (infinity)** - Updates all descendant directories and files recursively.
- **Immediate children (immediates)** - Updates the directory, including direct child directories and files, but does not populate the child directories.
- **File children only (files)** - Updates the directory, including only child files without the child directories.
- **This folder only (empty)** - Updates only the selected directory, without updating any children.

For some operations, you can use as depth the current depth registered on the directories from the working copy (the value **Current depth**). This is the depth value defined in a previous check out or update operation.

The sparse checked out directories are presented in the **Working Copy** view (on page 2162) with a marker corresponding to each depth value, in the top left corner, as follows:

-  **Recursive (infinity)** - This is the default value and it has no mark. The directory has no limiting depth.
-  **Immediate children (immediates)** - The directory is limited to direct child directories (without contents) and files.
-  **File children only (files)** - The directory is limited to direct child files only.
-  **This folder only (empty)** - The directory has *empty* depth set.

A depth set on a directory means that some operations process only items within the specified depth range. For example, **Synchronize** on a working copy directory reports the repository modified items within the depth set on the directory and those existing in the working copy outside of this depth.

The depth information is also presented in the **SVN Information** dialog box and in the tooltip displayed when hovering a directory in the **Working Copy** view.

Syncro SVN Client Views

The main working area occupies the center of the application window, which contains the most important views:

- [Repositories View \(on page 2157\)](#)
- [Working Copy View \(on page 2162\)](#)
- [History View \(on page 2177\)](#)
- [Console View \(on page 2192\)](#)

The other views that support the main working area are also presented in this section.

Repositories View

The **Repositories** view allows you to define and manage Apache Subversion™ repository locations and browse repositories. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

If no connections to your repository are available, you can [add a new repository location \(on page 2082\)](#).

Repository files and folders are presented in a tree view with the repository locations at the first level, where each location represents a connection to a specific repository. More information about each resource is displayed in a tabular form:

- **Date** - Date when the resource was last modified.
- **Revision** - The revision number at the time the resource was last modified.
- **Author** - Name of the person who made the last modification on the resource.
- **Size** - Resource size on disk.
-  **Lock information** - Information about the lock status of a file. When a repository file is locked by a user the  icon is displayed in this column. If no icon is displayed the file is not locked. The tooltip of this column displays the details about the lock:
 - **Owner** - The name of the user who created the lock.
 - **Date** - The date when the user locked the file.
 - **Expires on** - Date when the lock expires. Lock expiry policy is set in the repository options, on the server side.
 - **Comment** - The message attached when the file was locked.
- **Type** - Contains the resource type or file extension.

Toolbar

The **Repositories** view's toolbar contains the following buttons:

- **New Repository Location** - Allows you to enter a new repository location by means of the **Add SVN Repository** dialog box.
- **Move Up** - Move the selected repository up one position in the list of repositories in the **Repositories** view.
- **Move Down** - Move the selected repository down one position in the list of repositories in the **Repositories** view.
- **Collapse all** - Collapses all repository trees.
- **Stop** - Stops the current repository browsing operation executed when a repository node is expanded. This is useful when the operation takes too long or the server is not responding.
- **Settings** - Allows you to configure the resource table appearance.

Repositories View Contextual Menu Actions

The **Repositories** view contextual menu contains various actions, depending on the selected item. If a repository location is selected, the following management actions are available:

- **New Repository Location** (**Ctrl + Alt + N** (**Command + Option + N** on macOS))

Displays the **Add SVN Repository** dialog box. This dialog box allows you to define a new repository location.

Figure 562. Add SVN Repository Dialog Box

If the **Validate repository connection** option is selected, the URL connection is validated before being added to the **Repositories** view.

Edit Repository Location (Ctrl + Alt + E (Command + Option + E on macOS))

Context-dependent action that allows you to edit the selected repository location using the **Edit SVN Repository** dialog box. It is active only when a repository location root is selected.

Change the Revision to Browse (Ctrl + Alt + B (Command + Option + B on macOS))

Context-dependent action that allows you to change the selected repository revision using the **Change the Revision to Browse** dialog box. It is active only when a repository location root is selected.

Remove Repository Location (Ctrl + Alt + R (Command + Option + R on macOS))

Allows you to remove the selected repository location from the view. It shows you a confirmation dialog box before removal. It is active only when a repository location root is selected.

The following actions are common to all repository resources:

Open

Opens the selected file in the Editor view in read-only mode.

Open with

Displays the **Open with** dialog box to specify the editor where the selected file is opened. If multiple files are selected, only external applications can be used to open the files.

Save as

Saves the selected files locally, as they are in the browsed revision.

Refresh (F5)

Refreshes the resource selected in the **Repositories** view.

Check out (Ctrl + Alt + O (Command + Option + O on macOS))

Allows you to create a working copy from a repository directory, on your local file system. To read more about this operation, see [Check out a working copy \(on page 2088\)](#).

Branch/Tag

Allows you to create a branch or a tag from the selected folder in the repository. To read more about how to create a branch/tag, see the [Creation and management of Branches/Tags \(on page 2117\)](#) section.

Share project

Allows you to [share a new project \(on page 2085\)](#) using an SVN repository. The local project is automatically converted into an SVN working copy.

Import:

Import folder (Ctrl + Shift + L (Command + Shift + L on macOS))

Allows you to import the contents of a specified folder from the file system into the selected folder in a repository. To read more about this operation, see the section [Importing resources into a repository \(on page 2151\)](#).

Note:

The difference between the **Import folder** and **Share project** actions is that the latter also converts the selected directory into a working copy.

Import Files (Ctrl + Shift + I (Command + Shift + I on macOS))

Imports the files selected from the files system into the selected folder in the repository.

Export

Opens the **Export dialog box (on page 2152)** that allows you to configure options for exporting a folder from the repository to the local file system.

Show History (Ctrl + H (Command + T on macOS))

Displays the history of the selected resource. At the start of the operation, you can set filtering options.

Show Annotation (Ctrl + Shift + A (Command + Shift + A on macOS))

Opens the **Show Annotation** dialog box that computes [the annotations for a file and displays them in the Annotations view \(on page 2184\)](#), along with the history of the file in the **History** view.

Revision Graph (Ctrl + G (Command + G on macOS))

This action allows you to see the graphical representation of a resource history. For more details about a resource revision graph see [Revision Graph \(on page 2192\)](#). This operation is available for any resource selected in the **Repositories** view or **Working Copy** view.

Copy URL Location (Ctrl + Alt + U (Command + Option + U on macOS))

Copies to clipboard the URL location of the selected resource.

Copy to

Copies to a specified location the currently selected resource(s). This action is also available when you browse other revisions than the latest one (*HEAD*), to allow restoring previous versions of an item.

Move to (Ctrl + M (Command + M on macOS))

Moves to a specified location the currently selected resource(s).

Rename (F2)

Renames the selected resource.

✗ Delete (Delete)

Deletes selected items from the repository via an immediate commit.

New Folder (Ctrl + Shift + F (Command + Shift + F on macOS))

Allows you to create a folder in the selected repository path (available only for folders).

Locking

The following options are available only for files:

Lock (Ctrl + K (Command + K on macOS))

Allows you to lock certain files that need exclusive access. For more details on the use of this action, see [Locking a file \(on page 2099\)](#).

Unlock (Ctrl + Shift + K (Command + Shift + K on macOS))

Releases the exclusive access to a file from the repository. You can also choose to unlock it by force (*break the lock*).

Show SVN Properties (Ctrl + Shift + P (Command + Shift + P on macOS))

Brings up the [Properties view \(on page 2190\)](#) displaying the SVN properties for the selected resource. This view does not allow adding, editing, or removing SVN properties of a repository resource. These operations are allowed only for working copy resources.

Show SVN Information (Ctrl + I (Command + I on macOS))

Provides additional information for the selected resource. For more details, go to [Obtain information for a resource \(on page 2115\)](#).

Assistant Actions

When there is no repository configured, the **Repositories** view mode lists the following two actions:

Figure 563. Repositories View Actions

Drag and Drop Operations

The structure of the files tree can be changed with drag and drop operations inside the **Repositories** view. These operations behave in the same way with the **Copy to/Move to** operations.

Working Copy View

The **Working Copy** view allows you to manage the content of an SVN working copy. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The toolbar contains the following:

- The list of defined working copies.
- A set of view modes that allow you to filter the content of the working copy based on the resource status (such as incoming or outgoing changes).
- **Settings** menu.

If you click any of the view modes (**All Files**, **Modified**, **Incoming**, **Outgoing**, **Conflicts**), the information displayed changes as follows:

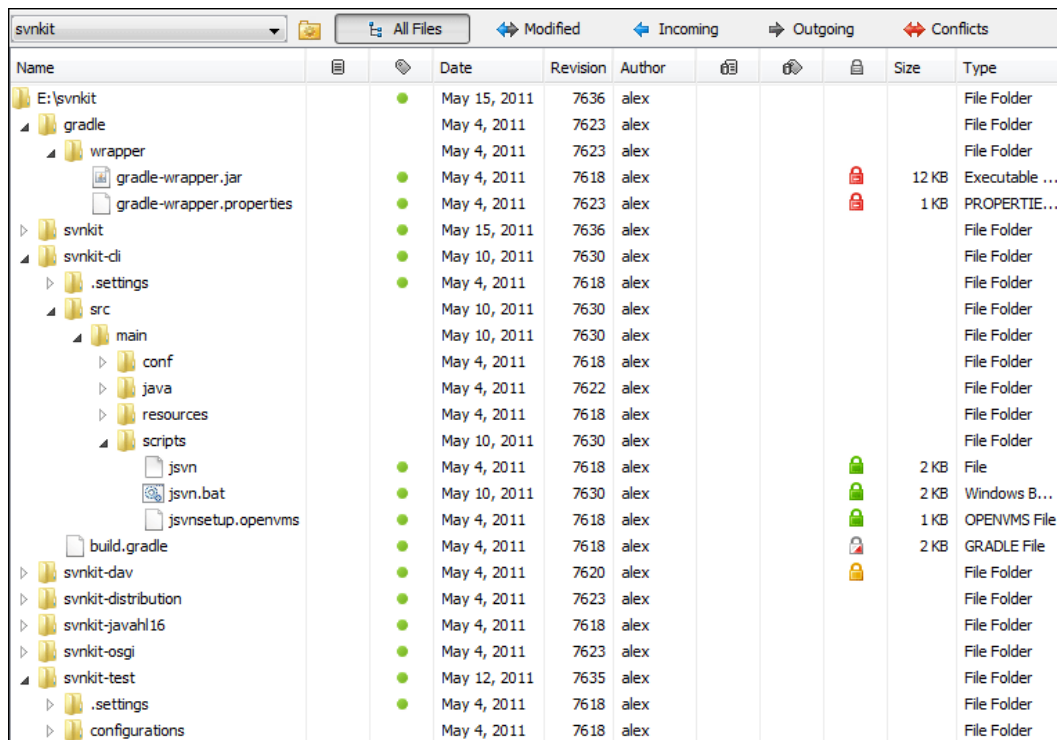

-  **All Files** - Resources (files and folders) are presented in a hierarchical structure with the root of the tree representing the location of the working copy on the file system. Each resource has an icon representation that describes the type of resource and also depicts the state of that resource with a small overlay icon.

-  **Modified** - The resource tree presents resources modified locally (including those with conflicting content) and remotely. Decorator icons are used to differentiate between various resource states:
 - Incoming modification from repository:
 -  - File content or properties modified remotely.
 -  - New file added remotely.
 -  - File deleted remotely.
 - Outgoing modification to repository:
 -  - File content or properties modified locally.
 -  - New file added locally.
 -  - File deleted locally.
 -  **Pseudo-conflict state** - A resource being locally and remotely modified at the same time, or a parent directory of such a resource.
 -  **Real conflict state** - A resource that had both incoming and outgoing changes and not all the differences could be merged automatically through the update operation (manually editing the local file is necessary for resolving the conflict).

-  **Incoming** - The resource tree presents only incoming changes.
-  **Outgoing** - The resource tree presents only outgoing changes.
-  **Conflicts** - The resource tree presents only conflicting changes (real conflicts and pseudo-conflicts).

The following columns provide information about the resources:

- **Name** - Resource name. Resource icons can have the following decorator icons:
 - Additional status information:
 -  **Propagated modification marker** - A folder marked with this icon indicates that the folder itself presents some changes (such as modified properties) or a child resource has been modified.
 -  **External** - This indicates a mapping of a local directory to the URL of a versioned resource. It is declared with a `svn:externals` property in the parent folder and it indicates a working copy not directly related with the parent working copy that defines it.
 -  **Switched** - This indicates a resource that has been switched from the initial repository location to a new location within the same repository. The resource goes to this state as a result of [the Switch action \(on page 2136\)](#) executed from the contextual menu of the Working Copy view.
 -  **Grayed** - A resource with a grayed-out icon, but no overlaid icon, is an ignored resource. It is obtained with the **Add to svn:ignore** action.
 - Current SVN depth of a folder:
 -  **Immediate children (immediates)** (a variant of [sparse checkout \(on page 2156\)](#)) - The directory contains only direct file and folder children. Child folders ignore their content.
 -  **File children only (files)** (a variant of [sparse checkout \(on page 2156\)](#)) - The directory contains only direct file children, disregarding any child folders.
 -  **This folder only (empty)** (a variant of [sparse checkout \(on page 2156\)](#)) - The directory discards any child resource.

Note:

- Any folder not marked with one of the depth icons, has recursive depth (*infinity*) set by default (presents all levels of child resources).
- Although folders not under version control can have no depth set, Oxygen XML Developer presents *unversioned* and *ignored* folders with *empty* depth when **Show unversioned directories content** or **Show ignored directories content** options are not selected.

-  **Local file status** - Shows the changes of working copy resources that were not committed to the repository yet. The following icons are used to mark resource status:
 -  - Resource is *not under version control (unversioned)*.
 -  - Resource is being *ignored* because it is not under version control and its name matches a file name pattern defined in one of the following places:

- *global-ignores* section in the SVN client-side *config file* (on page 2079).

Attention:

If you do not explicitly set the `global-ignores` runtime configuration option (either to your preferred set of patterns or to an empty string), Subversion uses the default value.

- **Application global ignores option** (on page 250) of Oxygen XML Developer.
- The value of a *svn:ignore property* (on page 2094) set on the parent folder of the resource being ignored.
- - Marks a newly created resource, *scheduled for addition* to the version control system.
- - Marks a resource *scheduled for addition*, created by copying a resource already under version control and inheriting all its SVN history.
- - The content of the resource has been *modified*.
- - Resource has been *replaced* in your working copy (the file was scheduled for deletion, and then a new file with the same name was scheduled for addition in its place).
- - Resource is *deleted* (scheduled for deletion from **Repository** upon the next commit).
- - The resource is *incomplete* (as a result of an interrupted *check out* or *update* operation).
- - The resource is *missing* because it was moved or deleted without using an SVN-aware application.
- - The contents of the resource is in *real conflict state* (on page 2102).
- - Resource is in a *name conflict* state.
- - Resource is in *tree conflict* state after an update operation because:
 - Resource was locally modified and incoming deleted from repository.
 - Resource was locally scheduled for deletion and incoming modified.
- - Resource is *obstructed* (versioned as one kind of object: file, directory, or symbolic link, but has been replaced outside Syncro SVN Client by a different kind of object).
- **Local properties status** - Marks the resources that have SVN properties, with the following possible states:
 - - The resource has SVN properties set.
 - - The resource properties have been modified.
 - - Properties for this resource are in *real conflict* (on page 2102) with property updates received from the repository.
- **Revision** - The current revision number of the resource.
- **Date** - Date when the resource was last time modified on the disk.
- **BASE Revision** - The revision number of the pristine version of the resource.
- **BASE Date** - Date when the pristine version of the resource was last time committed in the repository.
- **Author** - Name of the person who made the last modification on the pristine version of the resource.
- **Remote file status** - Shows changes of resources recently modified in the repository. The following icons are used to mark incoming resource status:
 - - Resource is newly added in repository.
 - - The content of the resource has been modified in repository.

-  - Resource was replaced in repository.
-  - Resource was deleted from repository.
-  **Remote properties status** - Resources marked with the  icon have incoming modified properties from the repository.
- **Remote revision** - Revision number of the resource latest committed modification.
- **Remote date** - Date of the resource latest modification committed on the repository.
- **Remote author** - Name of the author who committed the latest modification on the repository.
-  **Lock information** - Shows the lock state of a resource. The lock mechanism is a convention intended to help you signal other users that you are working with a particular set of files. It minimizes the time and effort wasted in solving possible conflicts generated by clashing commits. A lock gives you exclusive rights over a file, only if other users follow this convention and they do not try to bypass the lock state of a file.

A folder can be locked only by the SVN client application, completely transparent to the user, if an operation in progress was interrupted unexpectedly. As a result, folders affected by the operation are marked with the  symbol. To clear the locked state of a folder, use the **Clean up** action.

**Note:**

Users can lock only files.

The following lock states are displayed:

- *no lock* - the file is not locked. This is the default state of a file in the SVN repository.
- *remotely locked* () - shown when:
 - Another user has locked the file in the repository.
 - The file was locked by the same user from another working copy.
 - The file was locked from the **Repositories** view.

If you try to commit a new revision of the file to the repository, the server does not allow you to bypass the file lock.

**Note:**

To commit a new revision, you need to wait for the file to be unlocked. Ultimately, you might try to *break* or *steal* the lock, but this is not what other users expect. Use these actions carefully, especially when you are not the file lock owner.

- *locked* () - displayed after you have locked a file from the current working copy. Now you have exclusive rights over the corresponding file, being the only one who can commit changes to the file in the repository.

**Note:**

Working copies keep track of their locked files, so the locks are presented between different sessions of the application. Synchronize your working copy with the repository to make sure that the locks are still valid (not *stolen* or *broken*).

- *stolen* (🔒) - a file already locked from your working copy is being locked by another user. Now the owner of the file lock is the user who stole the lock from you.
- *broken* (🔓) - a file already locked from your working copy is no longer locked in the repository (it was unlocked by another user).

**Note:**

To remove the *stolen* or *broken* states from your working copy files, you have to **Update** them.

If one of your working copy files is locked, hover the mouse pointer over the lock icon to see more information:

- Lock type - current file lock state
- Owner - the name of the user who created the lock
- Date - the date when the user locked the file
- Expires on - date when the lock expires. Lock expiry policy is set in the repository options, on the server side
- Comment - the message attached when the file was locked
- **Size** - Resource size on disk
- **Type** - Contains the resource type or file extension

**Note:**

The working copy table allows you to show or hide any of its columns and also to sort its contents by any of the displayed columns. The table header provides a contextual menu that allows you to customize the displayed information.

The toolbar contains the following options for switching to a different working copy:

- **List of Defined Working Copies** - A drop-down menu that contains all the working copies Oxygen XML Developer is aware of. When you select a different working copy from the list, the newly selected working copy content is scanned and displayed in the **Working Copy** view.
- **Working Copies Manager** (📁 on macOS) - Opens a dialog box that displays the working copies Oxygen XML Developer is aware of. In this dialog box, you can add existing working copies or remove

those you no longer need. If you try to add a folder that is not a valid Subversion working copy, Oxygen XML Developer warns you that the selected directory is not under version control.

**Note:**

Removing a working copy from this dialog box does NOT remove it from your file system; you will have to do that manually.

Working Copy Settings

The **Settings** button from the toolbar of the **Working Copy** view provides the following options:

- **Show unversioned directories content** - Displays the content of unversioned directories.

**Note:**

If this option is not selected, it will be ignored for items that, after a synchronize, are reported as incoming from the repository. This applies for all working copy modes, except **All Files**.

- **Show ignored items** - Displays the ignored resource when **All Files** mode is selected.
- **Show ignored directories content** - Displays the content of ignored directories when **All Files** mode is selected.

**Note:**

Although *ignored* items are not presented in the **Modified**, **Incoming**, and **Conflicts** modes, they will be if, after a synchronize, they are reported as incoming from the repository.

- **Show deleted items** - Displays the deleted resource when **All Files** mode is selected. All other modes always display deleted resources, disregarding this option.
-  **Tree** /  **Compressed** /  **Flat** - Affect the way information is displayed inside the **Modified**, **Incoming**, **Outgoing**, and **Conflicts** view modes.
- **Configure columns** - Allows you to customize the structure of the **Working Copy** view data. This action opens the following dialog box:

Figure 566. Configure Columns of Working Copy View

The order of the columns can be changed with the two arrow buttons. The column size can be edited in the **Width of selected column** field. The **Restore Defaults** button reverts all columns to the default order, width, and enabled/disabled state from the installation of the application.

Working Copy Format

When an SVN working copy is loaded, Syncro SVN Client first checks the format of the working copy:

- If the format is older than SVN 1.7, you are prompted to upgrade it to SVN 1.8 to load it.
- If the format is 1.7, Syncro SVN Client takes into account the state of the **When loading an old format working copy** option (on page 249).

To change how working copy formats are handled, open the **Preferences** dialog box (**Options > Preferences**) (on page 114), go to **SVN > Working copy**, and configure the options in the **Administrative area** (on page 249) section.

Note:

- The format of the working copy can be downgraded or upgraded at any time with the **Upgrade** and **Downgrade** actions available in the **Tools** menu. These actions allow switching between SVN 1.7 and SVN 1.8 working copy formats.
- SVN 1.7 working copies cannot be downgraded to older formats.

Refresh a Working Copy

A refresh is a frequent operation triggered automatically when you switch between two working copies using the toolbar selector of the **Working Copy** view and when you switch between Oxygen XML Developer and other applications.

The **Working Copy** view features a fast refresh mechanism: the content is cached locally when loading the working copy for the first time. Later on, when the same working copy is displayed again, the application uses this cache to detect the changes between the cached content and the current content found on disk. The refresh operation is run on these changes only, thus improving the response time. Improvement is noticeable especially when working with large working copies.

Working Copy View Contextual Menu Actions

The contextual menu in the **Working Copy** view contains the following actions:

Edit conflict (Ctrl + E (Command + E on macOS))

Opens the **Compare** editor, allowing you to modify the content of the currently conflicting resources. For more information about editing conflicts, see [Edit conflicts \(on page 2104\)](#).

Open in Compare Editor (Ctrl + Alt + C (Command + Option + C on macOS))

Displays changes made in the currently selected file.

Open (Ctrl + O (Command + O on macOS))

Opens the selected resource from the working copy. Files are opened with an internal editor or an external application associated with that file type, while folders are opened with the default file system browsing application (Windows Explorer on Windows, Finder on macOS, etc).

Open with...

Submenu that allows you to open the selected resource either with Oxygen XML Developer or with another application.

Show in Explorer/Show in Finder

Opens the parent directory of the selected working copy file and selects the file.

Expand All (Ctrl + Alt + X (Command + Option + X on macOS))

Displays all descendants of the selected folder. The same behavior is obtained by double-clicking a collapsed folder.

Refresh(F5)

Re-scans the selected resources recursively and refreshes their status in the working copy view.

Synchronize (Ctrl + Shift + S (Command + Shift + S on macOS))

Connects to the repository and determines the working copy and repository changes made to the selected resources. The application switches to **Modified** view mode if the **Always switch to 'Modified' mode** option ([on page 249](#)) is selected.

Update (Ctrl + U (Command + U on macOS))

Updates the selected resources to the *HEAD* revision (latest modifications) from the repository. If the selection contains a directory, it will be updated depending on its depth.

Update to revision/depth

Allows you to update the selected resources from the working copy to an earlier revision from the repository. You can also select the update *depth* for the current folder. You can find out more about the *depth* term in the [sparse checkouts \(on page 2156\)](#) section.

Commit

Collects the outgoing changes from the selected resources in the working copy and allows you to choose exactly what resources to commit. A directory will always be committed recursively. Unversioned resources will be deselected by default. In the **Commit** dialog box you can also enter a comment before sending your changes to the repository.

 Revert (Ctrl + Shift + V (Command + Shift + V on macOS))

Undoes all local changes for the selected resources. It does not contact the repository and the files are obtained from the Apache Subversion™ pristine copy. It is available only for modified resources. See [Revert your changes \(on page 2106\)](#) for more information.

Override and Update

Drops any outgoing change and replaces the local resource with the HEAD revision. This action is available on resources with outgoing changes, including conflicting ones. See the [Revert your changes \(on page 2106\)](#) section.

Override and Commit

Drops any incoming changes and sends your local version of the resource to the repository. This action is available on conflicting resources. For more information see [Drop incoming modifications \(on page 2108\)](#).

 Mark Resolved (Ctrl + Shift + R (Command + Shift + R on macOS))

Instructs the Subversion system that you resolved a conflicting resource. For more information, see [Merge conflicts \(on page 2107\)](#).

 Mark as Merged (Ctrl + Shift + M (Command + Shift + M on macOS))

Instructs the Subversion system that you resolved the pseudo-conflict by merging the changes and you want to commit the resource. Read the [Merge conflicts \(on page 2107\)](#) section for more information about how you can solve the pseudo-conflicts.

 Create patch (Ctrl + Alt + P (Command + Option + P on macOS))

Allows you to create a file containing all the differences between two resources, based on the `svn diff` command. To read more about creating patches, see [the section about patches \(on page 2141\)](#).

Compare with:

- **Latest from HEAD (Ctrl + Alt + H (Command + Option + H on macOS))** - Performs a 3-way diff operation between the selected file and the *HEAD* revision from the repository and displays the result in the **Compare view**. The common ancestor of the 3-way diff operation is the *BASE* version of the file from the local working copy.
- **BASE revision (Ctrl + Alt + C (Command + Option + C on macOS))** - Compares the working copy file with the *BASE* revision file (the so-called *pristine copy*).
- **Revision (Ctrl + Alt + R (Command + Option + R on macOS))** - Displays the **History view** that contains the log history of that resource.
- **Branch/Tag** - Opens the **Compare with Branch/Tag** dialog box that allows you to specify [another file from the repository \(on page 2197\)](#) (**To URL** field) to compare with the working copy file. You can specify the revision of the repository file by choosing between **HEAD revision** or specific **Other revision**.

**Tip:**

To compare with a file that was deleted, moved, or replaced, you need to specify the original URL (before the file was removed) and use a [peg revision \(on page 2199\)](#) at the end (for example, `URL@rev1234`).

- **Each other** - Compares two selected files with each other.

These *compare* actions are available only if the selected resource is a file.

Replace with:

- **Latest from HEAD** - Replaces the selected resources with their versions from the *HEAD* revision of the repository.
- **BASE revision** - Replace the selected resources with their versions from the pristine copy (the *BASE* revision).

**Note:**

In some cases it is impossible to replace the currently selected resources with their versions from the *BASE/HEAD* revision:

- For the **Replace with BASE revision** action, the resources being unversioned or added have no *BASE* revision, and thus cannot be replaced. However, they will be deleted if the action is invoked on a parent folder. The action will never work for missing folders or for obstructing files (folders being obstructed by a file), since you cannot recover a tree of folders.
- For the **Replace with latest from HEAD** action, you must be aware that there are cases when resources will be completely deleted or reverted to the *BASE* revision and then updated to a *HEAD* revision to avoid conflicts. These cases are:

- The resource is *unversioned*, *added*, *obstructed*, or *modified*.
- The resource is affected by a `svn:ignore` or `svn:externals` property that is locally added on the parent folder and not yet committed to the repository.

Show History (Ctrl + H (Command + H on macOS))

Displays the **History view** where the log history for the selected resource will be presented. For more details about resource history, see the sections about [the resource history view \(on page 2177\)](#) and [requesting the history for a resource \(on page 2116\)](#).

Show Annotation (Ctrl + Shift + A (Command + Shift + A on macOS))

Opens the **Show Annotation** dialog box that computes [the annotations for a file and displays them in the Annotations view \(on page 2184\)](#), along with the history of the file in the **History** view.

Revision Graph (Ctrl + G (Command + G on macOS))

This action allows you to see the graphical representation history of a resource. For more details about the revision graph of resources, see [Revision Graph \(on page 2192\)](#).

Copy URL Location (Ctrl + Alt + U (Command + Option + U on macOS))

Copies the encoded URL of the selected resource from the Working Copy to the clipboard.

Mark as copied

You can use this action to mark an item from the working copy as a copy of another item under *version control*, when the copy operation was performed outside of an SVN client. The **Mark as copied** action is available when you select two items (both the new item and source item), and it depends on the state of the source item.

Mark as moved

You can use this action to mark an item from the working copy as being moved from another location of the working copy, when the move operation was performed outside of an SVN client. The **Mark as moved** action is available when you select two items from different locations (both the new item and the source item that is usually reported as *missing*), and it depends on the state of the source item.

Mark as renamed

You can use this action to mark an item from the working copy as being renamed outside of an SVN client. The **Mark as renamed** action is available when you select two items from the same directory (both the new item and the source item that is usually reported as *missing*), and it depends on the state of the source item.

Copy to

Copies the currently selected resource to a specified location.

Move to (Ctrl + M (Command + M on macOS))

Moves the currently selected resource to a specified location.

Rename (F2)

As with the move command, a copy of the original resource will be made with the new name and the original will be marked as deleted. Note that you can only rename one resource at a time.

✗ Delete (Delete)

Schedules selected items for deletion upon the next commit and removes them from the disk. Depending on the state of each item, you are prompted to confirm the operation.

New:

-  **New File** - Creates a new file inside the selected folder. The newly created file will be added under version control only if the parent folder is already versioned.
- **New Folder (Ctrl + Shift + F (Command + Shift + F on macOS))** - Creates a child folder inside the selected folder. The newly created folder will be added under version control only if its parent is already versioned.
- **New External Folder (Ctrl + Shift + W (Command + Shift + W on macOS))** - This operation allows you to add a new external definition on the selected folder. An external definition is a mapping of a local directory to a [URL of a versioned directory \(on page 2197\)](#), and ideally a particular revision, stored in the `svn:externals` property of the selected folder.

Tip:

You can specify a particular revision of the external item by using a [peg revision \(on page 2199\)](#) at the end of the URL (for example, `URL@rev1234`). You can also use peg revisions to access external items that were deleted, moved, or replaced.

The URL used in the external definition format can be relative. You can specify the repository URL that the external folder points to by using one of the following relative formats:

- `../` - Relative to the URL of the directory that the `svn:externals` property is set.
- `^/` - Relative to the root of the repository where the `svn:externals` property is versioned.
- `//` - Relative to the scheme of the URL of the directory that the `svn:externals` property is set.
- `/` - Relative to the root URL of the server that has the `svn:externals` property versioned.

Important:

To change the target URL of an external definition, or to delete an external item, do the following:

1. Modify or delete the item definition found in the `svn:externals` property that is set on the parent folder.
2. For the change to take effect, use the **Update** operation on the parent folder of the external item.

**Note:**

Syncro SVN Client does not support definitions of local relative external items.

Add to "svn:ignore" (Ctrl + Alt + I (Command + Option + I on macOS))

Allows you to add files that should not participate in the *version control* operations inside your working copy. This action can only be performed on resources not under *version control*. It actually modifies the value of the `svn:ignore` property in the parent directory of the resource. Read more about this in the [Ignore Resources Not Under Version Control \(on page 2094\)](#) section.

**Add to version control (Ctrl + Alt + V (Command + Option + V on macOS))**

Allows you to add resources that are not under *version control*. For further details, see [Add Resources to Version Control \(on page 2092\)](#) section.

Remove from version control

Schedules the selected items for deletion from the repository upon the next commit. The items are not removed from the file system after committing.

**Clean up (Ctrl + Shift + C (Command + Shift + Cd on macOS))**

Performs a maintenance cleanup operation on the selected resources from the working copy. This operation removes the Subversion maintenance locks that were left behind. This is useful when you already know where the problem originated and want to fix it as quickly as possible. It is only active for resources under *version control*.

Locking:

- **Scan for locks (Ctrl + L (Command + L on macOS))** - Contacts the repository and recursively obtains the list of locks for the selected resources. A dialog box containing the locked files and the lock description will be displayed. This is only active for resources under *version control*. For more details see [Scanning for locks \(on page 2098\)](#).
- **Lock (Ctrl + K (Command + K on macOS))** - Allows you to lock certain files that need exclusive access. You can write a comment describing the reason for the lock and you can also force (*steal*) the lock. This action is active only on files under *version control*. For more details on the use of this action see [Locking a file \(on page 2099\)](#).
- **Unlock (Ctrl + Alt + K (Command + Option + K on macOS))** - Releases the exclusive access to a file from the repository. You can also choose to unlock it by force (*break the lock*).

Show SVN Properties (Ctrl + P (Command + P on macOS))

Brings up the [Properties view \(on page 2190\)](#) and displays the SVN properties for the selected resource.

Show SVN Information (Ctrl + I (Command + I on macOS))

Provides additional information for the selected resource from the working copy. For more details, go to [Obtain information for a resource \(on page 2115\)](#).

Drag and Drop Operations

The structure of the files tree can be changed with drag and drop operations inside the **Working Copy** view. These operations behave in the same way with the **Copy to/Move to** operations.

Also, files and folders can be added to the file tree of the view as *unversioned* resources by drag and drop operations from other applications (for example, from Windows Explorer or macOS Finder). In this case, the items from the file system are only copied, without removing them from their original location.

Attention:

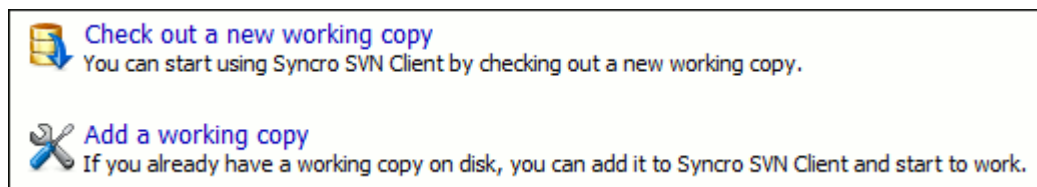

When you drag items from the working copy to a different application, the performed operation is controlled by that application. This means that the moved items are left as *missing* in the working copy (items are moved in the file system only, but no SVN versioning meta-data is changed).

Assistant Actions

To ensure a continuous and productive work flow, when a view mode has no files to present, it offers a set of guiding actions with some possible paths to follow.

Initially, when there is no working copy configured the **All Files** view mode lists the following two actions:

Figure 567. All Files Panel

For **Modified**, **Incoming**, **Outgoing**, **Conflicts** view modes, the following actions may be available, depending on the current working copy state in various contexts:

-  **Synchronize with Repository** - Available only when there is nothing to present in the **Modified** and **Incoming** view modes.
-  **Switch to Incoming** - Selects the **Incoming** view mode.
-  **Switch to Outgoing** - Selects the **Outgoing** view mode.

-  **Switch to Conflicts** - Selects the **Conflicts** view mode.
-  **Show all changes/incoming/outgoing/conflicts** - Depending on the currently selected view mode, this action presents the corresponding resources after a synchronize operation was executed only on a part of the working copy resources.
-  **(Information message)** - Informs you why there are no resources presented in the currently selected view mode.

History View

In Apache Subversion™, both files and directories are versioned and have a history. If you want to examine the history for a selected resource and find out what happened at a certain revision you can use the **History view** that can be accessed from [Repositories view \(on page 2157\)](#), [Working Copy view \(on page 2162\)](#), [Revision Graph \(on page 2192\)](#), or [Directory Change Set view \(on page 2182\)](#). From the **Working copy view** you can display the history of local versioned resources. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The view consists of four distinct areas:

- The table showing details about each revision, such as revision number, commit date and time, number of changes (more details available in the tooltip), author's name, and a fragment of the commit message.

Some revisions may be highlighted to emphasize:

- The current revision of the resource that has the history displayed - a bold font revision.
- The last revision where the content or properties of the resource were modified - blue font revision.

Note:

Both font highlights may be applied for the same revision.

- The complete commit message for the selected revision.
- A tree structure showing the folders where the modified resources are located. You can compress this structure to a more compact form that focuses on the folders that contain the actual modifications.
- The list of resources modified in the selected revision. For each resource, the type of action done against it is marked with one of the following symbols:
 -  - A newly created resource.
 -  - A newly created resource, copied from another repository location.
 -  - The content/properties of the resource were *modified*.
 -  - Resource was *replaced* in the repository.
 -  - Resource was deleted from the repository.

Figure 568. History View

Revision	Date	Changes	Author	Message
Today (1 revision)				
16572	2011-11-30 16:15:29	1	mihai	oXygen-users meetup
Last week (1 revision)				
16476	2011-11-22 09:22:33	1	mihai	oXygen-user-meetup
Last month (35 revisions)				
16309	2011-10-26 16:01:09	1	sorin	Fixed DocumentationTest.
16246	2011-10-25 10:32:58	1	bogdan	Reviewed.
16245	2011-10-24 17:39:51	1	mihaela	Small corrections
16244	2011-10-24 17:32:24	1	george	More updates on new features.
16243	2011-10-24 17:21:46	1	george	More updates on new features.
16242	2011-10-24 17:08:52	1	george	Update Saxon, move components section last.
16241	2011-10-24 17:02:52	1	george	Just formatting.
16240	2011-10-24 17:01:39	1	george	More changes on the new features.
16239	2011-10-24 16:45:35	1	sorin	Fixed broken links.

More updates on new features.

Action	Name	Path	Copied from
	site.xml	/www.oxygenxml.com/trunk/xml	

You can group revisions in predefined time frames (today, yesterday, this week, this month), by pressing the **Group by date** button from the toolbar.

History Filter Dialog Box

The **History view** does not always show all the changes ever made to a resource because there may be thousands of changes and retrieving the entire list can take a long time. Normally you are interested in the more recent ones. That is why you can specify the criteria for the revisions displayed in the **History view** by selecting one of several options presented in the **History** dialog box that is displayed when you invoke the **Show History** action.

Figure 569. History Filters Dialog Box

Options for the set of revisions presented in the History view are:

- All revisions of the selected resource.
- Only revisions between a start revision number and an end revision number.
- Only revisions added in a period of time (such as today, last week, last month, etc.)
- Only revisions between a start and an end date.
- Only revisions committed by a specified SVN user.

The toolbar of the **History view** has two buttons for extending the set of revisions presented in the view: **Get next 50** and **Get all**.

History Filter Field

When only the history entries that contain a specified substring need to be displayed in the **History view**, the filter field displayed at the top of this view is a useful tool. Just enter the search string in the field next to the **Find** label. Only the items (with an author name, commit message, revision number, or date) that match the search string are kept in the **History view**. When you click the  **Search** button, the filter action is executed and the content of the table is updated.

History View Contextual Menu Actions

The **History view** contains the following contextual menu actions:

Compare with working copy

Compares the selected revision with your working copy file. It is available only when you select a file.

Open

Opens the selected revision of the file into the Editor. This is available only for files.

Open with

Displays the **Open with** dialog box to specify the editor where the selected file will be opened.

Get Contents

Replaces the current version from the working copy with the contents of the selected revision from the history of the file. The *BASE* version of the file is not changed in the working copy so that after this action the file will appear as modified in a synchronization operation, that is newer than the *BASE* version, even if the contents is from an older version from history.

Save as

Allows you to save the contents of a file as it was committed at a certain revision. This option is available only when you access the history of a file.

Copy to

Copies to the repository the item whose history is displayed, using the selected revision. This option is active only when presenting the history for a repository item (URL).

Note:

This action can be used to resurrect deleted items also.

Revert changes from this revision

Reverts changes that were made in the selected revisions. The are reverted only in the working copy and do not affect the repository items. It does not replace your working copy items with those from the selected revisions. This action is available when the resource history was launched for a local working copy resource.

Note:

For items displayed in the **Affected Paths** section that were *added*, *deleted*, or *replaced*, this action has no effect because such changes are considered to be changes to the parent directory. To revert these types of changes, follow these steps:

1. Request the history for the parent directory.
2. Identify the revision that contains the changes you want to revert.
3. Invoke the action on that revision.

Warning:

There are instances where the SVN Client is not able to identify the corresponding working copy item for the selected item in the **Affected Paths** section. In this case, the action does not proceed and an error message is displayed. For example, the selected

item in the **Affected Paths** section is from a different repository location than the working copy item that has the history displayed.

Update to revision

Updates your working copy resource to the selected revision. This is useful if you want your working copy to reflect a time in the past. It is best to update a whole directory in your working copy, not just one file. Otherwise, your working copy is inconsistent and you are unable to commit your changes.

Check out

Checks out a new working copy of the directory that has the history presented, from the selected revision.

Export

Opens the **Export** dialog box ([on page 2152](#)) that allows you to configure options for exporting a folder from the repository to the local file system.

Show Annotation (Ctrl + Shift + A (Command + Shift + A on macOS))

Opens the **Show Annotation** dialog box that computes [the annotations for a file and displays them in the Annotations view \(on page 2184\)](#), along with the history of the file in the **History** view.

Change

Allows you to change commit data for a file:

- *Author* - Changes the name of the SVN user that committed the selected revision.
- *Message* - Changes the commit message of the selected revision.

When two resources are selected in the **History** view, the contextual menu contains the following actions:

Compare revisions

When the resource is a file, the action compares the two selected revisions using the **Compare** view. When the resource is a folder, the action displays the set of all resources from that folder that were changed between the two revision numbers.

Revert changes from these revisions

Similar to the `svn merge` command, it merges two selected revisions into the working copy resource. This action is only available when the resource history was requested for a working copy item.

For more information about the **History view** and its features, see the [Request history for a resource \(on page 2116\)](#) and [Using the resource history view \(on page 2177\)](#) sections.

Directory Change Set View

The result of comparing two reference revisions from the history of a folder resource is a set with all the resources changed between the two revision numbers. The changed resources can be contained in the folder or in a subfolder of that folder. These resources are presented in a tree format. For each changed resource all the revisions committed between the two reference revision numbers are presented.

Figure 570. Directory Change Set View

The set of changed resources displayed in the tree is obtained by running the action **Compare revisions** available on the contextual menu of the **History** view when two revisions of a folder resource are selected in the **History** view.

The left side panel of the view contains the tree hierarchy with the names of all the changed resources between the two reference revision numbers. The right side panel presents the list with all the revisions of the resource selected in the left side tree. These revisions were committed between the two reference revision numbers. Selecting one revision in the list displays the commit message of that revision in the bottom area of the right side panel.

Double-clicking a file listed in the left-side tree performs a diff operation between the two revisions of the file corresponding to the two reference revisions. Double-clicking one of the revisions displayed in the right-side list of the view performs a diff operation between that revision and the previous one for the same file.

The contextual menu of the right side list contains the following actions:

Compare with previous version

Performs a diff operation between the selected revision in the list and the previous one.

Open

Opens the selected revision in the associated editor type.

Open with

Displays a dialog box with the available editor types and allows you to select the editor type for opening the selected revision.

Save as

Saves the selected file as it was in the selected revision.

Copy to

Copies to the repository the item whose history is displayed, using the selected revision.

Note:

This action can be used to resurrect deleted items also.

Check out

Checks out a new working copy of the selected directory, from the selected revision.

Export

Opens the **Export** dialog box ([on page 2152](#)) that allows you to configure options for exporting a folder from the repository to the local file system.

Show Annotation (**Ctrl + Shift + A (Command + Shift + A on macOS)**)

Opens the **Show Annotation** dialog box that computes the [annotations for a file and displays them in the Annotations view \(on page 2184\)](#), along with the history of the file in the **History** view.

Show SVN Information (**Ctrl + I (Command + I on macOS)**)

Provides additional information for a selected resource. For more details, go to [Obtain information for a resource \(on page 2115\)](#).

Editor Panel of SVN Client

You can open a file for editing in an internal built-in editor. There are default associations between frequently used file types and the internal editors in [the File Types preferences panel \(on page 263\)](#).

The internal editor can be accessed either from the [Working copy view \(on page 2162\)](#) or from the [History view \(on page 2177\)](#). No actions that modify the content are allowed when the editor is opened with a revision from history.

Only one file at a time can be edited in an internal editor. If you try to open another file it will be opened in the same editor window. The editor provides syntax highlighting for known file types. This means that a different color will be used for each recognized token type found in the file. If the file's content type is unknown you will be prompted to choose the proper way the file should be opened.

After editing the content of the file in an internal editor you can save it to disk by using the **Save** action from the [File \(on page 2067\)](#) menu or the **Ctrl + S (Command + S on macOS)** key shortcut. After saving your file you can see the file changed status in [the Working Copy view \(on page 2162\)](#).

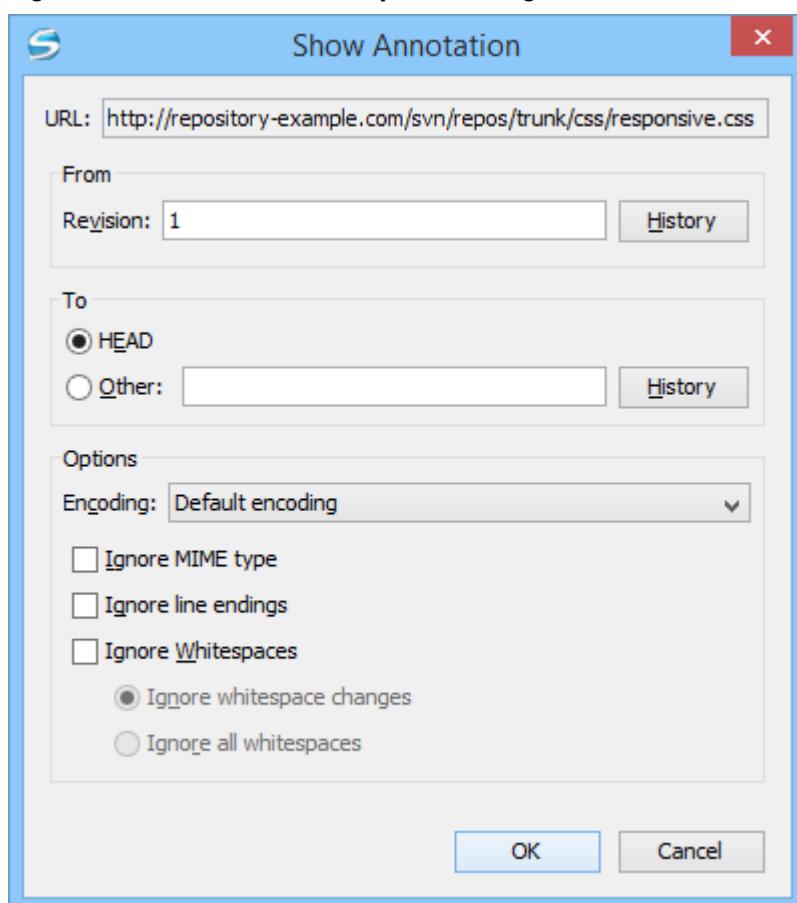

If the internal editor associated with a file type is not the XML Editor, then the encoding set in [the preferences for Encoding for non XML files \(on page 158\)](#) is used for opening and saving a file of that type. This is necessary because in the case of XML files, the encoding is usually declared at the beginning of the XML file in a special declaration or it assumes the default value UTF-8, but in the case of non-XML files, there is no standard mechanism for declaring the encoding for the file.

Annotations View

Sometimes you need to know not only what was changed in a file, but also who made those changes. The **Annotations** view displays the revision and the author that changed every line in a file. The annotations of a file are computed and this view is opened with the  **Show Annotation** action, which is available in the **History** menu, and from the contextual menu of the following views: **Repositories view (on page 2157)**, **Working copy view (on page 2162)**, **History view (on page 2177)**, and **Directory Change Set view (on page 2182)**.

This action opens a dialog box that allows you to configure some options for showing the annotations.

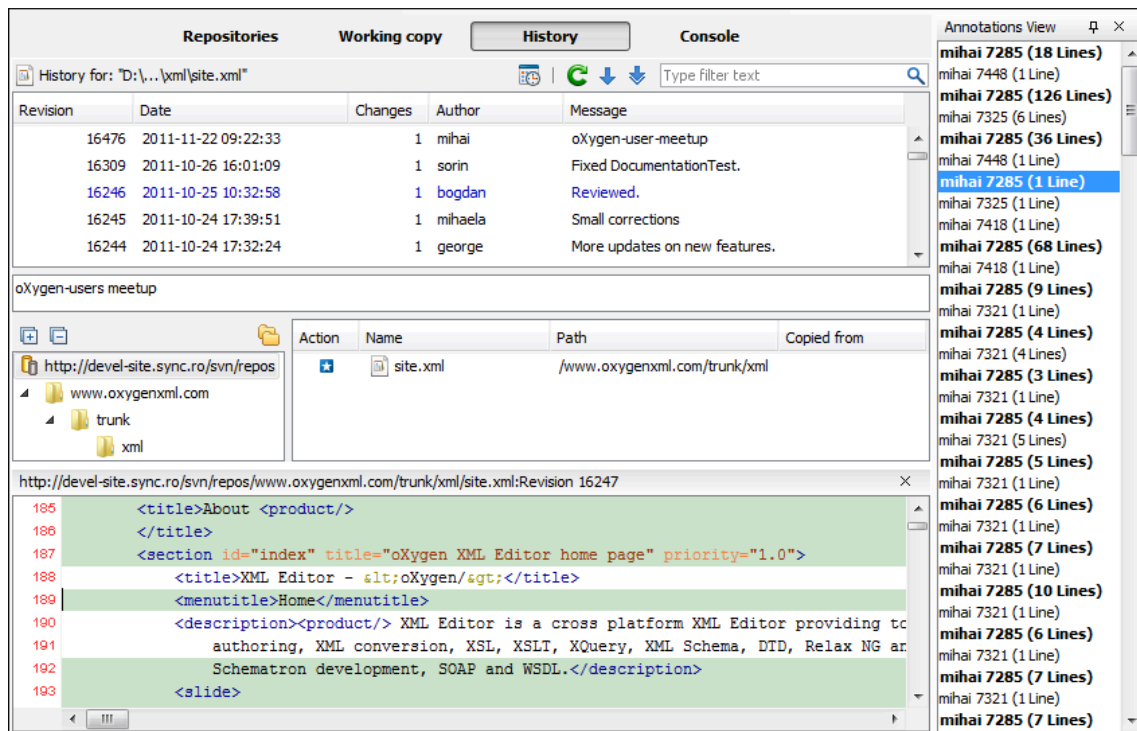

Figure 571. Show Annotation Options Dialog Box

Once you have configured the options and click **OK**, the **Annotations** view is displayed (by default, on the right side of the application). You can click a line in the editor panel where the file is opened to see the revision where the line was last modified. The same revision is highlighted in the **History view** and you can also see all the lines that were changed in the same revision highlighted in the editor panel. Also, the entries of the **Annotations view** corresponding to that revision are highlighted. Therefore, the **Annotations view**,

History view, and annotations editor panel are all synchronized. Clicking a line in one of them highlights the corresponding lines in the other two.

Figure 572. Annotations View

The following options can be configured in the **Show Annotation** dialog box:

From Revision Section

Select the revision to have the annotation computed. If you click the **History** button, the **History dialog box** (on page 2090) is displayed, which allows you to select a revision.

To Revision Section

Select the ending revision by choosing between the **HEAD** revision or specify it in the **Other** text box. If you click the **History** button, the **History dialog box** (on page 2090) is displayed, which allows you to select a revision.

Encoding

Select the encoding to be used when the annotation is computed. For each line of text, the SVN Client looks through the history of the file to be annotated see when it was last modified, and by whom. It is required that it is in the form of a text file. Therefore, encoding is needed to properly decode and read the file content. By default, the encoding of the operating system is used.

Ignore MIME type

If selected, the file is treated as a text file and ignores what the SVN system infers from the `svn:mime-type` property.

Ignore line endings

If selected, the differences in line endings are ignored when the annotation is computed.

Ignore whitespaces

If selected, it allows you to specify how the whitespace changes should be handled. When selected, you can then choose between two options:

- **Ignore whitespace changes** - Ignores changes in the amount of whitespaces or to their type (for example, when changing the indentation or changing tabs to spaces).

Note:

Whitespaces that were added where there were none before, or that were removed, are still considered to be changes.

- **Ignore all whitespaces** - Ignores all types of whitespace changes.

Tip:

Selecting any of these *ignore* options can help you better determine the last time a meaningful change was made to a given line of text.

After you configure the options and click **OK**, the annotations will be computed and the **Annotations** view is displayed, where all the users that modified the selected resource will be presented, along with the specific lines and revision numbers modified by each user.

Note:

If the file has a very long history, the computation of the annotation data can take a long time to process.

Compare View

In the Oxygen XML Developer, there are three types of files that can be checked for differences: text files, image files and binary files. For the text files and image files you can use the built-in **Compare** view. This view is automatically opened if you select two files and use the **Compare with > Each Other** action in the contextual menu.

Figure 573. Compare View

At the top of each of the two editors, there are presented the name of the open file, the corresponding SVN revision number (for remote resources) and the author who committed the associated revision.

When comparing text, the differences are computed using a *line differencing algorithm*. The view can be used to show the differences between two files in the following cases:

- After obtaining the outgoing status of a file with a **Refresh** operation, the view can be used to show the differences between your working file and the pristine copy. In this way you can find out what changes you will be committing.
- After obtaining the incoming and outgoing status of the file with the **Synchronize** operation, you can examine the exact differences between your local file and the *HEAD* revision file.
- You can use the **Compare view** from the **History view** to compare the local file and a selected revision or compare two revisions of the same file.

The Compare view contains two editors. Edits are allowed only in the left editor and only when it contains the working copy file. To learn more about how the view can be used, see [View Differences \(on page 2100\)](#).

Compare View Toolbar

The toolbar of the **Compare** view contains the operations that can be performed on the source and target files.

Figure 574. Compare View Toolbar

The following actions are available:

Algorithm

The algorithm to be used for performing a comparison. The following options are available:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Save action

Saves the content of the left editor when it can be edited.

Perform Files Differencing

Looks for differences between the two files displayed in the left and right side panels.

Ignore Whitespaces

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

Synchronized scrolling

Toggles synchronized scrolling. When toggled on, a selected difference can be seen in both panels.

Format and Indent Both Files (**Ctrl + Shift + P** (**Command + Shift + P** on macOS))

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

Note:

When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.

Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

Copy All Changes from Right to Left

Copies all changes from the file in the right panel to the file in the left panel.

Next Block of Changes (**Ctrl + Period** (**Command + Period** on macOS))

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

Note:

A change block groups one or more consecutive lines that contain at least one change.

Previous Block of Changes (**Ctrl + Comma** (**Command + Comma** on macOS))

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

Next Change (**Ctrl + Shift + Period** (**Command + Shift + Period** on macOS))

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

Previous Change (**Ctrl + Shift + Comma** (**Command + Shift + M** on macOS))

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

Ignore Nodes by XPath

You can use this text field to enter an [XPath expression \(on page 1732\)](#) to ignore certain nodes from the comparison. It will be processed as XPath version 2.0. You can also enter the name of the node to ignore all nodes with the specified name (for example, if you want to ignore all ID attributes from the document, you could simply enter `@id`). This field is only available when comparing XML documents using the **XML Fast** or **XML Accurate** algorithms.

Note:

If an XPath expression is specified in the [Ignore nodes by XPath option \(on page 254\)](#) in the **Diff / File Comparison** preferences page, that one is used as a default when the application is started. If you then enter an expression in this field on the toolbar, this one will be used instead of the default. If you delete the expression from this field, neither will be used.

First Change (**Ctrl + B** (**Command + B** on macOS))

Jumps to the first change.

Most of these actions are also available from the [Compare \(on page 2067\)](#) menu.

Image Preview

You can view your local files by using the built-in **Image Preview** component. The view can be accessed from the [Working copy view \(on page 2162\)](#) or from the [Repository view \(on page 2157\)](#). It can also be used from the [History view \(on page 2177\)](#) to view a selected revision of a image file.

Only one image file can be opened at a time. If an image file is opened in the *Image preview* and you try to open another one it will be opened in the same window. Supported image types are *GIF, JPEG/JPG, PNG, BMP*. Once the image is displayed in the **Image Preview** panel using the actions from the contextual menu, you can scale the image at its original size (**1:1** action) or scale it down to fit in the view's available area (**Scale to fit** action).

Compare Images View

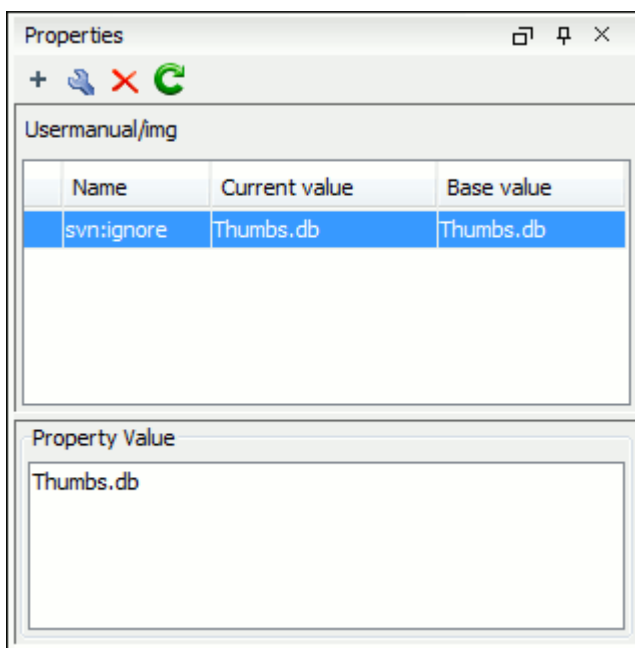

The images are compared using the **Compare Images** view. This view is automatically opened if you select two image files and use the **Compare with > Each Other** action in the contextual menu. The images are presented in the left and right part of the view, scaled to fit the available area. You can use the contextual menu actions to scale the images at their original size or scale them down to fit the view's available area.

The supported image types are: *GIF, JPG / JPEG, PNG, BMP*.

Properties View

The properties view presents Apache Subversion™ properties for the currently selected resource from either the **Working Copy** view or the **Repositories** view. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 575. Properties View

The table includes four columns:

- **State** - Can be one of the following:
 - *(empty)* - Normal unmodified property (same current and base values)
 - * *(asterisk)* - Modified property (current and base values are different)
 - + *(plus sign)* - New property
 - - *(minus sign)* - Removed property
- **Name** - The property name.
- **Current value** - The current value of the property.
- **Base value** - The base (original) value of the property.

svn:externals Property

The `svn:externals` property can be set on a folder or a file. In the first case, it stores [the URL of a folder from another repository \(on page 2174\)](#).

In the second case, it stores the URL of a file from another repository. The external file will be added into the working copy as a versioned item. There are a few differences between directory and external file:

- The path to the external file must be in a working copy that is already checked out. While external directories can place the external directory at any depth and it will create any intermediate directories, external files must be placed into a working copy that is already checked out.
- The external file URL must be in the same repository as the URL that the external file will be inserted into (inter-repository external files are not supported).
- While commits do not descend into an external directory, a commit in a directory containing an external file will commit any modifications to the external file.

The difference between a normal versioned file and an external file is that external files cannot be moved or deleted (the `svn:externals` property must be modified instead. However, external files can be copied).

An external file is displayed as an X in the switched status column.

Toolbar / Contextual Menu

The properties view toolbar and contextual menu contain the following actions:

-  **Add a new property** - This button invokes the *Add property* dialog box where you can specify the property name and value.
-  **Edit property** - This button invokes the *Edit property* dialog box where you can change the property value and also see its original(base) value.
-  **Remove property** - This button will prompt a dialog box to confirm the property deletion. You can also specify if you want to remove the property recursively.
-  **Refresh** - This action will refresh the properties for the current resource.

Console View

The **Console View** shows the traces of all the actions performed by the application. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Part of the displayed messages mirror the communication between the application and the Apache Subversion™ server. The output is expressed as subcommands to the Subversion server and simulates the Subversion command-line notation. For a detailed description of the Subversion console output read the **SVN User Manual**.

The view has a simple layout, with most of its space occupied by a message area. On its right side, there is a toolbar holding the following buttons:

 **Clear**

Erases all the displayed messages.

 **Lock scroll**

Disables the automatic scrolling when new messages are appended in the view.

The maximum number of lines displayed in the console (length of the buffer) can be modified in the [Preferences \(on page 247\)](#) page. By default, this value is set to 100.

Dynamic Help View

Dynamic Help view is a help window that changes its content to display the help section that is specific to the currently selected view. As you change the focused view, you can read a short description of it and its functionality. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Revision Graph of an SVN Resource

The history of an SVN resource can be watched on a graphical representation of all the revisions of that resource together with the tags in which the resource was included. The graphical representation is identical to a tree structure and very easy to follow.

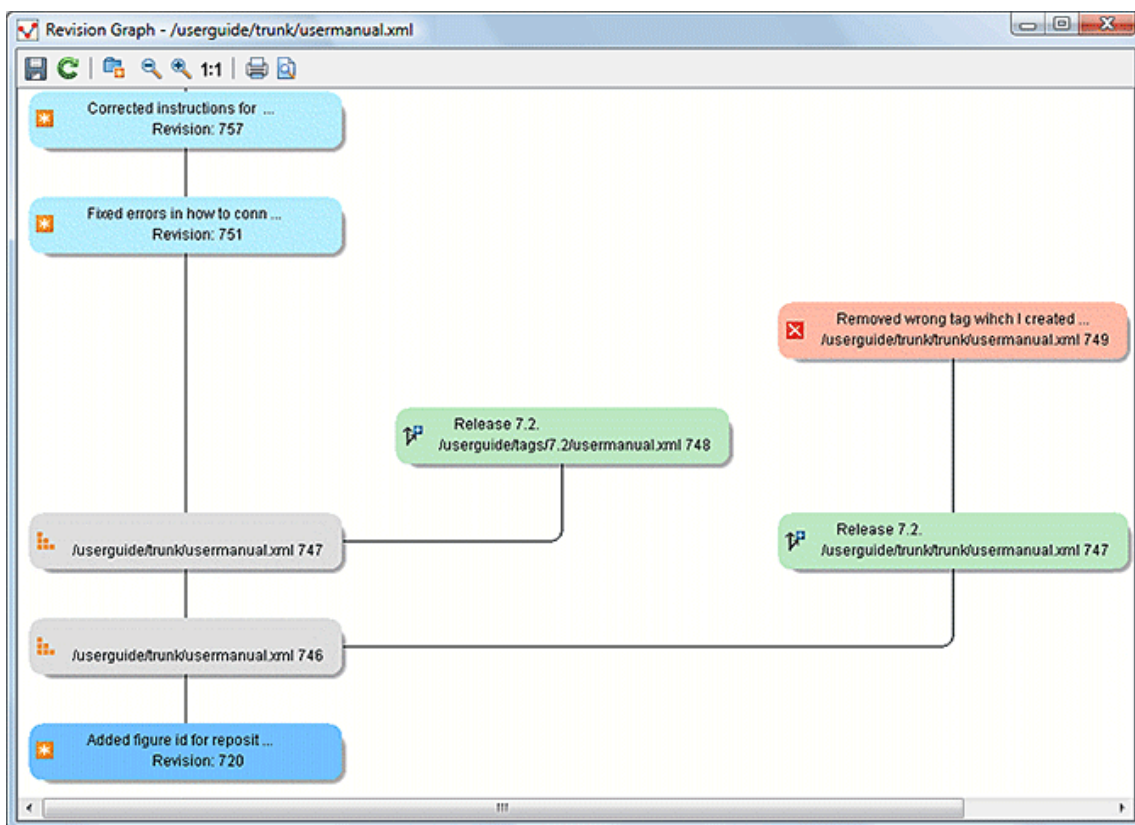

The graphical representation of a resource history is invoked with the  **Revision graph** action available on the right-click menu of an SVN resource in the [Working Copy view \(on page 2162\)](#) and the [Repository view \(on page 2157\)](#).

Figure 576. Revision Graph of a File Resource

In every node of the revision graph an icon and the background color represent the type of operation that created the revision represented in that node. The commit message associated with that revision, the repository path, and the revision number are also contained in the node. The tooltip displayed when the mouse pointer hovers over a node specifies the URL of the resource, the SVN user who created the revision of that node, the revision number, the date of creation, the commit message, the modification type and [the affected paths \(on page 2090\)](#).

The types of nodes used in the graph are:

Added resource

The  icon for a new resource added to the repository and a green background.

Copied resource

The  icon for a resource copied to other location (for example, when an SVN tag is created and a green background).

Modified resource

The  icon for a modified resource and a blue background.

Deleted resource

The  icon for a resource deleted from the repository and a red background.

Replaced resource

The  icon for a resource removed and replaced with another one on the repository and an orange background.

Indirect resource

The  icon for a revision from where the resource was copied or an indirectly modified resource, that is a directory where a resource was modified and a gray background. The *Modification type* field of the tooltip specifies how that revision was obtained in the history of the resource.

A directory resource is represented with two types of graphs:

Simplified graph

Lists only the changes applied directly to the directory;

Complete graph

Lists also the indirect changes of the directory resource, that is the changes applied to the resources contained in the directory.

Figure 577. Revision Graph of a Directory (Direct Changes)

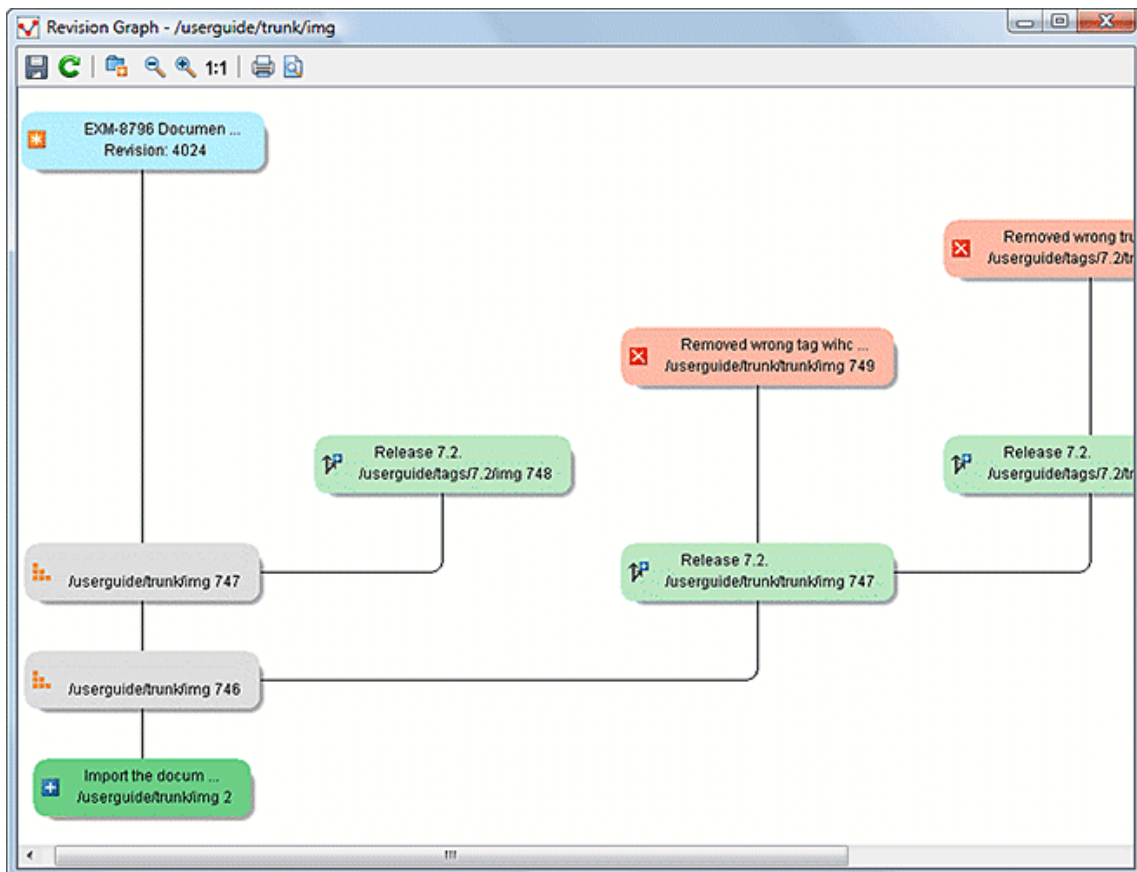

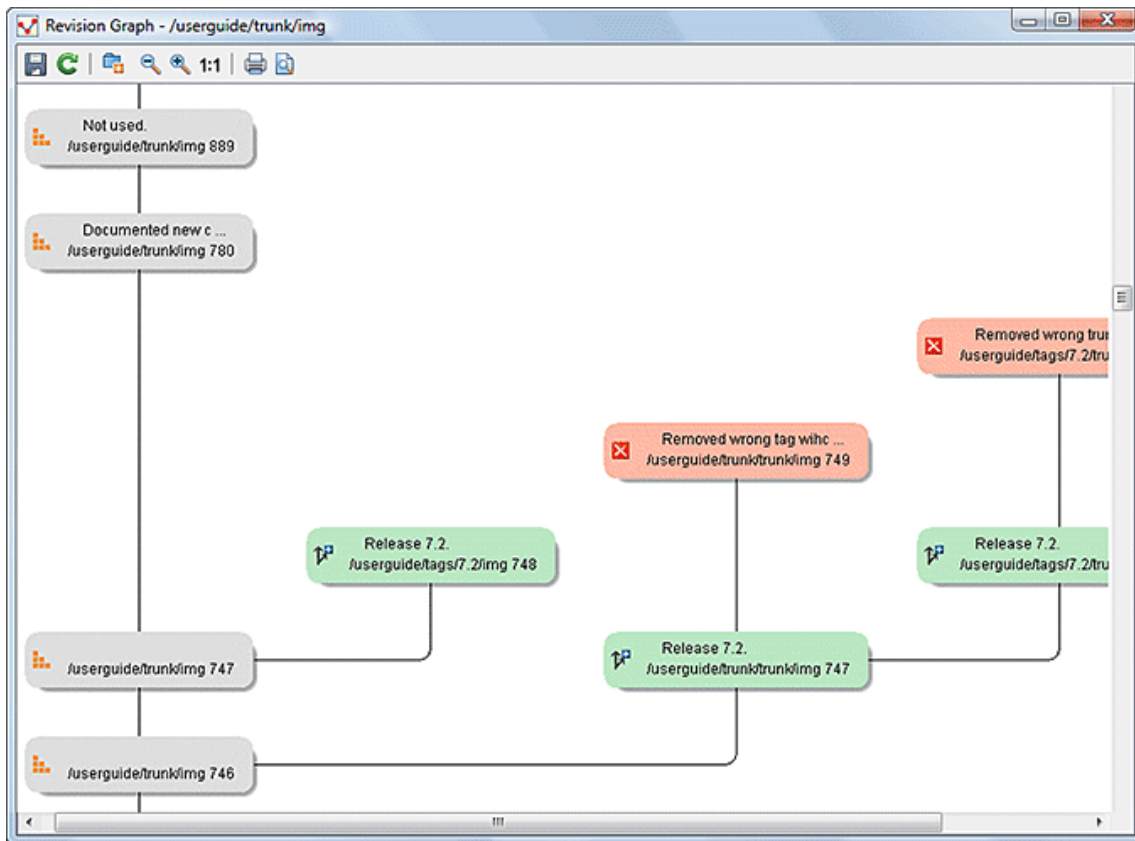

Figure 578. Revision Graph of a Directory (Including Indirect Changes)

The **Revision graph** toolbar contains the following actions:

 **Save as image**

Saves the graphical representation as image. For a large revision graph you have to [set more memory in the startup script \(on page 304\)](#). The default memory size is not enough when there are more than 100 revisions that are included in the graph.

 **Show/Hide indirect modifications**

Switches between simplified and complete graph.

 **Zoom In**

Zooms in the graph.

 **Zoom Out**

Zooms out the graph. When the font reaches its minimum size, the graph nodes will display only the icons, leading to a very compact representation of the graph.

1:1 Reset scale

Resets the graphical scale to a default setting.

 **Print**

Prints the graph.

 **Print preview**

Offers a preview of the graph to allow you to check the information to be printed.

The contextual menu of any of the graph nodes contains the following actions:

Open

Opens the selected revision in the editor panel. Available only for files.

Open with

Opens the selected revision in the editor panel. Available only for files.

Save as

Saves the file that had the revision graph generated, based on the selected node revision.

Copy to

Copies to the repository the item whose revision graph is displayed, using the selected revision.

Note:

This action can be used to resurrect deleted items also.

Compare with HEAD

Compares the selected revision with the HEAD revision and displays the result in the diff panel. Available only for files.

Show History

Displays the history of the resource in [the History view \(on page 2177\)](#). Available for both files and directories.

Check out

[Checks out \(on page 2088\)](#) the selected revision of the directory. Available only for directories.

Export

Opens [the Export dialog box \(on page 2152\)](#) that allows you to configure options for exporting a folder from the repository to the local file system.

When two nodes are selected in the revision graph of a file the right-click menu of this selection contains only the **Compare** for comparing the two revisions corresponding to the selected nodes. If the resource that had the revision graph built is a folder then the right-click menu displayed for a two nodes selection also contains the **Compare** action but it computes the differences between the two selected revisions as a set of directory changes. The result is displayed in the [Directory Change Set \(on page 2182\)](#) view.

Attention:

Generating the revision graph of a resource with many revisions may be a slow operation. You should enable caching for revision graph actions so that future actions on the same repository will not request the same data again from the SVN server, which will finish the operation much faster.

Oxygen XML Developer SVN Preferences

The options used in the SVN client are saved and loaded independently from the Oxygen XML Developer options. However, if Oxygen XML Developer cannot determine a set of SVN options to be loaded at startup, some of the preferences are imported from the XML Editor options (such as the License key and HTTP Proxy settings).

There is also an additional set of preferences applied to the SVN client that are set in global SVN files. There are two editing actions available in the **Global Runtime Configuration** submenu of the **Options** menu. These actions, **Edit 'config' file** and **Edit 'servers' file**, contain parameters that act as defaults applied to all the SVN client tools that are used by the same user on their login account.

Entering Local Paths and URLs

The Oxygen XML Developer includes a variety of option configuration pages or wizards that contain text boxes where you specify paths to local resources or URLs of items inside remote repositories. The Oxygen XML Developer provides support in these text boxes to make it easier to specify these paths and URLs.

Local Item Paths

The text boxes used for specifying local item paths support the following:

- *Absolute Paths* - In most cases, the Oxygen XML Developer expects absolute paths for local file system items.
- *Relative Paths* - The Oxygen XML Developer only accepts relative paths in the form `~[...]`, where `~` is the user home directory.
- *Path Validation* - Oxygen XML Developer validates the path as you type and invalid text becomes red.
- *Drag and Drop* - You can drag files and folders from the file system or other applications and drop them into the text box.
- *Automatic Use of Clipboard Data* - If the text box is empty when its dialog box is opened, any data that is available in the system clipboard is used, provided that it is valid for that text box.

Repository Item URLs

- *Local Repository Paths* - You can use local paths (absolute or relative) to access local repositories. When you use the **Browse** button, the Oxygen XML Developer will convert the file path to a `file://` form of URL, provided that the location is a real repository.
 - *Absolute Paths* - In most cases, the Oxygen XML Developer expects absolute paths for local file system items.
 - *Relative Paths* - The Oxygen XML Developer only accepts relative paths in the form `~[...]`, where `~` is the user home directory.
- *Peg Revisions* - For URL text boxes found inside dialog boxes where you are pulling information from the repository, you can [use peg revisions at the end of the URLs \(on page 2199\)](#) (for example, `URL@rev1234`).

**Note:**

If you try to use a *peg revision* number in a dialog box where you are sending information to the repository then the peg revision number will become part of the name of the item rather than searching for the specified revision. For example, in the URL `http://host/path/inside/repo/item@100`, the item name is considered to be `item@100`.

**Tip:**

You can even use *peg revisions* with local repository paths. For example, `C:\path\to\local\repo@100` will be converted to `file:///C:/path/to/local/repo@100` and the **Repository browser** will display the content of the local repository as it is at revision `100`.

- *URL Validation* - Oxygen XML Developer validates the URLs as you type and invalid text becomes red. Even paths to local repositories are not accepted unless using the **Browse** button to convert them to valid URLs.
- *Drag and Drop* - You can drag URLs from other applications or text editors and drop them into the URL text box. You can also drag folders that point to local repositories, from the local file system or from other applications, and they are automatically converted to valid `file://` type URLs.
- *Automatic Use of Clipboard Data* - If the URL text box is empty when its dialog box is opened, any data that is available in the system clipboard is used, provided that it is valid for that text box. Even valid local paths will be automatically converted to `file://` type URLs.

**Note:**

The text boxes that are in the form of a combo box also allow you to select previously used URLs, or URLs defined in the **Repositories** view.

Technical Issues

This section contains special technical issues found during the use of Syncro SVN Client.

Authentication Certificates Not Saved

If Syncro SVN Client prompts you to enter the authentication certificate, although you already provided it in a previous session, then you should make sure that your local machine user account has the necessary rights to store certificate files in the *Subversion* configuration folder (write access to *Subversion* folder and all its subfolders). Usually, it is located in the following locations:

- Windows: `[HOME_DIR]\AppData\Roaming\Subversion`
- macOS and Linux: `[HOME_DIR]/.subversion`

Updating Newly Added Resources

When you want to get a resource that is part of a newly created structure of folders from the repository, you need to also get its parent folders.

Figure 579. Incoming Changes

Syncro SVN Client allows you to choose how you want to deal with the entire structure from that moment onwards:

Update ancestor directories recursively

This option brings the entire newly added folders structure into your working copy. In this case, the update time depends on the total number of newly incoming resources, because of the full update operation (not updating only selected resource).

Update selected files only (leave ancestor directories empty)

This option brings a skeleton structure composed of the resource's parent folders only, and the selected resource at the end of the operation. All of the parent directories will have depth set to *empty* in your working copy, thus subsequent **Synchronize** operations will not report any remote modifications in those folders. If you need to update the folders to full-depth, you can use the [Update to revision/depth action \(on page 2171\)](#) from the working copy view.

Accessing Old Items from a Repository

Usually, you point to an item from a repository using a URL. However, sometimes this might not be enough because the URL alone might point to a different item than the one you want and a *peg revision* is needed.

A Subversion repository tracks any change made to its items by using *revisions*, which contain information such as the name of the author who made the changes, the date when they were made, and a number that uniquely identifies each of them. Over time, an item from a specific location in a repository evolves as a result of committing changes to it. When an item is deleted, its entire life cycle (all changes made to it from the moment it was created) remains recorded in the history of the repository. If a new item is created, with the same name and in the same location of the repository as a previously existing one, then both items are identified by the same URL even though they are located in different time frames. This is when a *peg revision* comes in handy. A *peg revision* is nothing more than a normal revision, but the difference between them is

made by their usage. Many of the Subversion commands also accept a peg revision as a way to precisely identify an item in time, beside an *operative revision* (the revision regarding the used command).

Example:

To illustrate an example, consider the following:

- A new repository file `config` was created, identified by the URL `http://host.com/myRepository/dir/config`.
- The file has been created at revision `10`.
- Over time, the file was modified by committing revisions `12, 15, 17`.

To access a specific version of the file identified by the `http://host.com/myRepository/dir/config` URL, you need to use a corresponding revision (the operative revision):

- If a revision number is used that is lower than `10`, an error is triggered, because the file has not been created yet.
- If a revision number is used that is between `10` and `19`, the specific version you are interested in would be obtained.

Note:

Although the file was modified in revisions `12, 15, 17`, it existed in all revisions between `10` and `19`. Starting with a revision where the file is modified, it has the same content across all revisions generated in the repository until another revision where it is modified again.

At this point, the file is deleted, creating revision `20`. Now, no version of the file can be accessed because it no longer exists in the latest repository revision. This is due to the fact that Subversion automatically uses the `HEAD` revision as a peg revision (it assumes any item currently exists in the repository if not instructed otherwise). However, using any of the revision numbers from the `10-19` interval (when the file existed) as a peg revision (beside the operative revision), will help Subversion to properly identify the time frame when the file existed, and access the file version corresponding to the operative revision. If you use a revision number greater than `19`, this will also trigger an error.

Continuing the example, suppose that at revision `30`, a directory called `config` is created in the same repository location as the deleted file. This means that the new directory will be identified by the same repository address: `http://host.com/myRepository/dir/config`. If you only use this URL in any Subversion command, you will access the new directory. You will also access the same directory if you use any revision number equal to or greater than `30` as peg revision. However, if you are interested in accessing an old version of the previously existing file, then you must use one of the revisions that existed (`10-19`), as a peg revision, similar to the previous case.

Checksum Mismatch Error

A *Checksum Mismatch* error could happen if an operation that sends or retrieves information from the repository to the working copy is interrupted. This means that there is a problem with the synchronization between a local item and its corresponding remote item.

If you encounter this error, try the following:

1. Identify the parent directory of the file that caused the error (the file name should be displayed in the error message).

Note:

If the parent directory is the root of the working copy or if it contains a large amount of items it is recommended that you check out the working copy again, rather than continuing with the rest of this procedure.

2. Identify the *current depth* ([on page 2164](#)) of that directory.
3. Update the parent directory using the **Update to revision/depth** action that is available from the contextual menu or the **Working copy** menu. For the **Depth** option, select **This folder only (empty)**.

Warning:

If you have files with changes in this directory, those changes could be lost. You should commit your changes or move the files to another directory outside the working copy prior to proceeding with this operation.

4. After clicking **OK** the contents of the directory will be erased and the directory is be marked as having an *empty depth* ([on page 2164](#)).
5. Once again, update the same directory using the **Update to revision/depth** action. This time, for the **Depth** option, select the depth that was previously identified in step 2.
6. If you moved modified files to another directory outside the working copy, move them back to the original location inside the working copy.

If this procedure does not solve the error, you need to check out the working copy again and move possible changes from the old working copy to the new one.

External Tools

A command-line tool can be started in the Oxygen XML Developer user interface as if from the command line of the operating system shell. Oxygen XML Developer offers you the option of integrating such a tool by specifying just the command line for starting the executable file and its working directory. To integrate such a tool, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#) and go to **External Tools** ([on page 258](#)) (or select **Configure** from the **Tools > External Tools** menu).

The **External Tools** preferences page (*on page 258*) presents a list of the external tools that have been configured. Once a tool has been configured (*on page 258*), you can open it by selecting it from the **Tools > External Tools** menu or from the  **External Tools** drop-down menu on the toolbar (the **Tools** toolbar needs to be selected in the **Configure Toolbars** dialog box (*on page 327*)). You can also [assign a keyboard shortcut](#) (*on page 260*) to be used to launch the tool.

If the external tool is applied on one of the files opened in Oxygen XML Developer, the **Save all files before calling external tools option** (*on page 170*) (in the **Save** preference page) should be selected so that all edited files are automatically saved when an external tool is applied.

When an external tool is launched, the icon on the toolbar changes to a stop icon () and you can use this button to stop the tool. When the tool has finished running (or you close it), the icon changes back to the original icon (.

Note:

Even though you can stop the external tool by invoking the stop action while it is running, that does not necessarily mean it will also stop the processes spawned by that external tool. For instance, if you stop an external tool that runs a batch file, the batch may be stopped but without actually stopping the processes that the batch was running at that time.

Example: Integrating the Ant Tool

This is an example procedure for integrating [the Ant build tool](#) into Oxygen XML Developer:

1. [Download](#) and [install Apache Ant](#) (*on page 2267*) on your computer.
2. Test your *Ant* installation from the command-line interface in the directory where you want to use *Ant* from. For example, run the `clean` target of your `build.xml` file `C:\projects\XMLproject\build.xml`:

```
ant clean
```

3. [Open the Preferences dialog box \(Options > Preferences\)](#) (*on page 114*) and go to **External Tools** (or select **Configure** from the **Tools > External Tools** menu).
4. Click the **New** button to create a new external tool entry and enter the following information:
 - **Name** - For example, `Ant tool`.
 - **Working directory** - For example, `C:\projects\XMLproject`.
 - **Command line** - For example, `"C:\projects\XMLproject\ant.bat" clean`.
5. Click **OK** to add the new tool to the list of external tools.
6. Run the tool from **Tools > External Tools > Ant tool**. You can see the output in the system console:

```
Started: "C:\projects\XMLproject\ant.bat" clean
Buildfile: build.xml

clean:
```

```
[echo] Delete output files.
```

```
[delete] Deleting 5 files from C:\projects\XMLproject
```

```
BUILD SUCCESSFUL
```

```
Total time: 1 second
```

20.

Troubleshooting

This section provides a collection of common performance and other types of problems that might be encountered when using Oxygen XML Developer, along with their possible solutions.

Performance Problems and Solutions

This section contains solutions for some common performance problems that may appear when running Oxygen XML Developer.

Related Information:

[Documents with Long Lines \(on page 430\)](#)

[Loading Large Documents \(on page 428\)](#)

[External Tools \(on page 2201\)](#)

Display Problems on Linux or Solaris

Problem

I experience display problems (such as screen freezes) on Linux or Solaris.

Cause

This is possibly a rendering problem with the off-screen pixmap support.

Solution

Add the following startup parameter (on page 304): **-Dsun.java2d.pmoftscreen=false**.

Out of Memory on External Processes

Problem

Oxygen XML Developer throws an *Out Of Memory* error when trying to generate PDF output with the built-in Apache FOP processor.

Cause

The amount of allocated memory might be insufficient.

Solutions

- Open the **Preferences** dialog box (**Options > Preferences**) (on page 114), go to **XML > PDF Output > FO Processors**, and increase the value of the **Memory available to the Apache FOP** option (on page 230).
- For external XSL-FO processors, XSLT processors, and external tools, the maximum value of the allocated memory is set in the command line of the tool using the **-Xmx** parameter set to the Java virtual machine.

Related Information:

[FO Processors Preferences \(on page 229\)](#)

[External Tools Preferences \(on page 258\)](#)

[How to Enable Debugging for FO Processor Transformations \(on page 1207\)](#)

Too many nested apply-templates calls Error When Running a Transformation

Problem

I'm getting the error message **Too many nested apply-templates calls** when I try to transform my DocBook file to HTML using default Oxygen XML Developer DocBook to HTML transformation scenario.

Cause

Most likely, this is the result of a masked stack overflow error.

Solution

Try setting a new VM option with the value **-Xss4m**. You can also try to slowly increase this to larger values (e.g. **-Xss5m** or **-Xss6m**). Note that this consumes memory on a per thread basis (Oxygen XML Developer can have tens of threads), so using a very large value here can backfire and leave Oxygen XML Developer without memory.

Related Information:

[Setting a Java Virtual Machine Parameter when Launching Oxygen XML Developer \(on page 304\)](#)

Performance Issues with Large Documents

Problem

The performance of the application slows down considerably over time when working with large documents.

Cause

A possible cause is that the application needs more memory to run properly.

Solutions

- You can increase the maximum amount of memory available to Oxygen XML Developer by [setting the `-Xmx` parameter in a configuration file \(on page 304\)](#) that is specific to the platform that runs the application.

Attention:

The maximum amount of memory should be less than 75% of the physical amount of memory available on the machine. Otherwise, the operating system and other applications will have no memory available.

- When installed on a multiple user environment, each instance of Oxygen XML Developer will be allocated the amount stipulated in the memory value. To avoid degrading the general performance of the host system, ensure that the amount of memory available is optimally apportioned for each of the expected instances.

Note:

When starting Oxygen XML Developer from the icon created on the Start menu or Desktop in Windows (or from the shortcut created on the Linux desktop), the default maximum memory available to the application is set to 40% of the amount of physical RAM (but not more than 1 GB for 32-bit distributions or 4 GB for 64-bit distributions).

When starting Oxygen XML Developer from a command-line script, the default maximum memory is 1 GB for 32-bit distributions or 4 GB for 64-bit distributions.

Performance Issues when Using Oxygen XML Developer with Remote Desktop

Problem

When trying to run Oxygen XML Developer in a Remote Desktop Protocol (RDP) environment, the performance is slow and choppy.

Cause

Running a standalone version of Oxygen XML Developer over a slow RDP connection may result in performance issues.

Solution

As a workaround, you try to run Oxygen XML Developer as an Eclipse plugin when working with a slow RDP connection.

Misc Problems and Solutions

This chapter presents common problems that may appear when running the application along with solutions for these problems.

Address Family Not Supported by Protocol Family

Problem

I have experienced the following error: *"Address Family Not Supported by Protocol Family; Connect"*. How do I solve it?

Cause

This seems to be an IPv6 connectivity problem. By default, the Java runtime used by Oxygen XML Developer prefers to create connections via IPv6, if the support is available. However, even though it is available in appearance, IPv6 sometimes happens to be configured incorrectly on some systems.

Solution

A quick solution for this problem is to set the `java.net.preferIPv4Stack` Java property to `true` (`java.net.preferIPv4Stack=true`), by following this procedure:

1. Create a file named `custom_commons.vmoptions` and on a single line, add `-Djava.net.preferIPv4Stack=true`. Then save the file and copy it to the Oxygen XML Developer installation folder (may need admin access).
2. Restart Oxygen XML Developer.
3. Make sure the procedure was successful by going to **Help > About > System properties** and check that the value of the `java.net.preferIPv4Stack` property is `true`.

Application Reports Errors During Startup After Installing a New Version

Problem

Sometimes, after installing a new version of Oxygen XML Developer, various errors are reported when the application starts.

Cause

This problem may occur if you install the application in a folder where an older version of the application was previously installed. Especially on macOS, there is a possibility for older resources and libraries from the previous application to remain in the installation folder and break the functionality of the newer version of the application.

Solution

Close the application and completely [uninstall it \(on page 113\)](#), then install it again. The user-specific settings are saved in a separate folder in the user home directory so they will not be lost.

- On macOS, you can move the entire application installation folder to the **Trash**, then re-install.
- On Linux and Windows, you can **uninstall using the facilities provided by the installer (on page 113)**, then re-install.

If you intentionally want to load extra Java libraries with Oxygen XML Developer, you have the following choices:

- If the libraries are necessary for XSLT transformations, each XSLT transformation scenario has an **Extensions** button that allows you to reference the libraries directly from the transformation scenario.
- If the libraries are necessary for database connections, you can configure them when you define the data sources.
- You can **add a plugin** in Oxygen XML Developer that contributes libraries to the global libraries list. The plugin can be distributed as an add-on. An example of such a plugin can be found here: <https://github.com/oxygenxml/oxygenxml.xlsx.import>.
- In the Oxygen XML Developer `lib` folder, there is a file called `libraries.list`. You can edit that file and add the names of the extra libraries present in the folder. You can also choose to delete that `libraries.list` completely if you want to inhibit the libraries checking completely.

Application Takes Several Minutes to Start

Problem

Oxygen XML Developer seems to take an abnormally long amount of time to start.

Cause 1

Some anti-virus software can cause Java applications, including Oxygen XML Developer, to start very slowly due to scanning compressed archives (such as the *JAR* libraries that all Java applications use). During the process, various files would be accessed by Oxygen XML Developer (including installed plugins) files from its installation folder, its user home folder (e.g. `C:\Users\<username>\AppData\Roaming\com.oxygenxml`), its project folder, or local files from the Git projects (if the Git Client is used).

Solution

A possible solution is to add the aforementioned folders to the list of exceptions in the anti-virus software settings.

Cause 2

If files/folders from the Oxygen XML Developer installation folder, its user home folder (e.g. `C:\Users\<username>\AppData\Roaming\com.oxygenxml`), its project folder, or local files from the Git projects (if the Git Client is used), project, Git projects) are located remotely, it sometimes slows down the process. For example, Oxygen XML Developer (or Java) may wait until these connections time out before proceeding.

Solution 2

Keep a copy of those files/folders locally, rather than using them from the remote location.

Cause 3

The built-in file browser may be slow to open if it is trying to access shortcuts to inaccessible network shares or drives on the Windows desktop.

Solution 3

Remove the shortcuts to inaccessible network shares or drives.

Archive Distribution Fails to Run on macOS 10.12 (Sierra)

Problem

For versions prior to 18.1, the classic archive distributions of Oxygen XML Developer (`.zip` or `.tar.gz`) fail to run on macOS 10.12 (Sierra).

Cause

This happens because the archives get quarantined and macOS 10.12 (Sierra) treats quarantined apps differently than older versions and isolates them from their parent folder at launch. If Oxygen XML Developer was already installed when you upgraded to macOS 10.12 (Sierra), there are no problems.

Solution

If Oxygen XML Developer was not already installed, or you need to reinstall an older version (prior to version 18.1), the quarantine flag must be removed for the entire content of the Oxygen XML Developer installation directory or the individual applications. To resolve this issue, follow these steps:

1. Open a *Terminal* window and change the directory to the folder where Oxygen XML Developer is located.
2. Run the following command:

```
xattr -dr com.apple.quarantine oxygen/
```

where "oxygen" is the actual name of the Oxygen XML Developer directory.

If Oxygen XML Developer is in a location that requires administrator privileges for write access, you need to run the command from an administrator account and prefix the command with `sudo`. You will then be prompted to enter your password.

Blank Window is Shown When Starting the App Over an RDP Connection on Linux

Problem

When starting Oxygen XML Developer or its installer on *Linux*, a blank window is displayed when started over an RDP connection.

Cause

Oxygen XML Developer and its installer are Java Swing apps that require a 24 bit color depth from the X server.

Solution

1. If you are using *xrdp*, find the `/etc/xrdp/xrdp.ini` file.
2. Uncomment the `xserverbpp=24` line.
3. Save your files and close all the apps (the subsequent step will terminate your remote session so you could lose your progress if you do not save your files first).
4. Restart the *xrdp* service:

```
sudo systemctl restart xrdp.service
```

Note:

Alternatively, you can try setting `max_bpp=24` in the same `/etc/xrdp/xrdp.ini` file.

Cannot Connect to SVN Repository from Repositories View

Problem

I cannot connect to an SVN repository from the **Repositories** view of SVN Client. How can I find more details about the error?

Solution

First check that you entered the correct URL of the repository in the **Repositories** view. Also, check that an SVN server is running on the server machine specified in the repository URL and is accepting connections from SVN clients. You can check that the SVN server accepts connections with the command-line SVN client from CollabNet.

If you try to access the repository with an `svn+ssh` URL, also check that an SSH server is running on port 22 on the server machine specified in the URL.

If the above conditions are verified and you cannot connect to the SVN repository, generate logging files on your computer and send them to support@oxygenxml.com. For generating the logging files, follow these steps:

1. Create a text file called `logback.xml` in the application installation folder with the following content:

```
<configuration>

  <appender name="R2" class="ch.qos.logback.core.rolling.RollingFileAppender">

    <file>${user.home}/Desktop/oxygenLog/oxygen.log</file>

    <rollingPolicy class="ch.qos.logback.core.rolling.FixedWindowRollingPolicy">

      <fileNamePattern>${user.home}/Desktop/oxygenLog/oxygen%i.log.gz</fileNamePattern>
```

```

    <minIndex>1</minIndex>

    <maxIndex>20</maxIndex>

  </rollingPolicy>

  <triggeringPolicy class="ch.qos.logback.core.rolling.SizeBasedTriggeringPolicy">

    <maxFileSize>12MB</maxFileSize>

  </triggeringPolicy>

  <encoder>

    <pattern>%r %marker %p [ %t ] %c - %m%n</pattern>

  </encoder>

</appender>

<root level="debug">

  <appender-ref ref="R2" />

</root>

</configuration>

```

2. Restart the application.
3. Reproduce the error.
4. Close the application.
5. Delete the `logback.xml` file because it might cause performance issues if you leave it in the installation folder.

Important:

The logging mode may severely decrease the performance of the application. Therefore, do not forget to delete the `logback.xml` file when you are done with the procedure.

Result: The resulting logging files are named `oxygen.log` and `oxygen#.log.gz` (for example, `oxygen.log`, `oxygen1.log.gz`, `oxygen2.log.gz`, etc.) and are located in the `Desktop\oxygenLog` folder.

Cannot Open Files from Desktop/Downloads/OneDrive on macOS

Problem

When using Oxygen XML Developer on *macOS*, the application cannot open files from Desktop/Downloads/OneDrive.

Cause

Sometimes, macOS shows a popup about allowing the application access to some special folders (e.g. Downloads or Desktop), and unless you explicitly agree, it will leave it unchecked (the app does not allowed access). The popup can go unnoticed and disappears after a while, so it is easy to overlook it and the application will not have access to that folder.

Solution

Go to the macOS **System preferences > Security & Privacy > Privacy tab > Files and Folders**. You should find *Oxygen* in that list and the folders you were prompted to access. Check the box for the folder (i.e. Downloads or Desktop), if there is one unchecked.

Note:

If that does not work, look at "Full Disk Access" from the same Privacy tab. Add *Oxygen* there so that it has full access. However, only use this method as a last resort.

Cannot Uninstall Oxygen XML Developer in Windows

Problem

When I try to uninstall Oxygen XML Developer in Windows, I get an error that says it cannot find the `files.log` file.

Cause

The `install4j` installer that is used by Oxygen XML Developer creates the `files.log` file during the installation process. If you cannot uninstall the product, then most likely something went wrong with this file during the installation process.

Solution

To solve this, simply reinstall the software in the same directory as the current installation. This will automatically uninstall the old version or overwrite it with a clean install. You should then be able to uninstall this new installation.

Compatibility Issue Between Java and Certain Graphics Card Drivers

Problem

Under certain settings, a compatibility issues can appear between Java and some graphics card drivers, which results in the text from the editor (in **Author** or **Text** mode) being displayed garbled.

Solution

If you encounter this problem, update your graphics card driver. Another possible workaround is, [open the Preferences dialog box \(Options > Preferences\) \(on page 114\)](#), go to **Appearance > Fonts**, and set the value of the **Text antialiasing** option [\(on page 124\)](#) to ON.

Note:

If this workaround does not resolve the problem, set the **Text antialiasing** option [\(on page 124\)](#) to other values.

Crash at Startup on Windows with an Error About the nvoglv32.dll File

Problem

I try to start Oxygen XML Developer on Windows but it crashed with an error message about “*Fault Module Name: nvoglv32.dll*”. What is the problem?

Cause

It is most likely an OpenGL driver issue.

Solution

This can be avoided by creating an empty file called `opengl32.dll` in the Oxygen XML Developer install folder (if you start Oxygen XML Developer with the shortcut created by the installer on the Start menu or on Desktop) or in the subfolder `bin` of the home folder of the Java virtual machine that runs Oxygen XML Developer (if you start Oxygen XML Developer with the `oxygen.bat` script). The home folder of the Java virtual machine that runs Oxygen XML Developer is the value of the `java.home` property that is available in the **System properties** tab of the **About** dialog box (**Help > About**).

Damaged File Associations on macOS

Problem

After upgrading macOS and Oxygen XML Developer, it is no longer associated to the appropriate file types (such as XML, XSL, XSD). How can I re-create the file associations?

Cause

The upgrade damaged the file associations in the LaunchService Database on your macOS machine.

Solution

You can rebuild the LaunchService Database with the following procedure. This will reset all file associations and rescan the entire file system searching for applications that declare file associations and collect them in a database used by Finder.

1. Find all the Oxygen XML Developer installations on your hard drive.
2. Delete them by dragging them to the Trash.
3. Clear the Trash.
4. Unpack the Oxygen XML Developer installation kit on your desktop.
5. Copy the contents of the archive into the folder `/Applications/Oxygen`.
6. Run the following command in a Terminal:

```
/System/Library/Frameworks/CoreServices.framework/Versions/A/Frameworks/  
LaunchServices.framework/Versions/A/Support/lsregister -kill -r -domain local -domain system  
-domain user
```

7. Restart Finder with the following command:

```
killall Finder
```

8. Create an XML or XSD file on your desktop. It should have the Oxygen XML Developer icon.

9. Double-click the file.

10. Accept the confirmation.

Result: When you start Oxygen XML Developer, the file associations should work correctly.

Details to Submit in a Request for Technical Support Using the Online Form

Problem

What details should I add to my request for technical support on the online form in the product website?

Solution

When completing a request for Technical Support using the online form, include as many details as possible about your problem. For problems where a simple explanation may not be enough for the Technical Support team to reproduce or address the issue (such as server connection errors, unexpected delays while editing a document, an application crash, etc.), you should generate log files and attach them to the problem report. In the case of a crash, you should also attach the crash report file generated by your operating system.

If the text content of an XML document you want to send to the support team contains sensitive or private information, you can use the [Randomize XML text content action \(on page 34\)](#) to create filler content. Before using this action, you need to copy the initial XML resources and save them in a separate folder. Otherwise, you might lose your original information.

To generate the Oxygen XML Developer log files, follow these steps:

1. Create a text file called `logback.xml` in the application installation folder, with the following content:

```
<configuration>

  <appender name="R2" class="ch.qos.logback.core.rolling.RollingFileAppender">

    <file>${user.home}/Desktop/oxygenLog/oxygen.log</file>

    <rollingPolicy class="ch.qos.logback.core.rolling.FixedWindowRollingPolicy">

      <fileNamePattern>${user.home}/Desktop/oxygenLog/oxygen%i.log.gz</fileNamePattern>

      <minIndex>1</minIndex>

      <maxIndex>20</maxIndex>

    </rollingPolicy>

    <triggeringPolicy class="ch.qos.logback.core.rolling.SizeBasedTriggeringPolicy">

      <maxFileSize>12MB</maxFileSize>

    </triggeringPolicy>

    <encoder>

      <pattern>%r %marker %p [ %t ] %c - %m%n</pattern>

    </encoder>
```

```

</appender>

<root level="debug">
  <appender-ref ref="R2" />
</root>
</configuration>

```

2. Restart the application.
3. Reproduce the error.
4. Close the application.
5. Delete the `logback.xml` file because it might cause performance issues if you leave it in the installation folder.

Important:

The logging mode may severely decrease the performance of the application. Therefore, do not forget to delete the `logback.xml` file when you are done with the procedure.

Result: The resulting log files are named `oxygen.log` and `oxygen#.log.gz` (for example, `oxygen.log`, `oxygen1.log.gz`, `oxygen2.log.gz`, etc.) and are located in the `Desktop\oxygenLog` folder.

Dialog Boxes Cannot Be Resized on Mac

Problem

When using Oxygen XML Developer on *macOS Big Sur*, dialog boxes (for example the **Find/Replace** or **Preferences** dialog box) cannot be resized.

Cause

This is caused by an issue with resizing dialog boxes in Oxygen XML Developer on *macOS Big Sur* (and possibly later versions) causing crashes if the main application is in full screen mode.

Solution

Until this limitation is resolved in a future Oxygen XML Developer version, dialog boxes cannot be maximized or resized on *macOS Big Sur*.

DITA Map Transformation Fails (Cannot Connect to External Location)

Problem

DITA map (on page 2268) transformation fails because it cannot connect to an external location.

Solution

The transformation is run as an external Ant process so you can continue using the application as the transformation unfolds. All output from the process appears in the **DITA Transformation** tab.

The HTTP proxy settings are used for the Ant transformation, so if the transformation fails because it cannot connect to an external location, you can check the [the Proxy preferences page](#) (on page 267)

DITA Map WebHelp Transformation Fails (Duplicate Topic References Found)

Problem

DITA Map WebHelp transformation fails with a message that indicates duplicate topic references were found.

Cause

By default the WebHelp transformation uses the `force-unique` parameter set to **true** to force the transformation to create unique output files for each instance of a resource when a map contains multiple references to a single topic. However, there are cases when this feature does not work as expected and the duplicate topic references are not handled properly.

Solution

To solve this issue, you should manually set a unique `@copy-to` attribute on any duplicate topic reference that was not handled automatically by DITA-OT:

```
<map>
...
<topicref href="../../../topics/MyTopic.dita"/>
...
<topicref href="../../../topics/MyTopic.dita" copy-to="../../../topics/MyTopic-2.dita"/>
</map>
```

DITA-OT Transformation Takes a Long Time to Process

Problem

A DITA transformation takes an extremely long time to process (over an hour, for example).

Cause

Large delays in DITA-OT processing are usually caused by intensive disk operations, CPU usage, or connections to remote websites. The DITA-OT processing is very disk-intensive, each stage takes the entire content from the transformation temporary files folder, reads it, modifies it, and then writes it back.

Solution

There are several things you can try to troubleshoot this problem:

- If you are using a shared or remote drive, it is recommended to specify a local drive for the output and temporary files directory (edit the transformation scenario and in the **Output** tab, select a local directory for **Temporary files directory** and **Output directory**).
- If you want to test if the publishing has a problem downloading remote resources, you could disable the network adapter on the computer and then try to publish. The purpose is to see if the publishing finishes without any reported error about obtaining a certain HTTP resource.
- Using DTDs instead of XML Schemas is faster. This is because of a default transformation parameter called `args.grammar.cache` that only works for DTD-based DITA topics.
- You can [increase the memory available to Oxygen XML Developer \(on page 2205\)](#). Sometimes, just increasing the amount of memory available to the DITA-OT process may be enough to lower the time necessary for the publishing to run.
- You can enable some logging to help you determine which stage in the process is taking a long time. Edit the transformation scenario and in the **Advanced** tab, enter **logger org.apache.tools.ant.listener.ProfileLogger** in the **Additional arguments** field. Then go to **Options > Preferences > DITA > Logging** and select **Always** for the **Show console output** option.
- You could try disabling antivirus applications since the publishing process is very disk intensive and certain antivirus application might slow down the process.
- If the published DITA map is part of a larger DITA project with lots of maps and topics, references from topics in the current map to topics in other sub-projects might result in problems resolving those references. You could look in the output folder to see if the number of HTML documents match the number of DITA topics in your map.

DITA PDF Transformation Fails

Problem

The DITA to PDF transformation fails.

Cause

To generate the PDF output, Oxygen XML Developer uses the DITA Open Toolkit. This process sometimes results in errors. For information about some of the most common errors, see [DITA PDF Processing Common Errors \(on page 2205\)](#).

Solution

You can analyze the **Results** tab of the DITA transformation and search for messages that contain text similar to `[fop] [ERROR]`. If you encounter this type of error message, edit the transformation scenario you are using and set the **clean.temp** parameter to **no** and the **retain.topic.fo** parameter to **yes**. Run the transformation, go to the temporary directory of the transformation, open the `topic.fo` file and go to the line indicated by the error. Depending on the XSL FO context try to find the DITA topic that contains the text that generates the error.

If none of the above methods helps you, go to **Help > About > Components > Frameworks** and check what version of the DITA Open Toolkit you are using. Copy the whole output from the DITA-OT console output and either report the problem on the DITA User List or send it to support@oxygenxml.com.

Related Information:

[How to Enable Debugging for FO Processor Transformations \(on page 1207\)](#)

DITA PDF Processing Common Errors

There are cases when the PDF processing fails when trying to publish DITA content to a PDF file. This topic lists some of the common problems and possible solutions.

Problem: Cannot Save PDF

The FO processor cannot save the PDF at the specified target. The console output contains messages like this:

```
[fop] [ERROR] Anttask - Error rendering fo file:
C:\samples\dita\temp\pdf\oxygen_dita_temp\topic.fo
<Failed to open C:\samples\dita\out\pdf\test.pdf>
Failed to open samples\dita\out\pdf\test.pdf
.....
[fop] Caused by: java.io.FileNotFoundException:
C:\Users\default\Desktop\bev\out\pdf\test.pdf
(The process cannot access the file because it is being used by another process)
```

Solution: Cannot Save PDF

Such an error message usually means that the PDF file is already opened in a PDF reader application. The solution is to close the open PDF before running the transformation.

Problem: Table Contains More Cells Than Defined in Colspec

One of the DITA tables contains more cells in a table row than the defined number of `<colspec>` elements. The console output contains messages like this:

```
[fop] [ERROR] Anttask - Error rendering fo file:
D:\projects\eXml\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo
<net.sf.saxon.trans.XPathException: org.apache.fop.fo.ValidationException:
The column-number or number of cells in the row overflows the number of
fo:table-columns specified for the table.
(See position 179:-1)>net.sf.saxon.trans.XPathException:
org.apache.fop.fo.ValidationException: The column-number or number of cells
in the row overflows the number of fo:table-columns specified for the table.
(See position 179:-1)
[fop] at org.apache.fop.tools.anttasks.FOPTaskStarter.renderInputHandler
```

```
(Fop.java:657)
[fop] at net.sf.saxon.event.ContentHandlerProxy.startContent
(ContentHandlerProxy.java:375)
.....
[fop] D:\projects\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo ->
D:\projects\samples\dita\flowers\out\pdf\flowers.pdf
```

Solution: Table Contains More Cells Than Defined in Colspec

To resolve this issue, correct the `@colspec` attribute on the table that caused the issue. To locate the table that caused the issue:

1. Edit the transformation scenario and set the parameter `clean.temp` to `no`.
2. Run the transformation, open the `topic.fo` file in Oxygen XML Developer, and look in it at the line specified in the error message (See position 179:-1).

Related Information:

[How to Enable Debugging for FO Processor Transformations \(on page 1207\)](#)

DITA PDF CSS-based Processing Common Errors

For information about possible common errors that could be encountered when processing CSS-based DITA to PDF output, see the [Troubleshooting section in the CSS-based PDF Customization guide \(on page 1713\)](#).

DITA to CHM Transformation Fails - Cannot Open File

Problem

The DITA to CHM transformation fails with the following error: `[exec] HHC5010: Error: Cannot open "fileName.chm". Compilation stopped.`

Cause

This error occurs when the CHM output file is opened and the transformation scenario cannot rewrite its content.

Solution

To solve this issue, close the CHM help file and run the transformation scenario again.

DITA to CHM Transformation Fails - Compilation Failed

Problem

The DITA to CHM transformation fails with the following error: `[exec] HHC5003: Error: Compilation failed while compiling fileName.`

Cause 1

One possible cause for this error is that the processed file does not exist.

Solution 1

To solve this issue, fix the file reference before executing the transformation scenario again.

Cause 2

Another possible cause for this error is that the processed file has a name that contains space characters.

Solution 2

To solve the issue, remove any spacing from the file name and run the transformation scenario again.

Fonts Installed in Windows Do Not Appear in Fonts Preferences Page

Problem

I installed a font in Windows and it does not appear in the list of available fonts in the [Preferences > Fonts page \(on page 123\)](#) (in the **Editor** section).

Cause

Oxygen XML Developer is a Java application and Java does not detect fonts that are installed at the user level. This most likely occurred because you installed the font via the **Install for me** option in Windows.

Solution

Reinstall the font using the **Install for all users** option in Windows. You will need Administrator privileges to access this option.

Format and Indent Fails

Problem

When I use the  **Format and Indent** function, I get an error message that indicates the *Format and Indent failed*.

Cause

This happens because the application tries to limit the exposure to XXE attacks so the parser blocks the expansion of system entities (the ones that are loaded from disk or from remote sources).

Solution

If you are in complete control of the XML documents (you manage or trust those who are creating and editing the documents), you can disable this particular check by selecting the **Enable system parameter entity expansion in other entity definitions** option (on page 205) in the **XML Parser** preferences page.

Handshake Failure Error When Accessing an HTTPS (SSL) Resource

Problem

When attempting to access an HTTPS (SSL) resource, I receive a **handshake_failure** error.

Cause

The issue is most likely due to the limitation of Java cryptography capabilities.

Solution

A solution might be to download and deploy *Java Cryptography Extension (JCE) Unlimited Strength Jurisdiction Policy Files 8 (for Java 11)*.

Warning:

It is possible that this may not be legal in your country. Be advised that you bare legal responsibility for activating unlimited strength Java cryptography capabilities, so you must have the legal right to use such cryptography (consult your export/import control counsel or attorney to determine the exact requirements for your jurisdiction).

To deploy it in Oxygen XML Developer, unpack the downloaded zip archive and move the two jar files (**local_policy.jar** and **US_export_policy.jar**) from **UnlimitedJCEPolicyJDK8** to the following directory, overwriting existing files:

- **Windows** - `[OXYGEN_INSTALL_DIR]/jre/lib/security`
- **Linux** - `[OXYGEN_INSTALL_DIR]/jre/lib/security`
- **macOS** - `[OXYGEN_INSTALL_DIR]/jre.bundle/Contents/Home/jre/lib/security`

Hunspell Spell Checker is Unusable on Your Platform Error

Problem

When trying to use the **Check Spelling** option, I receive the error **Hunspell spell checker is unusable on your platform. It has crashed the application in a previous session**.

Cause

There are instances where Oxygen XML Developer determines that an internal component (such as the spell checker) has crashed the application and disables that component from running in the future (to prevent a possible future crash).

Solution

To re-enable the spell checker component, follow these steps:

1. Close Oxygen XML Developer.
2. Open the `%APPDATA%\com.oxygenxml` folder and look for a file called something like **HunspellCrashGuard*.txt**. Delete that file.
3. Restart Oxygen XML Developer.

High Resolution Scaling Issues

Problem

I encounter scaling detection issues in a high resolution display (for example, some GUI components are too small).

Cause

This sometimes happens when using multiple displays with different resolutions because the application cannot detect the correct scaling setting.

Solution

You can use the `sun.java2d.uiScale` Java system property to instruct Java to use a particular scaling factor:

```
-Dsun.java2d.uiScale=1.5
```

High Resolution Scaling Issues on Linux

Problem

On Linux bundled with Oracle OpenJDK 11, Oxygen XML Developer does not automatically scale high-resolution images when using the system's scaling settings.

Cause

This happens because Java 11 does not detect the system scaling setting for HiDPI displays on Linux operating system.

Solution

In the Oxygen XML Developer installation folder, create a new file named **custom_commons.vmoptions**. Inside the file, manually add `-Dsun.java2d.uiScale=2`. This command instructs Java to use 2x (200%) scaling.

Images Appear Stretched Out in the PDF Output

Problem

When publishing XML content (DITA, DocBook, etc.), images are sometimes scaled up in the PDF outputs but are displayed perfectly in the HTML (or WebHelp) output.

Solution

PDF output from XML content is obtained by first obtaining an intermediary XML format called XSL-FO and then applying an XSL-FO processor to it to obtain the PDF. This stretching problem is caused by the fact that all XSL-FO processors take into account the DPI (dots-per-inch) resolution when computing the size of the rendered image.

The PDF processor that comes out of the box with the application is the open-source Apache FOP processor. Here is what Apache FOP does when deciding the image size:

1. If the XSL-FO output contains width, height or a scale specified for the image `<external-graphic>` tag, then these dimensions are used. This means that if in the XML (DITA, DocBook, etc.) you set explicit dimensions to the image they will be used as such in the PDF output.
2. If there are no sizes (width, height or scale) specified on the image XML element, the processor looks at the image resolution information available in the image content. If the image has such a resolution saved in it, the resolution will be used and combined with the image width and height to obtain the rendered image dimensions.
3. If the image does not contain resolution information inside, Apache FOP will look at the FOP configuration file for a default resolution. The FOP configuration file for XSLT transformations that output PDF is located in the `[OXYGEN_INSTALL_DIR]/lib/fop.xconf`. DITA publishing uses the DITA Open Toolkit that has the Apache FOP configuration file located in `[DITA-OT-DIR]/plugins/org.dita.pdf2.fop/fop/conf/fop.xconf`. The configuration file contains two XML elements called `<source-resolution>` and `<target-resolution>`. The values set to those elements can be increased (usually a DPI value of 110 or 120 should render the image in PDF the same as in the HTML output).

The commercial **RenderX XEP** XSL-FO processor behaves similarly but as a fallback it uses 120 as the DPI value instead of using a configuration file.

Tip:

It is best to save your images without any DPI resolution information. For example, when saving a PNG image in the open-source GIMP image editor, you do not want to save the resolution.

This allows you to control the image resolution from the configuration file for all referenced images.

Increasing the Memory for the Ant Process

Problem

The Ant build process runs out of memory.

Solution

For details about setting custom JVM arguments to the Ant build process, see [JVM Arguments](#) (on page [10](#)).

Java Virtual Machine (JVM) Crash on macOS

Problem

Oxygen XML Developer crashed the Java virtual machine or it could not start up on my macOS computer due to a JVM crash.

Cause

Usually it is an incompatibility between the JVM and a native library of the host system. More details are available in the crash log file generated by macOS and reported in the crash error message.

Solution

If this happens, it is best to send a copy of the logs via email to support@oxygenxml.com. Usually, the operating system will offer a prompt that allows you to see the logs. If not, you should be able to find the logs in the Console app (**Applications > Utilities**, under **~/Library/Logs/DiagnosticReports**). They are usually named *JavaApplicationStub*.crash/.hang*.

Keyboard Language Resets to Default on Windows

Problem

In Windows, I have set a specific language for my keyboard and while using Oxygen XML Developer, it keeps getting reset to the default language.

Cause

When multiple languages are enabled in Windows, the default shortcut key combination for switching the input language is **Left Alt + Shift**. Trying to use various shortcuts in Oxygen XML Developer that involves combinations of those two keys is probably resetting your input language to the default setting if you press those two keys without a third combination.

Solution

You can change the Windows shortcut keys that are assigned to the input language by going to the control panel and searching for the **Switch input languages** option. For example, in Windows, go to **Control Panel > Language > Advanced Setting**. In the **Switching input methods** section, click on **Change language bar hot**

keys. Click the **Change Key Sequence** button. This opens a dialog box that allows you to switch the shortcut keys for the input language or keyboard layout.

Keyboard Shortcuts Do Not Work At All

Problem

The keyboard shortcuts listed in the [Menu Shortcut Keys preferences page \(on page 260\)](#) do not work.

Cause

Usually this happens when a special keyboard layout is set (in the operating system) that generates non-standard characters. For example, an extended Greek layout will generate special characters that are not present in the default Greek layout. This causes the Java virtual machine that runs the application to receive unexpected key codes.

Solution

Reset the keyboard layout to the standard layout for your particular language.

Keyboard Shortcuts Result in Unexpected Behavior

Problem

In some rare cases, using certain keyboard shortcuts listed in the [Menu Shortcut Keys preferences page \(on page 260\)](#) result in something different than what is listed in that preferences page.

Cause

This is usually caused by the operating system intercepting the keyboard shortcut. For example, certain applications or hardware drivers intercept certain keyboard shortcuts by default. Another example is if you have multiple input sources configured, the operating system might intercept shortcuts if they match the ones used to change between the input sources.

Solution

Assign a different keyboard shortcut for the particular action in the [Menu Shortcut Keys preferences page \(on page 260\)](#) or refer to documentation for your operating system or hardware equipment to see if there are options to change the behavior.

Mac Touch Bar Function Keys Do Not Work

Problem

I am using a Mac that has a Touch Bar but its function keys do not work in Oxygen XML Developer.

Causes

By default, the Touch Bar function keys are not enabled for Oxygen XML Developer.

Solution

To enable the Touch Bar function keys for Oxygen XML Developer, follow these steps:

1. Go to **System Preferences** and select **Keyboard**.
2. Click **Shortcuts**.
3. From the left sidebar, select **Function Keys**.
4. Click the **+** symbol, select **Oxygen** from the list of apps, and click **Add**.

Server Signature Mismatch Error

Problem

I receive an error indicating that *the current license was already activated on a License Server* or that the *License Server's Signature does not match*.

During the license activation process, the license key becomes bound to a particular license server deployment. This means that a code that uniquely identifies your license server deployment (called *Server Signature*) is sent to the **Oxygen** servers, which in turn will sign the license key. The *Server Signature* is computed from the list of network interfaces of the server where you deployed the license.

When starting the license server, if you receive an error stating that your *Server Signature* does not match, there are several possible causes:

Possible Cause 1

The license key was moved to a new server that hosts your license server.

Solution

Revert to your previous configuration.

Possible Cause 2

A new network interface was changed, added, or activated in the server that hosts your license server.

Note:

A specific example of when this could happen is if the Bluetooth or the WiFi module is activated/deactivated.

Solution

If reverting is not possible, contact the [Oxygen support team](#).

Possible Cause 3

The license server was restarted from a different location as the previous restart. For example, some server configurations will have the Apache Tomcat server installed in a versioned folder (`/usr/local/apache-`

`tomcat-V.V.V`) with a symbolic link to the typical folder (`/usr/local/tomcat`). The server can be restarted from either location, but it is recommended to always restart from the typical folder (`/usr/local/tomcat`) and always restart from the same location.

Solution

The server simply needs to always be restarted from the same location.

MSXML 4.0 Transformation Issues

Problem

When running a transformation scenario that uses the MSXML 4.0 transformer (deprecated), I receive an error that looks like this:

```
Could not create the 'MSXML2.DOMDocument.4.0' object.  
Make sure that MSXML version 4.0 is correctly installed on the machine.
```

Cause

It is likely that the latest MSXML 4.0 service pack is not installed on your computer.

Solution

To fix this issue, go to the Microsoft website and get the latest MSXML 4.0 service pack.

Navigation to a Web Page is Canceled when Viewing CHM on a Network Drive

Problem

When viewing a CHM on a network drive, I only see the TOC and an empty page that displays the message:
Navigation to the web page was canceled.

Cause

This is actually normal behavior. The Microsoft viewer for CHM does not display the topics for a CHM open on a network drive.

Solution

As a workaround, copy the CHM file on your local system and view it there.

Out Of Memory Error When Opening Large Documents

Problem

I am trying to open a file larger than 100 MB in Oxygen XML Developer, but it runs out of memory (**OutOfMemoryError**).

Solution

You should make sure that the value of the **Optimize loading in the Text edit mode for files over** option ([on page 169](#)) is less than the size of your document. This will enable the optimized support for large documents. If that fails and you still get an *Out Of Memory* error you should [increase the memory available to Oxygen XML Developer](#) ([on page 2205](#)).

Other tips:

- Make sure that you close other files before opening the large file.
- You can set the default editing mode [in the Preferences dialog box](#) ([on page 161](#)). The **Text** editing mode uses less memory than other editing modes.
- If the file is too large for the editor to handle, you can [open it in for viewing in Large File Viewer](#) ([on page 2013](#)).

References Outside the Main DITA Map Folder

Problem

A reference to a DITA topic, *map*, or binary resource (for example, an image) that is located outside of the folder where the main *DITA map* ([on page 2268](#)) is located leads to problems when publishing the content using the DITA Open Toolkit.

Cause

DITA-OT often has trouble resolving references that are outside the directory where the published *DITA map* is found. By default, it does not even copy the referenced topics to the output directory.

Solution

To solve this, try one of the following solutions:

- Create another *DITA map* that is located in a folder path above all referenced folders and reference the original *DITA map* from this new map. Then transform this *DITA map* instead.
- Edit the transformation scenario and in the **Parameters** tab, change the value of the **fix.external.refs.com.oxygenxml** parameter to `true`. This parameter is used to specify whether or not the application tries to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content.

Important:

The **fix.external.refs.com.oxygenxml** parameter is only supported when the DITA-OT transformation process is started from Oxygen XML Developer or using the `transform` script.

- For PDF output, you can edit the transformation scenario and in the **Parameters** tab set the value of the **generate.copy.outer** parameter to `3`. This parameter specifies whether to generate output files for content that is not located in or beneath the directory containing the DITA map file. By setting the value

of this parameter to 3, the transformation scenario shifts the output directory so that it contains all output for the publication.

**Important:**

This method is recommended for transformation scenarios that use an external DITA-OT.

Saxon 9.7 Transformer Issues

Problem

I have upgraded to Oxygen XML Developer version 19.0 (which comes bundled with Saxon 9.7) and I am experiencing issues when trying to use the Saxon 9.7 transformer. Is it possible to use the Saxon 9.6 transformer with Oxygen XML Developer version 19.0 or later?

Solution

There is a plugin available that can be installed and it allows you to use Saxon 9.6. To install it, follow these instructions:

1. Go to **Help > Install new add-ons** to open an add-on selection dialog box.
2. Select the *default* update site from the drop-down menu (<https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml>).
3. Select the **Saxon 9.6 XSLT and XQuery Transformer** plugin and click **Next**.
4. Select the **I accept all terms of the end user license agreement** option and click **Finish**.
5. Restart the application.

Result: When you configure the transformation scenario, you will now have the option to choose the Saxon 9.6 transformer.

Scroll Function of my Notebook Trackpad is Not Working

Problem

I got a new notebook (Lenovo Thinkpad™ with Windows) and noticed that the scroll function of my trackpad is not working in Oxygen XML Developer.

Cause

It is most likely a problem with the Synaptics™ trackpads.

Solution

Try adding the following lines to the `C:\Program Files\Synaptics\SynTP\TP4table.dat` file (depending on your version of Oxygen XML Developer). For example:

```
*,*,oxygen20.1.exe,*,*,WheelStd,1,9  
*,*,oxygenAuthor20.1.exe,*,*,WheelStd,1,9
```

```

*,*,oxygenDeveloper20.1.exe,*,*,*,WheelStd,1,9
*,*,syncroSVNClient.exe,*,*,*,WheelStd,1,9
*,*,diffDirs.exe,*,*,*,WheelStd,1,9
*,*,diffFiles.exe,*,*,*,WheelStd,1,9

```

Special Characters are Replaced with a Square

Problem

My file was created with another application and it contains special characters (such as é, ©, ®, etc.) but Oxygen XML Developer displays a square for these characters.

Solution

You must set a font that is able to render the special characters in the **Font preferences** ([on page 123](#)). If it is a text file, you must also set **the encoding used for non XML files** ([on page 158](#)). If you want to set a font that is installed on your computer but that font is not accessible in the **Font preferences**, this means the Java virtual machine is not able to load the system fonts (probably because it is not a True Type font). It is a problem of the Java virtual machine and a possible solution is to copy the font file in the `[JVM_DIR]/lib/fonts` folder. `[JVM_DIR]` is the value of the property `java.home` that is available in the **System properties** tab of the **About** dialog box that is opened from menu **Help > About**.

TocJS Transformation Does not Generate All Files for a Tree-Like TOC

Problem

The *TocJS* transformation of a *DITA map* ([on page 2268](#)) does not generate all the files needed to display the tree-like table of contents.

Solution

To get a complete set of output files, follow these steps:

1. Run the *XHTML* transformation on the same *DITA map*. Make sure the output gets generated in the same output folder as for the *TocJS* transformation.
2. Copy the content of the `DITA-OT-DIR/plugins/com.sophos.tocjs/basefiles` folder to the transformation output folder.
3. Copy the `DITA-OT-DIR/plugins/com.sophos.tocjs/sample/basefiles/frameset.html` file to the transformation output folder.
4. Edit `frameset.html` file.
5. Locate element `<frame name="contentwin" src="concepts/about.html">`.
6. Replace `"concepts/about.html"` with `"index.html"`.

Text on Buttons and Labels is Invisible for Linux Installer

Problem

After starting the Linux installer, the text on buttons and labels is invisible.

Cause

This seems to be a font issue between Oracle Java SE 8 (bundled with the installer) and Fedora/Gnome.

Solution

There are two possible workarounds:

- Run the installer with the default (non-native) Java L&F by using the `-Dinstall4j.nolaf=true` argument. For example:

```
oxygen-64bit-openjdk.sh -Dinstall4j.nolaf=true
```

- Run the installer in console mode using the `-c` argument. For example:

```
oxygen-64bit-openjdk.sh -c
```

XML Document Takes a Long Time to Open

Problem

Oxygen XML Developer takes a long time to open an XML document.

Cause

It takes longer to open an XML document if the whole content of your document is on a single line or if the document size is very large.

Solution

If the content is on a single line, you can speed up loading by selecting the **Format and indent the document on open option** ([on page 172](#)) (in the **Format** preferences page).

If the document is very large (above 30 MB), make sure that the value of the **Optimize loading in the Text edit mode for files over option** ([on page 169](#)) (in the **Open** preferences page) is greater than the size of your document.

If that fails and you get an Out Of Memory error (**OutOfMemoryError**) you can [increase the memory available to Oxygen XML Developer](#). ([on page 2205](#))

XSLT Debugger Is Very Slow

Problem

When I run a transformation in the **XSLT Debugger perspective** ([on page 2271](#)), it is very slow.

Solution

If the transformation produces HTML or XHTML output, you can [disable rendering of output in the XHTML output view \(on page 225\)](#) during the transformation process. To view the XHTML output result do one of the following:

- Run the transformation in the **Editor perspective (on page 2271)** and make sure the **Open in Browser/System Application** option [\(on page 1140\)](#) is selected.
- Run the transformation in the **XSLT Debugger perspective (on page 2271)**, save the text output area to a file, and use a browser application for viewing it (for example, Firefox or Chrome).

21.

Scripting Oxygen

Although Oxygen XML Developer is mostly intended to be a visual editing tool, the [all platforms distribution](#) is bundled with a `scripts` subfolder that contains scripts to automate and run various utilities from a command line.

To run any of these scripts, you are required to purchase a special [scripting commercial license](#). Trial scripting licenses are also available, by request, for clients who are interested in testing the scripts for their particular workflows. Once you have a scripting license key available, you should copy the license key to a file named `scriptinglicensekey.txt` and save it in the main application directory (the parent directory of the "scripts" directory).

For more information about the **Oxygen Scripting** support, watch our Webinar: [Automate XML processing with Oxygen XML Scripting](#).

DITA Validate and Check For Completeness

Attention:

This script is bundled with the [all platforms distribution](#) of Oxygen XML Developer. To run the script, you are required to purchase a special [scripting commercial license](#).

The **Validate and Check For Completeness** action that is available on the toolbar of the **DITA Maps Manager** view provides the ability to validate a DITA map or a DITA Open Toolkit project file with a large array of settings. The settings dialog box has an **Export settings** option that can be used to export the settings to an XML configuration file. Once the settings are exported, you can use the `validateCheckDITA.sh` script (found in the `scripts` subfolder inside **Oxygen's** installation directory) to run a validation on a DITA map or DITA Open Toolkit project file and report the results in a separate XML document.

Sample Command-Line Arguments for the Validate and Check for Completeness Script:

```
sh scripts/validateCheckDITA.sh -i inputFile [-c contextId] [-s settingsFile] [-r reportFile]
```

A public example of using such a script as a GitHub action for reporting errors in pull requests on DITA project can be found here: <https://github.com/oxygenxml/blog/blob/master/.github/workflows/validate-check-completion.yml>. The GitHub action calls a Gradle script target named `runValidation`: <https://github.com/oxygenxml/blog/blob/master/build/build.gradle>.

Transform

Attention:

- This script is bundled with the [all platforms distribution](#) of Oxygen XML Developer. To run the script, you are required to purchase a special [scripting commercial license](#).
- To execute a scenario based on WebHelp using this script, in addition to the [scripting commercial license](#), you are required to purchase an [Oxygen XML WebHelp license](#) or a [Oxygen Publishing Engine license](#).
- To execute a scenario based on Chemistry using this script, in addition to the [scripting commercial license](#), you are required to purchase an [Oxygen PDF Chemistry license](#) or a [Oxygen Publishing Engine license](#).

The **Transform** script (`transform.sh`, found in the `scripts` subfolder inside **Oxygen's** installation directory) helps you to execute a transformation scenario. You can run the scenarios for the existing [document types \(frameworks\)](#) (*on page 2269*) without setting a scenarios file, but for others, you have to specify a specialized scenarios file or a project file that contains scenarios.

You can export transformation scenarios from Oxygen XML Developer into a specialized scenarios file by using the **Export selected scenarios** action from the **Transformation Scenarios** view or using the **Export Global Transformation Scenarios** action from the **Options** menu.

Arguments for the Transform Script

```
sh scripts/transform.sh -i inputFile -sn scenarioName [-s scenariosFile] [-v]
```

-i inputFile

The input file that the transformation scenario is applied to.

-sn scenarioName

The name of the transformation scenario to be executed.

-s scenariosFile

The name of a file that contains additional scenarios. It can be a specialized scenarios file or a project file that contains project transformation scenarios.

The scenarios from this file are merged with the scenarios from the [document types \(frameworks\)](#) (*on page 2269*).

-v

This argument can be specified to activate verbose logging for DITA-OT and ANT scenarios. It is useful for debugging.

**Tip:**

For a GitHub use case sample of this script, see [Oxygen Transformation Template](#).

Validate

**Attention:**

This script is bundled with the [all platforms distribution](#) of Oxygen XML Developer. To run the script, you are required to purchase a special [scripting commercial license](#).

All the validations possible in Oxygen XML Developer can also be performed from scripting. This includes validating various types of XML schemas, such as XSD, RNG, RNC, DTD, and NVDL, as well as JSON Schema, XProc, ANT, XSLT, XQuery, CSS, LESS, HTML, WSDL, OpenAPI, and of course, XML with XML schema, and JSON/YAML with JSON Schema.

The **Validate** script (`validate.sh`, found in the `scripts` subfolder inside **Oxygen's** installation directory) can be used to validate a file or a directory and get the validation results in various formats.

Arguments for the Transform Script

```
sh scripts/validate.sh fileOrDirPath [-s schemaFilePath | -sn scenarioName] [-sf scenariosFilePath] [-if includeFilesFilter]
[-ef excludeFilesFilter] [-ed excludeSubdirsFilter] [-rf reportFile] [-rft reportFormat] [-v] [-help | --help | -h | --h]
```

fileOrDirPath

Mandatory argument that specifies the path of the file or directory to validate (it can also be provided as a URL, but if you are validating directories, the only protocol considered is `'file:///'`).

-s schemaFilePath

Optional argument that specifies the file path of the schema to validate against (it can also be provided as a URL).

-sn scenarioName

Optional argument that specifies the name of the validation scenario to be applied.

-sf scenariosFilePath

Optional argument that specifies the path of the file that stores the validation scenarios (either an **Oxygen** scenarios file or an **Oxygen** project file). It can also be provided as a URL.

**Notes:**

- The file that stores the validation scenarios must have a similar format to that generated from **Oxygen** by invoking **Export Global Validation Scenarios** from the **Options** menu. This type of **Oxygen**-generated scenarios files has a `.scenarios`

file extension by default and contains all the necessary information about custom validation scenarios created in **Oxygen**.

- **Oxygen** also saves the custom validation scenarios (as well as the scenario associations made explicitly for the files you work with) in special formatted **Oxygen** project files (usually with the `.xpr` file extension). Therefore, by using the arguments provided through `-sn` and `-sf` options, you can apply any scenario that was previously stored in either a scenarios file or an **Oxygen** project file.
- The `-s` and `-sn` options are mutually exclusive. Specifying both in the same command line is not allowed.

-if includeFilesFilter

Use this argument to only validate the files that match the specified pattern (e.g. `.xml,.json`). The default value is `*`.

-ef excludeFilesFilter

Excludes the files that match the specified pattern (e.g. `test.wsdl,draft.xsl`) from the validation.

-ed excludeSubdirsFilter

Excludes the sub-directories that match the specified pattern (e.g. `.svn,_svn,.git`).

-rf reportFile

Specifies the path for the report file to save the validation results, instead of presenting them in the console. The content of the report file is formatted according to the `-rft` argument. The report file path can also be provided as a URL.

-rft reportFormat

Specifies the format of the validation report. Possible values: `txt, text, xml, json, html, htm`.
Default values: `txt, text`.

-v

Prints additional information to the console (Verbose mode).

-help | --help | -h | --h

Displays help text.

Additional Notes:

- Avoid activating the Verbose mode (`-v` option) when opting to redirect the console (and the validation report implicitly) to a specific file. That is done using the `>` operator instead of the `-rf` option. The additional information provided through verbose mode is also saved to the report file, making it to be reported as invalid when inspected in specialized editors. However, that information is placed at the beginning of the report, as plain text. If removed, the report should become valid.

- If the validation uses the **Saxon** engine and you do not have a commercial license, then the script automatically uses the **Saxon Home Edition** distribution that does not require a license. However, if the validation involves specific **Saxon Personal / Enterprise Edition** advanced features, then the validation report clearly signals that an appropriate **Saxon** license was not found. Placing a valid **Saxon** license file in the `lib` directory from the **Oxygen** installation folder solves the problem and the validation operation works as expected.

Examples of the Validate Script

Example 1: Validate a File by Applying a Custom Validation Scenario

```
sh scripts/validate.sh "workspace/xmlFolder/xmlFile.xml" -sn "xmlValScn"
-sf "workspace/scn/valScn.scenarios"
```

This command implies validating `xmlFile.xml` by applying the validation scenario named `xmlValScn`, described in the `valScn.scenarios` file. If you want to apply more than one validation scenario, you can use the `-sn scenarioName` construct multiple times.

Example 2: Validate a Directory by Applying an Oxygen Default Validation Scenario

```
sh scripts/validate.sh "workspace/DITAFolder" -sn "DITA"
```

A scenario name is provided, but without specifying a scenarios file. This command implies validating all files from `DITAFolder` by applying the **Oxygen** default validation scenario named `DITA` (in accordance with the association made in the **Document Type Configuration Dialog Box** (on page 130)).

Example 3: Validate a File by Applying Associated Scenarios Stored in an Oxygen Project File

```
sh scripts/validate.sh "workspace/mainFolder/main.xml" -sf "worksapce/proj/proj-1.xpr"
```

A scenarios file is provided, but without specifying a scenario name. In this case, the argument provided through the `-sf` option is assumed to be an **Oxygen** project file and it is used to search for validation scenario associations made for the `main.xml` file. This command line implies that if validation scenario associations for `main.xml` are found in `proj-1.xpr`, then those scenarios are identified and applied. Otherwise, the validation first considers the schema associations declared in `main.xml` (if any), or default **Oxygen** validation scenarios are applied in accordance with the type of the file to validate (e.g. XML in this example).

Example 4: Directory Default Validation and Custom Formatted Report Saved to a Specific Location

```
sh scripts/validate.sh ../important/xmlFolder -rft html -rf "../important/reports/validation rep.html"
```

No validation scenario name, no scenario file, and no schema provided. This command line involves validating all files from the `xmlFolder`. Each file is validated against the schema(s) internally associated (if any). Otherwise, the default **Oxygen** validation scenarios for the respective file type are applied. Also, the validation report is formatted in HTML and is saved to the `validation rep.html` file at the specified location.

Figure 580. Example of an HTML Validation Report

SUMMARY	
5 files verified in total	
3 files reported with validation problems	
6 problems found on aggregate	
FILES WITH VALIDATION PROBLEMS	
D:\workspace\library\lib-dir-final\library.json (4 problems)	
Description	#/books/0/authors/0/short_bio: expected maxLength: 200, actual: 250
Severity	Error
Engine name	JSON Validator
System ID	D:\workspace\library\lib-dir-final\library.json
Main validation file	D:\workspace\library\lib-dir-final\library.json
Schema	D:\workspace\library\test-dir\lib.jschema
Start location	line: 10, column: 21
End location	line: 10, column: 32
Description	#/books/1/genre: ["Prose","Fiction"] is not a valid value. Expected: [Prose, Drama, Science, Romance, Poetry]
Severity	Error
Engine name	JSON Validator
System ID	D:\workspace\library\lib-dir-final\library.json
Main validation file	D:\workspace\library\lib-dir-final\library.json
Schema	D:\workspace\library\test-dir\lib.jschema
Start location	line: 20, column: 13
End location	line: 20, column: 20

Resources

For more information about the validation script, see the following resources:

- Video: [Validating XML and JSON Using Oxygen Command Line Scripts](#)
- Webinar: [Validating XML and JSON Documents Using Oxygen Scripting](#)

Tip:

For some GitHub use case samples of this script, see [Oxygen Validation Template](#) and [Oxygen Validation Action](#).

XML Refactoring

Attention:

- This script is bundled with the [all platforms distribution](#) of Oxygen XML Developer. To run the script, you are required to purchase a special [scripting commercial license](#).
- To execute an XQuery refactoring operation using this script, in addition to the [scripting commercial license](#), you are required to purchase a [Saxon EE license](#).

The **XML Refactoring** script (`xmlRefactoring.sh`, found in the `scripts` subfolder inside **Oxygen's** installation directory) can be used to execute **XML refactoring operations** ([on page 607](#)). You can run a refactoring operation by specifying the operation id of the operation. If, in addition to the refactoring operations provided by Oxygen XML Developer in the `OXYGEN_INSTALL_DIR/refactoring` folder and in framework configurations, you want to run a custom refactoring operation, you have to specify the directory that contains it, using the `-od` (operations directory) argument.

Arguments for the XML Refactoring Script

```
sh scripts/xmlRefactoring.sh -id operationId -i inputFilesOrDirectories [-f filesFilter]
[-od operationsDirectory] [-p param1=value1...] [-v]
```

-id operationId

The ID of the refactoring operation to be executed.

-i inputFilesOrDirectories

A list of space-separated input files or directories that the refactoring operation is applied to.

-f filesFilter

Specifies a filter for the input files by using a file pattern. For example, to restrict the operation to only analyze build files, you could use `build*.xml` for the file pattern.

-od operationsDirectory

A directory that contains additional refactoring operations.

-p param1=value1...

A list of space-separated pairs of a parameter's name and value used by the refactoring operation.

-v

This argument can be specified to activate verbose logging.

DITA Translation Package Builder

Attention:

This script is bundled with the [all platforms distribution](#) of Oxygen XML Developer. To run the script, you are required to purchase a special [scripting commercial license](#).

The **DITA Translation Package Builder** (`translationPackageBuilder.sh`, found in the `scripts` subfolder inside **Oxygen's** installation directory) script helps you to build a translation package for DITA files that can be sent to translators. You can also extract the changed files back into your project once you receive the package back from the translators.

This script requires the **DITA Translation Package Builder** add-on to be installed in the [all platforms distribution](#) of Oxygen XML Developer. To install it the add-on, follow these instructions:

1. Go on the **DITA Translation Package Builder** plugin **Releases** page and download the latest [translation-package-builder-{version}-plugin.jar](#) package.
2. Unzip it inside `{oxygenInstallDir}/plugins`.

**Note:**

Do not create any intermediate folders. Afterwards, the file system should look like this:

```
{oxygenInstallDir}/plugins/translation-package-builder-{version}/
plugin.xml
```

Examples for the DITA Translation Package Builder Script

Example: Generating a Milestone File

```
sh scripts/translationPackageBuilder.sh -gm -i ditamapFile [-m milestoneFile] [-verbose]
```

This action is the first one to use. It will generate a unique hash for each documentation resource. This information will be used by the second action to detect which files have been modified. A milestone file should be generated the first time you install this plugin and henceforth, after each package is sent to translators.

-gm

Requests the generation of a milestone file.

-i ditamapFile

The main DITA map file.

-m milestoneFile

The path to the milestone file. If missing, it is assumed that the milestone will be saved in the DITA map parent folder with the following name:

```
{ditamapName}_translation_milestone.xml.
```

-verbose

Generates a console log about the performed steps. It is useful for debugging.

Example: Creating a Package with the Modified Files to Send to Translation

```
sh scripts/translationPackageBuilder.sh -gp -i ditamapFile [-m milestoneFile] -p package.zip [-verbose]
```

This action detects which files have been changed since the last generated milestone. These files are packed inside a ZIP file that can be sent to translators. After doing this, you can also generate a new milestone so that the next package will only contain new changes.

-gp

Requests the generation of a package with the modified files.

-i ditamapFile

The main DITA map file.

-m milestoneFile

The path to the milestone file. If missing, it is assumed that the milestone will be located in the DITA map parent folder with the following name:

```
{ditamapName}_translation_milestone.xml.
```

-p package.zip

The path to the zip archive where all the modified files are collected.

-verbose

Generates a console log about the performed steps. It is useful for debugging.

Example: Applying a Translation Package Over a DITA Map

```
sh scripts/translationPackageBuilder.sh -ap -i ditamapFile -p package.zip [-verbose]
```

When the translated files arrive from the translator, you should open the DITA map that corresponds to the received language (e.g. open **dita-map-french.ditamap** if the package contains the french translation). Invoking this action will extract the changed files inside the map's directory.

-ap

Requests the application of a translation package over a DITA map.

-i ditamapFile

The main DITA map file that matches the received package language. For example, if the package contains topics translated into French, then this map is the French version of your DITA map.

-p package.zip

The path to the archive with all the translated files.

-verbose

Generates a console log about the performed steps. It is useful for debugging.

Batch Converter

**Attention:**

This script is bundled with the [all platforms distribution](#) of Oxygen XML Developer. To run the script, you are required to purchase a special [scripting commercial license](#).

The **Batch Converter** script (`batchConverter.sh`, found in the `scripts` subfolder inside **Oxygen's** installation directory) helps you to convert between the following formats:

- HTML to XHTML
- HTML to DITA
- HTML to DocBook4 / DocBook5
- Markdown to XHTML

- Markdown to DITA
- Markdown to DocBook4 / DocBook5
- Word to XHTML
- Word to DITA
- Word to DocBook4 / DocBook5
- Excel to DITA
- Confluence to DITA
- DocBook to DITA
- OpenAPI to DITA
- JSON to XML
- JSON to YAML
- XML to JSON
- YAML to JSON

This script requires the **Oxygen Batch Documents Converter** add-on to be installed in the [all platforms distribution](#) of Oxygen XML Developer.

To install the add-on, follow these instructions:

1. Go on the **Oxygen Batch Documents Converter** plugin **Releases** page and download the latest [oxygen-batch-converter-{version}-plugin.jar](#) package.
2. Unzip it inside `{oxygenInstallDir}/plugins`.

Note:

Do not create any intermediate folders. Afterwards, the file system should look like this:

```
{oxygenInstallDir}/plugins/oxygen-batch-converter-{version}/plugin.xml
```

Arguments for the Batch Converter Script

```
sh scripts/batchConverter.sh -i inputFiles -if inputFormat -o outputDirectory
-of outputFormat [-ss (true|false)] [-csd (true|false)] [-cs converterSettingsFile]
```

-i inputFiles

A list of space-separated input files or directories in file syntax form.

-if inputFormat

The format of the input files. The possible values are: **html**, **markdown**, **word**, **confluence**, **docbook**, **excel**, **openapi**, **json**, **yaml**, or **xml**.

-o outputDirectory

The output directory in file syntax form.

-of outputFormat

The format of the output files. The possible values are: **xhtml**, **dita**, **docbook4**, **docbook5**, **json**, **yaml**, or **xml**.

-ss (true|false) [only for Word to DITA, HTML to DITA, Markdown to DITA, DocBook to DITA, and OpenAPI to DITA conversions]

Splits sections marked by titles or headings to separate files and create a DITA map. The possible values are **true** or **false** (default).

-csd (true|false) [only for Markdown to DITA conversions]

Creates short description elements from the first paragraph before the headings. Possible values are **true** or **false** (default).

-cs converterSettingsFile

A file that contains the Batch Documents Converter add-on preferences settings. It can be an xpr file that contains project options or an xml file that contains global options. If not specified, the operation uses the application's default settings.

Confluence to DITA

The **Confluence to DITA** conversion processes the HTML content generated by the Confluence export process. For exporting, login to your Confluence account and navigate to the specific space that you want to export. Go to **Space Settings > Export space** and choose to export it as HTML. The `index.html` file resulting from this process has to be provided in the **inputFiles** argument.

Compile Framework Script

Attention:

This script is bundled with the [all platforms distribution](#) of Oxygen XML Developer.

A custom *framework* ([on page 2269](#)) (document type) can be created using a special XML descriptor file, either from scratch or by extending an existing built-in framework (such as DITA or DocBook) and then making modifications to it.

The **Compile Framework Script** (`compileFrameworkScript.sh`, found in the `scripts` subfolder inside **Oxygen's** installation directory) helps you to compile the script into the `*.framework` file that represents the framework configuration. Although Oxygen XML Developer is now able to automatically compile and load scripts, you might want to compile it yourself to obtain the resulting `*.framework` file if your framework runs on a different version of Oxygen XML Developer.

Arguments for the Compile Framework Script

```
sh scripts/compileFrameworkScript.sh -i "script1.exf" "script2.exf" "frameworksDir"
```

-i inputFiles

A list of space-separated Framework Extension Script Files (*.exf) or directories in file syntax form. If a directory is specified, the Framework Extension Script Files are searched for inside it and in its child directories.

XSLT Stylesheets Documentation

Attention:

This script is bundled with the [all platforms distribution](#) of Oxygen XML Developer. To run the script, you are required to purchase a special [scripting commercial license](#).

You can generate documentation for XSLT Stylesheets from Oxygen XML Developer by using the **Tools > Generate Documentation > XSLT Stylesheet Documentation** main menu action. The settings dialog box has an **Export settings** option that can be used to export the settings to an XML configuration file. Once the settings are exported, you can use the `stylesheetDocumentation.sh` script (found in the `scripts` subfolder inside **Oxygen's** installation directory) to generate XSLT stylesheets documentation from the command line.

Sample Command-Line Arguments for the Generate XSLT Stylesheet Documentation Script

```
sh scripts/stylesheetDocumentation.sh xslFile [-cfg:configFile] | [-out:outputFile]
```

Tip:

For some GitHub use case samples of this script, see [Oxygen Documentation Template](#) and [Oxygen Documentation Action](#).

Related information

XML Schema Documentation

Attention:

This script is bundled with the [all platforms distribution](#) of Oxygen XML Developer. To run the script, you are required to purchase a special [scripting commercial license](#).

You can generate documentation for XML Schemas from Oxygen XML Developer by using the **Tools > Generate Documentation > XML Schema Documentation** main menu action. The settings dialog box has an **Export settings** option that can be used to export the settings to an XML configuration file. Once the settings are exported, you can use the `schemaDocumentation.sh` script (found in the `scripts` subfolder inside **Oxygen's** installation directory) to generate XML Schema documentation from the command line.

Sample Command-Line Arguments for the Generate XML Schema Documentation Script

```
sh scripts/schemaDocumentation.sh schemaFile [-cfg:configFile] [-out:outputFile]
[-format:<value>] [-xsl:xslFile] [-split:<value>] [-openInBrowser:<value>]
```

Tip:

For some GitHub use case samples of this script, see [Oxygen Documentation Template](#) and [Oxygen Documentation Action](#).

Related information

JSON Schema Documentation

Attention:

This script is bundled with the [all platforms distribution](#) of Oxygen XML Developer. To run the script, you are required to purchase a special [scripting commercial license](#).

You can generate documentation for a JSON Schema file from Oxygen XML Developer by using the **Tools > Generate Documentation > JSON Schema Documentation** main menu action. This tool requires an additional add-on to be installed, so the first time you invoke the action, Oxygen XML Developer presents a dialog box asking if you want to install it. Once installed, you need to restart Oxygen XML Developer and the **JSON Schema Documentation** action will invoke the tool.

You can use the `jsonSchemaDocGen.sh` script (found in the `scripts` subfolder inside **Oxygen's** installation directory) to generate documentation from a JSON schema file using the command line.

Tip:

For some GitHub use-case samples for this script, see [Oxygen Documentation Template](#) and [Oxygen Documentation Action](#).

Arguments for the JSON Schema Documentation Script

```
sh scripts/jsonSchemaDocGen.sh filePath [-ofp outputFilePath] [-sb split by (location, components)] [-ea exclude
annotations] [-ec exclude constraints] [-ep exclude properties] [-epp exclude pattern properties] [-ee exclude
enumerations] [-es exclude source] [-eub exclude used by] [-ecp exclude compositions] [-ed exclude diagram] [-eim exclude
image map] [-il include location] [-help | --help | -h | --h]
```

filePath

Mandatory argument specifying the path of the file that needs to generate documentation (it can also be provided as a URL).

-ofp output file path

Optional argument that specifies the path of the output file.

-sb split by (location, components)

Optional argument that specifies what type of split scenario is used (location, components). By default, one file scenario is used.

-ea exclude annotations

Optional argument that specifies if the JSON schema annotations should be present. Default value is true.

-ec exclude constraints

Optional argument that specifies if the JSON schema constraints should be present. Default value is true.

-ep exclude properties

Optional argument that specifies if the JSON schema properties should be present. Default value is true.

-epp exclude pattern properties

Optional argument that specifies if the JSON schema pattern properties should be present. Default value is true.

-ee exclude enumerations

Optional argument that specifies if the JSON schema enumerations should be present. Default value is true.

-es exclude source

Optional argument that specifies if the JSON schema source should be present. Default value is true.

-eub exclude used by

Optional argument that specifies if the JSON schema *used by* should be present. Default value is true.

-ecp exclude compositions

Optional argument that specifies if the JSON schema compositions should be present. Default value is true.

-ed exclude diagram

Optional argument that specifies if the JSON schema diagram should be present. Default value is true.

-eim exclude image map

Optional argument that specifies if the JSON schema image map should be present. Default value is true.

-il include location

Optional argument that specifies if the JSON schema location should be present. Default value is false.

Displays help text.

OpenAPI Documentation

**Attention:**

This script is bundled with the [all platforms distribution](#) of Oxygen XML Developer. To run the script, you are required to purchase a special [scripting commercial license](#).

You can generate documentation for an OpenAPI file from Oxygen XML Developer by using the **Tools > Generate Documentation > OpenAPI Documentation** main menu action. This tool requires an additional add-on to be installed, so the first time you invoke the action, Oxygen XML Developer presents a dialog box asking if you want to install it. Once installed, you need to restart Oxygen XML Developer and the **OpenAPI Documentation** action will invoke the tool.

You can use the `openApiDocGen.sh` script (found in the `scripts` subfolder inside **Oxygen's** installation directory) to generate documentation from an OpenAPI file using the command line.

**Tip:**

For some GitHub use case samples of this script, see [Oxygen Documentation Template](#) and [Oxygen Documentation Action](#).

Arguments for the OpenAPI Documentation Script

```
sh scripts/openApiDocGen.sh filePath [-ofp outputFilePath] [-sb split by (location, components)] [-ea exclude annotations]
[-ec exclude constraints] [-ep exclude properties] [-epp exclude pattern properties] [-ee exclude enumerations] [-es
exclude source] [-eub exclude used by] [-ecp exclude compositions] [-ed exclude diagram] [-eim exclude image map] [-il
include location] [-help | --help | -h | --h]
```

filePath

Mandatory argument specifying the path of the file that needs to generate documentation (it can also be provided as a URL).

-ofp output file path

Optional argument that specifies the path of the output file.

-sb split by (location, components)

Optional argument that specifies what type of split scenario is used (location, components). By default, one file scenario is used.

-ea exclude annotations

Optional argument that specifies if the JSON schema annotations should be present. Default value is true.

-ec exclude constraints

Optional argument that specifies if the JSON schema constraints should be present. Default value is true.

-ep exclude properties

Optional argument that specifies if the JSON schema properties should be present. Default value is true.

-epp exclude pattern properties

Optional argument that specifies if the JSON schema pattern properties should be present. Default value is true.

-ee exclude enumerations

Optional argument that specifies if the JSON schema enumerations should be present. Default value is true.

-es exclude source

Optional argument that specifies if the JSON schema source should be present. Default value is true.

-eub exclude used by

Optional argument that specifies if the JSON schema *used by* should be present. Default value is true.

-ecp exclude compositions

Optional argument that specifies if the JSON schema compositions should be present. Default value is true.

-ed exclude diagram

Optional argument that specifies if the JSON schema diagram should be present. Default value is true.

-eim exclude image map

Optional argument that specifies if the JSON schema image map should be present. Default value is true.

-il include location

Optional argument that specifies if the JSON schema location should be present. Default value is false.

-help | --help | -h | --h

Displays help text.

WSDL Documentation (Deprecated)

Attention:

This script is bundled with the [all platforms distribution](#) of Oxygen XML Developer. To run the script, you are required to purchase a special [scripting commercial license](#).

You can generate documentation for WSDL documents from Oxygen XML Developer by using the **Tools > Generate Documentation > WSDL Documentation** main menu action. The settings dialog box has an **Export settings** option that can be used to export the settings to an XML configuration file. Once the settings are exported, you can use the `wSDLDocumentation.sh` script (found in the `scripts` subfolder inside **Oxygen's** installation directory) to generate XML Schema documentation from the command line.

Sample Command-Line Arguments for the Generate WSDL Documentation Script

```
sh scripts/wSDLDocumentation.sh wSDLFile [-cfg:configFile] | [-out:outputFile]
```

Tip:

For some GitHub use case samples of this script, see [Oxygen Documentation Template](#) and [Oxygen Documentation Action](#).

[XML Schema Documentation \(on page 2244\)](#)

XML Instance Generator

Attention:

This script is bundled with the [all platforms distribution](#) of Oxygen XML Developer. To run the script, you are required to purchase a special [scripting commercial license](#).

You can generate multiple XML documents from an XML Schema from Oxygen XML Developer by using the **Tools > Generate Sample XML Files** main menu action. The settings dialog box has an **Export settings** option that can be used to export the settings to an XML configuration file. Once the settings are exported, you can use the `xmlGenerator.sh` script (found in the `scripts` subfolder inside **Oxygen's** installation directory) to generate multiple XML instance files from the command line.

Sample Command-Line Arguments for the Generate Sample XML Files Script

```
sh scripts/xmlGenerator.sh path/to/config/file [-verbose]
```

Extended Version of the Script and its Arguments

```
sh scripts/xmlGenerator.sh [[path_to_config_file] [-s XML_schema_path -r root [-n ns] [-o output_dir]
[-f instance_name] [-i num_of_instances]] [-verbose]]
```

path_to_config_file

The path to the file that contains the configuration to be used.

-s XML_schema_path

The path to the XML schema to be used for generating the XML file(s). This argument can also be provided as a URL.

-n ns

The namespace used for the XML namespace declaration.

-r root

The root element for the generated file(s).

-o output_dir

The output directory to be used for storing the generated file(s).

-f instance_name

The pattern name to be used for the generated file(s). It is usually the name plus extension.

-i num_of_instances

The number of XML files to be generated.

-verbose

This argument can be specified to activate verbose logging.

**Note:**

Any value specified by the **-s**, **-n**, **-r**, **-o**, **-f**, or **-i** arguments overrides the corresponding value from the configuration file, if that file is specified in the **path_to_config_file** argument.

Flatten XML Schema

**Attention:**

This script is bundled with the [all platforms distribution](#) of Oxygen XML Developer. To run the script, you are required to purchase a special [scripting commercial license](#).

You can flatten an XML schema that contains multiple includes and redefines to a single schema file from Oxygen XML Developer by using the **Tools > Flatten Schema** main menu action. You can use the equivalent `flattenSchema.sh` script (found in the `scripts` subfolder inside **Oxygen's** installation directory) to flatten an XML schema from the command line.

Sample Command-Line Arguments for the Flatten Schema Script

```
sh scripts/flattenSchema.sh [-in:inputSchemaURL -outDir:outputDirectory
                             [-flattenImports:<boolean_value>]
```

```
| [-useCatalogs:<boolean_value>]
|-flattenCatalogResolvedImports:<boolean_value>] [-verbose]]
```

Compare Directories

Attention:

This script is bundled with the [all platforms distribution](#) of Oxygen XML Developer. To run the script, you are required to purchase a special [scripting commercial license](#).

The **Compare Directories** script (`compareDirs.sh`, found in the `scripts` subfolder inside **Oxygen's** installation directory) can be used to compare two directories and get the comparison results in various formats.

Arguments for the Compare Directories Script

```
sh scripts/compareDirs.sh firstDirPath [-a dirPathAlias] secondDirPath [-a dirPathAlias] [[baseDirPath [-a dirPathAlias]]
[-sl suppressLinks] [-if includeFilesFilter] [-ia includeArchives] [-ef excludeFilesFilter] [-ed excludeSubdirsFilter]
[-cm comparisonMode] [-alg comparisonAlg] [-als algStrength] [-iws ignoreWS] [-ipi ignorePI] [-icm ignoreComments]
[-idt ignoreDocType] [-itn ignoreText] [-ins ignoreNS] [-ind ignoreNSDecl] [-inp ignorePrefixes] [-iao ignoreAttrOrder]
[-iee ignoreExpStateForEmptyElems] [-enx XPathExprToExcludeNodes] [-out outputFormat] [-outfile outputFile] [-merge
mergeOperation] [-mergeout outputDirPathForMerge]] [-help | --help | -h | --h]
```

firstDirPath

Mandatory argument that specifies the first directory path (it can also be provided as a URL using `'file://'` protocol).

secondDirPath

Mandatory argument that specifies the second directory path (it can also be provided as a URL using `'file://'` protocol).

baseDirPath

Optional argument that specifies the path of the base directory that the other two directories will be compared against in a 3-way comparison (it can also be provided as a URL). If present, it must appear immediately after the first two mandatory arguments.

-a dirPathAlias

Optional argument used as the directory path alias to be displayed in the HTML-formatted operation report instead of a long directory path. If present, it must appear immediately after a directory path.

-sl suppressLinks

Set this to **true** to suppress links to the compared directories and files shown in the HTML-formatted operation report. Default value = **false**.

-if includeFilesFilter

Use this argument to only include files that match the specified pattern in the comparison (e.g. `.xml`, `.json`). Default value = `*`.

-ia includeArchives

If set to **true**, files from archives are included in the comparison. Default value = **false**.

-ef excludeFilesFilter

Use this argument to exclude files that match the specified pattern from the comparison (e.g. `*.jpg`).

-ed excludeSubdirsFilter

Use this argument to exclude sub-directories that match the specified pattern from the comparison (e.g. `.svn`, `_svn`, `.git`).

-cm comparisonMode

Specifies the comparison mode. There are three modes available: **content**, **binary**, and **timestamp**. Default value = **content**.

-alg comparisonAlg

Specifies the algorithm to be used for the comparison. Possible values: **auto**, **chars**, **words**, **lines**, **syntax_aware**, **xml_fast**, and **xml_accurate**. Default value = **auto**.

-als algStrength

Specifies the strength of the algorithm to be used for the comparison. Possible values: **low**, **medium**, **high**, and **very_high**. Default value = **medium**.

-iws ignoreWS

If set to **true**, whitespaces are ignored if differences consist only of whitespaces. Default value = **false**.

-ipi ignorePI (only for the XML-aware algorithms)

If set to **true**, processing instructions are ignored in the comparison. Default value = **false**.

-icm ignoreComments (only for the XML-aware algorithms)

If set to **true**, comments are ignored in the comparison. Default value = **false**.

-idt ignoreDocType (only for the XML-aware algorithms)

If set to **true**, DOCTYPE sections are ignored in the comparison. Default value = **false**.

-itn ignoreText (only for the XML-aware algorithms)

If set to **true**, text content is ignored in the comparison. Default value = **false**.

-ins ignoreNS (only for the XML-aware algorithms)

If set to **true**, namespaces are ignored in the comparison. Default value = **false**.

-ind ignoreNSDecl (only for the XML-aware algorithms)

If set to **true**, namespace declarations are ignored in the comparison. Default value = **false**.

-inp ignorePrefixes (only for the XML-aware algorithms)

If set to **true**, prefixes are ignored in the comparison. Default value = **false**.

-iao ignoreAttrOrder (only for the XML-aware algorithms)

If set to **true**, the order of attributes is ignored in the comparison. Default value = **false**.

-iee ignoreExpStateForEmptyElems (only for the XML-aware algorithms)

If set to **true**, the expansion state for empty elements is ignored in the comparison. Default value = **false**.

-enx XPathExprToExcludeNodes

Specifies an XPath expression to exclude certain nodes from the comparison.

-merge mergeOperation

If set to **true**, a merge operation is invoked after the comparison. Default value = **false**.

**Notes:**

- This argument is considered only for 3-way comparisons (i.e. only if the `baseDirPath` argument is provided).
- The merge operation is similar to the same process in any versioning system. Following the comparison between the first and second directories (relative to the base folder), all the differences of the type **incoming** are considered and the content of the first directory is updated accordingly.
- Conflicting changes are not addressed.
- After the comparison, a report is created that provides details about the changes that were made.

-mergeout outputDirPathForMerge

Invokes a merge operation after the comparison and also allows you to specify the output directory path for the merge operation. For example, it allows you to specify a specific existing or new directory where the results of the merge operation is saved, other than the first directory path for the comparison (which is what happens when using only the `-merge` argument). The path of the directory can also be provided as a URL using `file://` protocol. This argument and the `-merge` argument are not dependent on each other.

-out outputFormat

Specifies the format of the output. Possible values: **yaml/grouped**, **yaml/raw**, **json/grouped**, **json/raw**, **xml/grouped**, **xml/raw**, **html**, **html/ifcr**, **htm**, or **htm/ifcr**. Default value = **yaml/grouped**.

**Notes:**

- If you choose to save/redirect the console output to a file, this argument establishes the type of the output file and its content is formatted accordingly. If you skip specifying the **"/grouped"** or the **"/raw"** qualifiers, **"/grouped"** takes precedence.
- If you choose the **html** or **htm** output format, it is recommended that you also choose to save/redirect the console to the specified HTML file to view the comparison result in your preferred browser.
- The **"/ifcr"** qualifier for the **html** or **htm** values is considered only if the `-outfile` argument is also present. *IFCR* is an acronym for *Include File Comparison Reports* and it means that, along with generating the directory comparison report, separate file comparison reports will be generated for all modified file pairs. These reports are available through links from the main report and are saved to a specific directory based on the value provided by the `outfile` argument. It will have the same parent directory and the same name as the **outputFile** plus **-OXY-FC-REPORTS** added to the end of its name.
- The **html** value, as well as the **grouped**, **raw**, or **ifcr** qualifiers, are not considered if the `-merge` argument is present.

-outfile outputFile

Specifies the path for an output file to save the comparison results, instead of presenting them in the console. The content of the output file is formatted according to the `-out` argument. The output file path can also be provided as a URL using `file://` protocol.

-help | --help | -h | --h

Displays help text.

**Notes:**

- For boolean arguments, it is not necessary to provide the "true" value. Their presence in the argument list is equivalent to setting their value to "true" (and their absence from the argument list is equivalent to setting their value to "false"). However, constructs of the form `bool_option true|false` are accepted and interpreted accordingly.
- File markers used in reports are as follows: M = modified, O1 = only found in 1st directory, O2 = only found in 2nd directory.

Examples of Compare Directories Script**Example 1: Compare Directories and Include Archives While Excluding JPEGs**

The following command results in archives being included in the comparison, while JPEGs are excluded:

```
sh scripts/compareDirs.sh dir1 dir2 -ia true -ef *.jpg
```

Example 2: Compare Directories Only Including XML Files While Excluding Comments and the Attribute Order

The following command only includes XML files (even from archives) in the comparison, while ignoring the comments and attribute order:

```
sh scripts/compareDirs.sh dir1 dir2 -if *.xml -ia -iao -icm
```

Example 3: Compare Directories Only Including XML Files While Excluding Comments and the Attribute Order

The following command redirects the comparison results to a JSON file named "results.json", with "raw" mode formatting:

```
sh scripts/compareDirs.sh dir1 dir2 -out json/raw > results.json
```

Example 4: Compare Directories and Generate Comparison Report

It is possible to generate a report in the form of an HTML file that contains the results of the comparison. The following command compares the directories and redirects the console to the specified HTML file to view the comparison results:

```
sh scripts/compareDirs.sh dir1 dir2 -out html -outfile results.html
```

Resources

For more information about the file comparison script and how to generate comparison reports in various formats, see the following resources:

- Webinar: [The New Oxygen Compare and Merge Scripts](#).
- Video: [Generating Directory Comparison Reports Using Command-Line Scripts](#).

**Tip:**

For some GitHub use case samples of this script, see [Oxygen Comparison Template](#) and [Oxygen Comparison Action](#).

Related information

[Compare Directories Tool](#) (on page 451)

[Compare Files Script](#) (on page 2256)

Compare Files

**Attention:**

This script is bundled with the [all platforms distribution](#) of Oxygen XML Developer. To run the script, you are required to purchase a special [scripting commercial license](#).

The **Compare Files** script (`compareFiles.sh`, found in the `scripts` subfolder inside **Oxygen's** installation directory) can be used to compare files (2-way or 3-way) and get the comparison results in various formats.

Arguments for the Compare Files Script

```
sh scripts/compareFiles.sh firstFilePath secondFilePath [[baseFilePath] [-ct contentType] [-alg comparisonAlg]
[-als algStrength] [-iws ignoreWS] [-ipi ignorePI] [-icm ignoreComments] [-icd ignoreCDATA] [-idt ignoreDocType]
[-itn ignoreText] [-ins ignoreNS] [-ind ignoreNSDecl] [-inp ignorePrefixes] [-iao ignoreAttrOrder] [-iee
ignoreExpStateForEmptyElems] [-enx XPathExprToExcludeNodes] [-out outputFormat]] [-help | --help | -h | --h]
```

firstFilePath

Mandatory argument that specifies the first file path (it can also be provided as a URL).

secondFilePath

Mandatory argument that specifies the second file path (it can also be provided as a URL).

baseFilePath

Optional argument that specifies the path of the base file that the other two files will be compared against in a 3-way comparison (it can also be provided as a URL).

-ct contentType

Specifies the content type of the files to be compared. Possible values (based on known extensions of some of the most common file types): `.xml`, `.dtd`, `.css`, `.rnc`, `.xquery`, `.json`, `.yaml`, `.java`, `.js`, `.c`, `.cpp`, `.pl`, `.py`, `.php`, `.sql`, `.bat`, `.sh`, `.properties`, `.txt`. The option is used to force the file handling to the specific type of file. Otherwise, the file extension is auto-detected.

-alg comparisonAlg

Specifies the algorithm to be used for the comparison. Possible values: **auto**, **chars**, **words**, **lines**, **syntax_aware**, **xml_fast**, and **xml_accurate**. Default value = **auto**.

-als algStrength

Specifies the strength of the algorithm to be used for the comparison. Possible values: **low**, **medium**, **high**, and **very_high**. Default value = **medium**.

-iws ignoreWS

If set to **true**, whitespaces are ignored if differences consist only of whitespaces. Default value = **false**.

-ipi ignorePI (only for the XML-aware algorithms)

If set to **true**, processing instructions are ignored in the comparison. Default value = **false**.

-icm ignoreComments (only for the XML-aware algorithms)

If set to **true**, comments are ignored in the comparison. Default value = **false**.

-idt ignoreDocType (only for the XML-aware algorithms)

If set to **true**, DOCTYPE sections are ignored in the comparison. Default value = **false**.

-itn ignoreText (only for the XML-aware algorithms)

If set to **true**, text content is ignored in the comparison. Default value = **false**.

-ins ignoreNS (only for the XML-aware algorithms)

If set to **true**, namespaces are ignored in the comparison. Default value = **false**.

-ind ignoreNSDecl (only for the XML-aware algorithms)

If set to **true**, namespace declarations are ignored in the comparison. Default value = **false**.

-inp ignorePrefixes (only for the XML-aware algorithms)

If set to **true**, prefixes are ignored in the comparison. Default value = **false**.

-iao ignoreAttrOrder (only for the XML-aware algorithms)

If set to **true**, the order of attributes is ignored in the comparison. Default value = **false**.

-iee ignoreExpStateForEmptyElems (only for the XML-aware algorithms)

If set to **true**, the expansion state for empty elements is ignored in the comparison. Default value = **false**.

-enx XPathExprToExcludeNodes

Specifies an XPath expression to exclude certain nodes from the comparison.

-merge mergeOperation

If set to **true**, a merge operation is invoked after the comparison. Default value = **false**.

**Notes:**

- This argument is considered only for 3-way comparisons (i.e. only if the `baseFilePath` argument is provided).
- The merge operation is similar to the same process in any versioning system. Following the comparison between the first and second files (relative to the base file), all the differences of the type **incoming** are considered and the content of the first file is updated accordingly.
- If conflicting changes are detected, the merge operation is aborted and the first file remains unchanged.
- After the comparison and merge, a report is created that provides some details about the changes that were made.

-mergeout outputDirPathForMerge

Invokes a merge operation after the comparison and also allows you to specify the output directory path for the merged file. Instead of directly affecting the first compared file (which is what happens when using only the `-merge` argument), a new file is created with the same name as the first file and it is saved in the specified directory. The path of the output directory can also be provided as a URL. This argument and the `-merge` argument are not dependent on each other.

-out outputFormat

Specifies the format of the output. Possible values: **yaml**, **json**, **xml**, **html**, **htm**, **html/inlineCSS**, or **htm/inlineCSS**. Default value = **yaml**.

**Notes:**

- If you choose to save/redirect the console output to a file, this argument establishes the type of the output file and its content is formatted accordingly.
- If you choose any of the **html**, **html/inlineCSS**, **htm**, or **htm/inlineCSS** output formats, it is recommended that you also choose to save/redirect the console to the specified HTML file to view the comparison result in your preferred browser.
- The **inlineCSS** qualifier for the **html** and **htm** values implies that the CSS-based generated HTML code is more suitable to be directly inserted in emails (as most email clients only accept inline CSS styling for HTML emails).
- The **html** and **htm** values (with or without the **inlineCSS** qualifier) are not considered if the `-merge` argument is present.

-outfile outputFile

Specifies the path for an output file to save the comparison results, instead of presenting them in the console. The content of the output file is formatted according to the `-out` argument. The output file path can also be provided as a URL.

-help | --help | -h | --h

Displays help text.

Note:

For boolean arguments, it is not necessary to provide the "true" value. Their presence in the argument list is equivalent to setting their value to "true" (and their absence from the argument list is equivalent to setting their value to "false"). However, constructs of the form `bool_option true|false` are accepted and interpreted accordingly

Examples of Compare Files Script

Example 1: Compare Files and View Results in XML Format

The following command compares the files (ignoring the namespaces and prefixes) and redirects the console output to the `results.xml` file (XML-formatted):

```
sh scripts/compareFiles file1 file2 -ins -inp -ind -out xml > results.xml
```

Example 2: Compare Files with Line by Line Algorithm

The following command compares the files using the **lines** algorithm and ignores whitespaces:

```
sh scripts/compareFiles.sh file1 file2 -alg lines -iws
```

Example 3: Compare Files and Generate Comparison Report

It is possible to generate a report in the form of an HTML file that contains the results of the comparison. The following command compares the files and redirects the console to the specified HTML file to view the comparison results:

```
sh scripts/compareFiles.sh file1 file2 -out html -outfile outFileName.html
```

[Compare Directories Script \(on page 2251\)](#)

Merge Files with Change Tracking Highlights

Attention:

This script is bundled with the [all platforms distribution](#) of Oxygen XML Developer. To run the script, you are required to purchase a special [scripting commercial license](#).

The **Merge Files with Change Tracking Highlights** script (`mergeFilesTrackChanges.sh`, found in the `scripts` subfolder inside **Oxygen's** installation directory) can be used to merge 2 XML files (based on a 2-way comparison). The **Author** mode comparison results are saved as documents with highlighted tracked changes that can later be reviewed and accepted or rejected.

Notice:

This script is intended to be used for merging XML documents (Oxygen XML Developer creates change tracking markers only for XML file types. Using this script for document types other than

XML, or for documents that are not XML well-formed, causes document parsing errors and the merge operation fails.

Arguments for the Merge Files with Change Tracking Highlights Script

```
sh mergeFilesTrackChanges.sh pathOfBaseFile pathOfFileToMergeWith [[pathOfOutFile] [-nb noBackupOfBaseFile]] [-help | --help
| -h | --h]
```

pathOfBaseFile

Mandatory argument that specifies the path of the base file (it can also be provided as a URL).

pathOfFileToMergeWith

Mandatory argument that specifies the file to merge with (it can also be provided as a URL).

pathOfOutFile

Optional argument that specifies the path of the file where the merge operation results are saved to (it can also be provided as a URL). If present, it must appear immediately after the first two mandatory arguments. If absent, the merge results are saved to the base file, by overwriting it. You cannot choose the same file specified as the file to merge with as the output file (the merge process is aborted in this case). Also, if the output is a remote resource, its entire parent directory structure must already exist. Otherwise, an I/O exception is thrown and the merge results cannot be saved.

-nb noBackupOfBaseFile

Set to **true** if you do not want a backup copy of the base file on the hard disk. There are 2 situations when a backup of the base file is performed automatically and the backup operation must succeed to proceed with the merge. Otherwise, the merge process is aborted if the output file is not specified (i.e. the `pathOfOutFile` argument is not present) or the specified output file is the base file itself.

The backup copy will have the same parent directory as the base directory and its name will be the name of the base file suffixed by ".OXY.BAK". The default value is **false**, which means that for either of the 2 previously mentioned situations, a backup copy of the base file will be kept on the hard disk.

Note:

The backup copy can be deleted only if the base file and, implicitly, its backup copy are local resources (not remote).

-help | --help | -h | --h

Displays help text.

**Note:**

For boolean arguments, it is not necessary to provide the "true" value. Their presence in the argument list is equivalent to setting their value to "true" (and their absence from the argument list is equivalent to setting their value to "false"). However, constructs of the form `bool_option true|false` are accepted and interpreted accordingly

Examples of Compare Files Script

Example 1: Compare Files and View Results in XML Format

The following command results in merging `file1` and `file2` into `outfile` with changes highlighted:

```
sh scripts/mergeFilesTrackChanges.sh file1 file2 outfile
```

Example 2: Compare Files with Line by Line Algorithm

The following command results in merging `file1` and `file2` by overwriting `file1`. However, the `file1` is backed up first:

```
sh scripts/mergeFilesTrackChanges.sh file1 file2
```

Example 3: Compare Files and Generate Comparison Report

The following command results in merging `file1` and `file2` by overwriting `file1`. Although `file1` is initially backed up, the backup is eventually removed:

```
sh scripts/mergeFilesTrackChanges.sh file1 file2 -nb
```

Merge Directories with Change Tracking Highlights

**Attention:**

This script is bundled with the [all platforms distribution](#) of Oxygen XML Developer. To run the script, you are required to purchase a special [scripting commercial license](#).

The **Merge Directories with Change Tracking Highlights** script (`mergeDirsTrackChanges.sh`, found in the `scripts` subfolder inside **Oxygen's** installation directory) can be used to merge 2 directories (based on a 2-way comparison). All pairs of modified XML files involved in the process are merged by saving the **Author** mode comparison results as documents with highlighted tracked changes that can be later reviewed and accepted or rejected.

Arguments for the Merge Directories with Change Tracking Highlights Script

```
sh mergeDirsTrackChanges.sh pathOfBaseDir pathOfDirToMergeWith [[pathOfOutDir] [-nb noBackupOfBaseDir] [-nu noUpdateOfModifNonXMLFiles] [-na noAddingFilesOnlyPresentInDirToMergeWith] [-nd noDeletionOfFilesOnlyPresentInBaseDir] [-cm createChangeTrackingMarkersForAddedXMLFiles]] [-help | --help | -h | --h]
```

pathOfBaseDir

Mandatory argument that specifies the path of the base directory (it can also be provided as a URL using `file://` protocol).

pathOfDirToMergeWith

Mandatory argument that specifies the path of the directory to merge with (it can also be provided as a URL using `file://` protocol).

pathOfOutDir

Optional argument that specifies the path of the directory where the merge operation results are saved to (it can also be provided as a URL using `file://` protocol). If present, it must appear immediately after the first two mandatory arguments. If absent, the merge results are saved to the base directory, by overwriting it. You cannot choose the same directory specified as the directory to merge with as the output directory (the merge process is aborted in this case).

-nb noBackupOfBaseDir

Set to **true** if you do not want a backup copy of the base directory on the hard disk. There are 2 situations when a backup of the base directory is performed automatically and the backup operation must succeed to proceed with the merge. Otherwise, the merge process is aborted if the output directory is not specified (i.e. the `pathOfOutDir` argument is not present) or the specified output directory is the base directory itself.

The backup copy will have the same parent directory as the base directory and its name will be the name of the base directory suffixed by ".OXY.BAK". The default value is **false**, which means that for either of the 2 previously mentioned situations, a backup copy of the base directory will be kept on the hard disk.

-nu noUpdateOfModifNonXMLFiles

Set to **true** if you want to keep the non-XML files at their versions from the base directory. The default value is **false**, which means that all files in the output directory that are copies of non-XML files in the base directory will be replaced by their corresponding files in the directory to merge with.

-na noAddingFilesOnlyPresentInDirToMergeWith

Set to **true** if you want to skip adding the files that are only present in the directory to merge with to the output directory as well. The default value is **false**, which means that all files that are only present in the directory to merge with are also added to the output directory.

-nd noDeletionOfFilesOnlyPresentInBaseDir

Set to **true** if you want to preserve the files that are only present in the base directory. The default value is **false**, which means that all files that are only present in the base directory and initially copied to the output directory are deleted.

-cm createChangeTrackingMarkersForAddedXMLFiles

Set to **true** if you want to create change tracking markers for the XML files only present in the directory to merge with (that will be added to the output directory). Although these files have no counterparts in the base directory, change tracking markers of the type "entire content added/inserted" will be created. The option is not necessarily intended for the merge process itself, but it might prove a useful addition when you want to apply various *Oxygen* transformation scenarios to the resulting output directory. For example, if you merge 2 versions of a DITA project and then want a PDF to highlight the changes between those versions, you can apply a transformation on the resulting `ditamap` file. The `-am` option presents the new DITA files as "added content" in the resulting PDF. Note that the option is only considered if the `-na` argument is absent or is explicitly set to **false** (default value).

-help | --help | -h | --h

Displays help text.

Notes:

- The merge process has a preliminary phase where the entire structure and content of the base directory is copied to the output directory.
- For boolean arguments, it is not necessary to provide the "true" value. Their presence in the argument list is equivalent to setting their value to "true" (and their absence from the argument list is equivalent to setting their value to "false"). However, constructs of the form `bool_option true|false` are accepted and interpreted accordingly.
- Once the merge operation is complete, a report file is created and saved in the output directory (in a separate subdirectory named `.__OXY__MERGE__REPORT`). Loading the report file in Oxygen XML Developer provides additional functionality. Aside from the fact that the report provides an overview of the merge process, it also provides links to all the files in the resulting output directory. You can use the respective links to load the XML files in the editor, then switch to **Author** mode to review the tracked changes and accept or reject them.

Examples of Compare Directories Script

Example 1: Compare Directories Without Updating non-XML Files

The following command results in merging `dir1` and `dir2` into `outdir`, but without updating the non-XML files in `dir1` detected with changes to their version in `dir2`:

```
sh scripts/mergeDirsTrackChanges.sh dir1 dir2 outdir -nu
```

Example 2: Compare Two Directories and Overwrite the First One

The following command results in merging `dir1` and `dir2` by overwriting `dir1`. However, the `dir1` is backed up first:

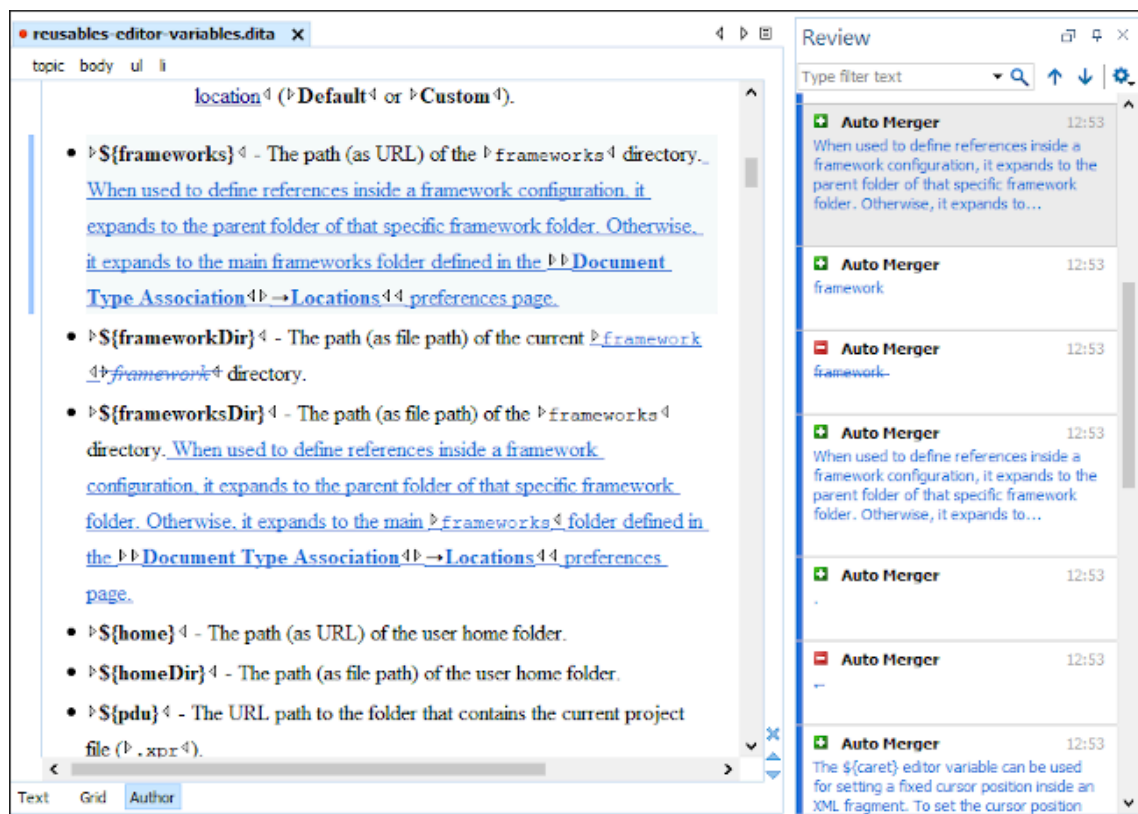

```
sh scripts/mergeDirsTrackChanges.sh dir1 dir2
```

Example 3: Compare Directories and Create Change Tracking Markers

The following command results in merging `dir1` and `dir2` into `outdir` and creating change tracking markers (of the type "entire content added/inserted") for all XML files that are only present in `dir2` (to be added to the `outdir`):

```
sh scripts/mergeDirsTrackChanges.sh dir1 dir2 outdir -cm
```

Figure 583. Example of a Merged File with Change Tracking Markers Opened in Author Mode

Format and Indent Files

Attention:

This script is bundled with the [all platforms distribution](#) of Oxygen XML Developer. To run the script, you are required to purchase a special [scripting commercial license](#).

The **Format and Indent Files** script (`batchFormatAndIndent.bat/batchFormatAndIndent.sh`, found in the `scripts` subfolder inside **Oxygen's** installation directory) can be used to format and indent multiple files at once.

Arguments for the Format and Indent Files Script

```
batchFormatAndIndent -i inputFilesAndDirs [-f filesFilter] [-s formattingSettingsFile] [-r] [-ih] [-v]
```

-i inputFilesAndDirs

The input files and directories.

-f filesFilter

A filter for the input files, specified by using a file pattern (e.g. `*.xml`, `t_*.dita`).

-s formattingSettingsFile

A file that contains formatting settings. It can be an `.xpr` file that contains project options or an `.xml` file that contains global options. If not specified, the operation uses the application's default settings.

-r

Use this argument if the operation should be performed recursively for the specified input directories.

-ih

Use this argument if you want the operation to also format and indent hidden files.

-v

Activates verbose logging. It is useful for debugging purposes.

22.

Glossary

Active Cell

Active cell refers to the selected cell where data is entered when you begin typing. Only one cell is active at a time. The *active cell* is bounded by a heavy border.

Anchor

An **Anchor** is used in various types of links to take the user to a specific location within the target document. It is designated in a URL or in the value of the `@href` attribute with a `#` symbol followed by the anchor that is defined in a target ID (for example `href="MyTopic.dita#anchor"`).

Apache Ant

Apache Ant (Another Neat Tool) is a software tool for automating software build processes.

Block Element

A **block element** is intended to be visually separated from its siblings, usually vertically. For instance, paragraphs and list items are *block elements*. It is distinct from a *inline element*, which has no such separation.

Bookmap

A **bookmap** is a specialized *DITA map* used for creating books. A *bookmap* supports book divisions such as chapters and book lists such as indexes.

Canonicalize

To **canonicalize** something means to convert it to a standard format that everyone generally uses. When using the term with regard to XML, it refers to the process of converting data that has more than one possible representations into a standardization that conforms to the specification of an XML document or document subset. It is helpful for applications that require the ability to test whether or not the content of an XML document or subset has been changed.

Content Completion Assistant

The **Content Completion Assistant** refers to a very helpful mechanism in Oxygen XML Developer that offers a list of proposed items that could be inserted at the current location, depending on the current context, editing mode, and type of document. It also tries to determine the most logical choice in the current editing context and displays that proposal at the beginning of the list.

For more information about this feature and how to invoke it, depending on your editing context, see the following:

- [Content Completion Assistant in Text Mode \(on page 486\)](#)
- [Content Completion Assistant in Grid Mode \(on page 541\)](#)
- [Content Completion in XSLT Stylesheets \(on page 661\)](#)

- [Content Completion in SQF \(on page 1031\)](#)

Dockable

A **Dockable** window is one that can be moved and resized, and either floated or pinned to a location, allowing you to configure the workspace according to your preferences.

Document Type Association

In general terms, a **Document Type Association** is a set of rules that associate a document type with a *framework* ([on page 2269](#)). In Oxygen XML Developer, **Document Type Association** also specifically refers to a [preferences page \(on page 128\)](#) where you can create new custom *frameworks* or edit existing ones. Note that *frameworks* (document types) that come built-in with Oxygen XML Developer are read-only, but you can **Extend** ([on page 129](#)) or **Duplicate** ([on page 129](#)) them to configure them as custom *frameworks*.

DITA Map

A **DITA map** is a component of the DITA *framework* ([on page 2269](#)) that provides the means for a hierarchical collection of DITA topics that can be processed to form an output. Maps do not contain the content of topics, but only references to them. These are known as topic references. Usually, the maps are saved on disk or in a CMS with the extension `.ditamap`.

Maps can also contain relationship tables that establish relationships between the topics contained within the map. Relationship tables are also used to generate links in your published document.

You can use your map or *bookmap* ([on page 2267](#)) to generate a deliverable using an output type such as XHTML, PDF, HTML Help, or Eclipse Help.

DITA Open Toolkit

DITA Open Toolkit is an open-source publishing engine for content authored in the Darwin Information Typing Architecture. It is a vendor-independent, open-source implementation of the DITA standard, released under the [Apache License, Version 2.0](#).

The toolkit supports all versions of the [OASIS DITA specification](#), including 1.0, 1.1, 1.2, and 1.3.

DITA-OT

Related information

<http://www.dita-ot.org/>

DITA-OT-DIR

DITA_OT_DIR refers to the default directory that is specified for your DITA Open Toolkit distribution in the [Options > Preferences > DITA preferences page \(on page 237\)](#).

For example, if you are using DITA-OT 4.2.3 that comes bundled with Oxygen XML Developer, the default directory is: `[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT`. You can also specify a custom directory.

Foldable Element

A **foldable element** refers to elements that can be collapsed and expanded in Oxygen XML Developer. *Foldable elements* are marked with a small triangle () on the left side of the editor panel and you can use that triangle to quickly collapse or expand them. This feature is helpful when you are working with large documents and you want to temporarily hide blocks of content. You can right-click the triangle to access additional collapse and expand actions (**Collapse Other Folds**, **Collapse Child Folds**, **Expand Child Folds**, **Expand All**).

Framework

A **framework** refers to a package that contains resources and configuration information to provide ready-to-use support for a vocabulary or document type. A *framework* is associated to a document type according to a set of rules. It also includes a variety of settings that improve editing capabilities for its particular file type. Oxygen XML Developer includes a **Document Type Configuration Dialog Box (on page 130)** that allows you to define the set of rules and customize various authoring mechanisms for new or existing *frameworks*.

Global Options

Global Options refers to the [storage option \(on page 277\)](#) in the Oxygen XML Developer preference pages (**Options > Preferences**). If you select **Global Options (on page 278)**, the options in that particular preferences page are stored locally on your computer and are not accessible to other users (unless you [export them into an XML options file \(on page 278\)](#) that can then be shared).

IDML

IDML is an abbreviation for Adobe InDesign Markup files.

Inline Element

An **inline element** is intended to be displayed in the same line of text as its siblings or the surrounding text. For instance, strong and emphasis in HTML are *inline elements*. It is distinct from a *block element*, which is visually separated from its siblings.

Java Archive

Java Archive (JAR) is an archive file format. *JAR* files are built on the ZIP file format and have the `.jar` file extension. Computer users can create or extract *JAR* files using the `jar` command or an archive tool.

Key Space

The concept of a **Key Space** in DITA refers to a set of all possible keys that can be used in a *DITA map* structure. A **Key Space** is established when a *root map* ([on page 2273](#)) defines a set of effective key bindings.

Keystore

A **Keystore** is an encrypted file that contains private keys and certificates. There are two types of *keystores* that are supported in Oxygen XML Developer:

- **Java Key Store (JKS)**
- **Public-Key Cryptography Standards version 12 (PKCS-12)**

Main File

A **Main File** typically refers to the root of an imported or included tree of modules and this support helps you simplify the configuration and development of XML projects. For more information, see the [Contextual Project Operations Using 'Main Files' Support](#) ([on page 381](#)) section.

Oxygen Publishing Template

Oxygen Publishing Template defines all the aspects related with the **look and feel (layout and styles)** for the **WebHelp Responsive** output.

The template is self-contained and packed as a ZIP archive making it easy to share with others. It represents the main method for customizing the *WebHelp Responsive* output.

Related Information:

[Publishing Template Package Contents for WebHelp Responsive Customizations](#) ([on page 1300](#))

Perspective

In Oxygen XML Developer, a **perspective** refers to an interface layout geared towards a specific editing environment. Each *perspective* includes a unique set of interface objects, toolbars, views, and features.

You can change the *perspective* by selecting the respective icon () in the top-right corner of Oxygen XML Developer or by selecting the *perspective* from the **Window > Open Perspective** menu.

The *perspectives* that are available in Oxygen XML Developer are:

-  **Editor** ([on page 309](#)) - The most commonly used *perspective* and it is used to edit XML documents.
-  **XSLT Debugger** ([on page 311](#)) - Used to detect problems in an XSLT transformation by executing the process step by step in a controlled environment.
-  **XQuery Debugger** ([on page 312](#)) - Used to detect problems in an XQuery transformation process by executing the process step by step in a controlled environment
-  **Database** ([on page 313](#)) - Used to browse and manage databases.

Plugin

In Oxygen XML Developer, a **plugin** is a component that adds extended functionality using a series of extension points and can be installed as an *add-on*. For more information, along with a full list of *add-ons* that are officially supported for Oxygen XML Developer, see [Oxygen XML Add-on Repositories](#).

For more information, see the following topics:

- [Installing and Updating Add-ons \(on page 108\)](#)
- [Automatic and Manual Methods for Installing Plugins \(on page 1866\)](#)
- [Packing and Deploying Plugins as Add-ons \(on page 1897\)](#)
- [Add-ons Preferences \(on page 127\)](#)
- [Extending Oxygen XML Developer with Plugins \(on page 1863\)](#)
- [General Configuration of an Oxygen XML Developer Plugin \(on page 1863\)](#)

Pretty-Print

Pretty-print refers to formatting and indenting the source code in **Text** mode to make the content easier to view and analyze. The formatting actions that are available in Oxygen XML Developer include:

-  **Format and Indent Element** - Available in the **Source** submenu of the contextual menu for the current element.
-  **Format and Indent** - Available on the toolbar for the entire current document.
-  **Format and Indent Files** - Available in the contextual menu of the **Project view** ([on page 365](#)) for one or more selected files.

Project Options

Project Options refers to the [storage option \(on page 277\)](#) in the Oxygen XML Developer preference pages (**Options > Preferences**). If you select **Project Options (on page 278)**, the options in that particular preferences page are stored at project level in the project file (`.xpr`), which can easily be [shared with other users \(on page 278\)](#).

QName

QName stands for "qualified name" and defines a valid identifier for elements and attributes. *QNames* are used as URI references to reference particular elements or attributes within XML documents.

Quick Fix/Assist

The **Quick Fix/Assist** feature gives you easy access to some of the most commonly used actions for the specific type of document you are editing. If one or more actions are available in the current context, they are accessible via a yellow bulb help (💡) placed at the current line in the stripe on the left side of the editor in **Text** mode. You can also invoke the quick assist menu by using the **Alt + 1 (Meta + Alt + 1 on macOS)** keyboard shortcuts.

Quick Fix

The **Quick Fix** support in Oxygen XML Developer helps you resolve errors that appear in an XML document by offering proposals to fix problems such as missing required attributes or invalid elements. *Quick Fixes* are available in **Text** mode and they can be presented and activated in several ways.

- When hovering over an area of text where a validation error or warning occurs, the *Quick Fix* proposals can be presented as links in a tooltip pop-up window.
- If you place the cursor in the highlighted area where a validation error or warning occurs, a *Quick Fix* icon (💡) is displayed in the stripe on the left side of the editor. Clicking that icon will allow you select from the available proposals.
- If you place the cursor in the highlighted area where a validation error or warning occurs, you can also access the *Quick Fix* menu by pressing **Alt + 1 (Command + Option + 1 on macOS)** on your keyboard.
- The *Quick Fix* menu also contains the option to automatically fix all validation errors in the document where quick fix proposals were generated. By selecting **Apply all default quick fix proposals**, each default quick fix proposal for each validation problem reported in the document will be applied (in bulk). The effect is similar to invoking the **Apply all default quick fix proposals action from the contextual menu in Text mode (on page 532)**.

Oxygen XML Developer also provides support for [defining and customizing a library of Quick Fixes using the Schematron language \(on page 1019\)](#).

Root Map

A **Root Map** (or main map) specifies a *DITA map* (on page 2268) that defines a hierarchical structure of submaps that are contained within the *root map*. Essentially, the *root map* defines a scope and provides the mechanism to allow your defined keys to be propagated throughout the entire map structure (this mechanism is also known as a *key space* (on page 2270)).

WebHelp Output Directory

WebHelp_OUTPUT_DIR refers to the output directory where WebHelp transformation files will be generated.

The output directory can be specified using the **Output Directory** text field in the **Output** tab of the transformation scenario dialog box.

When running the WebHelp transformation from a command line, the output directory can be specified using the `-o` or `--output` option.

Working Set

A **Working Set** refers to a set of files that will be used for the scope of search and refactoring operations. Many of the search and refactoring wizards include a step where you can specify the scope for the operation and you can choose one or more *working sets* to restrict the scope to that specified set of files.

XML Catalog

An **XML Catalog** maps a system ID or a URI reference for a resource (stored either remotely or locally) to a local copy of the same resource. Whenever XML processing relies on external resources (such as referenced schemas and stylesheets), the use of an *XML Catalog* becomes a necessity when Internet access is not available or the connection is slow.

Oxygen XML Developer includes default global catalogs as well as default catalogs for each of the built-in *frameworks* (on page 2269), and you can also create your own. Oxygen XML Developer uses these *XML Catalogs* to resolve references for document validation and transformations. For more information, see [Working with XML Catalogs](#) (on page 593).
